PLANTING NOTES

1. CONTRACTOR SHALL HAVE ALL SUBSURFACE UTILITIES MARKED PRIOR TO THE START OF WORK.
2. PLANT LOCATIONS ARE APPROXIMATE. PRIOR TO PLANTING, LOCATION OF ALL PLANT MATERIAL WILL BE APPROVED BY THE RESIDENT ENGINEER AND THE LANDSCAPE ARCHITECT.
3. ALL PLANT MATERIAL WILL HAVE TAGS INDICATING COMMON NAME, BOTANICAL NAME, CULTIVAR, & SIZE.
4. IMMEDIATELY AFTER ACCEPTANCE OF PLANTING, TAGS AND RIBBONS SHALL BE REMOVED.
5. ALL PLANTS WILL BE MULCHED PER PLANS AND SPECIFICATIONS.
6. ALL SHRUB AND PERENNIAL BEDS WILL BE WEEDED AND OTHERWISE NEATLY MAINTAINED FOR THE DURATION OF THE CONTRACT.
7. PLANTS AND PLANTING BEDS SHALL BE THOROUGHLY WATERED AS NECESSARY AND PER SPECIFICATIONS.

WATERING NOTES

1. IRRIGATION BAGS MAY BE USED FOR STREETSCAPE AND PARK PLANTINGS ONLY.
2. A SCHEDULE FOR FILLING AND REMOVAL SHALL BE SUBMITTED TO THE ENGINEER.
3. USE AND SCHEDULE MUST BE APPROVED BY THE MASSDOT LANDSCAPE ARCHITECT.
4. A MINIMUM OF 2 BAGS PER TREE SHALL BE USED. BAGS SHALL BE ATTACHED TO STAKES.
5. NO BAGS SHALL BE PLACED AROUND THE TREE TRUNK.
6. BAGS SHALL BE MAINTAINED FULL JUNE 1 - OCTOBER 1 OR AS APPROVED.
7. BAGS SHALL BE REMOVED AT THE END OF THE SEASON.

NOTE:

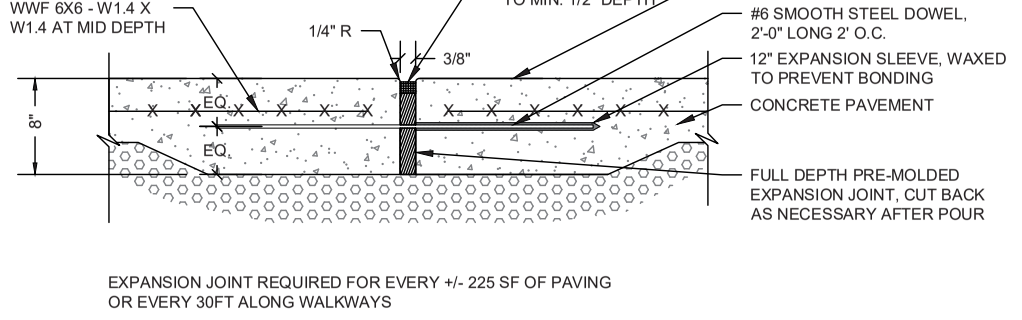
1. SEE LANDSCAPE PLAN 1 NORTH SHORE ROAD TRAILHEAD AND ENDICOTT STREET TRAILHEAD BLOW UP PLANS FOR CONCRETE AND JOINT LAYOUT.

CEMENT CONCRETE PAVEMENT NOTES

1. CEMENT CONCRETE PAVEMENT SHALL HAVE A 28-DAY COMPRESSIVE STRENGTH OF 4,000 PSI WITH 6% AIR-ENTRAINMENT AND MINIMUM CEMENT CONTENT OF 610 LBS/C.Y.
2. CONTRACTOR SHALL SUBMIT CONCRETE JOINT LAYOUT PLAN FOR APPROVAL. EXPANSION JOINTS SHALL BE TRANSVERSE PREFORMED EXPANSION JOINT FILLER (AASHTO M-213-65) ½ IN. THICKNESS.
3. PREFORMED EXPANSION JOINT FILLER SHALL BE PLACED ADJACENT TO OR AROUND EXISTING STRUCTURES AND WALKWAYS.
4. EXPANSION JOINTS SHALL BE CONSTRUCTED WITH DOWELS, AS INDICATED IN DETAIL 2 LANDSCAPE DETAIL SHEET 1.
5. AFTER CONSOLIDATION, CONCRETE DEPTH SHALL BE 6 INCHES IN DEPTH FOR TRAILHEADS.
6. ENSURE THAT NO BLED WATER OR WATER SHEEN EXISTS ON THE SURFACE OF THE CONCRETE AND THAT CONCRETE HAS STARTED TO STIFFEN BEFORE ANY FINISHING OPERATIONS ARE PERFORMED.
7. AFTER TROWELING, SURFACE SHALL BE BRUSHED BY DRAWING A SOFT-BRISTLED PUSHBROOM WITH A LONG HANDLE OVER THE SURFACE OF THE CONCRETE TO PRODUCE A NON-SLIP SURFACE.
8. THE FINISHING OF CONCRETE SURFACE SHALL BE DONE BY EXPERIENCED AND COMPETENT CEMENT CONCRETE FINISHERS.
9. FINISHING SHALL BE BROOM FINISH.
10. SAW CUT CONTROL JOINTS.
11. WHEN COMPLETED, CONCRETE SHALL BE KEPT MOIST AND PROTECTED FROM TRAFFIC AND WEATHER FOR AT LEAST 3 DAYS.
12. WELDED WIRE MESH SHALL BE 6"x6" No. 10 GAUGE AND SHALL BE SHEET MESH ONLY NOT ROLLED. MESH SHALL REST ON CONCRETE BLOCKS AND BE INSTALLED AT MID DEPTH IN CONCRETE.

1 CEMENT CONCRETE PAVEMENT AT TRAILHEADS

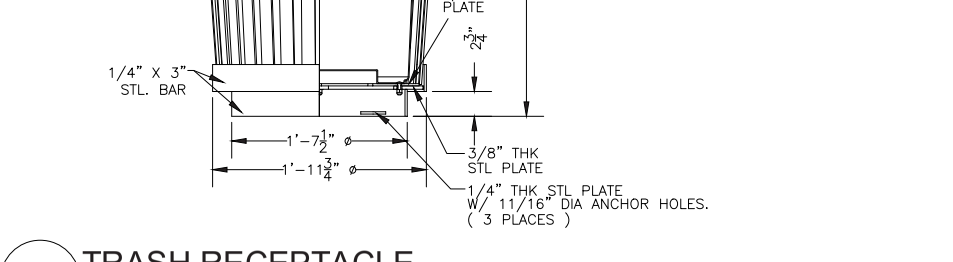
SCALE: N.T.S.



EXPANSION JOINT REQUIRED FOR EVERY +/- 225 SF OF PAVING OR EVERY 30FT ALONG WALKWAYS

EXPANSION JOINT NOTES:

1. DOWEL IS TYPICAL AT ALL EXPANSION JOINTS EXCEPT AGAINST VERTICAL JOINTS WITH WALLS, CURBS OR SITE IMPROVEMENTS.



SAWCUT CONTROL JOINT REQUIRED FOR EVERY 36 SF OF PAVING.

GENERAL NOTES

GENERAL NOTES

DESIGN:
IN ACCORDANCE WITH THE 2009 AASHTO LRFD GUIDE SPECIFICATION FOR DESIGN OF PEDESTRIAN BRIDGES WITH 2015 INTERIM REVISIONS, FOR 90 PSF DESIGN PEDESTRIAN LOADING.

MASSDOT BENCH MARK:
ELEVATIONS ARE BASED ON THE NORTH AMERICAN VERTICAL DATUM (NAVD) OF 1988.

BENCHMARK: 9 – MAG NAIL SET UP #28 ON WARREN ROAD
STATION: 347+49.19 – 8.971 LT
NORTHING: 3019612.4266
EASTING: 807741.8898
ELEVATION: 41.17'

BENCHMARK: 11 – MAG NAIL SET ABOUT 1' ABOVE GROUND AT LP#6 ON ENDICOTT STREET
STATION: 359+34.38 – 79.411 LT
NORTHING: 3018945.6274
EASTING: 808725.6506
ELEVATION: 37.33'

MASSDOT SURVEY:
THE EXISTING CONDITIONS SHOWN ON THIS BASEMAP ARE THE RESULTS OF AN AERIAL SURVEY PERFORMED BY SANBORN COMPANY IN JUNE, 2004 SUPPLEMENTED BY AN ON GROUND INSTRUMENT SURVEY PERFORMED IN SEPTEMBER, 2004 BY GREEN INTERNATIONAL AFFILIATES, INC. (GREEN). ADDITIONAL GROUND SURVEY WAS PERFORMED BETWEEN 2017 AND 2022 BY GREEN TO SUPPLEMENT EXISTING GROUND SURVEY.

SCALES:
SCALES NOTED ON THE PLANS ARE NOT APPLICABLE TO REDUCED SIZE PRINTS. DIVIDE SCALES BY 2 FOR HALF–SIZE PRINTS.

FOUNDATIONS:
FOUNDATIONS MAY BE ALTERED, IF NECESSARY, TO SUIT CONDITIONS ENCOUNTERED DURING CONSTRUCTION, WITH THE APPROVAL OF THE ENGINEER.

UNSUITABLE MATERIAL:
ALL UNSUITABLE MATERIAL SHALL BE REMOVED WITHIN THE LIMITS OF THE FOUNDATIONS OF THE STRUCTURE, AS DIRECTED BY THE ENGINEER.

GEOTECHNICAL REPORT:
REFER TO GEOTECHNICAL REPORT, DATED MAY 2023, PREPARED BY GZA GEO ENVIRONMENTAL.

EXISTING CONDITIONS:
CONTRACTOR SHALL DETERMINE AND ESTABLISH ALL DIMENSIONS AND DETAILS NECESSARY FOR COMPLETION OF ALL WORK BY FIELD MEASUREMENTS AND SURVEY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ADEQUACY THEREOF, AND SHALL NOT ORDER ANY MATERIAL OR COMMENCE ANY FABRICATION UNTIL HE/SHE HAS MADE THE REQUIRED MEASUREMENTS AND THE EXTENT OF THE PROPOSED WORK HAS BEEN APPROVED BY THE ENGINEER.

STRUCTURAL WOOD NOTES:
ALL DIMENSIONAL LUMBER SHALL BE SOUTHERN PINE STAMPED BY A MEMBER OF THE WWPA AND KILN DRIED TO 19% MAXIMUM MOISTURE CONTENT. ALL STRUCTURAL LUMBER SHALL BE SELECT STRUCTURAL GRADE. IN ACCORDANCE WITH AASHTO TABLE 8.4.1.1.4–1 AND THE 2018 NATIONAL DESIGN SPECIFICATIONS (NDS) FOR WOOD CONSTRUCTION ALL PROPOSED TIMBER ELEMENTS SHALL HAVE A MINIMUM MODULUS OF ELASTICITY OF 1800 KSI.

STRINGERS AND PIER BENTS SHALL NOT BE NOTCHED EXCEPT WHERE SHOWN IN DETAILS. OBTAIN STRUCTURAL ENGINEER'S APPROVAL FOR ANY HOLES THROUGH OR NOTCHES IN THE TOP OF HORIZONTAL MEMBERS.

FOR BLACK LOCUST DECKING MATERIAL REQUIREMENTS PLEASE REFER TO THE SPECIAL PROVISIONS.

PROPOSED WOOD SCREWS FOR TIMBER FRAMING ELEMENTS SHALL COMPLY WITH ASME B18.6 REQUIREMENTS AND SHALL BE GALVANIZED UNLESS OTHERWISE NOTED. WOOD SCREW SIZES AND LENGTHS SHALL BE AS SHOWN ON THE PLANS.

SEE SHEET 17 FOR CONNECTION HARDWARE NOTES.

GRS–IBS MATERIALS
SEE SPECIAL PROVISIONS FOR DETAILED REQUIREMENTS.

CONCRETE MASONRY UNIT (CMU) FACING ELEMENTS
FACING ELEMENTS CONSISTING OF SPLIT–FACE CMU BLOCK UNITS SHALL MEET ASTM C90–11B AND THE REQUIREMENTS OF THE SPECIAL PROVISIONS, WITH A MINIMUM REQUIRED COMPREHENSIVE STRENGTH OF 4000 PSI AND A MAXIMUM WATER ABSORPTION RATE OF 5 PERCENT AFTER 24 HOURS.

CONSTRUCTION JOINTS
CONSTRUCTION JOINTS, OTHER THAN THOSE SHOWN ON THE PLANS, WILL NOT BE PERMITTED WITHOUT PRIOR APPROVAL OF THE ENGINEER.

BACKFILL MATERIALS
A. GEOSYNTHETIC REINFORCED SOIL (GRS) BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.6 AND HAVE A MINIMUM ANGLE OF INTERNAL FRICTION OF 30 DEGREES AS CONFIRMED BY A DIRECT SHEAR TEST.
B. REINFORCED SOIL FOUNDATION (RSF) BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.4 AND HAVE A MINIMUM ANGLE OF INTERNAL FRICTION OF 38 DEGREES AS CONFIRMED BY A DIRECT SHEAR TEST.
C. INTEGRATED APPROACH BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.1.
D. LEVELING COURSE BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.6.

GEOSYNTHETICS
FURNISH GEOSYNTHETICS CONSISTING OF GEOTEXTILE FOR THE GRS ABUTMENT, RSF AND INTEGRATED APPROACH. THE GEOSYNTHETIC MATERIAL SHALL BE MANUFACTURED FROM POLYPROPYLENE, HIGH–DENSITY POLYETHYLENE, OR POLYESTER AND MEET THE REQUIREMENTS OF THE SPECIAL PROVISIONS.

A. GEOSYNTHETIC REINFORCED SOIL SHALL INCLUDE A CLASS 1 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11 AND A REINFORCEMENT STRENGTH OF 1370 LB/FT AT 2 PERCENT STRAIN IN THE CROSS DIRECTION.
B. REINFORCED SOIL FOUNDATION SHALL INCLUDE A CLASS 1 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11 AND A REINFORCEMENT STRENGTH OF 1370 LB/FT AT 2 PERCENT STRAIN IN THE CROSS DIRECTION.
C. INTEGRATED APPROACH SOIL SHALL INCLUDE A CLASS 2 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11.

								Bottom of boring at 36 feet.	9				

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 5.5 feet south of staked location due to restricted access and overhead wires.
3. Continuous sampling performed from sampling depths 0 to 10 feet below ground surface (bgs). Driller advanced 4-inch casing down as sampling advanced. The casing was advanced to 14 feet bgs following sampling of S-5.
4. Standard sampling performed from sample depths 14 to 24.2 feet bgs.
5. Driller advanced 4-inch casing from 14 to 24 feet bgs.
6. Clayey Silt observed in drill cuttings from 17.5 to 19 feet bgs.
7. Weathered Bedrock fragments and increased drill effort observed at 23.8 feet bgs.
8. Cored bedrock with a downward pressure of 500 psi at 1,350 rpm in 3rd gear using an NX core barrel.
9. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 3.5 feet south due to restricted access.
3. Advanced boring using 4-inch casing from sample depths 0 to 29 feet below ground surface (bgs).
4. Consistent coarse sand-sized rock fragments observed in drill cuttings from sample depths 30 to 31 feet bgs.
5. Drill rig did not have a downward pressure or RPM gauge. Cored bedrock in 3rd gear using an NX core barrel.
6. Core barrel jammed with no loss of water at sample depths 35.1 and 38.3 feet bgs.
7. Borehole backfilled to approximate ground surface with drill cuttings.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

BORING NOTES:

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B–#
2. BORINGS ARE TAKEN FOR PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS REQUIRED TO DRIVE A 1 3/8" I.D. SPLIT SPOON SAMPLER 6" USING A 140 POUND WEIGHT FALLING 30".
5. BORING SAMPLES ARE STORED AT A STORAGE FACILITY LOCATED ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.
6. B–7 AND B–8 WERE MADE IN JANUARY 2019 AND B–9 THROUGH B–12 WERE MADE IN FEBRUARY 2022.
7. BORINGS WERE MADE BY NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH, 03038.
8. THE NORTH AMERICAN VERTICAL DATUM (NAVD) OF 1988 IS USED THROUGHOUT.

NOTES:

1. SEE SHEET 10 FOR HELICAL PILE STATION AND OFFSET.
2. SEE SHEET 11 FOR HELICAL PILE NOTES.
3. HELICAL PILE MINIMUM EMBEDMENT SHALL BE 11'-6" TO THE TOP HELICE FOR ALL P#-3 LOCATIONS WITH AN OFFSET LESS THAN 3'-6" BETWEEN THE CENTER OF PILE AND THE EDGE OF THE SEWER LINE AS DIMENSIONED ON THIS SHEET.
4. ALL DIMENSIONS SHOWN FOR THE SOUTH HELICAL PILES TO THE EXISTING SEWER LINE ARE APPROXIMATE AND TAKEN PERPENDICULAR TO THE SEWER LINE.
6. THE VERIFICATION TEST HELICAL PILES SHALL BE A SACRIFICIAL HELICAL PILE. THE VERIFICATION TEST SHALL BE PERFORMED PRIOR TO CONSTRUCTION OF PRODUCTION HELICAL PILES. THE VERIFICATION TEST LOCATIONS ARE APPROXIMATE AS SHOWN. CONTRACTOR TO SELECT THE EXACT LOCATION OF THE VERIFICATION TEST HELICAL PILES WITH APPROVAL BY THE ENGINEER.
7. PRIOR TO LAYOUT AND INSTALLATION OF THE HELICAL PILES, THE CONTRACTOR SHALL LOCATE THE EXISTING SEWER MANHOLES AND STAKE OUT THE 42" RCP PIPE ALIGNMENT BETWEEN MANHOLES WITHIN THE LIMITS OF THE PROPOSED BOARDWALK. THE CONTRACTOR SHALL PERFORM A MINIMUM OF TWO (2) TEST PITS ALONG THE STAKED OUT ALIGNMENT OF THE SEWER WITHIN THE PROXIMITY OF THE HELICAL PILES.

LATERAL AND LONGITUDINAL HELICAL PILE ATTACHMENT ASSEMBLY

SCALE: 3/4" = 1'–0"

NOTES:

1. THE TABLE BELOW SUMMARIZES THE FACTORED AXIAL DESIGN LOADS PER PILE FOR AASHTO LRFD BRIDGE SPECIFICATIONS STRENGTH I LOAD COMBINATIONS. THE NOMINAL GEOTECHNICAL RESISTANCE, AND THE FACTORED GEOTECHNICAL RESISTANCE PER PILE:

	FACTORED DESIGN LOADS	NOMINAL GEOTECHNICAL RESISTANCE	FACTORED GEOTECHNICAL RESISTANCE**
HELICAL PILE (COMPRESSION)	10.00 KIPS	17.00 KIPS	11.90 KIPS
HELICAL PILE (TENSION)	5.00 KIPS	14.80 KIPS	10.35 KIPS

**FACTORED GEOTECHNICAL RESISTANCE IS THE PRODUCT OF THE NOMINAL GEOTECHNICAL RESISTANCE AND A RESISTANCE FACTOR OF 0.70.

2. THE TOP HELIX OF ALL PROPOSED HELICAL PILES SHALL BE TORQUED TO A MINIMUM EMBEDMENT OF 9 FEET BELOW EXISTING GRADE, EXCEPT AS NOTED ON SHEET 8 ADJACENT TO THE SEWER LINE.
3. THREE PRE–PRODUCTION VERIFICATION LOAD TESTS FOR THREE SACRIFICIAL PILES ARE REQUIRED TO CONFIRM THE HELICAL PILE NOMINAL RESISTANCE. LOAD TESTING SHALL BE PERFORMED IN ACCORDANCE WITH THE SPECIAL PROVISION REQUIREMENTS, THE GEOTECHNICAL REPORT RECOMMENDATIONS, AND THE SACRIFICIAL PILE LOCATIONS SHALL BE AGREED UPON BY THE CONTRACTOR AND ENGINEER. A RESISTANCE FACTOR OF 0.70 MAY BE UTILIZED UPON SUCCESSFUL COMPLETION OF STATIC LOAD TESTING.
4. THE CONTRACTOR SHALL SUBMIT A PILE SCHEDULE, PILE INSTALLATION, AND TESTING PLAN FOR REVIEW AND APPROVAL OF THE ENGINEER. THE CONTRACTOR SHALL SUBMIT SHOP DRAWINGS AND DESIGN CALCULATIONS FOR THE PROPOSED HELICAL PILES SIGNED AND STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE COMMONWEALTH OF MASSACHUSETTS.
5. ALTERNATIVE ATTACHMENT AND ASSEMBLIES CAN BE SUBMITTED THROUGH THE SHOP DRAWING PROCESS FOR REVIEW AND APPROVAL.
6. LATERAL PILES ALTERNATE DIRECTION EVERY BENT.
7. LATERAL AND LONGITUDINAL PILE ANGLE CAN RANGE BETWEEN 25° AND 35°.
8. LONGITUDINAL BATTERED PILES SHALL BE AT EVERY THIRD PIER BENT TO RESIST LONGITUDINAL LOADING.
9. HELICAL PILES AND CONNECTIONS SHALL BE HOT–DIPPED GALVANIZED.
10. REMOVAL OF SURFICIAL COBBLES/BOULDERS WILL BE REQUIRED PRIOR TO HELICAL PILE INSTALLATION. PRE–DRILLING MAY BE REQUIRED TO PENETRATE THE COBBLES AND BOULDERS.
11. HELICAL PILE MINIMUM EMBEDMENT SHALL BE 11'–6" TO THE TOP HELICE FOR ALL P#–3 LOCATIONS WITH AN OFFSET LESS THAN 3'–6" BETWEEN THE CENTER OF PILE AND THE EDGE OF THE SEWER LINE. MINIMUM EMBEDMENT FOR ALL REMAINING PILES SHALL BE 9'–0".
12. FOR ADDITIONAL HELICAL PILE REQUIREMENTS, SEE SPECIAL PROVISION ITEM NO. 943.20.

Date:	July 9, 2024
Project Name:	Independence Greenway Extension, Peabody, MA
Project Number:	Green No. 17118
Subject:	**Response to ACOE Review letter for 404 PCN Application No. NAE-2024-01390**

This memorandum provides the responses to ACOE Additional Info Review letter for 404 PCN Application No. NAE-2024-01390.

Responses to each technical review comment are noted below in **Bold.**

1. "Appendix B – Wetland Delineation Report with Data Forms" was missing from the application. Please provide the report and forms.

Appendix B – Wetland Delineation Report with Data Forms is included as an attachment to this memo.

2. Please provide photographs of the inlet and outlet of the 24" CMP connecting Wetland V and Proctor Brook at Sta. 342+20.

Below is a photo of the outfall of the hydrologic connection between Wetland V and Proctor Brook, on the Proctor Brook side at approximately Sta. 242+20. Please note this is not a stream crossing but a hydrologic connection only.

Existing 24” CMP Culvert outlet on a Proctor Brook side (Sta. 342+20 north)

3. The shading for permanent and temporary waterway impacts appears to be reversed on some sheets (see impact plan sheets 5-7). Please revise as necessary.

The permanent and temporary waterway impacts hatching has been revised on all WQC/ACOE impact sheets. The revised WQC/ACOE Impact Plans Sheets 1-8 are included as an attachment to this letter.

4. Detail sheets were only provided for two culverts and the boardwalk. Please provide cross-section and profile views for the three remaining culverts, at Sta. 340+10, 342+20, and 358+50.

Attached please find the cross-section and profile views sheet for the embedded 36” culvert at Sta. 340+10 conveying intermittent stream beneath the proposed bikepath.

The existing 15” RCP and 24” Corrugated Metal Pipe (CMP) culverts are not perched as can be seen in photos included in response to #2 (24” CMP at Sta 342+20) as well as a photo below for the views of 15” Reinforced Concrete Pipe (RCP) at Sta 358+50. The proposed 16” DIP and 24” DIP invert elevations at both inlet and outlet will match existing invert elevations. The revised impact plans are attached to these responses.

The existing 24”at Sta 342+20 does not convey a stream and it does not have an OHW line going through it. This culvert conveys a hydrological connection between a wetland V-series and Proctor Brook. As noted above, it will be replaced in-kind. The OHW mark associated with Proctor Brook exists only at the outlet side of this culvert where we propose stone for pipe ends within the brook (see screenshot below). The flow direction is from wetland V-series to Proctor Brook, so there would not be any OHW in that culvert and the stone for pipe ends will be places exactly to match the existing surface elevations within a riverbed, as noted in our Application.

As noted in the Application, the existing 15-inch RCP culvert conveying the intermittent stream at Sta. 358+50 is proposed to be replaced with a 16-inch Ductile Iron Pipe (DIP) to be able to support the H-20 vehicle loading with a shallow depth of cover.

Existing 15” RCP Culvert inlet (Sta. 358+50 south)

Existing 15” RCP Culvert outlet (Sta. 358+50 north)

Existing 15” RCP Culvert beneath the existing abandoned railroad (Sta. 358+50)

5. The Ordinary High Water (OHW) mark should be shown extending through the culverts for all streams, including those at Sta. 340+10 and 358+50, and impacts to the stream within the culverts calculated. Note that my supervisor typically considers replacing a culvert to result in permanent discharges of fill.

The plans have been revised to show the Ordinary High Water (OHW) mark extending through the culverts for all streams, including those at Sta. 340+10 and 358+50, and added callouts for the OHW elevations at each culvert. Additionally, the plans have been revised to show the permanent ACOE impacts to WOTUS extending through the culverts at Sta. 340+10 and 358+50. The revised table of WOTUS impacts is included below in Response #7.

6. On impact plan sheet 6, on the south side of the road at the culvert at Sta. 340+10, there appears to be an unshaded area of rip-rap below the OHW mark of the intermittent stream. If there is rip-rap being placed in this location it should be shaded as a permanent impact. Please confirm and revise the plans and impact calculations as necessary.

At Sta. 340+10, the riprap at the inlet of the culvert within the intermittent stream is within a wetland and will result in filling of the wetland. This area was inadvertently not included as VW impacts; but the WQC/ACOE impact plans have been revised to include this area as permanent VW impacts. The revised table is included below and the revised WQC/ACOE plans are included as an attachment to this letter.

Wetland Area Series (STA. #)	Permanent Impacts (ft^2)	Temporary Impacts (ft^2)
Z (STA. 329+85)	264	245
Y (STA. 329+85)	447	58
V (STA. 340+10)	293	122
V (STA. 342+20)	183	435
V (STA. 346+20)	914	216
E (STA. 346+20)	126	72
E (STA. 346+90)	117	66
X (STA. 352+00)	6	3,461
Total	**2,350**	**4,675**

7. On impact plan sheet 7, the stream impacts do not appear to match those in Table 5.2. At Sta. 345+50, Table 5.2 indicates there are 13 square feet of permanent and 72 square feet of temporary impact. I am unable to find these impacts called out on the plans. The plans also have a callout for 151 square feet of temporary impact at Sta. 346+20 that is not found in Table 5.2. Please review and ensure the impacts in the table and on the plans agree.

The callout at Sta. 345+50 on WQC/ACOE Impacts Plan Sheet 7 has been revised. Additionally, as part of addressing MassDEP comments, the riprap within LUW/WOTUS at Culvert No. 1 at Sta. 329+85 has been reduced. The revised Table 5.2 with updated LUW/WOTUS impacts is shown below

with updated numbers shown in red and revised WQC/ACOE impacts plans are included as an attachment to this letter.

Table 5.2: LUW/WOTUS Impacts

Resource Area	Permanent Impacts (ft^2)	Temporary Impacts (ft^2)	Dredge Volume (cy)
STA. 329+85*	6,309	1,107	1,210
STA. 340+10	151	32	16
STA. 342+20	79	64	12
STA. 345+50	13	72	-
STA. 346+20	1,474	283	241
STA. 351+50	305	550	12
STA. 358+50	345	202	--
Total	**8,676**	**2,310**	**1,491**

* impacts at station 329+85 were previously updated as part of the response to DEP's technical deficiency letter on 6/11/2024

8. On impact plan sheet 8 there are linear "bank" impacts at intermittent stream X. It appears there may be areas of grading and/or rip-rap below the OHW mark of this stream. Is there a corresponding area of impact (in square feet) below OHW in these locations? If so, these impact areas should be calculated, shaded, and called out on the plans.

The WQC/ACOE impact plans have been revised to include this area as permanent ACOE impacts to WOTUS. The revised table is included above in response #7 and the revised WQC/ACOE plans are included as an attachment to this letter.

9. Temporary impacts to wetlands and below OHW are depicted on the plans associated with the pile-supported boardwalk. In non-navigable waters Corps jurisdiction is limited to discharges of fill pursuant to Section 404 of the Clean Water Act. It is unclear from the plans what fills are causing the impacts associated with the boardwalk. Please clarify the nature of these impacts. The specifications mention temporary mats will be used. If mats are to be used and are the source of the temporary impacts, they should be labeled on the plans.

The 6 square feet of permanent BVW impacts for the boardwalk are associated with the installation of the approximately 2.5-inch diameter helical piles within the wetland. The 305 square feet of permanent LUW/WOTUS impacts are associated with the installation of the approximately 2.5-inch diameter helical piles within Proctor Brook as well as the placement of riprap within Proctor Brook at the start of the boardwalk to protect the bank and the pedestrian path at the bend of Proctor Brook in this area. The timber matting is to be used within the limits of the proposed boardwalk within the wetland area. A note has been added to the Construction Plan and Profile – 7 as well as the WQC/ACOE impacts plans to clarify, which are both included as attachments to this letter.

10. There appears to be a FEMA Floodway associated with Proctor Brook. To assist with our required FEMA coordination, at a minimum we need a statement on whether or not the project will result in

any increase in the base flood elevation (BFE) or alter the existing floodway delineation. If a Hydraulic Study Report/No-Rise Analysis was produced, please provide a copy.

The Hydraulic and Scour Study was performed by Green International Affiliates, Inc. (Green) for MassDOT for Proctor Brook along the Independence Greenway Extension in Peabody, MA. As found and explained in the study, the project implementation will neither result in any increase to the waterway's Base (100-year) Flood Elevation (BFE) profile, nor necessitate alteration of the waterway's floodway delineation, anywhere within the affected community. See Section 5.0 CONCLUSIONS in the attached Hydraulic and Scour Analysis Summary Report, dated November 2023.

11. IPaC now lists the tricolored bat (Proposed Endangered) as potentially present at the project site. Please state the lead federal agency's (FHWA or MassDOT on behalf of FHWA) effect determination for this species and provide documentation of any coordination that was completed with USFWS.

The Tricolored Bat (*Perimyotis subflavus*) species is only proposed to be endangered, as the USFWS has not made a determination on the uplisting and is currently under review. It is expected that they will make a determination this summer. If they determine the species warrants listing under the ESA we would then consult with the USFWS for Tricolor on any project in construction with potential stressors on the species in its range, as well the ad program going forward. But at this time, no official determination can be made for a species that's not listed.

Enclosed with this letter response are the following documents:

- Appendix B – Wetland Delineation Report with Data Forms
- Revised WQC/ACOE Impact Plan (Sheets 1-8)
- Culvert Cross Section Sheet for Culvert at Sta 340+10
- Construction Plan and Profile -7
- Hydraulic and Scour Analysis Summary Report, dated November 2023

From:	Brandon Faneuf, PWS
Date:	October 12, 2022
Project Name:	Peabody Bikeway Extension, Peabody, MA
Project Number:	Green No. 17118.0228
Subject:	Wetland Description

Introduction

This memo is to describe the types and extents of wetlands and wetland jurisdictional areas at the above-referenced site (Site). Wetland delineation work was originally performed on February 15, 2018 in conformance with the Massachusetts Wetlands Protection Act (MGL c. 131, §40)(WPA) and its Regulations (310 CMR 10.00). The site was reflagged, and the wetland boundaries were reconfirmed in 2022. Peabody has promulgated a local Wetlands & Rivers Protection Ordinance (The Ordinance) and Wetlands and Rivers Protection Regulations (Chapter 32) that exceed jurisdictional areas and performance standards of the WPA and 310 CMR 10.00. The project site is between Yankee Division Highway and Endicott Street, following the unfinished portion of the Independence Greenway bike trail and parallel to Proctor Brook.

Area of Interest (AOI)

The area between Yankee Division Highway and Endicott St., along Proctor Brook as referenced above, was investigated for wetland resource areas. To ensure that all potential jurisdictional areas that may extend onto the Area of Interest (AOI) were located and defined, all land within 200 feet of the AOI was investigated to the best possible extent while respecting private property rights.

The area of the AOI is heavily disturbed with a variety of developments and infrastructure. Along Proctor Brook, there is a historic railroad that is now decommissioned (i.e. the proposed Independence Greenway bike path). Left in its place is fill and grading that has affected the flow of the river and its floodplain. On either side of Proctor Brook there are housing developments including condominiums and single-family dwellings. Yankee Division Highway runs directly through the AOI in the western part. As a result of the historic disturbance, there is very little natural area left in the AOI and invasive, non-native plant species dominate much of the area.

Wetland Resource Areas

Wetland Resource Areas exist on either side of Yankee Division Highway adjacent to both Essex Center Drive and Northshore Road as well on either side of the abandoned railway between Northshore Road and Endicott Street. Wetlands revolve around a perennial stream, Proctor Brook, that flows west-to-east through the AOI and into a pond that exists to the southeast. Per 310 CMR 10.00 and the Ordinance, Proctor Brook is a perennial river and receives a two-hundred foot (200') Riverfront Area (RFA).

Multiple Bordering Vegetated Wetlands (BVW/BVW's) exist along the southern and western banks of Proctor Brook. These BVW's are delineated separately but are all hydrologically connected, mainly through Proctor Brook. Each alpha-numerically delineated section of BVW retains a one-hundred foot (100') buffer zone per 310 CMR 10.00 and the Ordinance.

The wetland types on site:

- Inland Bank- same as the mean annual high-water (aka bankfull conditions) mark, as delineated in the field with the 'MAHW' flags. This represents the first observable break-in-slope along the bank of the Brook.

- Land Under Waterbodies & Waterways- land between the two (2) mean low water marks (currently underwater and not flagged in the field).

- 200' Riverfront Area ("RFA") of the River. The inner boundary of the RFA is represented by the 'MAHW' flags along the Inland Bank. The RFA extends perpendicularly from the 'MAHW' flags without regard for topography.

- Bordering Vegetated Wetland ("BVW"), as delineated in the field with 'A', 'B', 'C', 'E', 'V', 'Y', and 'Z' series flags. These flags represent the edge of the BVW where it changes to from vegetated wetland to upland. Per 310 CMR 10.00 and The Ordinance, these receive 100' buffer zones.

- Bordering Land Subject to Flooding ("BLSF") associated with the River. This is the 100 year floodplain as delineated by FEMA (see attached FEMA Firmette). This follows Proctor Brook in the AOI.

Soils in the area consist of fine sandy loams and loamy sands on 0-8% slopes. The topography in the area is generally flat with land rising as it gets farther from Proctor Brook.

Table 1. Wetland Resource Areas

Flag Series	Wetland Type	Approx. Location
A1-A14 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Northwest of Independence Greenway and southwest of the parking area associated with Lahey Medical Center.
B1-B10 (pink flags)	N/A	Drainage ditch to between Independence Greenway and Yankee Division Highway.
C1-C7 (pink flags)	N/A	Drainage ditch between Northshore Road and Garden Road.
E1-E12 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Travels east-to-west along the northern bank of Proctor Brook south of the Peabody Municipal Light Plant.
V1-V17 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off of the southern bank of Proctor Brook and travels west. Located northeast of Jennifer Lane.
W1-W4 (blue flags)	Bank of Intermittent Stream w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Makes a semicircle adjacent to Endicott Street and south of Proctor Brook.
X1-X11 (blue flags)	Bank of Intermittent Stream w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off MAHW-11 and travels east along the southern portion of the AOI to Endicott Street.
Y1-Y7 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off of the southern bank of Proctor Brook and travels east. It is located north of Castle Circle. Starts at the end of the MAHW1-MAHW87 series.
Z1-Z8 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off of the northern bank of Proctor Brook and travels west. Located southwest of the condominium development, "Terrace Estates."

MAHW1-MAHW87 (blue flags)	Inland Bank of Perennial Stream w/ 200' RFA per 310 CMR 10.00 and the Ordinance.	Begins at Endicott Street and travels northwest. It delineates the southern Bank of Proctor Brook in the eastern portion of the AOI.
MAHW101-MAHW138 (blue flags)	Inland Bank of Perennial Stream w/ 200' RFA per 310 CMR 10.00 and the Ordinance.	Begins off of Warren Street Extension directly south of the Peabody Municipal Light Plant and travels northwest. It delineates the northern Bank of Proctor Brook.
MAHW201-MAHW230 (blue flags)	Inland Bank of Perennial Stream w/ 200' RFA per 310 CMR 10.00 and the Ordinance.	Begins off of Northshore Road and travels southeast. It delineates the northern Bank of Proctor Brook.

Other Resources

A search of other critical resources within the project area was conducted using GIS software and data available through various governmental agencies (FEMA, DEP, and others). The results of our search are listed in the table below.

Table 2. Selected MASSGIS Environmental Data Layers

Mapped Resource On or Within Proximity to Site	Yes	No
Area of Critical Environmental Concern		✓
NHESP Certified Vernal Pool		✓[1]
NHESP Potential Vernal Pool		✓
NHESP Estimated Habitat of Rare Wildlife		✓
NHESP Priority Habitat of Rare species		✓
Outstanding Resource Waters		✓
FEMA Flood Zones (BLSF)	✓[2]	
Surface Water Protection Area		✓
Interim Wellhead Protection Area		✓
Zone I Wellhead Protection Area		✓
Zone II Wellhead Protection Area		✓
Mass DCR Designated Coldwater Fisheries		✓

1. A NHESP Certified Vernal Pool exists just outside of the AOI to the southeast. It is located to the southwest of the intersection of the railroad right-of-way and Yankee Division Highway.
2. BLSF closely follows Proctor Brook in the area of the AOI (see attached Figures 5, 6, & 7).

Regulatory Jurisdiction

The wetland resource areas described above are regulated by the Massachusetts Department of Environmental Protection (DEP), through the Peabody Conservation Commission. The City of Peabody has its own City of Peabody Wetlands & Rivers Protection The Ordinance (The Ordinance) and Peabody Conservation Commission Bylaw (Bylaw).

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 10/4/2022 at 4:07 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Proposal No. 609211-132091

A00830 - 24

MassDEP Bordering Vegetated Wetland (310 CMR 10.55) Delineation Field Data Form

Applicant:_____ Prepared by: **Green International** Project location: **Peabody Bike Trail** DEP File #:_____

Check all that apply:

- ❑ Vegetation alone presumed adequate to delineate BVW boundary: fill out Section I only
- ❑ **Vegetation and other indicators of hydrology used to delineate BVW boundary: fill out Sections I and II**
- ❑ Method other than dominance test used (attach additional information)

Section I.

Vegetation	Observation Plot Number: **A-8**		Transect Number: **Upland**	Date of Delineation: **10/5/2022**
A. Sample Layer & Plant Species (by common/scientific name)	B. Percent Cover (or basal Area)	C. Percent Dominance	D. Dominant Plant (yes or no)	E. Wetland Indicator Category*
Tree Layer:				
Crabapple/*Pyrus malus*	38.0%	100.0%	YES	UPL
Shrub Layer:				
Staghorn Sumac/*Rhus typhina*	63.0%	75.0%	YES	UPL
Red-Osier Dogwood/*Cornus stolonifera*	20.5%	25.0%	YES	FACW+*
Groundcover:				
Canada Goldenrod/*Solidago canadensis*	10.5%	100.0%	YES	FACU

* *Use an asterisk to mark wetland indicator plants: plant species listed in the Wetlands Protection Act (MGL c.131, s.40); plants in the genus Sphagnum; plants listed as FAC, FAC+, FACW-, FACW, FACW+, or OBL; or plants with physiological or morphological adaptations. If any plants are identified as wetland indicator plants due to physiological or morphological adaptations, describe the adaptation next to the asterisk.*

Vegetation conclusion:

Number of dominant wetland indicator plants: **1** Number of dominant non-wetland indicator plants: **3**

Is the number of dominant wetland plants equal to or greater than the number of dominant non-wetland plants? yes **no**

If vegetation alone is presumed adequate to delineate the BVW boundary, submit this form with the Request for Determination of Applicability or Notice of Intent

Section II. Indicators of Hydrology

Hydric Soil Interpretation

1. Soil Survey

Is there a published soil survey for this site? **yes** no
title/date: **Websoil Survey, Essex County, MA, Southern Part 10/6/17**
map number: **MA606**
soil type mapped: **602 Urban Land**
hydric soil inclusions:

Are field observations consistent with soil survey? yes **no**
Remarks:
The Websoil Survey does not include hydric soil inclusions in this area although they are present.

2. Soil Description

Horizon	Depth	Matrix Color	Mottles Color
Oa	**0-5"**	**10YR 2/1 sapric muck**	
A	**5-20"**	**10YR 3/1 fine sandy loam**	

Remarks:

3. Other:

Conclusion: Is soil hydric? **yes** no

Other Indicators of Hydrology: (check all that apply & describe)

- ❑ Site Inundated: _____
- ❑ Depth to free water in observation hole: _____
- ❑ **Depth to soil saturation in observation hole**: **@ surface**
- ❑ Water marks: _____
- ❑ Drift lines: _____
- ❑ Sediment Deposits: _____
- ❑ **Drainage patterns in BVW**: _____
- ❑ Oxidized rhizospheres: _____
- ❑ **Water-stained leaves**: _____
- ❑ Recorded Data (streams, lake, or tidal gauge; aerial photo; other):
  _____
  _____
  _____
- ❑ Other: _____

Section II. Indicators of Hydrology

Hydric Soil Interpretation

1. Soil Survey

Is there a published soil survey for this site? Yes
Title/date: Essex County, Southern Part
Map number: Accessed via Web Soil Survey
Soil type mapped: 626B- Merrimac-Urban land complex, 0-8%
Hydric soil inclusions: none

Are field observations consistent with soil survey? Yes

Remarks:

2. Soil Description

Horizon	Depth	Color	Redox
A	**0-7**	**10YR 2/2**	**-**
Bg	**7-20**	**10YR 6/3**	**5YR 4/6**

Remarks:

3. Other:

Conclusion: Is soil hydric? **No**

Other Indicators of Hydrology: (check all that apply & describe)

- ☐ Site Inundated:
- ☐ Depth to free water in observation hole:
- ☐ Depth to soil saturation in observation hole:
- ☐ Water marks:
- ☐ Drift lines:
- ☐ Sediment Deposits:
- ☐ Drainage patterns in BVW:
- ☐ Oxidized rhizospheres:
- ☑ Water-stained leaves:
- ☐ Recorded Data (streams, lake, or tidal gauge; aerial photo):
- ☐ Other:

Vegetation & Hydrology Conclusion

	YES	NO
Number of wetland indicator plants ≥ # of non-wetland indicator plants	☑	☐
Wetland hydrology present		
Hydric soil	☑	☐
Other indicators of hydrology	☑	☐

Sample location is in a BVW **YES**

HYDRAULIC AND SCOUR ANALYSIS
SUMMARY REPORT

Independence Greenway Extension
Over Proctor Brook
Peabody, Massachusetts

Prepared for

Massachusetts Department of Transportation

November 2023

Prepared by

GREEN INTERNATIONAL AFFILIATES, INC.
Civil and Structural Engineers

Building Strong Client Relationships Through Engineering Excellence

1.0 EXECUTIVE SUMMARY

1.1 Purpose

The purpose of this report is to present the results of a Hydraulic and Scour Study performed by Green International Affiliates, Inc. (Green) for MassDOT for Proctor Brook along the Independence Greenway Extension. The proposed bikeway crosses Proctor Brook at three (3) locations. The Hydraulic Report submitted to MassDOT in February 2021 described the proposed bridge located approximated 800' west of Endicott Street. This study evaluates the hydraulic performance of the existing and proposed conditions for the remaining project area upstream of this proposed bridge, including the two (2) crossing locations that weren't discussed in the previous report.

This study was conducted in a manner consistent with the American Association of State Highway Officials (AASHTO), Federal Highway Administration (FHWA), and Massachusetts Highway Department of Transportation (MassDOT) guidelines for preparation of hydraulic studies at brook crossing sites.

1.2 Scope of Work

The Scope of Work for this study included a review of available hydrologic and hydraulic data for Proctor Brook from the City of Peabody Flood Insurance Study (FIS) dated November 1978, a detailed hydraulic analysis for the brook; and a scour/stability analysis. Pertinent data and the hydraulic computer modeling output are contained in the attachments of this report.

Section 2 of this report contains a project description. Section 3 outlines the data collected and applications used in the study. Section 4 describes the Engineering methods used in the hydrologic and hydraulic analyses, as well as the scour/stability analysis. Section 5 contains conclusions and recommendations.

This project involves the construction of two (2) new culverts that will cross over Proctor Brook in the City of Peabody, Massachusetts. There were previous culvert structures that used to carry railroad over Proctor Brook, the railroad was abandoned, along with the culverts, and the culvert structures have been washed away over time. The purpose of this report is to present the results of a study conducted for the subject culvert sites to evaluate the hydraulic performance of the proposed structures for these crossings.

The scope of this investigation consists of a review of pertinent hydrologic analysis data for the Proctor Brook at the project site and a detailed hydraulic analysis. Data collected, hydraulic model input/output and scour calculations are presented in the appendices of this report. A project description, engineering methods, as well as conclusions of the hydraulic study follows.

2.0 PROJECT DESCRIPTION

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is 1.45 miles.

The proposed project is located along the abandoned railroad right-of-way that has not seen any

improvements since the rails were removed. Existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed will be replaced with new culverts designed to address, to the maximum extent possible, the Massachusetts State Stream Crossings Standards.

In place of the former railroad bridge over Proctor Brook that has been washed away, a new light duty timber boardwalk on helical piles structure is proposed in order to make the abandoned railroad right-of-way usable for a bicycle/pedestrian path. The proposed 8-span structure will be approximately 60'-0" long with an out-to-out width of 12'-0" and will provide a clear width of 11'-0" to accommodate two 5-0" wide travel lanes, one in each direction.

2.1 Existing Conditions

Proctor Brook originates in western Peabody, Massachusetts and flows southeast until it joins Goldthwait Brook to form the North River. Historical flood data is not available for this waterway. The subject locations are within NFIP SFHA Zone AE and spans a section of the river's NFIP regulatory floodway.

Refer to Figure 1 for a locus map of the project area.

The remnants of two (2) culverts remain in the channel. There are no existing trail, roadway, or railroad tracks at the crossing location. The area surrounding the remains of the culverts are currently wooded and includes Bordering Vegetated Wetlands.

The existing culverts were studied during FEMA's 1978 FIS study. At the time of the study the culverts had not been washed out and were functioning as hydraulic connections to convey Proctor Brook under the railroad bed. More detailed description of the culverts are as follows:

Culvert at Station 329+85

This culvert is located at cross section H of the FEMA FIS study. The existing culvert is a 25' long double 42" barrel RCP culvert. The culvert hasn't been maintained and the railbed above the culvert has been washed away. The culvert piping has remained in place. Remnants of granite guidebanks remain at the upstream entrance to the culvert and remnants of a granite headwall remain on the downstream end of the culvert.

Culvert at Station 346+20

This culvert is located at cross section F of the FEMA FIS study. Review of the FEMA's HEC-2 hydraulic model indicates that the culvert was originally a 6'-5" box culvert. Due to a lack of maintenance along the abandoned railroad bed, the culvert has collapsed, and the remnants remain in the channel.

2.2 Proposed Conditions

Although the culvert crossings have failed to varying degrees, the horizontal alignment of Proctor Brook has remained. The culverts are being replaced at the same locations as the original structures in order to maintain the alignment of Proctor Brook at these crossings. The channel elevation will remain although some sediment will be removed to facilitate construction.

Both of the culverts will be replaced with 8'x4' concrete box culverts. The bottom 1' of each culvert will be filled with streambed material to provide a more natural wildlife habitat. This hydraulic study examines the impact of providing an 8'x3' hydraulic opening at both of these crossings.

3.0 DATA COLLECTION

The following data and reports on the study area were available and were used as guidance during the hydraulic and hydrologic model development and Analysis:

4.0 ENGINEERING METHODS

Proctor Brook was studied for its entire length within the City of Peabody, MA by FEMA using detailed methods as part of the FIS for the City of Peabody. To ensure compliance with FEMA requirements (44 CFR 60.3) and the requirements of the Massachusetts Wetlands Protection Act (310 CMR 10.0), the proposed conditions of the culverts have been analyzed to ensure that existing flood elevations will not increase underproposed conditions. In addition, a hydraulic analysis was also performed to calculate the potential for scour.

Figure 3 shows the project location in the flood insurance rate map.

In this hydraulic and scour summary report, peak flow rates from the effective FEMA FIS were used in the analysis.

4.1 Hydrologic Analysis

Peak 10-, 50-, 100- and 500-year flood discharges for Proctor Brook were adopted from Table 6, Essex County FIS, and are presented below in Table 4.1. Please consult the Essex County Effective FIS, last revised July 2018, for information regarding hydrologic computational procedures. As further described in the Stormwater Report prepared for this project, the peak flow rates have been adjusted to account for the proposed increase in impervious area. Table 4.1 also presents the proposed flow projections for the project area.

Table 4.1 – Summary of Discharges

Description	Alternative	10% Annual Chance [10-yr] (CFS)	4% Annual Chance [25-yr] (CFS)	2% Annual Chance [50-yr] (CFS)	1% Annual Chance [100-yr] (CFS)	0.2% Annual Chance [500-yr] (CFS)

	Proposed Conditions	243	290	366	428	618

4.2 Hydraulic Analysis

Green used a combination of the topographical survey and the proposed design of the brook crossings to create a proposed conditions hydraulic model in HEC-RAS. Cross sections were cut approximately every 100 to 200 ft and then imported into HEC-RAS. Backwater analyses using the USACE HEC-RAS computer program were performed for the 10-, 50-, and 100-, and 500-year return events in a manner consistent with the standards used to develop water surface profiles under the National Flood Insurance Program (NFIP).

The computed water surface elevations of this HEC-RAS analysis were compared to water surface elevations listed on the HEC-2 output received from FEMA.

Table 4.2 shows a comparison between the results of the HEC-2 data received from FEMA and Green's proposed model.

Table 4.2 – Comparison of FEMA and Proposed Base Flood Elevations (BFE - referenced to NAVD88) at several cross sections near the Proposed Structures

Adjusted datum to NAVD 88

As shown in Table 4.2, Proctor Brook will not have an increase in the Water Surface Elevation (WSEL) for the FEMA Base Flood Elevation.

Attachment A includes the 1977 HEC-2 model input/output report received from FEMA Headquarters. Attachment B includes the output of Green's Proposed Conditions HEC-RAS analyses for the proposed Independence Greenway Extension boardwalkover Proctor Brook with the new crossing culverts.

Table 4.3 a– Summary of Hydraulic Performance at Culvert at Sta 329+85

0.2%	610	45.70	0.71	618	46.55	11.08

Table 4.3 b– Summary of Hydraulic Performance at Culvert at Sta 346+20

AEP [%]	Existing			Proposed		
	Peak Flow (CFS)	WSEL (FT) Sta. 26 FEMA Sta. F	Velocity* (FT/S) (Max. at Bridge)	Peak Flow (CFS)	WSEL (FT) Sta. 26 FEMA Sta. F	Velocity* (FT/S) (Max. at Bridge)
10%	240	40.41	3.31	243	40.86	5.80
4%	285	40.71	3.58	290	41.03	5.68
2%	360	41.17	3.93	366	41.25	5.62
1%	420	41.53	4.11	428	41.39	5.57
0.2%	610	42.29	4.75	618	41.77	4.70

In Table 4.3a and Table 4.3b, the hydraulic performance of the culverts at station 329+85 and Sta 346+20 is depicted. The velocities and elevations shown in the tables for existing conditions were obtained from the model developed on HEC-RAS by Green. This model was created using survey data and did not account for functioning culverts. The velocities and water surface elevations are anticipated to increase with the restoration of the culverts.

4.3 Scour Safety/Stability Analyses

We calculated the scour hole dimensions (length, width, and depth) using the Hydraulic Engineering Circular

(HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 5:

"Estimating Scour at Culvert Outlets" and using equation 5.1 for cohesionless soils shown below:

$$\left[\frac{h_s}{R_c}, \frac{W_s}{R_c}, \frac{L_s}{R_c}, \frac{V_s}{R_c^3}\right] = C_s C_h \left(\frac{\alpha}{\sigma^{1/3}}\right)\left(\frac{Q}{\sqrt{g}(R_c^{2.5})}\right)^{\beta}\left(\frac{t}{316}\right)^{\theta}$$

The equations are based on tests that were conducted to determine the maximum scour for the given condition and therefore represent what might be termed worst case scour geometries.

We utilized the flows with the highest exit velocities for analyzing the scour hole dimensions of each culvert. No scour potential under current conditions was assessed, as one of the structures has washed away and based on evidence, there are no indications of vertical or horizontal instability.

Soil samples were taken at points within the brook, upstream of the culverts and the banks of the brook. These samples were analyzed, and the results are included in Attachment C. The grain size (D_x) was estimated for each soil sample. The D_x results of the samples were used in the scour analysis.

The results of the scour analyses are shown on Table 4.3.

Table 4.3 – Summary of Calculated Scour at Proposed Culverts

Alternative	Return Frequency	Scour Hole Depth (Feet)	Scour Hole Width (Feet)	Scour Hole Length (Feet)	Scour Hole Volume (Cubic Feet)	Location of Maximum Scour (Feet)
Sta 329+85	Peak Velocity Flow (100-year)	5.89	32.00	57.82	8,133.98	23.13
Sta 346+20	Peak Velocity Flow (100-year)	4.69	23.64	44.11	3,527.78	17.65

Scour Countermeasures

The scour/stability analyses were performed using Hydraulic Engineering Circular (HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 10: "Riprap Basins and Aprons" and using equation 10.4 shown below:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right)$$

Table 4.4 displays dimensions for riprap apron at the proposed culverts.

Table 4.4 – Summary of Scour Countermeasure Design at Proposed Culverts

Alternative	Riprap Size D_{50} (Inches)	Riprap Class	Riprap Apron Length (Feet)	Riprap Apron Depth (Feet)	Riprap Apron Width (Feet)
Sta 329+85	12	3	57.82	3.0	34
Sta 346+20	12	3	44.11	3.0	31

Attachment D includes the scour analyses, and computations.

5.0 CONCLUSIONS

A. The HEC-RAS model under proposed conditions resulted in lower elevations than the effective FEMA FIS. Therefore, the project implementation will result in no increase to the waterway's Base (100-year) Flood Elevation (BFE) profile, and it will not necessitate alteration of the waterway's floodway delineation, anywhere within the affected community.
B. The natural stream bed will result in a scour depth at culvert at Station 329+85 of 5.89' during peak velocity flow.
C. The natural stream bed will result in a scour depth at culvert at Station 340+26 of 4.69' during peak velocity flow.
D. The dimensions calculated represent worst-case scour geometries, and consideration of site and environmental constraints were considered when designing the riprap apron.
E. Riprap Countermeasures are proposed to mitigate against the risk of scour. The proposed riprap size has been chosen to exceed the minimum size calculated but readily available MassDOT specified material. Depth of riprap apron is sized in accordance with HEC-23 methodology for chosen riprap material.
F. By placing riprap revetment at the ends of the culvert, it is anticipated that the scour depth will be negligible.

Hydraulic Engineering Circular No. 14 - Estimating Scour at Culvert Outlets

5.1 COHESIONLESS SOILS

The general expression for determining scour geometry in a cohesionless soil at the culvert outlet is:

$$\left[\frac{h_s}{R_c}, \frac{W_s}{R_c}, \frac{L_s}{R_c}, \frac{V_s}{R_c^3}\right] = C_s C_h \left(\frac{\alpha}{\sigma^{1/3}}\right)\left(\frac{Q}{\sqrt{g(R_c^{2.5})}}\right)^{\beta}\left(\frac{t}{316}\right)^{\theta} \quad (5.1)$$

where,

- h_s = depth of scour, m (ft)
- W_s = width of scour, m (ft)
- L_s = length of scour, m (ft)
- V_s = volume of scour, m^3 (ft^3)
- R_c = hydraulic radius at the end of the culvert (assuming full flow)
- Q = discharge, m^3/s (ft^3/s)
- g = acceleration of gravity, 9.81 m/s^2 (32.2 ft/s^2)
- t = time in minutes
- σ = $(D_{84}/D_{16})^{0.5}$, material standard deviation
- α, β, θ are coefficients, see Table 5.1
- C_s = slope correction coefficient, see Table 5.2
- C_h = drop height adjustment coefficient, see Table 5.3

Input:

Hydraulic Engineering Circular No. 14, Third Edition

Several relationships have been proposed for riprap sizing for culvert aprons and several of these are discussed in greater detail in Appendix D. The independent variables in these relationships include one or more of the following variables: outlet velocity, rock specific gravity, pipe dimension (e.g. diameter), outlet Froude number, and tailwater. The following equation (Fletcher and Grace, 1972) is recommended for circular culverts:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right) \qquad (10.4)$$

where,

- D_{50} = riprap size, m (ft)
- Q = design discharge, m^3/s (ft^3/s)
- D = culvert diameter (circular), m (ft)
- TW = tailwater depth, m (ft)
- g = acceleration due to gravity, 9.81 m/s^2 (32.2 ft/s^2)

Tailwater depth for Equation 10.4 should be limited to between 0.4D and 1.0D. If tailwater is unknown, use 0.4D.

D=	5.97	ft		
g=	32.2	ft/s^2

1.0 EXECUTIVE SUMMARY

1.1 Purpose

The purpose of this report is to present the results of a Hydraulic and Scour Study performed by Green International Affiliates, Inc. (Green) for MassDOT for the Independence Greenway Extension, Bridge No. TBD, a pedestrian bridge over the Proctor Brook in Peabody, Massachusetts. This study evaluates the hydraulic performance of the existing and proposed conditions. This study was conducted in a manner consistent with the American Association of State Highway Officials (AASHTO), Federal Highway Administration (FHWA), and Massachusetts Highway Department of Transportation (MassDOT) guidelines for preparation of hydraulic studies at bridge sites.

1.2 Scope of Work

The Scope of Work for this study included a review of available hydrologic and hydraulic data for Proctor Brook from the City of Peabody Flood Insurance Study (FIS) dated November 1978, a detailed hydraulic analysis for the bridge; and a scour/stability analysis. Pertinent data and the hydraulic computer modeling output are contained in the attachments of this report.

Section 2 of this report contains a project description. Section 3 outlines the data collected and applications used in the study. Section 4 describes the Engineering methods used in the hydrologic and hydraulic analyses, as well as the scour/stability analysis. Section 5 contains conclusions and recommendations. Lastly, Section 6 outlines the references.

This project involves the construction of a timber boardwalk on helical piles that will cross over Proctor Brook in the City of Peabody, Massachusetts. There was a previous bridge structure that used to carry railroad over Proctor Brook, the railroad was abandoned, along with the bridge, and the bridge structure has been washed away over time. The purpose of this report is to present the results of a study conducted at the subject bridge site to evaluate the hydraulic performance of the proposed alternative for this crossing.

The scope of this investigation consisted of review of pertinent hydrologic analysis data for the Proctor Brook at the project site and a detailed hydraulic analysis. Data collected, hydraulic model input/output and scour calculations are presented in the appendices of this report. A project description, engineering methods, as well as conclusions of the hydraulic study follows.

2.0 PROJECT DESCRIPTION

2.1 Existing Conditions

A railroad, now abandoned, once crossed Proctor Brook in the city of Peabody, Essex County, Massachusetts (Figure 1).

Scattered blocks of granite in the channel and remnants of stone wingwalls are the only indication that a bridge had once been at this location (Figure 2). There are no existing trail, roadway, or railroad tracks at the crossing location. The area surrounding the remains of the bridge is currently wooded and includes Bordering Vegetated Wetlands.

Crossed Waterway at the Bridge Location

Proctor Brook originates in western Peabody, Massachusetts and flows southeast until it joins Goldthwait Brook to form the North River. Historical flood data is not available for this waterway. The subject location is within a NFIP SFHA Zone AE and spans a section of the river's NFIP regulatory floodway.

2.2 Proposed Conditions

The design loading criteria will be pedestrian loading only. No vehicular access will be permitted on the trail, and bollards will be installed at roadway intersections and access points to prevent any vehicular access. The boardwalk will not be maintained in the winter for snow removal.

The proposed structure over the brook will be a 64'-0" long timber framed boardwalk with helical piles spaced 8'-0" center-to-center. The proposed boardwalk will have a 13'-0" out-to-out width and 12'-0" clear width to accommodate two (2) 5'-0" travel lanes and two (2) 1'-0" shoulders. 4" x 4" timber posts will be spaced 4'-0" apart with a top rail height of 3'-6" with timber pickets between each post. Top and bottom rails will be 2" x 4" timber boards. The proposed boardwalk will also consist of 8" x 1" timber planking or composite wood decking over 2" x 8" timber joists.

Within this present hydraulic study, the existing and proposed bridge waterway openings were evaluated for hydraulic adequacy and scour safety. More alternative bridge opening geometries will be evaluated at the request of the State Bridge Engineer.

3.0 DATA COLLECTION

The following data and reports on the study area were available and were used as guidance during the hydraulic and hydrologic model development and Analysis:

Sources

- Federal Emergency Management Agency, Flood Insurance Study, City of Peabody, Essex County, Massachusetts, November 1978.
- Federal Emergency Management Agency, Flood Insurance Study, Essex County, MA, July 19, 2018.
- Federal Emergency Management Agency, Original HEC-2 Model for Flood Insurance Study-Peabody, MA, November 1976.
- Topographic field survey prepared by Green, March 2018.
- Particle Size Analysis included in Geotechnical Engineering Report by GZA GeoEnvironmental, Inc., April 22, 2019.
- Massachusetts Department of Transportation: LRFD Bridge Manual, January 2020 Revision.
- FHWA; Hydraulic Engineering Circular Number 23, HEC-23. Bridge Scour and Stream Instability Countermeasures, Volumes 1 and 2, 2009.

Green also used the following computer applications and/or design guidelines for this study:

Applications

- U.S. Army Corps of Engineers: HEC-RAS River Analysis System, Computer Program and User's Manual, Version 5.0.7, March 2019.
- U.S. Dept. of Transportation, Federal Highway Administration: Hydraulic Engineering Circular No. 18 Evaluating Scour at Bridges, Fifth Edition, April 2012.

4.0 ENGINEERING METHODS

Proctor Brook was studied for its entire length within the City of Peabody, MA by FEMA using detailed methods as part of the FIS for the City of Peabody. To ensure compliance with FEMA requirements (44 CFR 60.3) and the requirements of the Massachusetts Wetlands Protection Act (310 CMR 10.0), the proposed conditions of the bridge have been analyzed to ensure that existing flood elevations will not increase under proposed conditions. In addition, a hydraulic analysis was also performed to calculate the potential for scour.

Proctor Brook flows west to east in the vicinity of the crossing. Using the U.S. Geological Survey (USGS) Massachusetts StreamStats, the Proctor Brook's watershed basin area at the crossing site is estimated to be 2.5 square miles (Figure 3). Figure 4 shows the project location in the flood insurance rate map.

In this hydraulic and scour report, peak flow rates from the effective FEMA FIS were used in the analysis.

4.1 Hydrologic Analysis

Peak 10-, 50-, 100- and 500-year flood discharges for Proctor Brook were adopted from Table 6, Essex County FIS, and are presented below in Table 4.1. Please consult the Essex County Effective FIS, last revised July 2018, for information regarding hydrologic computational procedures. The brook's drainage area at the Proctor Brook crossing was delineated using the USGS StreamStats Website. Refer to Figure 3 for drainage area at the bridge.

Table 4.1 – Summary of Discharges from 2018 Essex County FIS

Description	Drainage Area (mi^2)	10% Annual Chance [10-yr] (CFS)	4% Annual Chance [25-yr] (CFS)	2% Annual Chance [50-yr] (CFS)	1% Annual Chance [100-yr] (CFS)	0.2% Annual Chance [500-yr] (CFS)
North River and Proctor Brook Upstream of Goldthwait Brook	3.52	240	285	360	420	610

4.2 Duplicate Effective Analysis

The Duplicate Effective HEC-RAS Model was developed using the HEC-2 model obtained from FEMA. The HEC-2 inputs between FIS cross sections at river sta. 1.402 upstream of the bridge to river sta. 1.127 downstream of the bridge were imported into HEC-RAS. After making minor edits, Green was able to run the imported HEC-2 data in HEC-RAS. The duplicate effective model reproduced relatively close values that are less than 1 ft for the cross sections near the bridge when compared to the current effective Base Flood Elevation (BFE) profile. The variation in BFE is attributed to using different hydraulic programs. The summary of the WSEL's from FIS is presented in Table 4.2.

Table 4.2 – Summary of Duplicate Effective Analysis

River Station HEC-RAS/HEC-2	FIS Cross-Section	[1] Published Data* (FEET, NAVD)	[2] Duplicate Effective Model (FEET, NAVD)	[2] – [1]
26/1.402	F	41.96	41.33	-0.63
25/1.393	-	41.95	41.28	-0.67
24/1.389	-	40.97	41.12	0.15
23/1.380	-	40.99	41.14	0.15
22/1.276	E	40.84	40.97	0.13
21/1.267	-	39.85	40.46	0.61
21.5	Bridge			
20/1.263	-	39.65	39.85	0.20
19/1.254	-	39.40	39.20	-0.20
18/1.127	D	39.60	39.60	0.00

4.3 Hydraulic Analysis

Green used the topographical survey to create an existing conditions hydraulic model in HEC-RAS. Cross sections were cut approximately every 100 to 200 ft and then imported into HEC-RAS. Backwater analyses using the USACE HEC-RAS computer program were performed for the 10-, 50-, and 100-, and 500-year return events in a manner consistent with the standards used to develop water surface profiles under the National Flood Insurance Program (NFIP).

The computed water surface elevations of this HEC-RAS analysis were compared to water surface elevations listed on the HEC-2 output received from FEMA, and Green's existing and proposed conditions HEC-RAS models.

The HEC-RAS model parameters such as channel and overbank roughness coefficients (Manning's 'n'), ineffective flow areas, bank stations, and expansion and contraction coefficients were modified to reflect current conditions. Pertinent computational results of the existing and proposed conditions flood simulations performed for the subject bridge in this project hydraulic study are presented in Table 4.3. The table show a comparison between the results of Green's model using the HEC-2 data received from

FEMA, Green's existing model built with the recent topographic survey, and the proposed post construction model. Figure 5 shows the cross sections locations.

Table 4.3 – Comparison of FEMA, Existing and Proposed Base Flood Elevations (BFE - referenced to NAVD 88) at several cross sections near the Bridge

HEC-RAS Model Cross Sections	FIS Cross-Section	[1] Existing Condition Model (FEET)	[2] Proposed Condition Model (FEET)	[2] – [1] No – Rise Evaluation
26	F	41.97	41.69	-0.28
25	-	41.97	41.69	-0.28
24.7	-	41.77	41.45	-0.32
24.6	-	41.73	41.46	-0.27
24.4	-	40.41	40.29	-0.12
24.3	-	40.09	40.06	-0.03
24	-	40.38	40.36	-0.02
23	-	40.32	40.29	-0.03
22	E	40.19	40.19	0.00
21.7	-	40.07	40.06	-0.01
21.6	-	40.10	40.10	0.00
21.5	Bridge			
21.4	-	39.89	39.84	-0.05
21.35	-	39.77	39.76	-0.01
21.3	-	39.86	39.85	-0.01
20	-	39.62	39.62	0.00
19	-	39.67	39.67	0.00
18	D	39.60	39.60	0.00

As shown in Tables 4.2 and 4.3, there are variations in the elevations obtained from the existing conditions Green's HEC-RAS model compared to the HEC-2 Imported HEC-RAS model, the FEMA FIS flood elevations. The variations in flood elevations can be explained and justified due to the following reasons:

- Different hydraulic programs were used, and the HEC-2 coding of the bridge is different than its coding in HEC-RAS.
- Ineffective areas were added and modified to ignore ineffective flow areas.
- More cross sections are added in the HEC-RAS model to depict the geometry of the channel and riverbed.
- Based on site observations, the manning (n) coefficients were adjusted to reflect actual conditions.

Because of the above, Green's HEC-RAS model under existing conditions was used as a design base to compare flood elevations under the proposed conditions.

Table 4.4 compares Hydraulic Performance at the Bridge under existing and proposed conditions. The peak head water elevations and the maximum velocity for each return event at the bridge location are shown in the table.

Table 4.4 – Summary of Hydraulic Performance at the Bridge

AEP [%]	Peak Flow (CFS)	Existing		Proposed	
		WSEL (FT) Sta. 22 FEMA Sta. E	Velocity* (FT/S) (Max. at Bridge)	WSEL (FT) Sta. 22 FEMA Sta. E	Velocity* (FT/S) (Max. at Bridge)
10%	240	39.25	5.90	39.33	5.97
4%	285	39.44	6.14	39.53	6.25
2%	360	39.73	6.58	39.82	6.59
1%	420	40.19	3.97	40.19	4.34
0.2%	610	40.95	3.83	40.88	5.01

As shown in Table 4.4, the proposed bridge will not have an increase in the Water Surface Elevation (WSEL) at the upstream face of the bridge for the FEMA Base Flood Elevation.

Note that the velocities decrease for the 100-year and 500-year storms as compared to the more frequent storms. The 100-year and 500-year storms are approaching a backwater condition as demonstrated by a flattening of the energy grade line.

The analysis also shows that the proposed bridge deck is above the 100-year flood elevation and the only components impacting the hydraulics are the western abutment and the piers.

Attachment A includes the output of Green's Existing Conditions HEC-RAS analysis for the Independence Greenway Extension over Proctor Brook. Attachment B includes the output of Green's Proposed Conditions HEC-RAS analyses for the proposed bridge scenario for a new Independence Greenway Extension boardwalk over Proctor Brook. Attachment C includes the 1977 HEC-2 model input/output report received from FEMA Headquarters.

4.4 Scour Safety/Stability Analyses

Scour potential at the crossing site under proposed conditions was analyzed using the guidelines set forth in Reference 4, Sections 1.3 and 3.2.9 and AASHTO LRFD Bridge Design Specifications, Sections 2.6.4.4.2 and 3.7.S. In accordance with Section 1.3.4 of Reference 4, we used the river's 25-year and 50-year floods as the scour design and scour check events, respectively, in this analysis. Scour potential under existing conditions was not analyzed because there is no existing structure in place. As said in section 2.1, scattered blocks of granite in the channel and remnants of stone wingwalls are the only indication that a bridge had once been at this location.

Peak 50-year flood discharge used in this analysis was taken from Table 4.1. The peak 25-year flood discharge (285 cfs) was interpolated from 10- and 50-year flood discharge rates presented in the same table and was used as the "Design Scour Event" in the scour analysis.

Soil samples were taken at points within the brook, upstream of the bridge and the banks of the brook. These samples were analyzed, and the results are included in Attachment D. The grain size (D50) was estimated for each soil sample. The D50 results of the samples varied widely from 0.51 to 2.78 mm from left of bank to right of bank, which were used in the scour analysis.

The scour/stability analyses for the 25- and 50-year floods were performed using the equations from FHWA Hydraulic Engineering Circular No. 18 (HEC-18), Evaluation Scour at Bridges. Calculations to determine scour potential were performed according to HEC-18 live-bed equation for the bridge types associated with existing and proposed conditions.

The local scour was calculated for the piers using the HEC-18 pier scour equations (HEC-18, equations 7.1 – 7.4). The variables are based on the results from the HEC-RAS model for the 25-year storm. The scour calculation was also performed for the 50-year design storm as a check. Pressure scour is not applicable at this bridge because the low chord is above the design storms being considered for these calculations.

The results of the scour analyses are shown on Table 4.5.

Table 4.5 – Summary of Calculated Scour at Bridge

Alternative	Return Frequency (year)	[1] Contraction Scour (Feet)	[2] Maximum Local Pier Scour (Feet)	[3]* Long Term Degradation (Feet)	[4] Abutment Scour (Feet)	[3] + [4] Design Total Abutment Scour (Feet)	[1] + [2] + [3] Design Total Pier Scour (Feet)
Existing Condition	Design 25-yr	n/a	n/a	n/a	n/a	n/a	n/a
	Check 50-yr	n/a	n/a	n/a	n/a	n/a	n/a
Proposed Condition	Design 25-yr	0.0	1.17	n/a	1.95	1.95	1.17
	Check 50-yr	0.0	1.22	n/a	2.28	2.28	1.22

*Long Term Degradation Calculations were not computed for this bridge

The HEC-RAS method uses the Froelich equation that has been identified by MassDOT as being too conservative in calculating scour at the abutments. Therefore, the abutment scour depths calculated in the HEC-RAS analysis should not be held for design purposes. Instead, the scour depths for the abutments were

computed using the NCHRP 24-40 Abutment Scour Approach in the FHWA HEC-18, Evaluating Scour at Bridges Section 8.6.3 and shown below.

$$y_{max} = \alpha_A y_c \text{ or } y_{max} = \alpha_B y_c$$

$$y_s = y_{max} - y_0$$

The computed abutment scour depths using the above equation are listed below and should be used for design.

Table 4.6 – Abutment Scour Depths at Bridge

Alternative	Return Frequency (year)	Design Abutment Scour (Feet)	Design Pier Scour (Feet)
Existing Condition	Design 25-yr	n/a	n/a
	Check 50-yr	n/a	n/a
Proposed Condition	Design 25-yr	1.95	1.17
	Check 50-yr	2.28	1.22

Scour Countermeasures

The natural stream bed will result in a scour depth at the left abutment of 1.95' during the 25 year design storm. By placing riprap revetment around the abutment it is anticipated that the scour depth will be negligible as shown in Table 4.7. The proposed right abutment is located on the eastern end of the boardwalk and outside of the flow of the channel. For this reason scour protection is not needed at the right abutment.

The calculated contraction, and pier scour depths resulted in a value of less than 1.5 ft. For this reason, scour countermeasures are not required within the main channel, and are only required at the left abutment.

The scour countermeasure design at the left abutment were computed using HEC-23, Bridge Scour and Stream Instability Countermeasures: Experience, Selection, and Design Guidance-Third Edition, Volume 2, Section 4, Design Guideline 14 and shown below.

Table 4.7 – Summary of Scour Countermeasure Design at Bridge Abutments

Alternative	Riprap Size D_{50} (Inches)	Riprap Size D_{100} (Inches)	Riprap Thickness (Feet)	Riprap Apron Extend from toe (Feet)	Riprap Extend along u/s and d/s face of the Embankment (Feet)	Vertical Extend up Abutment Slope (Feet)
Existing	n/a	n/a	n/a	n/a	n/a	n/a
Proposed (left abutment)	6	12	1	10	25	10
Proposed (right abutment)	n/a	n/a	n/a	n/a	n/a	n/a

Attachment D includes the scour analyses, and computations.

5.0 CONCLUSIONS

A. The project hydraulic model indicates that proposed replacement bridge will safely convey the 10-year design flood event.

B. To minimize the environmental impacts of the western approach on the adjacent wetlands, 1.5 ft of freeboard was maintained over the 10-year design flood event. Although this does not meet the recommended 2 feet of freeboard between the hydraulic design flood water surface elevation and the proposed superstructure low chord, we consider that 1.5 ft of freeboard will be appropriate because it is a recreational pedestrian bridge.

C. HEC-RAS models under existing and proposed conditions resulted in lower elevations than the effective FEMA FIS. Therefore, the project implementation will result in no increase to the waterway's Base (100-year) Flood Elevation (BFE) profile and it will not necessitate alteration of the waterway's floodway delineation, anywhere within the affected community.

D. The natural stream bed will result in a scour depth at the abutment of 1.95' during the 25 year design storm. By placing riprap revetment around the abutment it is anticipated that the scour depth will be negligible.

E. The calculated contraction, and pier scour depths resulted in a value of less than 1.5ft. For that reason, scour countermeasures are only required at the left abutment for this bridge.

F. The information in Table 5.1 should be presented within the Hydraulic Data Tables in the General Notes of the Bridge Sketch Plans.

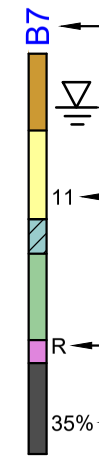
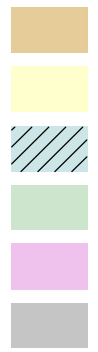
LEGEND



- B7 — BOREHOLE DESIGNATION
- INDICATES WATER LEVEL MEASURED IN BOREHOLE
- 11 — INDICATES STANDARD PENETRATION TEST (SPT) N-VALUE
- R — INDICATES REFUSAL
- 35% — INDICATES RQD VALUE

LITHOLOGY KEY



- FILL
- SAND & GRAVEL
- CLAY & SILT
- GLACIAL DEPOSIT
- WEATHERED BEDROCK
- BEDROCK

NOTES:

1. THE STRATIFICATION LINES SHOWN ON ARE BASED ON INTERPOLATIONS BETWEEN WIDELY SPACED EXPLORATION LOCATIONS AND THUS REPRESENT THE APPROXIMATE BOUNDARIES BETWEEN SOIL TYPES. ACTUAL TRANSITIONS MAY VARY FROM THOSE SHOWN.

SCALE			

Using HEC-18 Evaluation of Scour at Bridges
Chapter 5 General Scour
Live-Bed Equation
25 YEAR DESIGN FLOW RATE

Live Bed Contraction Scour calculations:

$$y_2/y_1 = (Q_2/Q_1)^{6/7}(W_1/W_2)^{k1}$$

$y_s = y_2 - y_0$ = (average contraction scour depth)

Where:
y_1= Average depth in the upstream main channel (ft)
y_2= Average depth in the contracted section (ft)
y_0= Existing depth in the contracted section before scour (ft)
Q_1= Flow in the upstream channel transporting sediment (ft^3/s)
Q_2= Flow in the contracted channel (ft^3/s)
W_1= Bottom width of the upstream main channel that is transporting bed material (ft)
W_2= Bottom width of the main channel in the contracted section less pier width(s) (ft)
K_1= Exponent determined below

V*/w	K_1	Mode of Bed Material Transport
<0.50	0.59	Mostly contact bed material discharge
0.50 to 2.0	0.64	Some suspended bed material discharge
>2.0	0.69	Mostly suspended bed material discharge

For D_{50} = 2.7818 mm

y_1 =	y_0	Q_1	Q_2	W_1	W_2	K_1	y_2	y_s	
2.02	3.65	285	247	134	101	0.64	2.14	**-1.51**	*NO SCOUR*

Where,

$$V^* = (t/q)^{1/2} = (gy_1s_1)^{1/2}$$

s_1	Slope of energy grade line of main channel (ft/ft)
y_1	Average depth in the upstream main channel (ft)
g	Acceleration of Gravity(32.2 ft/s^2)
w	Fall velocity of bed material based on D_{50}, m/s (figure 5.8, HEC-18) (for velocity in english units (ft/s), multiply w in m/s by 3.28
t	Shear stress on the bed, Pa (N/m^2) (lb/ft^2)
q	Density of water (1000 Kg/m^3) (1.94 $slug/ft^3$)

Then for s_1 = 0.0034

V* = 0.47 ft/s

And for D_{50} = 2.7818 mm

w = 0.7872 ft/s (from figure 5.8 for temperature between 0 and 20 C degree)

V*/w = 0.6 then K_1 = 0.64

Using NCHRP 24-20 Abutment Scour Approach from Evaluating Scour at Bridges, Fifth Edition, Chapter 8.6.3

25 YR Proposed Scour at Abutments

$$y_{max} = \alpha_A y_c \text{ or } y_{max} = \alpha_B y_c$$

$$y_s = y_{max} - y_0$$

Where:

y_{max}= Maximum flow depth resulting from abutment scour, ft (m)
K_2= Coefficient for angle of embankment to flow, = $(\Theta/90)^{0.13}$
α_A = Amplification factor for live-bed conditions
y_s = Abutment scour depth, ft (m)
y_0 = Flow depth prior to scour, ft (m)

The contraction scour equation:

$$y_c = \left(\frac{q_{2f}}{K_u D_{50}^{1/3}} \right)^{6/7}$$

Where:

y_c = Flow depth including clear-water contraction scour, ft
q_{2f} = Unit discharge in the constricted opening accounting for non-uniform flow distribution, ft^2/s
K_u = 11.17 English units
D_{50} = Particle size with 50 percent finer, ft
q_1=upstream unit discharge, ft^2/s

Left Abutment

D_{50}= 0.009
v_2= 6.25
d_2= 1.21
K_u= 11.17

Using NCHRP 24-20 Abutment Scour Approach from Evaluating Scour at Bridges, Fifth Edition, Chapter 8.6.3

50 YR Proposed Scour at Abutments

$$y_{max} = \alpha_A y_c \text{ or } y_{max} = \alpha_B y_c$$

$$y_s = y_{max} - y_0$$

Where:

y_{max}= Maximum flow depth resulting from abutment scour, ft
K_2= Coefficient for angle of embankment to flow, = $(\Theta/90)^{0.13}$
α_A = Amplification factor for live-bed conditions
y_s = Abutment scour depth, ft
y_0 = Flow depth prior to scour, ft

The contraction scour equation:

$$y_c = \left(\frac{q_{2f}}{K_u D_{50}^{1/3}} \right)^{6/7}$$

Where:

y_c = Flow depth including clear-water contraction scour, ft
q_{2f} = Unit discharge in the constricted opening accounting for non-uniform flow distribution, ft^2/s
K_u = 11.17 English units
D_{50} = Particle size with 50 percent finer, ft
q_1=upstream unit discharge, ft^2/s

Left Abutment

Dear Mr. Callahan and Ms. Larner:

This letter is in response to the application you submitted to the U.S. Army Corps of Engineers, New England District, on May 17, 2024, for a Department of the Army general permit verification. This project has been assigned the file number NAE-2024-01390. This file number should be referenced in all correspondence with this office.

The work includes the permanent discharge of fill material within 8,661 square feet below the Ordinary High Water (OHW) mark of Proctor Brook and two unnamed intermittent streams, and within 2,344 square feet of wetlands, associated with the extension of the Independence Greenway rail trail 1.3 miles from its current terminus at Essex Center Drive to Endicott Street, at Latitude 42.5343º and Longitude -70.9436º, in Peabody, Essex County, Massachusetts. The existing rail bed will be paved, and five existing culvert crossings and one former bridge will be replaced. Four culverts will be upsized, while one will be replaced with the same size culvert, as follows:

- STA 329+85: Two existing 42” reinforced concrete pipe (RCP) culverts conveying the trail over Proctor Brook will be replaced with a new 4’H x 8’W reinforced concrete box culvert embedded with 12” of natural streambed material.
- STA 340+10: Existing 30” corrugated metal pipe (CMP) culvert conveying trail over an unnamed intermittent stream will be replaced with a new 36” ductile iron pipe (DIP) embedded with 12” of natural streambed material.
- STA 342+20: Existing 24” CMP connecting Wetland V to Proctor Brook will be replaced with a new 24” DIP.

- STA 346+20: Existing collapsed 4'H x 6.4'W concrete box culvert that formerly conveyed the trail over Proctor Brook will be replaced with a new 4'H x 8'W reinforced concrete culvert embedded with 12" of natural streambed material.
- STA 358+51: Existing 15" RCP culvert conveying trail over an unnamed intermittent stream will be replaced with a new 16" DIP.

Rip-rap over-topped with natural material will be installed at culvert inlets and outlets. The project also includes temporary impacts within 2,312 square feet below the OHW marks of Proctor Brook and the two unnamed intermittent streams, and within 4,681 square feet of wetlands, due to cofferdams and dewatering associated with the culvert replacements, and the installation of temporary mats to facilitate the construction of a pile-supported bridge. The work is shown on the enclosed plans titled "MASSACHUSETTS DEPARTMENT OF TRANSPORTATION HIGHWAY DIVISION PLAN AND PROFILE OF INDEPENDENCE GREENWAY EXTENSION BRIDGE P-03-020 (CAK) IN THE CITY OF PEABODY ESSEX COUNTY," on 63 sheets, and dated "REVISED JULY 26, 2024."

Based on the information you have provided, we verify that the activity is authorized under General Permit 23 of the June 2, 2023, Federal Permit known as the Massachusetts General Permits (GPs). If the extent of the project area and/or nature of the authorized impacts to waters are modified, a revised application must be submitted to this office for written approval before work is initiated. A copy of these permits can be found at: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/.

Any deviation from the terms and conditions of the permit, or your submitted plans, may subject the permittee to the enforcement provisions of our regulations. Therefore, in the event changes to this project are contemplated, it is recommended you coordinate with this office prior to proceeding with the work. This office must approve any changes before you undertake them. You must perform this work in compliance with the terms and conditions of the GPs listed above, and also in compliance with the following special conditions:

Project Specific Special Conditions:

1. The permittee shall complete and return the enclosed Work-Start Notification Form to this office at least two weeks prior to the anticipated construction start date.

2. The permittee shall complete and return the enclosed Completion Certification Form to this office at least one month following the completion of the authorized work.

3. A conditioned Water Quality Certification (WQC) has been issued by the Massachusetts Department of Environmental Protection for your project and is attached. You must comply with the conditions specified in the WQC.

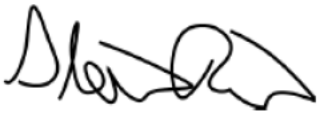
This verification is valid until June 1, 2028. You must commence or be under contract to commence the work authorized herein by June 1, 2028, and complete the work by June 1, 2029. If not, you must contact this office to determine the need for further authorization before beginning or continuing the activity. It is recommended that you contact this office before this authorization expires to discuss if permit reissuance is a possibility.

This general permit verification and any associated authorizations does not preclude the necessity to obtain any other Federal, State, or local permits, licenses, and/or certifications, which may be required.

If you have any questions related to this verification or have issues accessing documents referenced in this letter, please contact Dan Vasconcelos, Project Manager, at 978-318-8653, or by email at daniel.b.vasconcelos@usace.army.mil.

This agency continually strives to improve our customer service. In order to better serve you, please complete the Customer Service Survey located at: https://regulatory.ops.usace.army.mil/customer-service-survey/.

Sincerely,



Stephen Rochette
Chief, Technical Support Branch
Regulatory Division

Work-Start Notification Form

File Number: NAE-2024-01390 State: Massachusetts County: Essex

Permittee: MassDOT - Highway Division, Erica Larner
Date Verification Issued: 9/6/2024
Project Manager: Dan Vasconcelos

At least two weeks prior to commencing the activity authorized by this permit, sign this certification and return it to the following address:

US ARMY CORPS OF ENGINEERS
New England District
Attn: Dan Vasconcelos
696 Virginia Road
Concord, MA 01742
or
daniel.b.vasconcelos@usace.army.mil and cenae-r-ma@usace.army.mil
978-318-8653

Please note that your permitted activity is subject to a compliance inspection by a U. S. Army Corps of Engineers (USACE) representative. Failure to comply with any terms or conditions of this authorization may result in the USACE suspending, modifying or revoking the authorization and/or issuing a Class I administrative penalty, or initiating other appropriate legal action.

The people (e.g. contractor) listed below will do the work, and they understand the permit's conditions and limitations.

Contractor Name/Contractor Firm: _____
Business Address: _____
_____
Contractor Phone and Email: _____

Proposed Construction Dates: Start: _____ Finish: _____

_____ _____
Signature of Permittee Date

Compliance Certification Form

File Number: NAE-2024-01390 State: Massachusetts County: Essex

Permittee: MassDOT - Highway Division, Erica Larner
Date Verification Issued: 9/6/2024
Project Manager: Dan Vasconcelos

Within one month of completion of the activity authorized by this permit and any mitigation required by the permit (you must submit this form after mitigation is complete, but not the mitigation monitoring, which requires separate submittals), sign this certification and return it to the following address:

US ARMY CORPS OF ENGINEERS
New England District
Attn: Dan Vasconcelos
696 Virginia Road
Concord, MA 01742
or
daniel.b.vasconcelos@usace.army.mil and cenae-r-ma@usace.army.mil

Please note that your permitted activity is subject to a compliance inspection by a U. S. Army Corps of Engineers (USACE) representative. Failure to comply with any terms or conditions of this authorization may result in the USACE suspending, modifying, or revoking the authorization and/or issuing a Class I administrative penalty, or initiating other appropriate legal action.

I hereby certify that the work, and mitigation (if applicable), authorized by the above referenced permit has been completed in accordance with the terms and conditions of the said permit including any general or specific conditions.

Date Authorized Work Started: _____ Completed: _____

Describe any deviations from permit (attach drawing(s) depicting the deviations):

_____

WQC/ACOE PLAN SHEET 2 OF 63

GENERAL NOTES

1. ALL UTILITY POLES REQUIRING RELOCATION ARE TO BE RELOCATED BY OTHERS.
2. THE CONTRACTOR SHALL MAINTAIN COMPLIANCE WITH THE AMERICANS WITH DISABILITIES ACT AND MASSACHUSETTS ARCHITECTURAL ACCESS BOARD AT ALL OBSTRUCTIONS.
3. PEDESTRIAN CURB RAMPS SHALL CONFORM TO THE CURRENT MASSDOT STANDARDS.
4. TRANSITION GRANITE CURB SHALL BE INSTALLED AT PROJECT LIMITS TO MATCH EXISTING ELEVATIONS (PAVEMENT OR EXISTING CURB).
5. THE CONTRACTOR SHALL RETAIN ALL CURBS, FENCES, WALLS, TREES, SHRUBS, POSTS, LANDSCAPE FEATURES, AND OTHER MISCELLANEOUS ITEMS WITHIN ABUTTING PROPERTIES, UNLESS OTHERWISE NOTED. WHEN RETAINING THOSE ITEMS IS NOT PRACTICAL IN THE OPINION OF THE ENGINEER, THE CONTRACTOR SHALL REMOVE, STOCKPILE, PROTECT AND RESET THE ITEMS. THE CONTRACTOR SHALL REPLACE ITEMS DAMAGED DURING REMOVAL, STOCKPILING, OR RESETTING DUE TO NEGLIGENCE, CARELESSNESS, OR MISHANDLING WITH EQUIVALENT NEW ITEMS AT NO COST TO THE OWNER.
6. ALL TREES WITHIN THE SLOPE LIMIT SHALL BE RETAINED AND PROTECTED UNLESS OTHERWISE NOTED.
7. ALL TREES CALLED OUT TO BE RETAINED SHALL BE PROTECTED USING ITEM NO. 102.511 TREE PROTECTION - ARMORING AND PRUNING AND ITEM NO. 102.521 TREE AND PLANT PROTECTION FENCE.
8. CONTRACTOR SHALL PROTECT ALL PROPERTY MARKERS OF ABUTTERS.
9. TREATMENT OF SLOPE AREAS SHALL BE REPLACED IN KIND UNLESS OTHERWISE NOTED.
10. THE CONTRACTOR SHALL EXERCISE CAUTION WHEN EXCAVATING ALONG THE ABUTMENT FOR THE SHARED-USE PATH AT THE ROUTE 128 UNDERPASS.

UTILITY NOTES:

1. THE LOCATION OF ALL UNDERGROUND UTILITIES ARE SHOWN APPROXIMATE AND WERE COMPILED USING FIELD SURVEY INFORMATION AND AVAILABLE RECORD INFORMATION. THE LOCATION OF EXISTING PIPES OR OTHER UNDERGROUND STRUCTURES OR PROPERTY LINES ARE NOT WARRANTED TO BE EXACT, NOR IS IT WARRANTED THAT ALL UNDERGROUND PIPES OR STRUCTURES ARE SHOWN. THE CONTRACTOR SHALL CALL "DIG SAFE" (1-888-344-7233) AND NOTIFY THE CITY OF PEABODY AND MASSDOT AT LEAST 72 HOURS (EXCLUDING SATURDAYS, SUNDAYS AND HOLIDAYS) PRIOR TO ANY EXCAVATION TO OBTAIN ACCURATE UTILITY LOCATIONS.
2. RECORD UTILITY INFORMATION FROM THE VARIOUS UTILITY COMPANIES AND PUBLIC AGENCIES ARE APPROXIMATE ONLY AND ACTUAL LOCATIONS MUST BE DETERMINED IN THE FIELD.
3. THE COMPLETION AND ACCURACY OF LATERAL UTILITY SERVICES IS NOT GUARANTEED AND MUST BE VERIFIED BY THE CONTRACTOR IN THE FIELD.
4. ALL UTILITY COMPANIES, PUBLIC AND PRIVATE MUST BE NOTIFIED, INCLUDING THOSE IN CONTROL OF UTILITIES NOT SHOWN ON THIS PLAN, (SEE CHAPTER 370, ACTS OF 1963, MASSACHUSETTS) PRIOR TO DESIGNING, EXCAVATING, BLASTING, INSTALLING, BACKFILLING, GRADING, PAVEMENT RESTORING OR REPAVING.
5. SUBSURFACE UTILITY LOCATIONS HAVE BEEN PLOTTED TO MEET UTILITY QUALITY LEVEL "C" AS DESCRIBED IN ASCE STANDARD 38-02 AND SUMMARIZED ON THIS SHEET. THE UNDERGROUND UTILITIES ARE SHOWN IN APPROXIMATE LOCATIONS BASED ON ABOVE-GROUND FIELD OBSERVATION AND EXISTING RECORD INFORMATION RECEIVED FROM UTILITY STAKE-HOLDERS.
6. INVERTS SHOWN ON PLAN ARE NOT GUARANTEED TO BE ACCURATE. DUE TO THE LIMITATIONS OF FIELD OBSERVATION AND SURVEY TECHNIQUES THE INVERTS ARE SHOWN AS APPROXIMATE ONLY AND SHALL NOT BE WARRANTED TO BE CORRECT. ADDITIONAL FIELD INVESTIGATION IS NECESSARY WHERE ACCURATE MEASUREMENTS ARE REQUIRED FOR DESIGN OF CRITICAL AREAS.
7. WHERE AN EXISTING UTILITY IS FOUND TO BE IN CONFLICT WITH THE PROPOSED WORK, THE CONTRACTOR SHALL ACCURATELY DETERMINE THE LOCATION, ELEVATION AND SIZE OF THE UTILITY AND FURNISH THE INFORMATION TO THE ENGINEER FOR RESOLUTION OF THE CONFLICT.
8. THE CONTRACTOR SHALL EXERCISE EXTREME CARE WHEN EXCAVATING NEAR AND BACKFILLING IN THE VICINITY OF EXISTING UTILITIES. THE CONTRACTOR SHALL USE HAND EXCAVATION WHERE APPROPRIATE TO PROTECT EXISTING UTILITIES.
9. THE CONTRACTOR SHALL MAINTAIN ALL EXISTING UTILITIES IN SERVICE AT ALL TIMES UNLESS NOTED ON THE PLANS OR APPROVED BY THE ENGINEER.
10. THE CONTRACTOR SHALL SUPPORT AND PROTECT EXISTING UTILITIES IN AND AROUND EXCAVATIONS, AND IN PARTICULAR, WHEN CROSSING OVER OR UNDER ANY DUCT OR PIPE. ALL PROTECTIVE MEASURES SHALL BE CONSIDERED INCIDENTAL WORK.
11. IF THE CONTRACTOR DAMAGES ANY UTILITY SYSTEM, HE OR SHE SHALL IMMEDIATELY NOTIFY THE RESPECTIVE UTILITY COMPANY AND SHALL REPAIR/REPLACE THE AFFECTED SYSTEM AT HIS OR HER OWN EXPENSE.
12. THE CONTRACTOR SHALL COORDINATE WITH PRIVATE UTILITY COMPANIES AND MAKE ARRANGEMENTS FOR ADJUSTMENTS, ALTERATIONS AND REPLACEMENT OF PRIVATE UTILITIES.
13. BELOW GROUND STRUCTURES ARE SHOWN SYMBOLIC UNLESS DIMENSIONED.
14. THE EXISTING CONDITIONS PLAN IS TO BE USED FOR THE SPECIFIED PROJECT ONLY AND IS NOT WARRANTED TO BE COMPLETE FOR ANY OTHER FUTURE PROJECTS.
15. THE EXISTING SEWER LINE WITHIN THE PROJECT LIMITS SHALL BE INSPECTED USING CLOSED CIRCUIT TV (CCTV) AT THE BEGINNING OF THE PROJECT, PRIOR TO ANY MAJOR WORK ACTIVITIES OR LARGE EQUIPMENT MOBILIZING ON SITE. A CCTV INSPECTION OF THE EXISTING SEWER LINE FOR THE SAME LIMITS SHALL ALSO BE PERFORMED AT THE END OF CONSTRUCTION TO CONFIRM ITS CONDITION HAS NOT CHANGED OVER THE COURSE OF THE PROJECT.
IN ADDITION TO THE PRE AND POST CONSTRUCTION CCTV INSPECTION OF THE EXISTING SEWER LINE FOR THE PROJECT LIMITS, INTERIM CCTV INSPECTION OF CERTAIN SEGMENTS OF THE SEWER LINE SHALL BE PERFORMED FOR SPECIFIC VIBRATION GENERATING ACTIVITIES. CCTV INSPECTION SHALL BE PERFORMED AT THE FOLLOWING LOCATIONS AND PROPOSED CONSTRUCTION ITEMS FOR EXCAVATION AND STONE INSTALLATION ACTIVITIES:

- STA 329+85 BOX CULVERT NO. 1
- STA 340+05 36" DIP PIPE CULVERT
- STA 342+25 24" DIP PIPE CULVERT
- STA 346+20 BOX CULVERT NO. 2
- STA 351+10 BOARDWALK WEST ABUTMENT
- STA 355+48 BOARDWALK EAST ABUTMENT
- STA 358+50 16" DUCTILE IRON PIPE

SUMMARY OF UTILITY MAPPING QUALITY LEVELS:

THE FOLLOWING IS A SUMMARY OF THE SURVEY MAPPING LEVELS FOR UTILITIES AS DESCRIBED IN ASCE STANDARD 38-02, "STANDARD GUIDELINE FOR THE DEPICTION OF EXISTING SUBSURFACE UTILITY DATA". THESE GUIDELINES ARE MORE FULLY DESCRIBED IN THE ASCE STANDARD.

UTILITY QUALITY LEVEL A:
PRECISE HORIZONTAL AND VERTICAL LOCATION OF UTILITIES OBTAINED BY THE ACTUAL EXPOSURE (OR VERIFICATION OF PREVIOUSLY EXPOSED AND SURVEYED UTILITIES) AND SUBSEQUENT MEASUREMENT OF SUBSURFACE UTILITIES, USUALLY AT A SPECIFIC POINT. MINIMALLY INTRUSIVE EXCAVATION EQUIPMENT IS TYPICALLY USED TO MINIMIZE THE POTENTIAL FOR UTILITY DAMAGE. A PRECISE HORIZONTAL AND VERTICAL LOCATION, AS WELL AS OTHER UTILITY ATTRIBUTES, IS SHOWN ON PLAN DOCUMENTS. ACCURACY IS TYPICALLY SET TO 15-MM VERTICAL AND TO APPLICABLE HORIZONTAL SURVEY AND MAPPING ACCURACY AS DEFINED OR EXPECTED BY THE PROJECT OWNER.

UTILITY QUALITY LEVEL B:
INFORMATION OBTAINED THROUGH THE APPLICATION OF APPROPRIATE SURFACE GEOPHYSICAL METHODS TO DETERMINE THE EXISTENCE AND APPROXIMATE HORIZONTAL POSITION OF SUBSURFACE UTILITIES. QUALITY LEVEL B DATA SHOULD BE REPRODUCIBLE BY SURFACE GEOPHYSICS AT ANY POINT OF THEIR DEPICTION. THIS INFORMATION IS SURVEYED TO APPLICABLE TOLERANCES DEFINED BY THE PROJECT AND REDUCED ONTO PLAN DOCUMENTS.

UTILITY QUALITY LEVEL C:
INFORMATION OBTAINED BY SURVEYING AND PLOTTING VISIBLE ABOVE-GROUND UTILITY FEATURES AND BY USING PROFESSIONAL JUDGMENT IN CORRELATING THIS INFORMATION TO QUALITY LEVEL D INFORMATION.

UTILITY QUALITY LEVEL D:
INFORMATION DERIVED FROM EXISTING RECORDS OR ORAL RECOLLECTIONS.

SURVEY NOTES

1. THE EXISTING CONDITIONS SHOWN ON THIS BASEMAP ARE THE RESULT OF AN ARIAL SURVEY PERFORMED BY SANBORN COMPANY IN JUNE, 2004 SUPPLEMENTED BY AN ON THE GROUND INSTRUMENT SURVEY PERFORMED IN SEPTEMBER, 2004 BY GREEN INTERNATIONAL AFFILIATES, INC. (GREEN). ADDITIONAL GROUND SURVEY WAS PERFORMED BETWEEN 2017 AND 2022 BY GREEN TO SUPPLEMENT EXISTING GROUND SURVEY.
2. HORIZONTAL DATUM IS BASED ON THE MASSACHUSETTS STATE PLANE COORDINATE SYSTEM, VERTICAL DATUM IS NAVD88. THE UNIT OF MEASUREMENTS IS US SURVEY FEET.
3. WETLANDS WERE DELINEATED BY GREEN ON 2/15/2018 AND REFLAGGED BY ECOSYSTEMS-SOLUTIONS IN 2022 ACCORDANCE WITH THE MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION AND FIELD LOCATED BY GREEN ON 2/20/2018. REFLAGGING DETERMINED BOUNDARIES HAD NOT CHANGED.
4. THE RIGHT OF WAY LINES SHOWN ON THIS PLAN ARE THE DIRECT RESULT OF AN INSTRUMENT SURVEY PERFORMED ON THE GROUND BY GREEN INTERNATIONAL AFFILIATES, INC. WITH AN ERROR OF CLOSURE LESS THAN 1:15,000, AND FROM PLANS AND DEEDS OF RECORD. PRIVATE PROPERTY LINES ARE COMPILED FROM DEEDS AND PLANS AND SHOULD BE CONSIDERED APPROXIMATE.
5. THE SAID PARCELS SHOWN HERE ARE SUBJECT TO RIGHTS AND EASEMENTS AS CONTAINED IN THE VARIOUS DEEDS OF RECORD DESCRIBING SAID PREMISES. THE LOCATIONS AND EXTENT OF SAID RIGHTS AND EASEMENTS ARE NOT THE SUBJECT OF THIS SURVEY.

EROSION AND SEDIMENT CONTROL

1. ALL EROSION CONTROL MEASURES SHALL BE INSTALLED PRIOR TO THE START OF ANY LAND DISTURBANCE/EARTHWORK ACTIVITIES.
2. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE MAINTENANCE, REPAIR AND REPLACEMENT OF ALL SEDIMENTATION/EROSION CONTROL MEASURES UNTIL ALL DISTURBED AREAS ARE STABILIZED.

20													
25													
30													

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Borehole relocated approximately 25 feet from staked location due to access.
3. Driller noted increased drilling resistance at 6.5 feet below ground surface (bgs).
4. Gravel and Cobbles (less than 6 inches) observed in drill spoils at approximately 11 feet bgs.
5. Auger refusal at 15.3 feet bgs on possible bedrock. Borehole terminated.
6. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

174019 PROPOSED PEABODY BIKEWAY.GPJ; STRATUM ONLY; 3/18/2019

BORING NOTES

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B-1
2. BORINGS TAKEN FOR THE PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES TO THE LEFT OF COLUMNS INDICATE DEPTH BELOW SURFACE AT BORING POINT.
5. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS PRODUCED BY A 30" FALL OF 140 POUND MASS HAMMER REQUIRED TO DRIVE 2" I.D. SPOON 1 FOOT.
6. BORING SAMPLE TAKEN 1/2/2019 - 1/3/2019.
7. BORING CONTRACTOR - NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH 03038
8. BORING SAMPLES WERE STORED AT A STORAGE FACILITY ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.

30													

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Driller noted increased drilling effort at 9 feet below ground surface (bgs).
3. Auger refusal at 17 feet bgs on possible bedrock. Borehole terminated.
4. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

Boring No.: B-4

30								Bottom of boring at 25.9 feet.	3				

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Hole appears to have blown in prior to sampling S-5. Blow counts at S-5 may be inaccurate. Driller removed augers and offset 4 feet southeast of staked location and continued hole with 4-inch casing. Samples S-6 through S-8 obtained using drive and wash drilling methods.
3. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

Boring No.: B-6

174019 PROPOSED PEABODY BIKEWAY.GPJ; STRATUM ONLY; 3/18/2019

BORING NOTES

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B-1
2. BORINGS TAKEN FOR THE PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES TO THE LEFT OF COLUMNS INDICATE DEPTH BELOW SURFACE AT BORING POINT.
5. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS PRODUCED BY A 30" FALL OF 140 POUND MASS HAMMER REQUIRED TO DRIVE 2" I.D. SPOON 1 FOOT.
6. BORING SAMPLE TAKEN 1/2/2019 - 1/3/2019.
7. BORING CONTRACTOR - NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH 03038
8. BORING SAMPLES WERE STORED AT A STORAGE FACILITY ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.

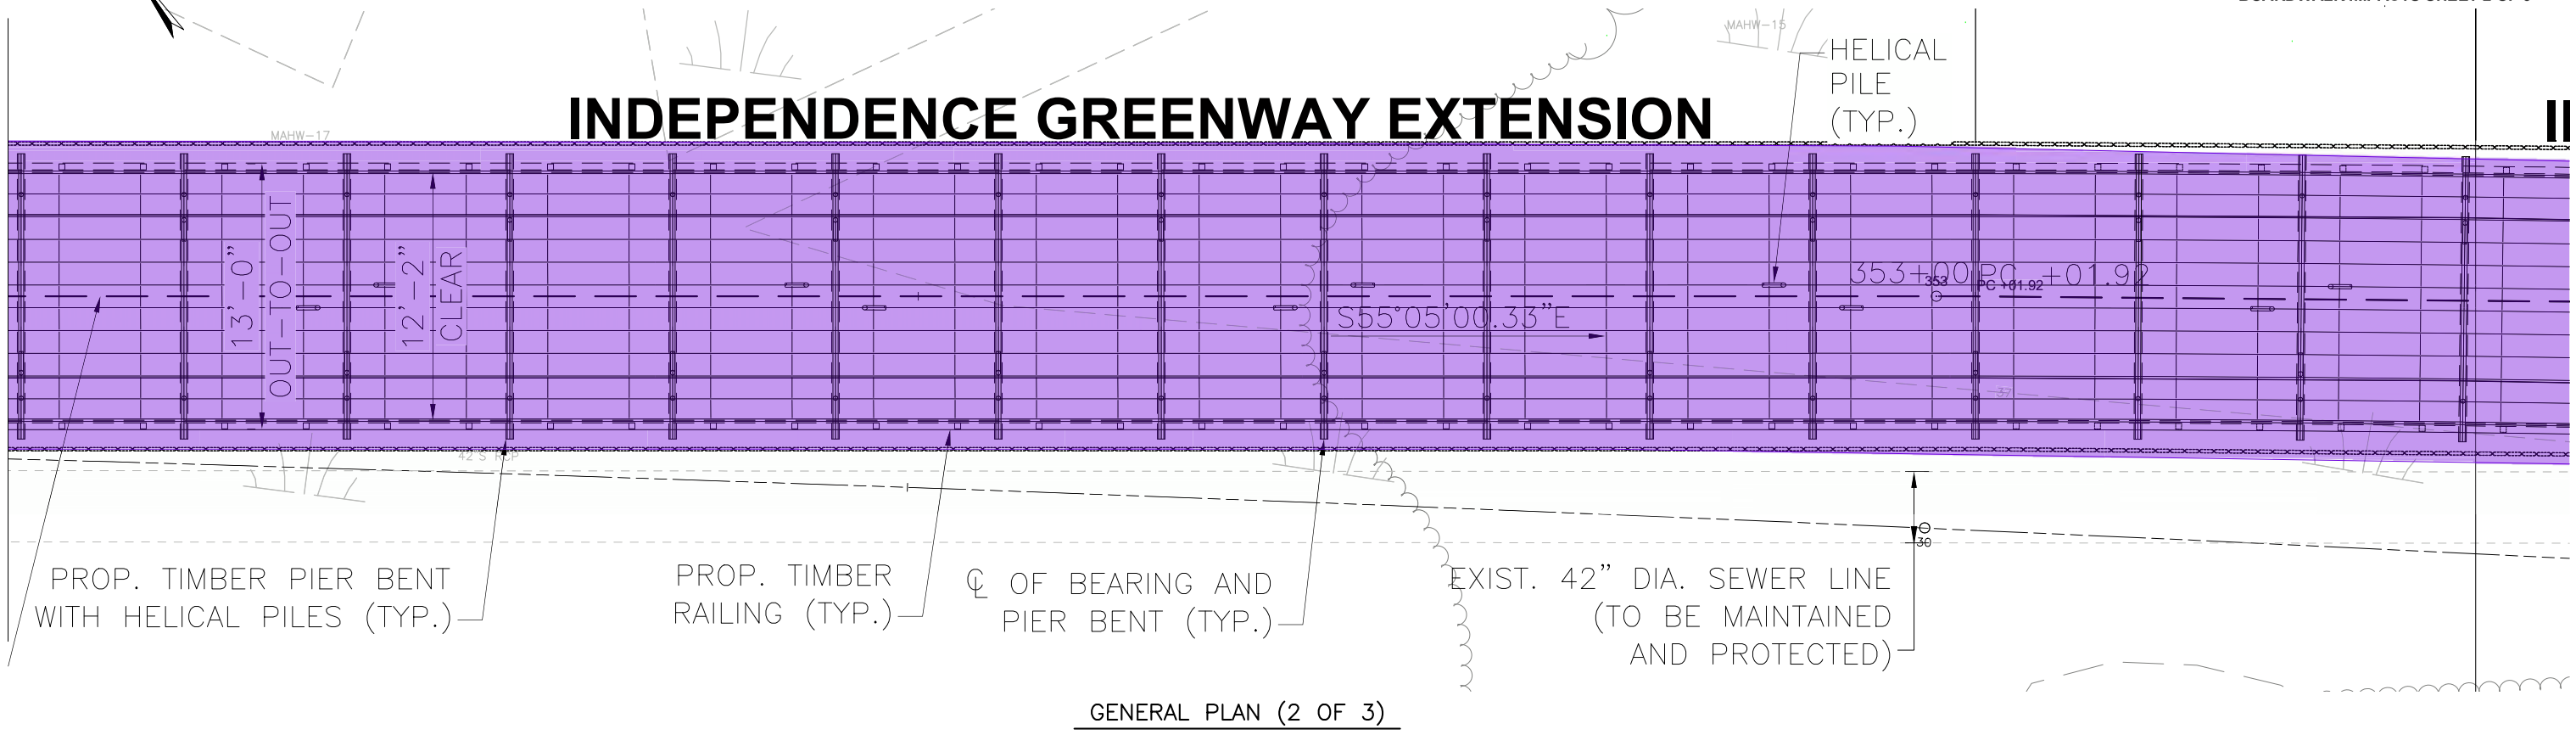
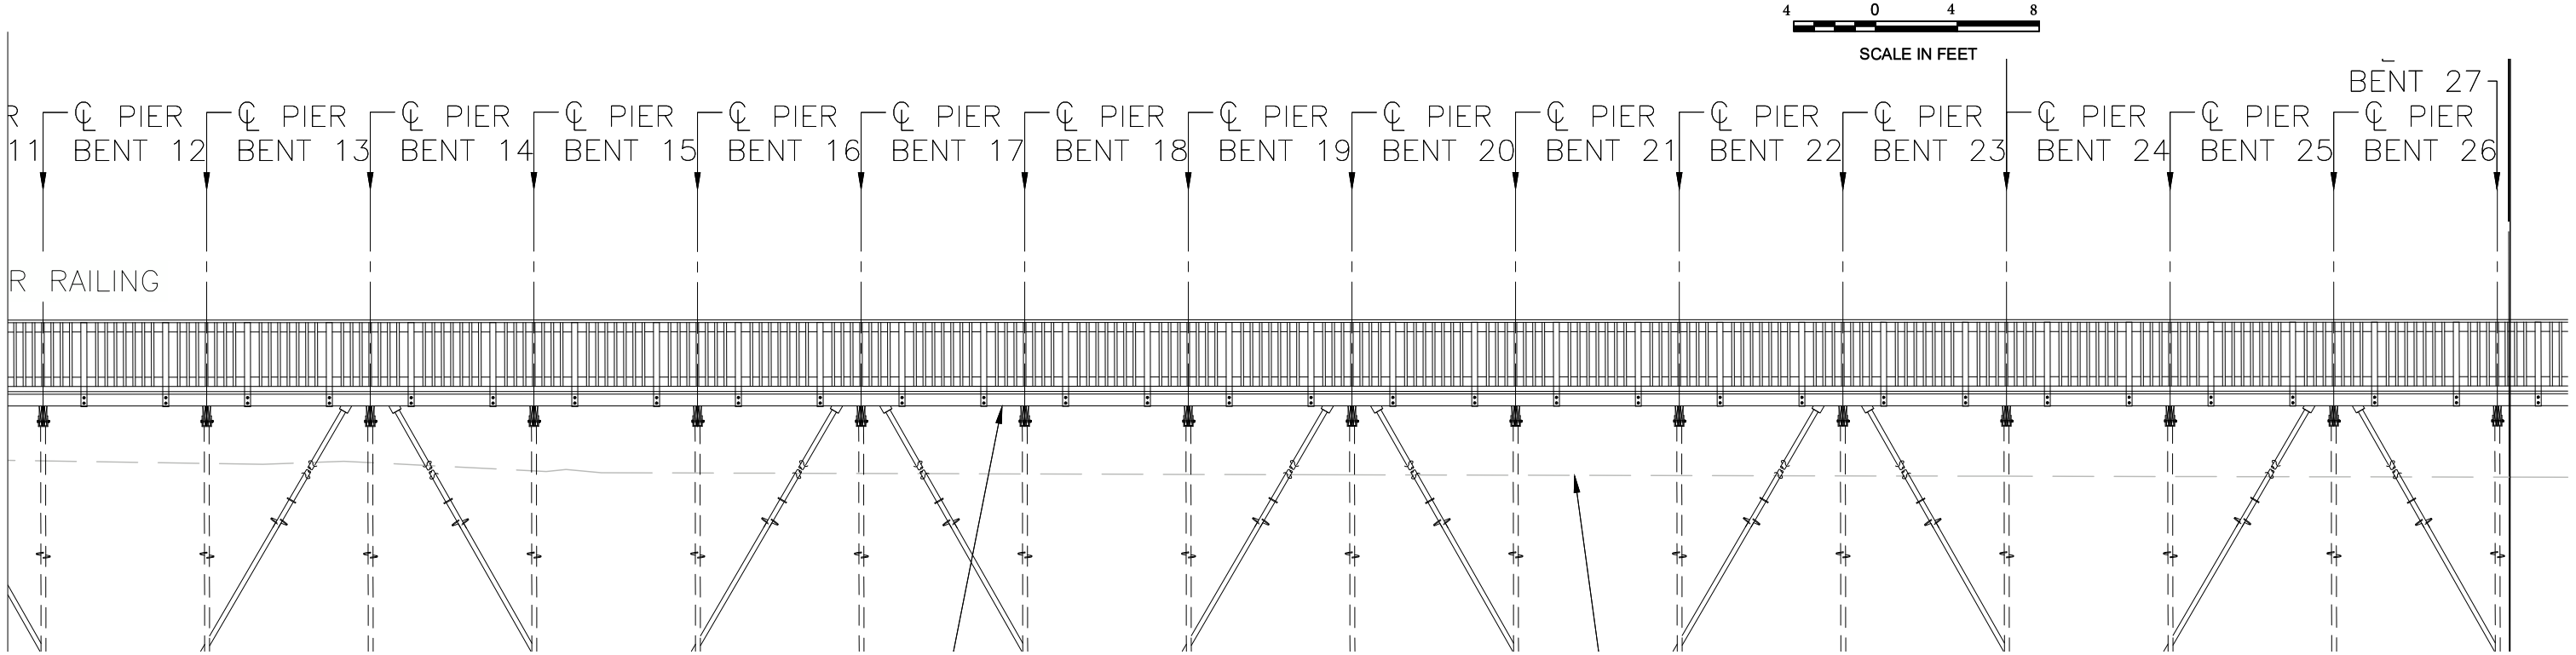
BOARDWALK IMPACTS SHEET 2 OF 3

INDEPENDENCE GREENWAY EXTENSION



GENERAL PLAN (2 OF 3)



TYPICAL ELEVATION (2 OF 3)

IMPACTS FROM STA. 348+50 TO 358+50 ONLY:

- PERMANENT BVW IMPACT AREA
- TEMPORARY BVW IMPACT AREA
- PERMANENT LUW IMPACT AREA
- TEMPORARY LUW IMPACT AREA
- VEGETATED WETLAND (VW)
- BANK/OHW (PERENNIAL STREAM)
- STREAM/BANK IMPACT (PERM.)
- STREAM/BANK IMPACT (TEMP.)

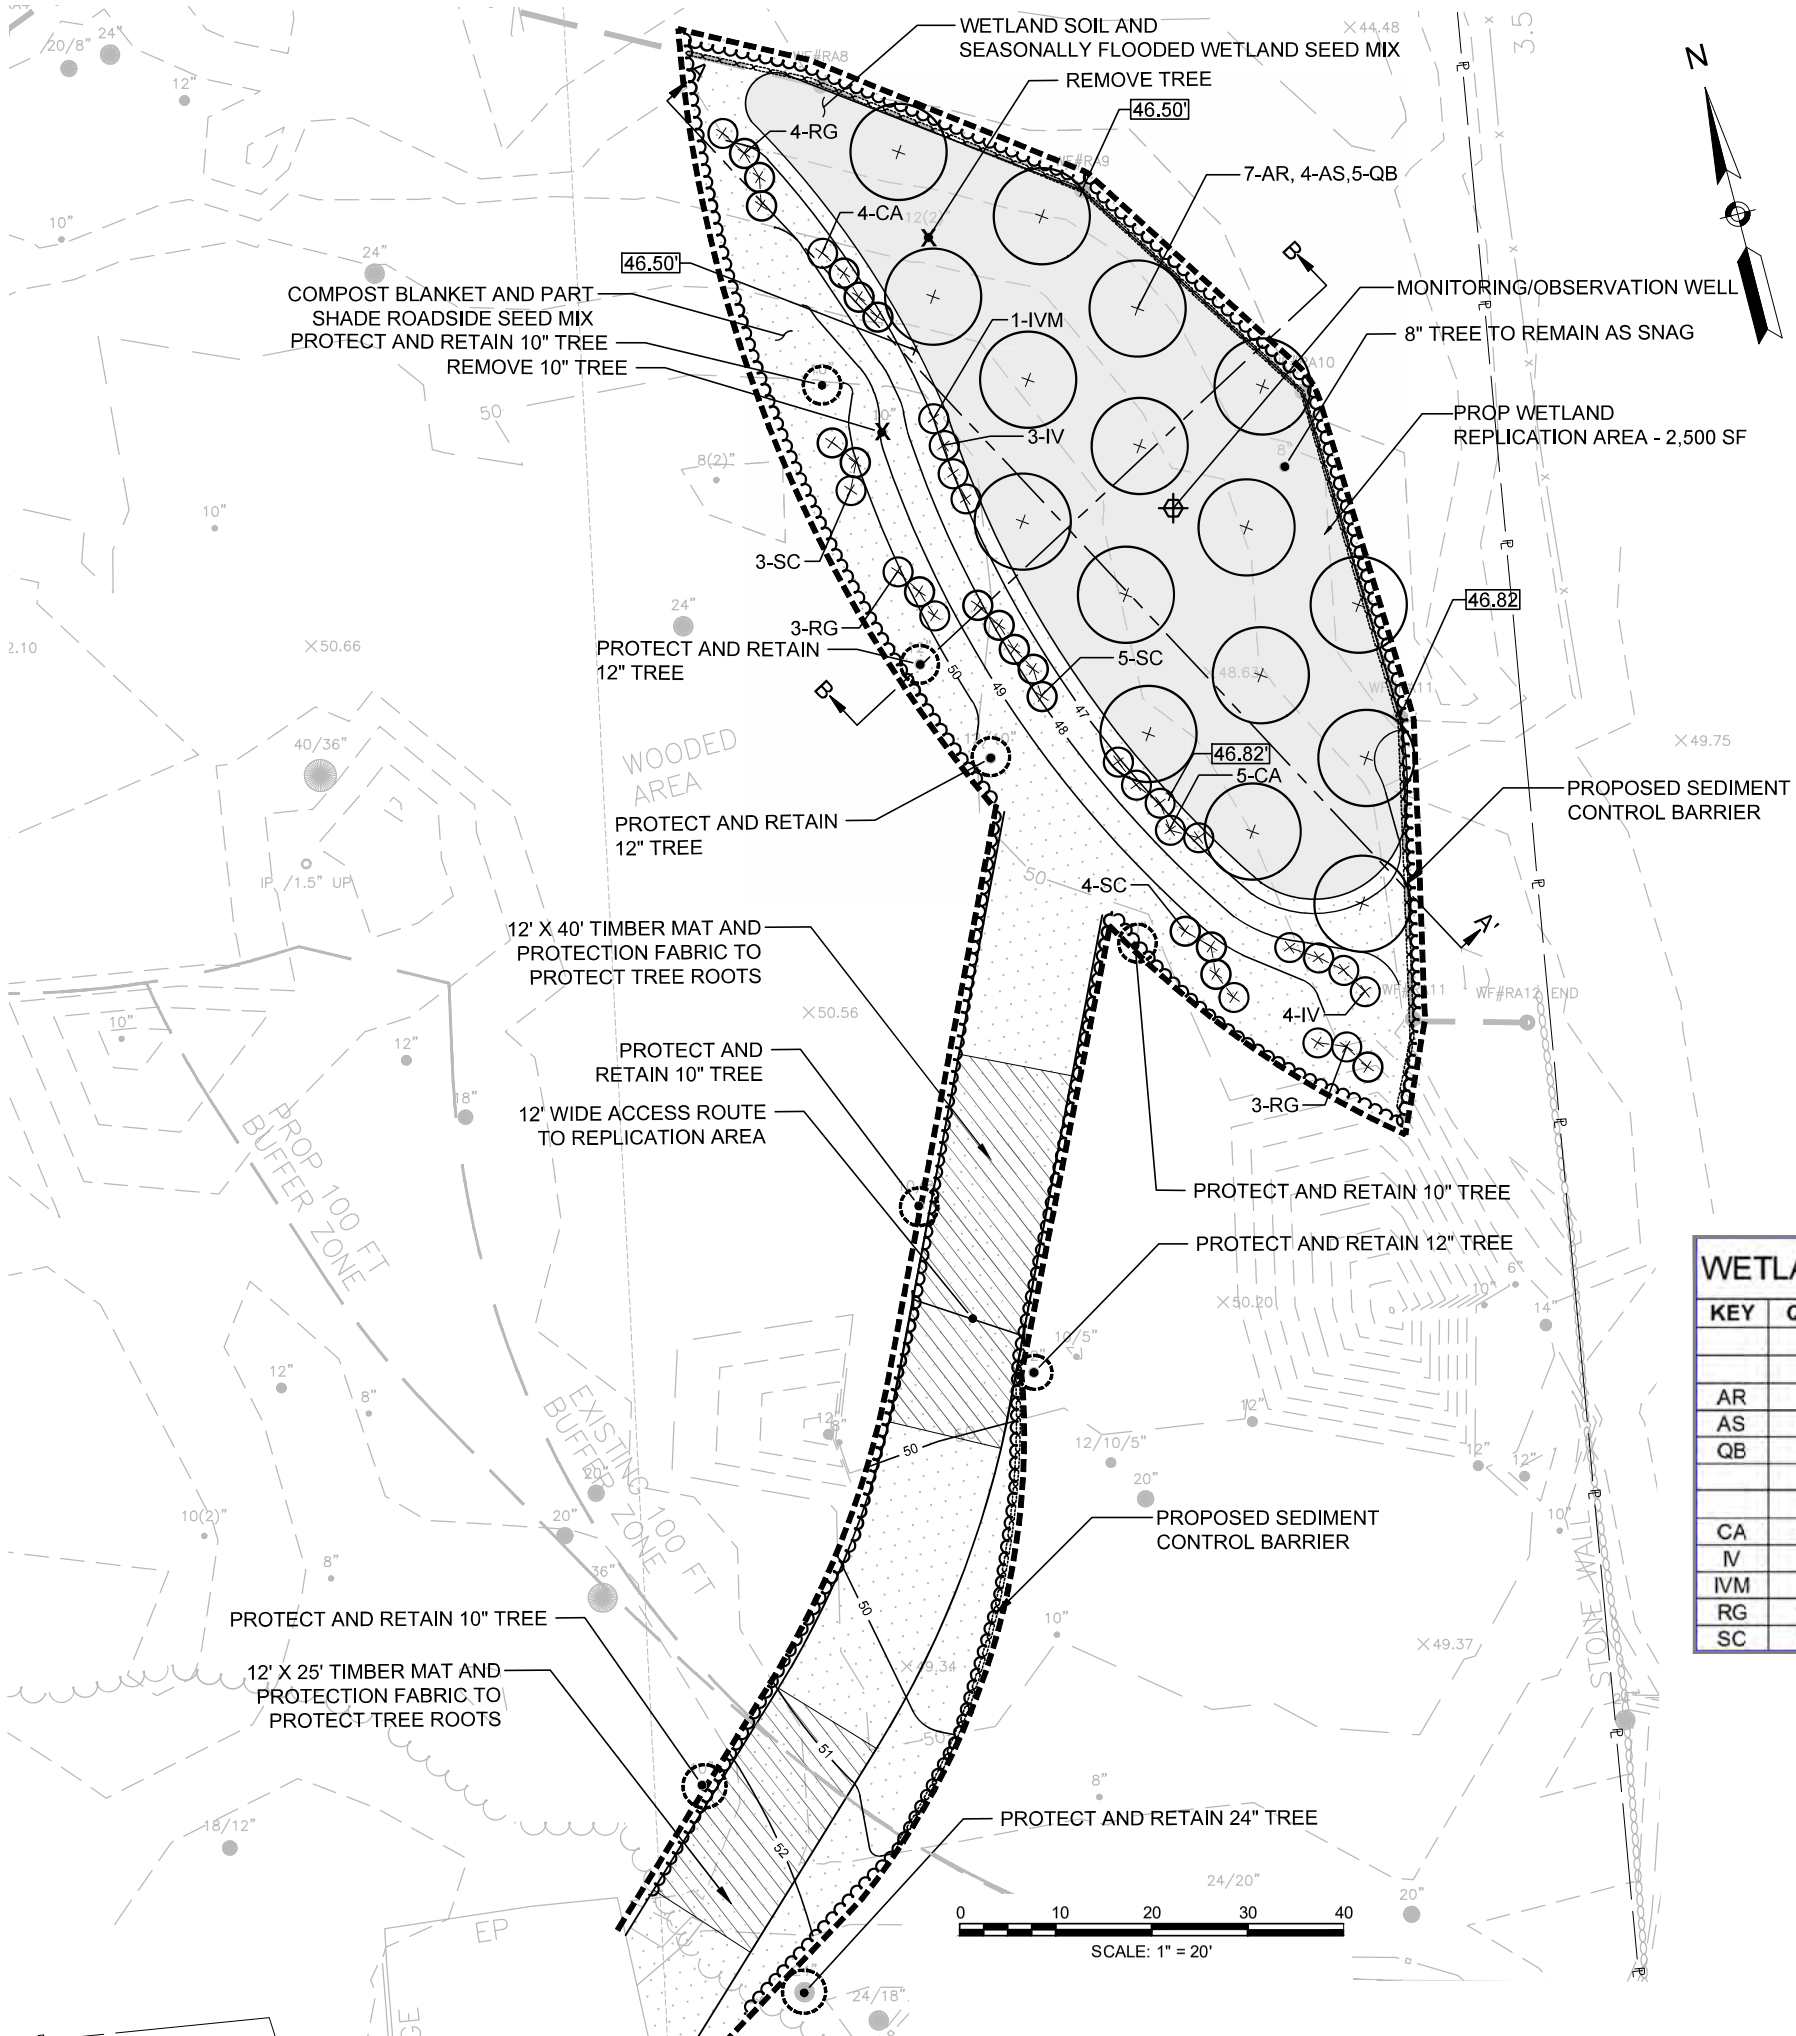
WETLAND REPLICATION PLAN



NOTES:

1. IMPACTS TO EXISTING TREES AND SOILS SHALL BE MINIMIZED TO THE EXTENT POSSIBLE.
2. CONTACT THE REPRESENTATIVE FROM MASSDOT LANDSCAPE DESIGN SECTION PRIOR TO THE START OF CONSTRUCTION. THE REPRESENTATIVE FOR THIS PROJECT IS MAXWELL R. MCNULTY MAXWELL.R.MCNULTY@DOT.STATE.MA.US.
3. FINAL GRADES TO BE TO MATCH ADJACENT WETLAND. MINOR ADJUSTMENTS IN FINAL GRADES SHALL BE MADE IN THE FIELD BY THE WETLAND SPECIALIST.
4. REPLICATION AREA SHALL BE EXCAVATED BELOW PROPOSED GRADES TO ALLOW FOR THE PLACEMENT OF WETLAND SOILS. THE DEPTH OF WETLAND SOILS SHALL BE 18" MAXIMUM AND SHALL MATCH THE DEPTH OF WETLAND SOIL IN THE ADJACENT WETLAND. DEPTH OF WETLAND SOIL SHALL BE DETERMINED BY THE WETLAND SPECIALIST. THE SALVAGED TOPSOIL MATERIAL AND B-HORIZON SUBSOIL MATERIAL EXCAVATED FROM THE WETLAND IMPACT AREAS SHALL BE PLACED IN SEPARATE STOCKPILES TO BE REUSED IN THE PROPOSED REPLICATION AREA IF SUITABLE.
5. REPLICATION AREA GRADES SHALL MATCH THE ELEVATIONS OF THE ABUTTING WETLAND TO MAINTAIN A HYDROLOGIC CONNECTION. WETLAND SPECIALIST SHALL INSPECT THE SUB-GRADE OF THE REPLICATION AREA TO ENSURE THAT THE PROPER HYDROLOGY HAS BEEN ESTABLISHED. MINOR MODIFICATIONS TO THIS GRADING PLAN MAY BE MADE IN THE FIELD BY THE QUALIFIED WETLAND SPECIALIST IN RESPONSE TO SUBSURFACE HYDROLOGIC CONDITIONS.
6. TREES AND SHRUBS IN THE REPLICATION AREA AND ADJACENT UPLAND AREA SHALL BE FIELD LOCATED BY THE WETLAND SPECIALIST.

PLANTING & SEEDING NOTES:

1. SEED SHALL BE MANUALLY BROADCAST. LIMITS SHOWN ARE APPROXIMATE. ACTUAL LIMITS SHALL BE AS DIRECTED BY THE WETLAND SPECIALIST.

STATE	FED. AID PROJ. NO.	SHEET NO.	TOTAL SHEETS
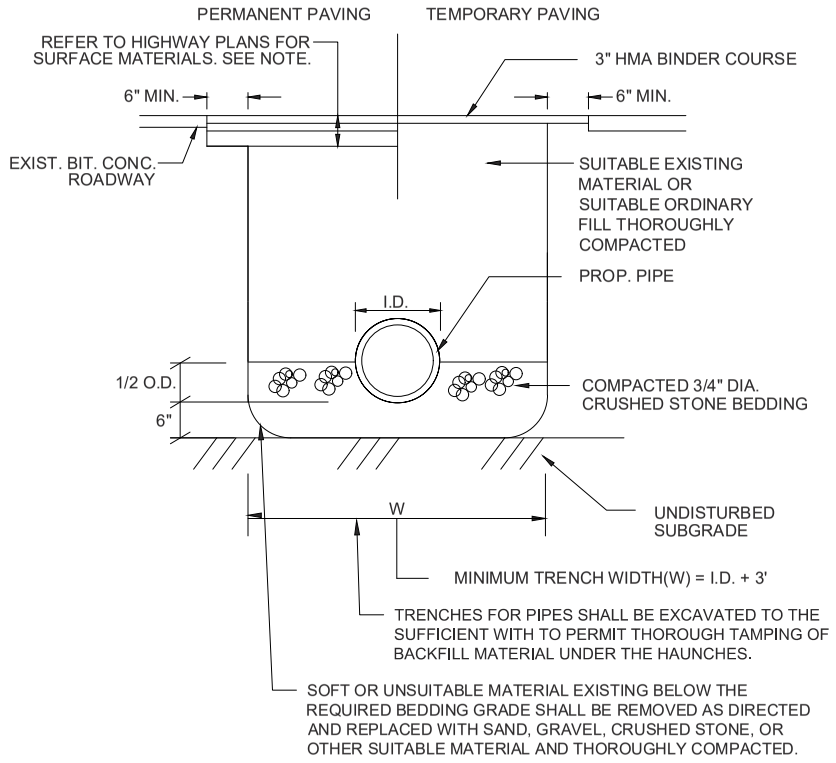
MA	-	42	142
PROJECT FILE NO.	609211		

CONSTRUCTION DETAILS - 3

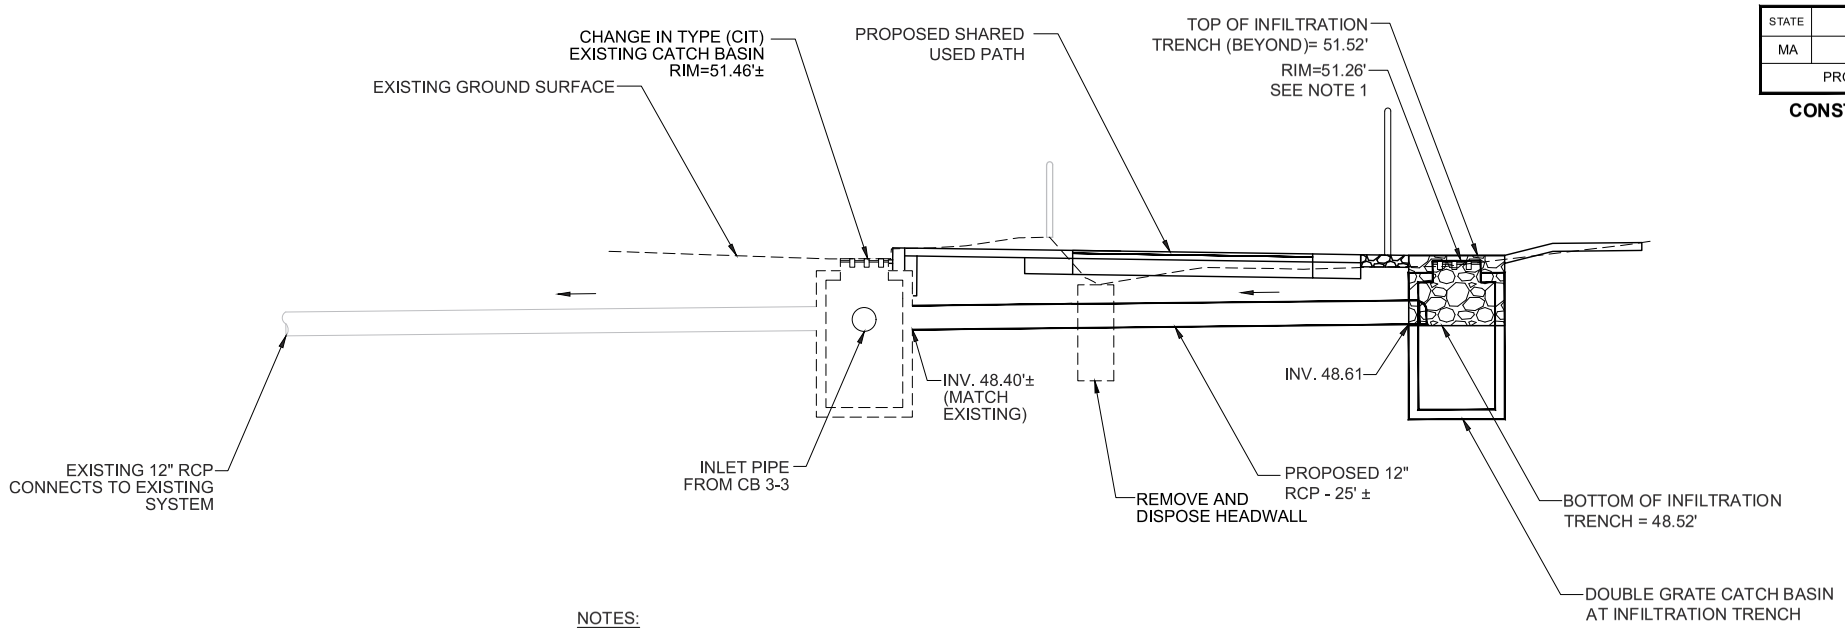


TYPICAL PIPE TRENCH

NOT TO SCALE

NOTE:

1. PERMANENT PAVING TO BE USED IN ALL AREAS OF MILL AND OVERLAY. MATERIALS SHALL MATCH CORRESPONDING FULL DEPTH SECTION. REFER TO TYPICAL ROADWAY SECTIONS.
2. HMA FOR PATCHING TO BE USED IN AREAS OF FUTURE FULL DEPTH CONSTRUCTION.
3. EXISTING MATERIAL OBTAINED FROM EXCAVATION THAT IS DETERMINED TO BE SUITABLE, AND APPROVED BY THE ENGINEER, OR SATISFACTORY BORROW SHALL BE USED. BACKFILL SHALL BE PLACED IN LAYERS NO MORE THAN 6 INCHES IN DEPTH AND THOROUGHLY COMPACTED. BACKFILLING TO A POINT 2 FEET OVER THE PIPE SHALL CONTAIN NO STONES LARGER THAN 3 INCHES.



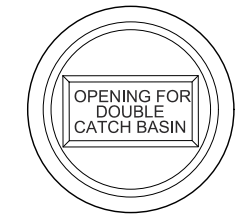
NOTES:

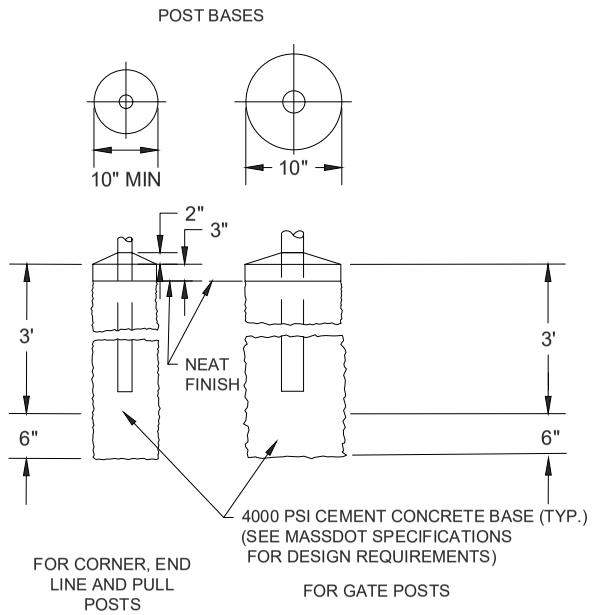
1. THE CRUSHED STONE SHALL BE PLACED AT A 3:1 SLOPE FROM THE GRATE TO THE TOP OF THE INFILTRATION TRENCH TO PREVENT DEBRIS FROM ENTERING THE GRATE

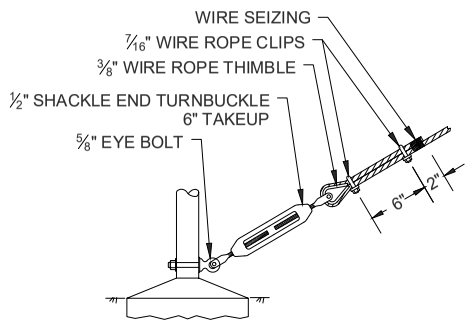
INFILTRATION TRENCH TO CULVERT DETAIL

SCALE: 1" = 8'

0 4 8 12 16





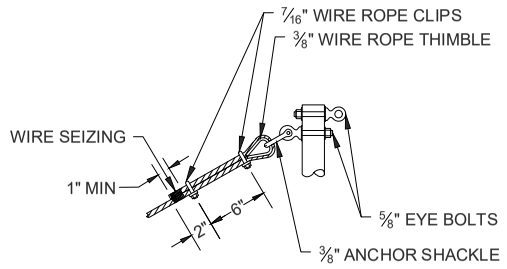


FOR FASTENING TO BASE OF POST

NOTE:

1. FOR EYE BOLT INSTALLATION THROUGH PIPE SECTIONS, USE 2 WASHERS ON "SHOULDER SIDE" AND 1 WASHER WITH LOCK WASHER ON "NUT SIDE" OF POSTS.

DETAILS OF CABLE ATTACHMENTS



FOR END PULL POST

CHAIN LINK FENCE DETAILS OF CABLE ATTACHMENTS AND POST BASES

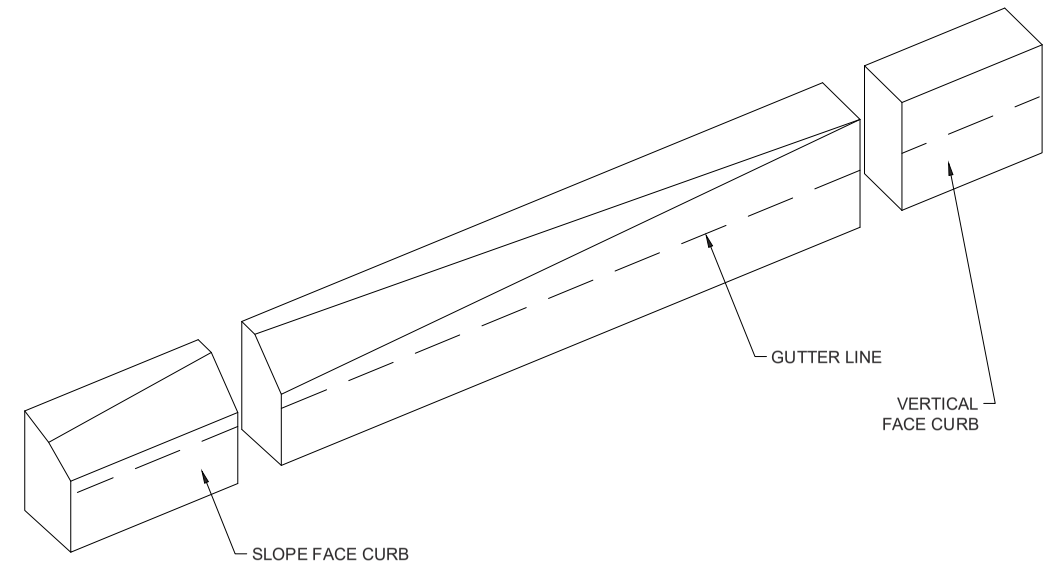
ACCESS ROAD GATE

NOT TO SCALE

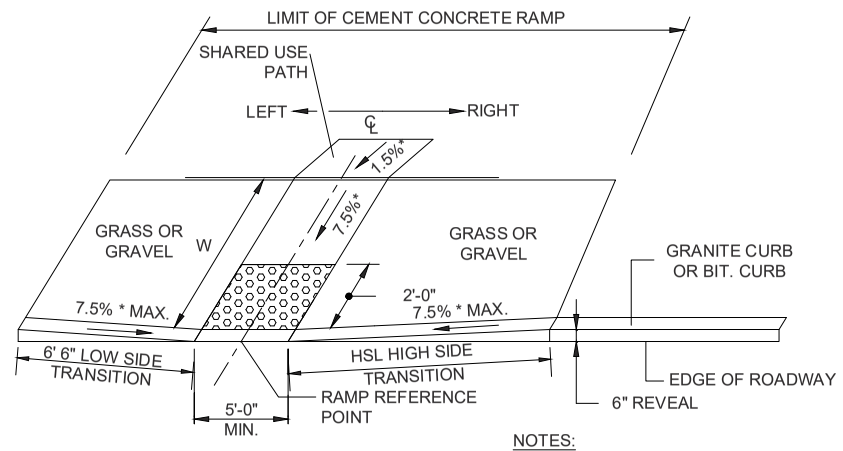
NOTE:
1. ALL GALVANIZED STEEL SHALL MEET GRADE B, Fy = 33,000 KSI AND SHALL BE IN ACCORDANCE WITH SUBSECTION 960.
2. THE GALVANIZED STEEL HINGE BRACKET AND GALVANIZED STEEL LOCKING BRACKET SHALL BE $\frac{1}{4}$" (MIN) COLD ROLLED GALVANIZED STEEL.
3. VENT HOLES SHALL BE INSTALLED IN GALVANIZED TUBES, PER MANUFACTURER'S RECOMMENDATIONS.
4. CONCRETE SHALL MEET THE REQUIREMENTS OF SUBSECTION 901 OF THE STANDARD SPECIFICATIONS.
5. STEEL REINFORCEMENT SHALL BE GRADE 60 REINFORCING LEVEL I.



GRANITE TRANSITION TYPE VB - SPLAYED END

NOT TO SCALE

NOTE:
1. TOP SURFACE AND SLOPED SURFACE TO BE DRESSED BY SAW. REMAINDER TO BE QUARRY SPLIT.
2. DETAIL SHOWS TRANSITION CURB FOR ONE DIRECTION. FOR OTHER DIRECTION USE OPPOSITE HAND.



NOTES:
* CONSTRUCTION TOLERANCE ± 0.5%
- DETECTABLE WARNING PANELS SHALL BE INSTALLED IN ACCORDANCE WITH CONSTRUCTION STD E 107.6.5
- PCR 9 LANDING TO BE CONSTRUCTED WITH HMA TO MATCH SHARED USE PATH
** TRANSITION LENGTHS FOR CURBS ONLY

CORNER CURB CUT RAMP (ADJACENT TO SHARED USE PATH)

PLANTING NOTES

1. CONTRACTOR SHALL HAVE ALL SUBSURFACE UTILITIES MARKED PRIOR TO THE START OF WORK.
2. PLANT LOCATIONS ARE APPROXIMATE. PRIOR TO PLANTING, LOCATION OF ALL PLANT MATERIAL WILL BE APPROVED BY THE RESIDENT ENGINEER AND THE LANDSCAPE ARCHITECT.
3. ALL PLANT MATERIAL WILL HAVE TAGS INDICATING COMMON NAME, BOTANICAL NAME, CULTIVAR, & SIZE.
4. IMMEDIATELY AFTER ACCEPTANCE OF PLANTING, TAGS AND RIBBONS SHALL BE REMOVED.
5. ALL PLANTS WILL BE MULCHED PER PLANS AND SPECIFICATIONS.
6. ALL SHRUB AND PERENNIAL BEDS WILL BE WEEDED AND OTHERWISE NEATLY MAINTAINED FOR THE DURATION OF THE CONTRACT.
7. PLANTS AND PLANTING BEDS SHALL BE THOROUGHLY WATERED AS NECESSARY AND PER SPECIFICATIONS.

WATERING NOTES

1. IRRIGATION BAGS MAY BE USED FOR STREETSCAPE AND PARK PLANTINGS ONLY.
2. A SCHEDULE FOR FILLING AND REMOVAL SHALL BE SUBMITTED TO THE ENGINEER.
3. USE AND SCHEDULE MUST BE APPROVED BY THE MASSDOT LANDSCAPE ARCHITECT.
4. A MINIMUM OF 2 BAGS PER TREE SHALL BE USED. BAGS SHALL BE ATTACHED TO STAKES.
5. NO BAGS SHALL BE PLACED AROUND THE TREE TRUNK.
6. BAGS SHALL BE MAINTAINED FULL JUNE 1 - OCTOBER 1 OR AS APPROVED.
7. BAGS SHALL BE REMOVED AT THE END OF THE SEASON.

Proposal No. 609211-132091

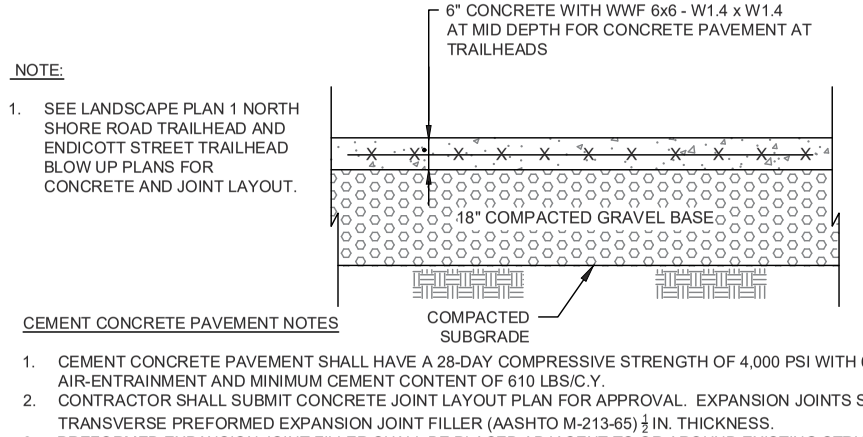
A00831 - 54



NOTE:

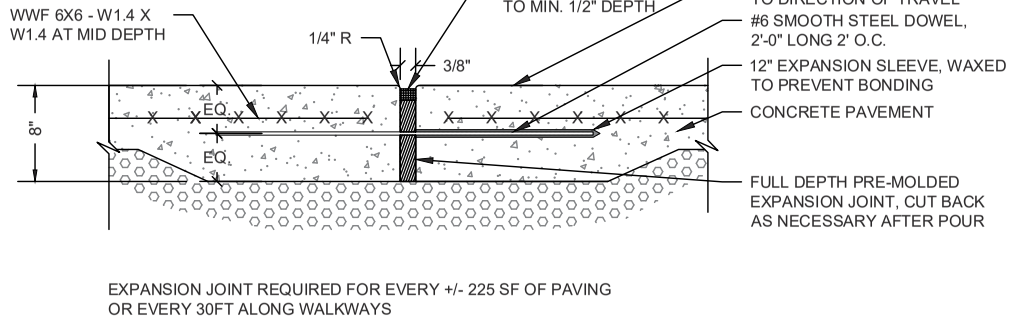
1. SEE LANDSCAPE PLAN 1 NORTH SHORE ROAD TRAILHEAD AND ENDICOTT STREET TRAILHEAD BLOW UP PLANS FOR CONCRETE AND JOINT LAYOUT.

CEMENT CONCRETE PAVEMENT NOTES

1. CEMENT CONCRETE PAVEMENT SHALL HAVE A 28-DAY COMPRESSIVE STRENGTH OF 4,000 PSI WITH 6% AIR-ENTRAINMENT AND MINIMUM CEMENT CONTENT OF 610 LBS/C.Y.
2. CONTRACTOR SHALL SUBMIT CONCRETE JOINT LAYOUT PLAN FOR APPROVAL. EXPANSION JOINTS SHALL BE TRANSVERSE PREFORMED EXPANSION JOINT FILLER (AASHTO M-213-65) ½ IN. THICKNESS.
3. PREFORMED EXPANSION JOINT FILLER SHALL BE PLACED ADJACENT TO OR AROUND EXISTING STRUCTURES AND WALKWAYS.
4. EXPANSION JOINTS SHALL BE CONSTRUCTED WITH DOWELS, AS INDICATED IN DETAIL 2 LANDSCAPE DETAIL SHEET 1.
5. AFTER CONSOLIDATION, CONCRETE DEPTH SHALL BE 6 INCHES IN DEPTH FOR TRAILHEADS.
6. ENSURE THAT NO BLED WATER OR WATER SHEEN EXISTS ON THE SURFACE OF THE CONCRETE AND THAT CONCRETE HAS STARTED TO STIFFEN BEFORE ANY FINISHING OPERATIONS ARE PERFORMED.
7. AFTER TROWELING, SURFACE SHALL BE BRUSHED BY DRAWING A SOFT-BRISTLED PUSHBROOM WITH A LONG HANDLE OVER THE SURFACE OF THE CONCRETE TO PRODUCE A NON-SLIP SURFACE.
8. THE FINISHING OF CONCRETE SURFACE SHALL BE DONE BY EXPERIENCED AND COMPETENT CEMENT CONCRETE FINISHERS.
9. FINISHING SHALL BE BROOM FINISH.
10. SAW CUT CONTROL JOINTS.
11. WHEN COMPLETED, CONCRETE SHALL BE KEPT MOIST AND PROTECTED FROM TRAFFIC AND WEATHER FOR AT LEAST 3 DAYS.
12. WELDED WIRE MESH SHALL BE 6"x6" No. 10 GAUGE AND SHALL BE SHEET MESH ONLY NOT ROLLED. MESH SHALL REST ON CONCRETE BLOCKS AND BE INSTALLED AT MID DEPTH IN CONCRETE.

1 CEMENT CONCRETE PAVEMENT AT TRAILHEADS

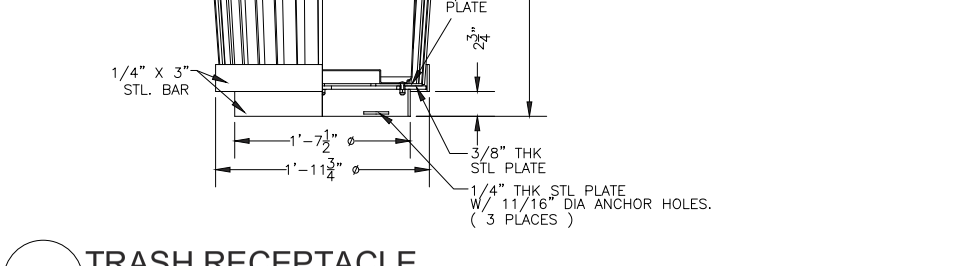
SCALE: N.T.S.



EXPANSION JOINT REQUIRED FOR EVERY +/- 225 SF OF PAVING OR EVERY 30FT ALONG WALKWAYS

EXPANSION JOINT NOTES:

1. DOWEL IS TYPICAL AT ALL EXPANSION JOINTS EXCEPT AGAINST VERTICAL JOINTS WITH WALLS, CURBS OR SITE IMPROVEMENTS.



SAWCUT CONTROL JOINT REQUIRED FOR EVERY 36 SF OF PAVING.

2 CONCRETE PAVEMENT JOINTS AT TRAILHEADS

SHEET 1 OF 17 SHEETS BRIDGE NO. P-03-020 (CAK)

Proposal No. 609211-132091

A00831 - 56

GENERAL NOTES

DESIGN:
IN ACCORDANCE WITH THE 2009 AASHTO LRFD GUIDE SPECIFICATION FOR DESIGN OF PEDESTRIAN BRIDGES WITH 2015 INTERIM REVISIONS, FOR 90 PSF DESIGN PEDESTRIAN LOADING.

MASSDOT BENCH MARK:
ELEVATIONS ARE BASED ON THE NORTH AMERICAN VERTICAL DATUM (NAVD) OF 1988.

BENCHMARK: 9 – MAG NAIL SET UP #28 ON WARREN ROAD
STATION: 347+49.19 – 8.971 LT
NORTHING: 3019612.4266
EASTING: 807741.8898
ELEVATION: 41.17'

BENCHMARK: 11 – MAG NAIL SET ABOUT 1' ABOVE GROUND AT LP#6 ON ENDICOTT STREET
STATION: 359+34.38 – 79.411 LT
NORTHING: 3018945.6274
EASTING: 808725.6506
ELEVATION: 37.33'

MASSDOT SURVEY:
THE EXISTING CONDITIONS SHOWN ON THIS BASEMAP ARE THE RESULTS OF AN AERIAL SURVEY PERFORMED BY SANBORN COMPANY IN JUNE, 2004 SUPPLEMENTED BY AN ON GROUND INSTRUMENT SURVEY PERFORMED IN SEPTEMBER, 2004 BY GREEN INTERNATIONAL AFFILIATES, INC. (GREEN). ADDITIONAL GROUND SURVEY WAS PERFORMED BETWEEN 2017 AND 2022 BY GREEN TO SUPPLEMENT EXISTING GROUND SURVEY.

SCALES:
SCALES NOTED ON THE PLANS ARE NOT APPLICABLE TO REDUCED SIZE PRINTS. DIVIDE SCALES BY 2 FOR HALF–SIZE PRINTS.

FOUNDATIONS:
FOUNDATIONS MAY BE ALTERED, IF NECESSARY, TO SUIT CONDITIONS ENCOUNTERED DURING CONSTRUCTION, WITH THE APPROVAL OF THE ENGINEER.

UNSUITABLE MATERIAL:
ALL UNSUITABLE MATERIAL SHALL BE REMOVED WITHIN THE LIMITS OF THE FOUNDATIONS OF THE STRUCTURE, AS DIRECTED BY THE ENGINEER.

GEOTECHNICAL REPORT:
REFER TO GEOTECHNICAL REPORT, DATED MAY 2023, PREPARED BY GZA GEO ENVIRONMENTAL.

EXISTING CONDITIONS:
CONTRACTOR SHALL DETERMINE AND ESTABLISH ALL DIMENSIONS AND DETAILS NECESSARY FOR COMPLETION OF ALL WORK BY FIELD MEASUREMENTS AND SURVEY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ADEQUACY THEREOF, AND SHALL NOT ORDER ANY MATERIAL OR COMMENCE ANY FABRICATION UNTIL HE/SHE HAS MADE THE REQUIRED MEASUREMENTS AND THE EXTENT OF THE PROPOSED WORK HAS BEEN APPROVED BY THE ENGINEER.

STRUCTURAL WOOD NOTES:
ALL DIMENSIONAL LUMBER SHALL BE SOUTHERN PINE STAMPED BY A MEMBER OF THE WWPA AND KILN DRIED TO 19% MAXIMUM MOISTURE CONTENT. ALL STRUCTURAL LUMBER SHALL BE SELECT STRUCTURAL GRADE. IN ACCORDANCE WITH AASHTO TABLE 8.4.1.1.4–1 AND THE 2018 NATIONAL DESIGN SPECIFICATIONS (NDS) FOR WOOD CONSTRUCTION ALL PROPOSED TIMBER ELEMENTS SHALL HAVE A MINIMUM MODULUS OF ELASTICITY OF 1800 KSI.

STRINGERS AND PIER BENTS SHALL NOT BE NOTCHED EXCEPT WHERE SHOWN IN DETAILS. OBTAIN STRUCTURAL ENGINEER'S APPROVAL FOR ANY HOLES THROUGH OR NOTCHES IN THE TOP OF HORIZONTAL MEMBERS.

FOR BLACK LOCUST DECKING MATERIAL REQUIREMENTS PLEASE REFER TO THE SPECIAL PROVISIONS.

PROPOSED WOOD SCREWS FOR TIMBER FRAMING ELEMENTS SHALL COMPLY WITH ASME B18.6 REQUIREMENTS AND SHALL BE GALVANIZED UNLESS OTHERWISE NOTED. WOOD SCREW SIZES AND LENGTHS SHALL BE AS SHOWN ON THE PLANS.

SEE SHEET 17 FOR CONNECTION HARDWARE NOTES.

GRS–IBS MATERIALS
SEE SPECIAL PROVISIONS FOR DETAILED REQUIREMENTS.

CONCRETE MASONRY UNIT (CMU) FACING ELEMENTS
FACING ELEMENTS CONSISTING OF SPLIT–FACE CMU BLOCK UNITS SHALL MEET ASTM C90–11B AND THE REQUIREMENTS OF THE SPECIAL PROVISIONS, WITH A MINIMUM REQUIRED COMPREHENSIVE STRENGTH OF 4000 PSI AND A MAXIMUM WATER ABSORPTION RATE OF 5 PERCENT AFTER 24 HOURS.

CONSTRUCTION JOINTS
CONSTRUCTION JOINTS, OTHER THAN THOSE SHOWN ON THE PLANS, WILL NOT BE PERMITTED WITHOUT PRIOR APPROVAL OF THE ENGINEER.

BACKFILL MATERIALS

A. GEOSYNTHETIC REINFORCED SOIL (GRS) BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.6 AND HAVE A MINIMUM ANGLE OF INTERNAL FRICTION OF 30 DEGREES AS CONFIRMED BY A DIRECT SHEAR TEST.
B. REINFORCED SOIL FOUNDATION (RSF) BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.4 AND HAVE A MINIMUM ANGLE OF INTERNAL FRICTION OF 38 DEGREES AS CONFIRMED BY A DIRECT SHEAR TEST.
C. INTEGRATED APPROACH BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.1.
D. LEVELING COURSE BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.6.

GEOSYNTHETICS
FURNISH GEOSYNTHETICS CONSISTING OF GEOTEXTILE FOR THE GRS ABUTMENT, RSF AND INTEGRATED APPROACH. THE GEOSYNTHETIC MATERIAL SHALL BE MANUFACTURED FROM POLYPROPYLENE, HIGH–DENSITY POLYETHYLENE, OR POLYESTER AND MEET THE REQUIREMENTS OF THE SPECIAL PROVISIONS.

A. GEOSYNTHETIC REINFORCED SOIL SHALL INCLUDE A CLASS 1 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11 AND A REINFORCEMENT STRENGTH OF 1370 LB/FT AT 2 PERCENT STRAIN IN THE CROSS DIRECTION.
B. REINFORCED SOIL FOUNDATION SHALL INCLUDE A CLASS 1 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11 AND A REINFORCEMENT STRENGTH OF 1370 LB/FT AT 2 PERCENT STRAIN IN THE CROSS DIRECTION.
C. INTEGRATED APPROACH SOIL SHALL INCLUDE A CLASS 2 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11.

BORING LOGS 1 OF 3

TEST BORING LOG

GZA GeoEnvironmental, Inc. Engineers and Scientists

Peabody Bikeway - Phase II
Peabody, Massachusetts

BORING NO.: B-7
SHEET: 1 of 1
PROJECT NO: 01.0174019.00
REVIEWED BY: MPS

Drilling Co.: New England Boring Contractors
Foreman: Matt Soucy
Logged By: Doug Maguire
Type of Rig: ATV
Rig Model: Mobile B-53
Drilling Method: Drive & Wash
Boring Location: N: 3019395.2599, E: 808062.9728
Ground Surface Elev. (ft.): 38.5
Final Boring Depth (ft.): 36
Date Start - Finish: 1/4/2019 - 1/4/2019
H. Datum: NAD83
V. Datum: NAVD88

Auger/Casing Type: HW
I.D/O.D.(in): 4.0/4.5
Hammer Weight (lb.): 300
Hammer Fall (in.): 24
Other: Safety Hammer

Sampler Type: Split Spoon
I.D./O.D. (in.): 1.375/2
Sampler Hmr Wt (lb): 140
Sampler Hmr Fall (in): 30
Other: Auto Hammer

Groundwater Depth (ft.)

	2:30 2:45 2:30 2:45 3:00 3:00 2:45	C-2	31-36	60	60			C-2: Hard, slightly weathered, medium to coarse grained, gray with pink, GRANITE, rough to smooth, planar to irregular, very close, moderately dipping to subvertical joints/fractures. RQD=35%				BEDROCK	
								Bottom of boring at 36 feet.	9		36		2.5'

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 5.5 feet south of staked location due to restricted access and overhead wires.
3. Continuous sampling performed from sampling depths 0 to 10 feet below ground surface (bgs). Driller advanced 4-inch casing down as sampling advanced. The casing was advanced to 14 feet bgs following sampling of S-5.
4. Standard sampling performed from sample depths 14 to 24.2 feet bgs.
5. Driller advanced 4-inch casing from 14 to 24 feet bgs.
6. Clayey Silt observed in drill cuttings from 17.5 to 19 feet bgs.
7. Weathered Bedrock fragments and increased drill effort observed at 23.8 feet bgs.
8. Cored bedrock with a downward pressure of 500 psi at 1,350 rpm in 3rd gear using an NX core barrel.
9. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

								Bottom of boring at 41 feet.	7		41		-3.2'

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 3.5 feet south due to restricted access.
3. Advanced boring using 4-inch casing from sample depths 0 to 29 feet below ground surface (bgs).
4. Consistent coarse sand-sized rock fragments observed in drill cuttings from sample depths 30 to 31 feet bgs.
5. Drill rig did not have a downward pressure or RPM gauge. Cored bedrock in 3rd gear using an NX core barrel.
6. Core barrel jammed with no loss of water at sample depths 35.1 and 38.3 feet bgs.
7. Borehole backfilled to approximate ground surface with drill cuttings.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

Boring No.: B-8

174019 PROPOSED PEABODY BIKEWAY.GPJ; STRATUM ONLY; 3/18/2019

B–8
SCALE: 1/8" = 1'–0"

BORING NOTES:

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B–#
2. BORINGS ARE TAKEN FOR PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS REQUIRED TO DRIVE A 1 3/8" I.D. SPLIT SPOON SAMPLER 6" USING A 140 POUND WEIGHT FALLING 30".
5. BORING SAMPLES ARE STORED AT A STORAGE FACILITY LOCATED ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.
6. B–7 AND B–8 WERE MADE IN JANUARY 2019 AND B–9 THROUGH B–12 WERE MADE IN FEBRUARY 2022.
7. BORINGS WERE MADE BY NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH, 03038.
8. THE NORTH AMERICAN VERTICAL DATUM (NAVD) OF 1988 IS USED THROUGHOUT.

1. THE TABLE BELOW SUMMARIZES THE FACTORED AXIAL DESIGN LOADS PER PILE FOR AASHTO LRFD BRIDGE SPECIFICATIONS STRENGTH I LOAD COMBINATIONS. THE NOMINAL GEOTECHNICAL RESISTANCE, AND THE FACTORED GEOTECHNICAL RESISTANCE PER PILE:

	FACTORED DESIGN LOADS	NOMINAL GEOTECHNICAL RESISTANCE	FACTORED GEOTECHNICAL RESISTANCE**
HELICAL PILE (COMPRESSION)	10.00 KIPS	17.00 KIPS	11.90 KIPS
HELICAL PILE (TENSION)	5.00 KIPS	14.80 KIPS	10.35 KIPS

**FACTORED GEOTECHNICAL RESISTANCE IS THE PRODUCT OF THE NOMINAL GEOTECHNICAL RESISTANCE AND A RESISTANCE FACTOR OF 0.70.

2. THE TOP HELIX OF ALL PROPOSED HELICAL PILES SHALL BE TORQUED TO A MINIMUM EMBEDMENT OF 9 FEET BELOW EXISTING GRADE, EXCEPT AS NOTED ON SHEET 8 ADJACENT TO THE SEWER LINE.
3. THREE PRE–PRODUCTION VERIFICATION LOAD TESTS FOR THREE SACRIFICIAL PILES ARE REQUIRED TO CONFIRM THE HELICAL PILE NOMINAL RESISTANCE. LOAD TESTING SHALL BE PERFORMED IN ACCORDANCE WITH THE SPECIAL PROVISION REQUIREMENTS, THE GEOTECHNICAL REPORT RECOMMENDATIONS, AND THE SACRIFICIAL PILE LOCATIONS SHALL BE AGREED UPON BY THE CONTRACTOR AND ENGINEER. A RESISTANCE FACTOR OF 0.70 MAY BE UTILIZED UPON SUCCESSFUL COMPLETION OF STATIC LOAD TESTING.
4. THE CONTRACTOR SHALL SUBMIT A PILE SCHEDULE, PILE INSTALLATION, AND TESTING PLAN FOR REVIEW AND APPROVAL OF THE ENGINEER. THE CONTRACTOR SHALL SUBMIT SHOP DRAWINGS AND DESIGN CALCULATIONS FOR THE PROPOSED HELICAL PILES SIGNED AND STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE COMMONWEALTH OF MASSACHUSETTS.
5. ALTERNATIVE ATTACHMENT AND ASSEMBLIES CAN BE SUBMITTED THROUGH THE SHOP DRAWING PROCESS FOR REVIEW AND APPROVAL.
6. LATERAL PILES ALTERNATE DIRECTION EVERY BENT.
7. LATERAL AND LONGITUDINAL PILE ANGLE CAN RANGE BETWEEN 25° AND 35°.
8. LONGITUDINAL BATTERED PILES SHALL BE AT EVERY THIRD PIER BENT TO RESIST LONGITUDINAL LOADING.
9. HELICAL PILES AND CONNECTIONS SHALL BE HOT–DIPPED GALVANIZED.
10. REMOVAL OF SURFICIAL COBBLES/BOULDERS WILL BE REQUIRED PRIOR TO HELICAL PILE INSTALLATION. PRE–DRILLING MAY BE REQUIRED TO PENETRATE THE COBBLES AND BOULDERS.
11. HELICAL PILE MINIMUM EMBEDMENT SHALL BE 11'–6" TO THE TOP HELICE FOR ALL P#–3 LOCATIONS WITH AN OFFSET LESS THAN 3'–6" BETWEEN THE CENTER OF PILE AND THE EDGE OF THE SEWER LINE. MINIMUM EMBEDMENT FOR ALL REMAINING PILES SHALL BE 9'–0".
12. FOR ADDITIONAL HELICAL PILE REQUIREMENTS, SEE SPECIAL PROVISION ITEM NO. 943.20.

RE: 401 WATER QUALITY CERTIFICATION
BRP WW 10, Major Fill Project
BRP WW 08, Minor Dredge Project
Independence Greenway Extension
Peabody, MA

401 WQC Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge)
USACE Application No. NAE-2024-01390
MassDOT File Number: 609211

Dear Mr. Callahan:

The Massachusetts Department of Environmental Protection (MassDEP) has reviewed your application for a Water Quality Certification (WQC), as referenced above; this application was deemed complete on June 11, 2024. In accordance with the provisions of MGL Ch. 21, §§26-53 and Section 401 of the Federal Clean Water Act as amended (33 U.S.C. §1251 et seq.), it has been determined there is reasonable assurance the proposed project will be conducted in a manner which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law.

The City of Peabody, in coordination with the Massachusetts Department of Transportation (MassDOT), proposes to extend the existing Independence Greenway rail trail from Essex Center Drive to Endicott Street along an existing former railroad right-of-way owned and maintained by the City of Peabody (the Project). The Project includes construction of a paved shared-use pathway (SUP) along the existing abandoned railroad right-of-way; construction of a light duty timber boardwalk structure supported on helical piles over Proctor Brook and associated wetlands; replacement of culverts that convey Proctor Brook and its tributaries beneath the railroad bed; stormwater infrastructure improvements; construction of a compensatory flood storage area; and modifications required for connections to the existing paths at either end including sidewalk reconstruction and drainage improvements. The Project purpose is to provide a continuation and connection of the existing rail trail facilities to be utilized by pedestrians and bicyclists.

This information is available in alternate format. Please contact Melixza Esenyie at 617-626-1282.

MassDEP Website: www.mass.gov/dep

Printed on Recycled Paper

Existing Conditions

The proposed SUP alignment generally extends in an east/west orientation along an existing abandoned and elevated railroad bed in a forested area. At the west end, a portion of the SUP will also extend along Essex Center Drive and Northshore Road to connect the alignment from the existing terminus of the Independence Greenway to the railroad bed. Essex Center Drive is classified as a local roadway with two 15-foot-wide lanes, a typical pavement width of 30 feet and five-foot-wide paved and concrete sidewalks on each side. Where Essex Center Drive extends under Route 128, it is 23 feet wide with 11-foot-wide and 12-foot-wide lanes, a 9.5-foot-wide raised median, and 3.5-foot-wide paved sidewalks on each side. Northshore Road is classified as a local roadway with two 11-foot-wide lanes, a pavement width of 23 feet, and a 4.5-foot-wide paved sidewalk on the west side.

Proctor Brook, a perennial stream, meanders west to east generally parallel to the railroad bed, crossing it in three locations. The bankfull width of Proctor Brook varies between 19 and 35 feet within the Project area. Two crossings at Stations 329+85 and 346+20 consist of culverts that are obstructed and/or washed out and are no longer functioning. Twin 42-inch culverts are present at Station 329+85 and the crossing at Station 346+20 was formerly a four-foot-high by approximately six-foot-wide concrete culvert that washed out. The third Proctor Brook crossing at Station 351+50 consists of a former railroad bridge that also washed out and is largely no longer present.

Two existing intermittent streams also flow north under the railroad bed at Stations 340+10 and 358+51 via a 30-inch corrugated metal pipe (CMP) and 15-inch ductile iron pipe (DIP), respectively. A 24-inch CMP at Station 342+20 provides a hydrologic connection between Bordering Vegetated Wetlands (BVWs) on either side of the railroad bed. Extensive BVWs are present along Proctor Brook and the railroad bed throughout the corridor.

On Essex Center Drive, Northshore Road, and Endicott Street, stormwater flows to a combination of country drainage and closed drainage systems. The Project will occur within a Federal Emergency Management Agency 1% annual chance of flooding zone (Zone AE) and Regulatory Floodway with a Base Flood Elevation ranging from 47.1 feet at the west end to 39.6 feet at the east end.

Project Description

The Project is approximately 1.3 miles in length. The SUP path will be 10 feet wide carrying two five-foot-wide travel lanes, one in each direction. Two-foot-wide stone dust shoulders will be present on either side along the railroad bed. Portions of Essex Center Drive will be fully reconstructed and/or repaved but will not be widened. Intersection improvements will also occur along Essex Center Drive, Northshore Road, and Endicott Street, and two compensatory flood storage areas will also be constructed along the SUP.

A 56-span light-duty timber boardwalk structure supported on helical piles will replace the previous railroad bridge that washed away. The boardwalk will be approximately 438 feet long and a total of 13 feet wide. It will carry two five-foot-wide travel lanes, one in each direction, with one-foot-wide shoulders on each side. Riprap scour protection will be placed along the abutment at the west end.

A four-foot-high by eight-foot-wide precast concrete box culvert will be installed at each of the Proctor Brook crossings at Stations 329+85 and 346+20. The streams within each box culvert will be restored

with 12 inches of natural streambed substrate and will match the existing invert elevations. Riprap scour protection will be installed within the channels as depicted on the plans approved herein.

The CMP at Station 340+10 will be replaced with a 36-inch DIP and the CMP at Station 342+20 will be replaced with a 24-inch DIP. Both culverts will be embedded 12 inches with a layer of natural streambed substrate and will match the existing invert elevations. The RCP at Station 358+51 will be replaced with a 16-inch DIP but due to its small diameter will not have natural stream substrate.

BVW and LUW Impacts

In total, 17,998 sf of fill impacts to BVWs and LUW are required to construct the Project; 2,344 sf of permanent and 4,681 sf of temporary BVW impacts, and 8,661 sf of permanent and 2,312 sf of temporary LUW impacts. The Project requires 1,491 cubic yards of dredging. Impacts are required to construct the boardwalk, replace the culverts, and install associated scour protection.

Alternatives Analysis

Several alternative alignments and cross sections were evaluated for the SUP. Constructing the SUP along Warren Street Extension rather than constructing the boardwalk over Proctor Brook and associated BVWs was considered but rejected due to safety concerns. The SUP and shoulders are the minimum width required and the side slopes have been narrowed to the extent practicable to avoid and minimize impacts to adjacent BVWs and LUW. Riprap scour protection in BVW and LUW at the culvert replacements is the minimum amount required based on Federal Highway Administration standards. A concrete deck was considered for the boardwalk but would require a more substantial substructure in BVWs and LUW, including the potential need for a pier and foundation. It would also require the use of larger equipment and potentially more temporary impacts. A timber boardwalk allows for the use of helical piles to support the structure, which results in less impacts to BVWs and LUW.

BVW and LUW Replication and Restoration

Permanent BVW impacts will be mitigated through construction of a 2,500 sf BVW replication area under the supervision of a qualified Wetland Scientist. The replication area will be located at the end of Gilmore Terrace along BVWs associated with Proctor Brook. Wetland soil will be installed to a depth of 18 inches to match the existing adjacent BVW elevation, the area will be planted with native trees and shrubs, and a native wetland seed mix will be applied.

Temporary BVW impacts will be restored in place under the supervision of a qualified Wetland Scientist. Where riprap scour protection will be placed in BVWs at the culvert replacements, a layer of compost will be placed over the riprap, native live stakes will be installed, and a native wetland seed mix will be applied. Twelve inches of natural streambed substrate will be placed over the riprap scour protection in LUW at the culvert replacements.

Stormwater Management Standards

The Project will increase impervious surface by 1.1 acres (46,907 sf). The roadway reconstruction portion of the Project qualifies as a redevelopment as defined at 314 CMR 9.02. Per Volume 1, Chapter

1 of the Massachusetts Stormwater Management Standards, the Standards only apply to the SUP portion of the Project to the maximum extent practicable.

Through the installation of deep sump catch basins, an infiltration trench, and a rock-lined drainage swale, the Project will meet Stormwater Management Standards 2, 3, and the structural stormwater best management practice requirements of Standard 4 to the maximum extent practicable. Two-foot-wide stone dust shoulders over eight inches of subbase gravel borrow will also be installed along each side of the SUP to capture and treat stormwater, which will improve existing conditions. A complete evaluation concluded additional Stormwater Control Measures are not practicable within the Project area.

Stream Crossing Standards

The Project will meet the Massachusetts Stream Crossing Standards to the maximum extent practicable in accordance with 314 CMR 9.06(2)(b)4. The boardwalk will meet all Stream Crossing Standards and all stream crossing culvert sizes will be increased from existing conditions. Except for the boardwalk, spans are not practicable for the other stream crossings and would require footings resulting in more impacts to adjacent BVWs and LUW. Both Proctor Brook culverts will exceed the openness ratio Standard. Twelve inches of natural streambed material will be placed within three of the replacement culverts which is the maximum practicable given the constraints. Improved water depths and velocities more consistent with natural conditions are anticipated due to the crossing improvements.

Sediment Chemistry

Sediment sample analytical results were compared to the Reportable Concentration (RC) S-1 criteria of the Massachusetts Contingency Plan (MCP). Results of the sediment samples analyzed indicated the presence of lead in Sample SS-3 in concentrations above the RC S-1 criteria. As conditioned herein, the City of Peabody is required to determine if dredged sediments are suitable for reuse or required to be handled and disposed of at an offsite facility in accordance with all applicable regulations. If required, all materials will be limited to specific pre-approved disposal facilities. MassDEP is to be notified, in writing, of the name and location of the licensed facility accepting the dredged material for disposal or reuse as daily cover material.

Invasive Species

Invasive species will be managed in accordance with an Invasive Plant Management Strategy (IPMS) to be approved by MassDEP.

Based on a review of information provided by the applicant, MassDEP finds that this project complies with the standards described under 314 CMR 9.06 and 9.07. Public notice was provided in the Peabody Weekly News on May 23, 2024, and in the MEPA Environmental Monitor on June 7, 2024. No comment letters were received during the public comment period.

Therefore, based on information currently in the record, MassDEP grants a WQC for this project subject to the following conditions to maintain water quality, to minimize impact on waters and wetlands, and to ensure compliance with appropriate state law. The Department further certifies in accordance with 314 CMR 9.00 that there is reasonable assurance the project or activity will be conducted in a manner

which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law. Finally, the Department has determined that upon satisfying the conditions and mitigation requirements of this approval, the project provides a level of water quality necessary to protect existing uses and accordingly finds that the project to be implemented satisfies the Surface Water Quality Standards at 314 CMR 4.00.

Pursuant to 314 CMR 9.09(1)(d); 314 CMR 9.06(6)(a); 310 CMR 9.06(2); 314 CMR 9.07; 314 CMR 9.07(1); 314 CMR 9.09(7)(5)(c); 314 CMR 9.11; and 314 CMR 9.09(1)(e), the following Special Conditions are necessary to ensure that construction practices and stormwater controls are implemented in such a manner as to prevent degradation to wetlands and waters; ensure that practicable steps have been taken which will avoid and minimize impacts to wetlands and waters; minimize turbidity and sediment caused by construction activities; ensure that water quality is not degraded, and that biology of the waters are not negatively impacted by potential discharges; and/or maintain a record of the dredged material for reference and to ensure accountability in its transportation.

Those Special Conditions that require direct submittals to MassDEP for either review, or review and approval, are denoted by the following notation (Submittal) at the end of the condition and are summarized in Attachment A. In addition, those conditions with the (Submittal) designation shall be included in the Special Provisions and, as applicable, reviewed at the Pre-Construction Meeting.

1. All work shall be performed in accordance with the following documents and plans:

    - Application for Water Quality Certification. Prepared by Green International Affiliates, Inc. on behalf of the City of Peabody, with cover letter and attachments. Dated May 15, 2024. 401 WQC Filing Number: 24-WW26-0034-APP.
    - Plans entitled: “Massachusetts Department of Transportation Highway Division Plan and Profile of Independence Greenway Extension Bridge P-03-020 (CAK) in the City of Peabody, Essex County. PS&E Submittal.” Last revised April 19, 2024.
    - MassDEP Administrative Completeness and Technical Deficiency Review. 401 WQC Transmittal No: 24-WW26-0034-APP (Fill and Dredge). Dated June 5, 2024.
    - Response to MassDEP Administrative Completeness and Technical Deficiency Review letter for 401 WQC Transmittal No: 24-WW26-0034-APP, including attachments. Prepared by Green International Affiliates, Inc. on behalf of the City of Peabody. Dated June 11, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Expanded Environmental Notification Form and Proposed Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated January 29, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Draft Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated May 24, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Final Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated August 5, 2024.

- Order of Conditions issued by the Peabody Conservation Commission. MassDEP File #: 055-0939. Issued July 3, 2024.
- MassDEP Notice of Appeal. MassDEP File #055-0939. Issued July 15, 2024.

Pre-Construction

2. A qualified **Wetland Scientist** (WS) with a minimum of five years of relevant professional experience with wetland and stream replacement and restoration projects shall be employed to oversee all BVW and LUW replacement and restoration activities, including but not limited to grading, placement of substrate, seeding, vegetation plantings, and placement of wildlife habitat features. The name, contact information, and qualifications of the WS shall be provided to MassDEP for approval prior to the Pre-Construction Meeting required in Condition 4. The name and contact information of the approved WS shall be provided to the Peabody Conservation Commission prior to the start of work. **(Submittal)**

3. Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name and contact information of the Resident Engineer (RE) responsible for ensuring that all work complies with the conditions of this WQC. **(Submittal)**

4. A minimum of 21 days prior to the start of work, MassDOT shall contact MassDEP to schedule an onsite Pre-Construction Meeting to review the approved plans and terms and conditions of this WQC. The RE, the Construction Contractor (Contractor), the WS, and a representative from the MassDOT Environmental Section and/or the District Environmental Engineer shall attend the Pre-Construction Meeting.

5. MassDEP shall be copied on applicable submittals to the U.S. Army Corps of Engineers (USACE). These include but are not limited to: Self-Verification Notification Form (SVNF); Pre-Construction Notification (PCN); Work-Start Notification Form; Mitigation Work-Start Notification Form; and Compliance Certification Form. The Work-Start Notification Form shall be submitted at least 14 days before the anticipated start of work and the Compliance Certification Form shall be submitted within 30 days following the completion of the authorized work. **(Submittal)**

6. A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan (CP/PP) shall be developed and implemented as required by 314 CMR 9.06(6)(a)8. A minimum of 14 days prior to the start of work, the City of Peabody or its Contractor shall submit the CP/PP for review and approval. If the U.S. Environmental Protection Agency (EPA) Construction General Permit (CGP) applies, the Stormwater Pollution Prevention Plan (SWPPP) may serve as the CP/PP, providing it includes the measures required to be in the CP/PP per these Special Conditions, in addition to the measures specifically required by the CGP. Any subsequent changes to the Final CP/PP (defined herein as including the construction period SWPPP if applicable) must be approved by MassDEP. **(Submittal)**

7. Training regarding erosion and sedimentation controls is required. The RE, CP/PP Inspector, and any other relevant personnel responsible for erosion and sedimentation controls shall complete the EPA CGP Inspector Training, or other training that meets the CGP requirements, as well as

complete a comprehensive review of the Final CP/PP. Verification of proof of completion of the training shall be submitted to MassDEP prior to the start of work. **(Submittal)**

8. The CP/PP shall identify, but shall not be limited to, staging and laydown areas in relation to BVWs and LUW, proposed dewatering locations, proposed stockpile locations and their proximity to catch basins or other drainage conveyances that discharge to wetland resource areas, and the location of construction-period erosion and sedimentation controls.

9. A minimum of 14 days prior to the start of work, the City of Peabody or its Contractor shall submit a Water Management Plan for review and approval. The Plan shall include proposed methods to manage construction-period water including but not limited to dewatering methods and locations, specifications for any water bypass systems, and dredge and debris material dewatering prior to shipment off site, as applicable. The plan shall meet requirements of the CP/PP and be specific to the Project. Dewatering and water bypasses shall be conducted under the supervision of the RE and comply with the applicable conditions identified herein. **(Submittal)**

10. Prior to the start of work, approved erosion and sedimentation control measures shall be installed per the approved CP/PP and as applicable, the manufacturer specifications. Erosion and sedimentation control measures may consist of, but are not limited to, silt fence, staked straw bales, silt/turbidity curtains, compost filter tubes, etc.

11. Prior to the Pre-Construction Meeting, the boundaries of BVWs and LUW shall be re-flagged where they are within 50 feet of the limits of work. In the event BVWs and LUW boundaries overlap, the outermost boundary (i.e., closest to the proposed work) shall be flagged. All boundary markers, once in place, shall remain in place throughout construction until all disturbed surfaces have been permanently stabilized. Boundary markers shall be fully evaluated annually and refreshed where needed. Implementation of and compliance with this requirement shall be documented by the WS. All construction personnel shall be made aware of these markers.

12. A Flood Contingency Plan shall be submitted to MassDEP for review and approval that addresses areas that fall within the 1% annual chance of flooding zone within project limits. The Plan shall address the potential need for temporary relocation of construction and auxiliary equipment during flood events to designated upland locations above the Base Flood Elevation. The Plan shall be approved by MassDEP prior to any work within the 1% annual chance of flooding zone, including mobilization or storage of equipment and materials. **(Submittal)**

13. The applicant shall develop an Invasive Plant Management Strategy (IPMS) to be submitted to MassDEP for review and approval prior to the Pre-Construction Meeting. The IPMS shall be implemented as approved. **(Submittal)**

14. If needed, use of herbicides to control invasive species shall be implemented in accordance with the approved IPMS and with the following requirements:

    a. Herbicides can only be applied by a Licensed Applicator;

b. Applicant must provide MassDEP Material Safety Data Sheets (MSDS) of the product being used and must also keep MSDS sheets on site;

c. Product registration in MA with Massachusetts Pesticide Product Registration Number must be confirmed with Massachusetts Department of Agricultural Resources Pesticide Division;

d. EPA Registration Number for the product must be identified;

e. Product label restricted use provisions must be followed; and

f. Applicant must contact MassDEP Division of Watershed Planning to determine if a BRP WM 04 herbicide permit is required.

15. Final Construction Plans (the plans provided to the Contractor) shall be submitted for review at least 30 days prior to the Pre-Construction Meeting. Sufficient supporting information, explanation, and documentation shall be provided to MassDEP and the Peabody Conservation Commission for any changes, and MassDEP may at its discretion require additional supporting documentation as a condition of review. Once MassDEP provides written approval, the updated set of plans shall become the "Final Plan of Record." The Plan shall be prepared and signed by a Professional Engineer in the Commonwealth of Massachusetts and shall incorporate all revisions and additions to the original plans that have been approved as discussed herein. **(Submittal)**

Construction Period

16. No more than **2,344 sf** of permanent and **4,681 sf** of temporary impacts to BVWs shall occur. No more than **8,661 sf** of permanent and **2,312 sf** of temporary impacts to LUW shall occur. No more than **1,491 cy** of dredging in LUW shall occur. All work shall avoid unapproved impacts to BVW and LUW.

17. CP/PP inspections shall occur at least once every seven calendar days and within 24 hours of a storm event that produces 0.5 inches or more of rain within a 24-hour period, or at a more stringent frequency if the CP/PP requires.

18. Copies of CP/PP Inspection and Maintenance Log Forms shall be submitted to MassDEP within 14 days upon request.

19. Inspection and maintenance of erosion and sediment controls in active work areas shall be the responsibility of both the Contractor and RE. The project team shall include an individual with at least three years of experience with construction period erosion and sedimentation controls. The RE shall be ultimately responsible for inspection and maintenance of site controls. The RE and/or Contractor shall immediately notify MassDEP and the Peabody Conservation Commission if any unauthorized discharges to BVWs or LUW occur.

20. Disturbed areas shall be stabilized immediately after activities have permanently ceased or will be temporarily inactive for 14 or more calendar days. The installation of stabilization measures

shall be implemented as soon as practicable, but no later than 14 calendar days after stabilization has been initiated.

21. Work within LUW shall be conducted in low or no-flow conditions to the extent practicable. Notice shall be provided to MassDEP and the Peabody Conservation Commission within 24 hours prior to the commencement of dewatering. Dewatering methods and location(s) shall be approved by the RE prior to use, and shall be documented in the CP/PP. There shall be no discharge of untreated dewatered stormwater or groundwater to BVWs or LUW. Any discharges shall be visibly free of sediment.

22. Additional erosion and sedimentation control materials shall be stored on-site at all times for emergency and routine replacement. Materials shall be kept covered, dry, and accessible at all times. The RE shall be responsible for anticipating the need for and installation of additional erosion and sedimentation controls and shall have the authority to require additional erosion control measures to protect wetland resource areas beyond what is shown on the plans if field conditions or professional judgment dictate that additional protection is necessary.

23. The RE shall monitor the National Weather Service forecast for updates, and upon issuance of a flood watch for the 1% annual chance of flooding zone, shall implement the flood contingency plan referenced in Condition 12.

24. Any storm drains with potential to receive discharge from stockpiled materials or construction operations shall be managed to inhibit the inflow of sediment while not increasing the likelihood of roadway flooding during periods of precipitation. Stockpiles shall be located no less than 50 feet from BVWs, LUW, catch basins, or other drainage conveyances that discharge to BVWs or LUW. The CP/PP shall specify measures to implement this. Filter fabric stretched under storm drain inlet grates are not acceptable for this purpose.

25. The contractor shall have designated washout areas for concrete equipment that will be comprised of impermeable material and sized to contain project concrete wastes and wash water. Concrete wash out areas shall be located no less than 50 feet from BVWs, LUW, and catch basins or other drainage conveyances that discharge directly or indirectly to BVWs, or LUW.

26. Refueling, washing, and cleaning of vehicles and other construction equipment shall not take place within 50 feet of BVWs or LUW and any wash water shall be contained such that it does not drain toward BVWs or LUW. MassDEP shall explicitly approve in writing any deviation to this condition for oversized stationary vehicles.

27. The contractor shall have spill containment kits on site. In the event of a release of fuels and/or oils, the local fire department and MassDEP shall be notified.

28. Construction vehicles or other vehicles or heavy equipment are prohibited from traversing over the proposed infiltration Stormwater Control Measures (SCMs) to avoid compaction of soils during construction. These areas shall be demarcated by silt fence with signage, or high visibility fencing. If access through the location of an infiltration SCM is unavoidable, the City of Peabody

or its Contractor shall request written approval from MassDEP to use low ground pressure equipment to complete the work. Following completion of the work, subsoils shall be tilled to a minimum depth of 18 inches prior to placement of final surface dressing materials required by the approved plans. Tilling shall only be conducted when the subsoils are in a friable condition and dry enough so that a clump cannot be formed into a ball shape by hand. No vehicles or heavy equipment shall be permitted within the infiltration SCM following placement of the final materials without written approval from MassDEP. Proposed infiltration SCMs shall remain offline until final stabilization is achieved, unless written approval is obtained from MassDEP.

29. If sheet piles are required, they shall be fully removed from wetland resource areas upon stabilization of the area as required. No portion of sheet piles shall remain unless approved by MassDEP in writing prior to installation. A request to leave sheet piles shall include, but not be limited to, demonstration that full removal of the sheet piles is not feasible or practicable, and an alternatives analysis demonstrating alternative methods to isolate the work area(s) are not feasible or practicable.

Dredging

30. No later than 21 days prior to commencement of dredging activity, a Dredged Material Dewatering Plan shall be submitted to MassDEP for review and approval. At a minimum, the Plan shall include but not be limited to the type of containment, method of dewatering (i.e. mechanical or by gravity), method of collecting the dewatered effluent and method of disposal. **(Submittal)**

31. All sediment management activities authorized by this WQC shall be conducted under the supervision of a Licensed Site Professional (LSP). Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name and contact information of the LSP. **(Submittal)**

32. A Health & Safety Plan shall be required for handling of sediment which has been characterized as exceeding MCP RCS-1 criteria. A copy shall be provided to MassDEP within six weeks of the effective of this WQC or two weeks prior to the commencement of the dredging operation, whichever comes first.

33. Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001-Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. MassDEP will review the data to determine if the sediment will require offsite disposal. Under no circumstances shall the material be transported until MassDEP has reviewed the data and approved disposal methods. **(Submittal)**

34. Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined and securely covered with wind tear resistance

tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down. Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted daily and more frequently immediately before, during and after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner.

35. In the event of a precipitation or storm event, the site shall be secured beforehand in such a way as to protect resource areas and waters on site and downstream of the site, including covering of stockpiles of dredged material. Sediment stockpile areas shall be inspected immediately prior to, during and immediately after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner to prevent discharge from the stockpiled material. If stormwater runoff and erosion is observed from stockpiled dredged material, additional erosion and/or damage prevention controls measures shall be implemented.

36. Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation.

37. Measures shall be in place to prevent turbid waters, due to dredging, demolition, or debris removal activities, from extending past the limits of work into Proctor Brook and its tributaries. These measures can be items such as turbidity curtains and/or sheet piles.

38. MassDEP shall be notified one week prior to the start of dredging so that staff may inspect the work for compliance throughout the project.

39. If visual turbidity escapes the controls in place, work shall stop immediately and MassDEP shall be notified within 24 hours. Work shall not resume until the issue is corrected and MassDEP to the satisfaction of MassDEP.

40. All turbidity controls shall be inspected daily by the RE. If any damage is observed the controls in place will be replaced or repaired immediately.

41. MassDEP shall be notified in writing of the name and location of the upland licensed facilities accepting the dredged material for disposal or reuse for review and approval. If the licensed facility is located out of state, documentation shall be provided to MassDEP that the dredged material disposal/reuse has been approved and will be accepted by the receiving state. The dredged material shall not be transported to the facility without concurrence of MassDEP.

42. Transportation and disposal of the dredged material shall be overseen by the LSP of record. A Bill-of-Lading (BOL) or a Material Shipping Record (MSR) shall be used to track the dredged material to the proposed intermediate (stockpiling /dewatering) facility. A fully executed copy of the BOL or MSR shall be provided to MassDEP within 30 days of final shipment to the reused location or facility.

43. BMPs shall be implemented during transportation of the dredged material to the licensed receiving facility. At a minimum, when transported upon public roadways, all dredged material shall have no free liquid as determined by the Paint Filter Test or other suitably analogous methodology acceptable to MassDEP, and a tarpaulin or other means shall be used to cover the dredged material during transport.

Wetland Mitigation

44. A minimum of 2,500 sf of wetland replication shall be completed in coordination with an approved WS. The WS shall oversee all BVW replication and restoration, including final grading, seeding, and planting. The WS shall confirm that constructed BVW replication and restoration areas have adequate soils and hydrology to promote wetland plant species prior to seeding and installation of plantings and shall recommend measures to amend soils and promote wetland hydrology as needed.

45. Planting and seeding shall not take place between November 15th and April 15th, except as allowed by MassDEP in writing. The WS shall inspect trees and shrubs to ensure they are healthy prior to planting. Trees and shrubs deemed unhealthy in the professional judgment of the WS shall be replaced. Plantings and seed mixes shall consist of native and non-invasive species. Species may be substituted at the recommendation of the WS, and review and approval by MassDEP.

46. At least 75% of the surface area of the BVW replication and restoration areas shall be vegetated with indigenous wetland plant species within two growing seasons, or the period required by the Section 404 permit, whichever is longer. Additionally, evidence of hydrology, including hydric soil formation shall be submitted at the same time. Annual monitoring reports shall be submitted by the WS no later than January 15th each year. Monitoring reports shall include an assessment based on the approved success criteria, representative photos, and recommended corrective actions as needed. **(Submittal)**

47. MassDEP reserves the right to determine the success or failure of the BVW replication and restoration areas, and reserves the right to require additional plantings, regrading, or other measures deemed necessary to promote success.

Stream Mitigation

48. The WS shall oversee all LUW replication and restoration. Placement of streambed materials shall take place in no- or low-flow conditions. The Water Management Plan required in Condition 9 shall include measures to create no-flow conditions for this work such as a pump bypass system or other dewatering method, if needed. Placement of streambed materials during greater than low-flow conditions shall require a placement plan, with a narrative describing turbidity control measures, submitted to MassDEP for review and approval.

49. Water shall be slowly introduced back into the restored and dewatered LUW work areas as to not cause erosion and sedimentation. This work shall be overseen by the WS.

50. MassDEP reserves the right to determine the success or failure of the LUW replication and restoration areas and reserves the right to require additional measures deemed necessary to promote success.

Post-Construction

51. All temporary erosion controls shall be removed at the conclusion of work once the surrounding area has achieved final stabilization.

General Conditions

52. Any proposed alterations, minor plan changes, or amendment requests, as well as any required submittals shall be sent by email for review and approval to heidi.davis@mass.gov and ryan.hale@mass.gov. **(Submittal)**

53. This WQC remains in effect for the same duration as the Section 404 permit that requires it.

54. No Special Condition set forth herein shall be construed or operate to prohibit MassDEP from taking enforcement against the City of Peabody or its contractors for any failure to comply with the terms and requirements of this WQC.

55. No activity authorized by this WQC may begin prior to expiration of the 21-day appeal period, or until a final decision is issued by MassDEP in the event of an appeal.

Failure to comply with this Certification is grounds for enforcement, including civil and criminal penalties, under MGL Ch. 21 §42, MGL Ch. 21A §16, or other possible actions/penalties as authorized by the General Laws of the Commonwealth.

This Certification does not relieve the applicant of the obligation to comply with other appropriate state or federal statutes or regulations.

NOTICE OF APPEAL RIGHTS

a.) Appeal Rights and Time Limits

Certain persons shall have a right to request an adjudicatory hearing concerning certifications by MassDEP when an application is required: (a) the applicant or property owner; (b) any person aggrieved by the decision who has submitted written comments during the public comment period; (c) any ten (10) persons of the Commonwealth pursuant to M.G.L. c.30A where a group member has submitted written comments during the public comment period; or (d) any governmental body or private organization with a mandate to protect the environment which has submitted written comments during the public comment period. Any person aggrieved, any ten (10) persons of the Commonwealth, or a governmental body or private organization with a mandate to protect the environment may appeal without having submitted written comments during the public comment period only when the claim is based on new substantive issues arising from material changes to the scope or impact of the activity and not apparent at the time of public notice. To request an adjudicatory hearing pursuant to M.G.L. c.30A, § 10, a Notice of Claim must be made in writing, provided that the request is made by certified mail or

hand delivery to MassDEP, with the appropriate filing fee specified within 310 CMR 4.10 along with a DEP Fee Transmittal Form within twenty-one (21) days from the date of issuance of this Certificate, and addressed to:

Case Administrator
Department of Environmental Protection
100 Cambridge Street, 9th Floor
Boston, MA 02114

A copy of the request shall at the same time be sent by certified mail or hand delivery to the Department of Environmental Protection at:

Department of Environmental Protection
Commissioner's Office
100 Cambridge Street, Suite 900
Boston, MA 02114

b.) Contents of Hearing Request

A Notice of Claim for Adjudicatory Hearing shall comply with MassDEP's Rules for Adjudicatory Proceedings, 310 CMR 1.01(6), and shall contain the following information pursuant to 314 CMR 9.10(3):

3. the 401 Certification Transmittal Number;
4. the complete name of the applicant and address of the project;
5. the complete name, address, and fax and telephone numbers of the party filing the request, and, if represented by counsel or other representative, the name, fax and telephone numbers, and address of the attorney;
6. if claiming to be a party aggrieved, the specific facts that demonstrate that the party satisfies the definition of "aggrieved person" found at 314 CMR 9.02;
7. a clear and concise statement that an adjudicatory hearing is being requested;
8. a clear and concise statement of (1) the facts which are grounds for the proceedings, (2) the objections to this Certificate, including specifically the manner in which it is alleged to be inconsistent with the MassDEP's Water Quality Regulations, 314 CMR 9.00, and (3) the relief sought through the adjudicatory hearing, including specifically the changes desired in the final written Certification; and
9. a statement that a copy of the request has been sent by certified mail or hand delivery to the applicant, the owner (if different from the applicant), the conservation commission of the city or town where the activity will occur, the Department of Conservation and Recreation (when the certificate concerns projects in Areas of Critical Environmental Concern), the public or private water supplier where the project is located (when the certificate concerns projects in Outstanding Resource Waters), and any other entity with responsibility for the resource where the project is located.

c.) Filing Fee and Address

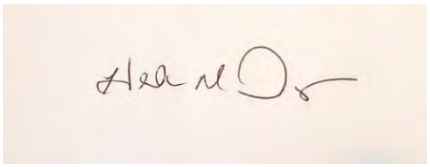
The hearing request along with a DEP Fee Transmittal Form and a valid check or money order payable to the Commonwealth of Massachusetts in the amount of one hundred dollars ($100) must be mailed to:

Commonwealth of Massachusetts
Department of Environmental Protection
Commonwealth Master Lockbox
PO Box 4062
Boston, MA 02211

The request will be dismissed if the filing fee is not paid, unless the appellant is exempt or granted a waiver. The filing fee is not required if the appellant is a city or town (or municipal agency), county, or district of the Commonwealth of Massachusetts, or a municipal housing authority. MassDEP may waive the adjudicatory hearing filing fee pursuant to 310 CMR 4.06(2) for a person who shows that paying the fee will create an undue financial hardship. A person seeking a waiver must file an affidavit setting forth the facts believed to support the claim of undue financial hardship together with the hearing request as provided above.

Should you have any questions relative to this permit, please contact myself or Ryan Hale at heidi.davis@mass.gov and ryan.hale@mass.gov.

Very truly yours,



Heidi M. Davis
Highway Unit Supervisor

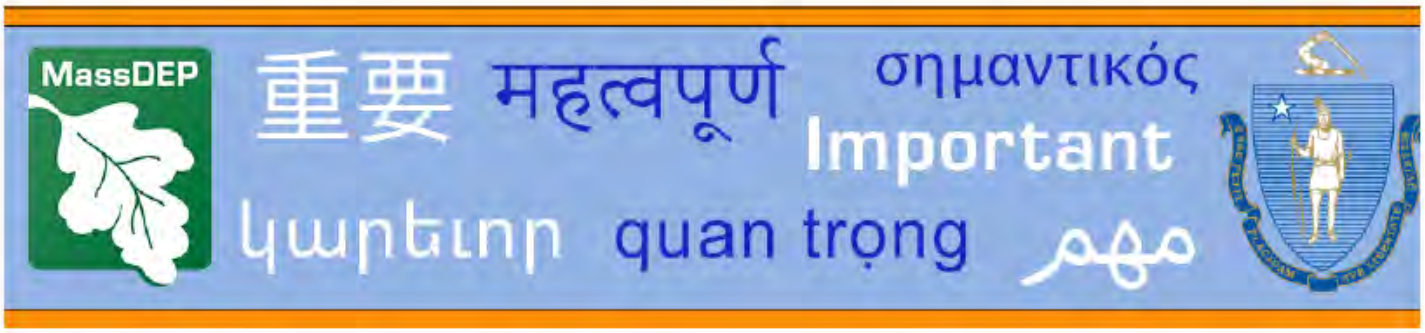
ATTACHMENT A
PRE-CONSTRUCTION SUBMITTAL CHECKLIST

Independence Greenway Extension
Peabody, MA

THIS CHECKLIST MUST BE COMPLETED PRIOR TO THE START OF WORK. NOTE THAT SOME CONDITIONS REQUIRE THAT INFORMATION BE SUBMITTED A SPECIFIC NUMBER OF DAYS PRIOR TO THE START OF WORK OR THE PRE-CONSTRUCTION MEETING.

Condition	Required Submittal	Due Date	Date Submitted	Date Approved
PRE-CONSTRUCTION SUBMITTAL REQUIREMENTS				
2	Name, contact information, and qualifications of the WS, including specific experience and years to meet requirement	Prior to Pre-Construction Meeting		
3	Name and contact information of the RE	Prior to Pre-Construction Meeting		
5	USACE Work-Start Notification Form	14 days prior to work start		
6	CP/PP	14 days prior to work start		
7	EM Verification of SWPPP Training	Prior to work start		
9	Water Management Plan	14 days prior to work start		
12	Flood Contingency Plan	Prior to any work within 1% annual chance of flooding zone		
13	Invasive Plant Management Strategy	Prior to Pre-Construction Meeting		
15	Final Construction Plans	30 days prior to Pre-Construction Meeting		



Communication for Non-English-Speaking Parties

General Permit No.: NAE-2022-02649 Final Effective Date: June 2, 2023
Applicant: General Public, Commonwealth of Massachusetts Expiration Date: June 1, 2028

Department of the Army
General Permits for the Commonwealth of Massachusetts

The New England District of the U.S. Army Corps of Engineers (USACE) hereby issues twenty-five (25) regional general permits (GPs) for activities subject to USACE jurisdiction in waters of the U.S., including wetlands, navigable waters within the Commonwealth of Massachusetts and adjacent ocean waters to the seaward limit of the outer continental shelf. The Massachusetts GPs (hereafter referred to as the MA GP or GP) are issued in accordance with USACE regulations at 33 CFR 320 – 332 [see 33 CFR 325.5(c)(1)]. These GPs establish criteria and contain permit conditions to ensure that the authorized activities have no more than minimal individual and cumulative adverse impacts to the environment.

This document contains the following sections:		Pages
SECTION I	Statutory Authorities & Regulated Activities	2
SECTION II	Review Categories & Application Procedures	3-7
SECTION III	Massachusetts General Permits	8-34
SECTION IV	General Conditions	35-51
SECTION V	Mitigation Standards	52-54
SECTION VI	Federal & State Agency Contact Information & Websites	55-56
SECTION VII	Definitions & Acronyms	57-66
APPENDIX A	Guidance for Section 106 NHPA Compliance in Massachusetts	67-71
APPENDIX B	Pre-Construction Notification	72-77
APPENDIX C	Self-Verification Notification	78-81
APPENDIX D	Pre-Construction Notification Application Checklist	82-88

In issuing these GPs, the Federal Government does not assume any liability for the following: (a) damages to the permitted project or uses thereof as a result of other permitted or unpermitted activities or from natural causes; (b) damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the U.S. in the public interest; (c) damages to persons, property or to other permitted or unpermitted activities or structures caused by the activity authorized by any of the GPs; (d) design or construction deficiencies associated with the permitted work; or (e) damage claims associated with any future modification, suspension or revocation of these permits.

Tammy R. Turley 02 June 2023

Tammy R. Turley Date
Chief, Regulatory Division

SECTION I. STATUTORY AUTHORITES & REGULATED ACTIVITIES

1. Work Requiring USACE Authorization

a. Section 10: Work and structures that are located in, over, under or that affect navigable waters of the United States (U.S.) (see 33 CFR 329). The USACE regulates these activities under section 10 of the Rivers and Harbors Act of 1899 (see 33 CFR 322).

b. Section 404: The discharge of dredged or fill material into waters of the U.S (see 33 CFR 328). The USACE regulates these activities under Section 404 of the Clean Water Act (CWA). The term "discharge of dredged or fill material" also includes certain discharges resulting from excavation. Applicants should contact USACE to determine if a particular excavation discharge occurring within waters of the U.S., is a regulated activity. See 33 CFR 323.4 of the CWA for exempted activities.

For additional information on the limits of USACE jurisdiction, please see: https://www.nae.usace.army.mil/Portals/74/docs/regulatory/JurisdictionalLimits/Jurisdictional_Limits_Brochure.pdf

2. Authority to Issue General Permits

a. In accordance with 33 CFR 322.2(f), 325.2(e)(2), and 325.5(c), USACE may issue regional general permits authorizing activities under Section 10 of the RHA.

b. In accordance with Section 404(e) of the CWA, 33 USC 1344(e), and 33 CFR 323.2(h), 325.2(e)(2), and 325.5(c), after notice and opportunity for public hearing, USACE may issue regional general permits for any category of activities involving discharges of dredged or fill material if the activities in such category are similar in nature, will cause only minimal adverse environmental effects when performed separately, and will only have minimal cumulative adverse effect on the environment.

3. Related Laws

33 CFR 320.3 includes a list of related laws including, but not limited to, Section 408 of the Rivers and Harbors Act of 1899, Section 401 of the Clean Water Act, Section 402 of the Clean Water Act, Section 307(c) of the Coastal Zone Management Act of 1972, Section 106 of the National Historic Preservation Act of 1966, Section 7 of the Endangered Species Act, the Fish and Wildlife Coordination Act of 1956, the Magnuson-Stevens Fishery Conservation and Management Act, the Fish and Wildlife Coordination Act, Section 302 of the Marine Protection, Research and Sanctuaries Act of 1972, Section 7(a) of the Wild and Scenic Rivers Act, the Golden Eagle Protection Act, and the Migratory Bird Treaty Act.

SECTION II. REVIEW CATEGORIES & APPLICATION PROCEDURES

To qualify under these GPs, the design, construction, and maintenance associated with each proposed activity must meet the terms and eligibility criteria listed in Section III, all applicable general conditions (GCs) in Section IV, and any specific mitigation requirements in Section V. Applicants should first review the GPs to see if a project is eligible for authorization under one or more of the GPs within this document. Any activity not specifically listed may still be eligible for authorization under these GPs; applicants are advised to contact USACE for specific eligibility determination.

Please note that these GPs allow for Self-Verification (SV) contingent upon meeting all criteria and with full adherence to all GCs. Projects that do not qualify for SV, may meet criteria for Pre-Constriction Notification (PCN). Tables are provided under each activity, which outline criteria for SV and PCN. Activities that do not meet criteria for SV or PCN may require review as an Individual Permit (IP). Activities may require a PCN or IP as noted in Sections III and/or IV of this GP. Notwithstanding compliance with the terms of these GPs, USACE retains discretionary authority to require either PCN review or IP review on a case-by-case basis for any project based on concerns for the environment or for any of the other public interest factors found in 33 CFR 320.4(a). These GPs also do not replace or change those activities identified as exempt from USACE regulation (33 CFR 323.4).

1. Pre-Application Assistance

Prospective applicants may request a pre-application meeting to address any questions they may have. USACE may also request a pre-application meeting or additional information to facilitate review of the request. Pre-application meetings and/or site visits help streamline the authorization process by alerting the prospective applicant to potentially time-consuming factors that may arise during the evaluation of their project (e.g., avoidance, minimization and compensatory mitigation requirements, historic properties, endangered species, essential fish habitat, impacts to federal projects, and/or dredging of contaminated sediments).

To schedule a pre-application meeting, present questions, or if you need further assistance, please contact USACE at:

Email: cenae-r-ma@usace.army.mil (strongly preferred) Phone: (978) 318-8338

Mail: U.S. Army Corps of Engineers
New England District
Regulatory Division, Massachusetts Section
696 Virginia Road
Concord, MA 01742

2. Submitting a Request

Please follow the procedures outlined in Sections II.2-5 when requesting an SV or applying for PCN authorization for activities covered by these GPs. The GPs are provided in Section III below. For SV-eligible projects, the Self-Verification Notification (SVN) must be submitted within 30 days of commencing work. Otherwise, a Pre-Construction Notification (PCN) must be submitted for work that is not SV-eligible. Please include appropriate drawings and attachments and submit your request using the mailbox identified in Section II.4 or II.5 below. USACE will promptly confirm receipt of your request and notify you in the event additional information is required. Guidance on

how to submit electronic correspondence is located on the NAE Regulatory website here: https://www.nae.usace.army.mil/Missions/Regulatory/Submitting-Electronic-Correspondence.

3. Local, State & Federal Approvals

Applicants are responsible for applying for and obtaining any required local, state, and federal permits or approvals. These must be obtained prior to the commencement of work in waters. Such authorizations may include a Water Quality Certification, a Coastal Zone Management Act consistency determination, and other approvals as noted below. Authorization under these GPs does not obviate the need for the permittee to obtain other Federal, State, or local permits, approvals, or authorizations required by law.

I. Water Quality Certification under Section 401 of the Federal Clean Water Act (33 USC 1341).
Applicants are responsible for determining the appropriate 401 Water quality Certification (WQC) requirements and submitting this information to the USACE at the time of their PCN application or when completing their SVN. Applicants that are unsure of whether their activity has been certified should contact MassDEP, or EPA Region 1 when the activity is located on tribal lands, for a determination. The 401 WQC requirement must be satisfied by acquiring one of the following WQCs from MassDEP (see GC 8):

General 401 WQC: The MassDEP issued a WQC on April 21, 2023 conditionally certifies all activities in GPs 1 – 24 eligible for SV and PCN so long as the activity is described in 314 CMR 9.03, and is not an activity described in 314 CMR 9.04, and so long as the activity meets all other requirements, terms and conditions of this WQC. The MassDEP WQC also conditionally certifies activities described in GP 25 so long as the activity meets all other conditions of the WQC. Emergency projects described in GP 25 must obtain an emergency certification or otherwise be authorized pursuant to 310 CMR 10.06, qualify under a Severe Weather Emergency Declaration pursuant to 310 CMR 10.06(8) issued by the MassDEP, or meet the requirements of 9.12(2) or (3) in order to be certified under the WQC

Applicants should refer to the following link to determine if their activity is eligible: *https://www.nae.usace.army.mil/Missions/Regulatory/ State-General-Permits/ Massachusetts-General-Permit/*. If eligible, you must comply with all applicable WQC conditions. Activities listed in 314 CMR 9.03 that are not exempt from the Wetland Protection Act must have a valid Final Order of Conditions (OOC) or Final Restoration Order of Conditions pursuant to 310 CMR 10.00 to be eligible under the General 401 WQC.

Individual 401 WQC: In the event the proposed activity is not covered by the general WQC, applicants shall contact MassDEP and apply for an individual 401 WQC if their activity does not qualify for a General 401 WQC as outlined above. MassDEP may issue, waive, or deny the individual 401 WQC on a case-by-case basis. All activities listed in 314 CMR 9.04 must obtain an individual 401 WQC from MassDEP to be eligible under these GPs. When an Individual 401 WQC is required for *PCN activities*, the applicant shall submit their Individual 401 WQC application concurrently to MassDEP and the USACE to comply with 40 CFR 121.

Activities Proposed on Tribal Lands: When an activity is proposed on Tribal lands, the applicant shall refer to the general 401 WQCs granted by the Environmental Protection Agency (EPA), Region 1 on May 15, 2023. These 401 WQCs are located on the USACE Regulatory website: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/.

II. Coastal Zone Management Act Federal Consistency Concurrence pursuant to Section 307 of the CZMA of 1972, as amended. Federal consistency concurrence is required for all activities located within the coastal zone, unless determined otherwise by the Massachusetts Office of Coastal Zone Management (MA CZM) (see GC 9). As applicable, this requirement must be satisfied by acquiring one of the following from the MA CZM:

General CZM Federal Consistency Concurrence (General Concurrence): MA CZM has granted General Concurrence for all SV and PCN activities for GPs 1-25 and this can be found at: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/. The applicant must obtain all applicable permits and approvals prior to the commencement of work in USACE jurisdiction (i.e., construction begins on site). For SVs, General Concurrence is automatically granted and no further action is required from the applicant. For PCNs, the USACE will coordinate with MA CZM to acquire General Concurrence as part of the PCN application review. During review of the PCN application, USACE may request additional information from the applicant to support CZM's evaluation of the activity.

Individual CZM Federal Consistency Concurrence (Individual Concurrence): In certain cases, MA CZM may elevate any GP activity 1-25 to require Individual Concurrence. The applicant must contact MA CZM and follow the procedures to obtain Individual Concurrence as determined appropriate by MA CZM.

The MA CZM program includes five regional offices that serve 78 coastal municipalities. The following map provides more information about these offices: https://www.mass.gov/service-details/czm-regions-coastal-communities-and-coastal-zone-boundary

III. Other Approvals: Approvals typically required in Massachusetts include, but are not limited to, a Chapter 91 Permit/License, Massachusetts Environmental Protection Act (MEPA) review, Wetlands Protection Act Order of Conditions, and/or Aquaculture Certification. *Applicants should also be aware that USACE may not be able to render a permit decision in the event the proposed activity is denied by another local, state and/or federal agency.*

4. Procedures for Self-Verification (SV) Eligible Projects

If the activity is eligible for an SV, the Self-Verification Notification (SVN) must be completed prior to the start of project construction and submitted to USACE within 30 days of commencing work. The purpose of the SVN is to provide applicants with a tool to assist them when determining if the activity as proposed is SV-eligible. The following GPs do not require submission of the SVN: GP 1 (SV #1), GP 3 (SV #2-3), GP 4 (SV #2), GP 11, GP 12 (note #2), GP 14 (see note), GP 15 (see note), and GP 24 (SV #3). **For the activities not listed above, the SVN must be completed prior to the start of work and be kept on site at all times during project construction.** The applicant shall not begin work for SV-eligible activities until they have completely verified the bulleted items below.

Digital submittals by email are **strongly encouraged** to facilitate the most efficient processing of the SVN submittal. Please communicate with USACE staff if you are unable to provide a digital copy. Addresses are cenae-r-ma-sv@usace.army.mil (email) or Regulatory Division, U.S. Army Corps of Engineers, New England District, 696 Virginia Road, Concord, MA 01742-2751 (mail).

Eligible SV Activities:

- Are subject to USACE jurisdiction (see GC 2); and
- Qualify for one or more of the GPs within this document (Section III); and
- Meet the GCs within this document (Section IV); and

- When required, are supported by a complete SVN (Appendix C); and
- Receive all other required local, State, and/or Federal approvals.

5. Procedures for Pre-Construction Notification (PCN) Eligible Projects

For activities that require a PCN, an application to and written authorization from USACE is required. *No work requiring a PCN may proceed until the applicant receives written authorization from USACE verifying that the activity is authorized.* The verification letter may include special conditions that the applicant must comply with. When possible, it is *highly* recommended that PCN application materials are submitted at least 90 days before the target start date to allow for USACE evaluation and any necessary agency consultations. PCN applications shall demonstrate in writing how the proposed activity complies with all GCs, as applicable to their activity.

Digital submittals by email are **strongly encouraged** to facilitate the most efficient processing of the PCN application. Please communicate with USACE staff if you are unable to provide a digital copy. Addresses are cenae-r-ma@usace.army.mil or Regulatory Division, U.S. Army Corps of Engineers, New England District, 696 Virginia Road, Concord, MA 01742-2751 (mail).

Eligible PCN Activities:

- Are subject to USACE jurisdiction (see GC 2); and
- Qualify for one or more of the GPs within this document (Section III); and
- Meet the GCs within this document (Section IV); and
- Comply with the Mitigation Standards within this document (Section V); and
- Are supported by a complete PCN document (Appendix B); and
- When required, are supported by the submittal of project information to the appropriate parties identified in Appendix A; and
- Receive all other required local, State, and/or Federal approvals.

6. Interagency Review Procedures

The USACE reserves the opportunity to coordinate PCN activities with Federal and State agencies to ensure that the proposed activity results in no more than a minimal impact to the aquatic environment. In some cases, USACE may require project modifications involving avoidance, minimization, and/or compensatory mitigation for unavoidable impacts to ensure the net effects of a project are minimal. The USACE determines, after review and coordination with the agencies and/or the applicant, if PCN applications:

a. Meet the terms and conditions of the GP as proposed;
b. Require additional information;
c. Require avoidance, minimization, compensatory mitigation, construction sequencing, project modification, or other special conditions to avoid or minimize adverse impacts to the aquatic environment;
d. Require individual permit review regardless of whether the terms and GCs of these GPs are met, based on concerns for the aquatic environment or any other factor of the public interest (see Section 9 below).

For activities requiring a PCN, the applicant must wait for written authorization from USACE before commencing activities in waters of the U.S. Beginning work for PCN required activities without a USACE written authorization is a violation of these GPs, and the terms and conditions of this document. The applicant may be subjected to an enforcement action by USACE and/or the Environmental Protection Agency (EPA).

7. Construction of Solid Fill Structures and Fills Along the Coastline or Baseline from Which the Territorial Sea is Measured.

Projects involving the construction of solid fill structures or discharge of fill that may extend beyond the coastline or the baseline from which the territorial sea is measured (i.e., mean low water) will require a PCN. The USACE will submit a description of the proposed work and a copy of the plans to the Solicitor, Department of the Interior, Washington, DC 20240, and request comments concerning the effects of the proposed work on the outer continental rights of the United States. These comments will be included in the administrative record of the application. After completion of permit review, the record will be forwarded to the Chief of Engineers. The decision on the application will be made by the Secretary of the Army after coordination with the Attorney General.

8. Emergency Activities

Per 33 CFR 325.2(e)(4), an emergency is limited to a situation that would result in an unacceptable hazard to life, a significant loss of property, or an immediate, unforeseen, and significant economic hardship if corrective action requiring a permit is not undertaken within a time period less than the normal time needed to process an application under standard procedures. Emergency work shall be limited to that which is necessary to stabilize and secure the situation. Additional work needed for final repairs shall not be completed until approval is obtained through the appropriate, non-emergency process. Emergency work is subject to the same terms and conditions of these GPs as non-emergency work, and similarly, must qualify for authorization under these GPs; otherwise, an IP is required. *See GP 25 Emergency Situations for additional information.*

9. Individual Permit

Projects that do not meet the terms and conditions of this GP may require review as an IP (33 CFR 325.5 (b)). Proposed work in this category will require a separate Federal application for an individual permit from USACE (33 CFR 325.1). In addition, USACE retains discretionary authority on a case-by-case basis to elevate GP-eligible activities to an IP based on concerns for the environment or any other factor of the public interest (33 CFR 320.4 (a)). Applicants are required to submit the appropriate application materials directly to USACE as early as possible to expedite the permit review process. General information and application forms can be obtained at our website or by contacting our office at cenae-r-ma@usace.army.mil or (978) 318-8338. Individual 401 WQC and/or CZMA Federal consistency concurrence from the appropriate MA agencies are required before USACE can issue an individual permit. Applying for an IP does not relieve the applicant from their obligation to obtain all required Federal, State and/or local approvals.

10. Compliance

Applicants shall ensure compliance with all applicable GPs in Section III, GCs in Section IV, and any special conditions included in USACE verification letters. Noncompliance with these GPs, GCs, and special conditions may subject the applicant to criminal, civil, or administrative penalties, and/or an ordered restoration, and/or the permit may be modified, suspended or revoked by USACE. The USACE will consider any activity requiring USACE authorization to be noncompliant if that activity does not comply with all GP terms and conditions at all times, including while the project is under construction and when work is completed.

SECTION III. MASSACHUSETTS GENERAL PERMITS

Applicants are encouraged to review Sections I & II prior to submitting an application to confirm that the activity as proposed complies with all terms and conditions of the 2023 MA GPs. Applicants are also encouraged to review the definitions in Section VII, Definitions & Acronyms, of this document. Several terms are frequently used throughout the GPs, and it is important for the reader to understand these terms. If seeking verification for an activity previously verified under the 2018 MA GPs, please contact the USACE to discuss permitting needs in advance of submitting an application.

General Permits

1. Aids to Navigation and Temporary Recreational Structures
2. Maintenance
3. Moorings
4. Structures in Navigable Waters of the U.S.
5. Boat Ramps and Marine Railways
6. Utility Lines, Oil or Natural Gas Pipelines, Outfall Or Intake Structures, and Appurtenant Features
7. Dredging, Disposal of Dredged Material, Beach Nourishment, Rock Removal and Rock Relocation
8. U.S. Coast Guard Approved Bridges
9. Bank and Shoreline Stabilization
10. Aquatic Habitat Restoration, Enhancement, and Establishment Activities
11. Fish and Wildlife Harvesting and Attraction Devices and Activities
12. Response Operations, Oil and Hazardous Substances
13. Cleanup of Hazardous and Toxic Waste
14. Scientific Measurement Devices
15. Survey Activities
16. Land and Water-Based Renewable Energy Generation Facilities and Hydropower Projects
17. Residential, Commercial and Institutional Developments, and Recreational Facilities
18. Aquaculture
19. Mining Activities
20. Living Shorelines
21. Agricultural Activities
22. Reshaping Existing Drainage Ditches, Construction of New Ditches, and Mosquito Management
23. Linear Transportation Projects and Wetland/Stream Crossings
24. Temporary Construction, Access, and Dewatering
25. Emergency Situations

GP 1. AIDS TO NAVIGATION AND TEMPORARY RECREATIONAL STRUCTURES (Authority: §10)

(a) The placement of aids to navigation and regulatory markers that are approved by and installed in accordance with the requirements of the U.S. Coast Guard (USCG). See 33 CFR, Part 66; and (b) Temporary buoys, markers, and similar structures placed for recreational use during specific events such as water skiing competitions and boat races or seasonal use. See GC 16.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. Aids to navigation and regulatory markers approved by and installed in accordance with the requirements of the USCG. 2. Temporary buoys, markers and similar structures that are: (a) placed for recreational use during specific events and removed within 30 days after event; or (b) placed during winter events on ice and removed before spring thaw. These structures must be authorized by the local harbormaster, not located within an FNP or its buffer zone, and not located in saltmarsh or tidal vegetated shallows.	1. Impacts in saltmarsh or tidal vegetated shallows. 2. Activities that are not SV eligible.
Note: An SVN submittal to USACE is not required for work authorized under SV #1 above.	

GP 2. MAINTENANCE (Authorities: §10 and §404)

Repair, rehabilitation, or replacement of any previously authorized[1], currently serviceable structure, or fill, or of any currently serviceable structure or fill authorized by 33 CFR 330.3 (activities occurring before certain dates), provided that the structure or fill is not to be put to uses differing from those uses specified or contemplated for it in the original permit or the most recently authorized modification. Minor deviations in the structure's configuration or filled area, including those due to changes in materials, construction technique requirements of other regulatory agencies, or current construction codes or safety standards that are necessary to make the repair, rehabilitation, or replacement are authorized. This GP also authorizes temporary structures, fills, and work, including the use of temporary mats, necessary to conduct the activities above. Maintenance dredging and beach nourishment are not eligible under GP 2 (see GP 7). Stream crossing modifications (including sliplining), replacements or extensions are not eligible under GP 2 (see GPs 6, 17, 23). *See GP 25 Emergency Situations for expedited review of emergency activities.*

Not authorized under GP 2 (IP required): (a) Permanent impacts in >1 acre in non-tidal waters and/or wetlands; or (b) Permanent impacts >1/2 acre in tidal waters; >1000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF in tidal vegetated shallows; or (c) Temporary impacts >1 acre in tidal waters; >5000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >1000 SF in vegetated shallows; (d) New stream channelization or stream relocation projects (e.g., those in response to storm or flood events).

Self-Verification Eligible

Maintenance activities that meet all of the following terms:

1. In non-tidal waters, the combined permanent and temporary impacts extending beyond the original footprint are ≤5,000 SF[2] and not located in vegetated shallows or riffle and pool complexes.

2. In tidal waters, the combined permanent and temporary impacts extending beyond the original footprint are ≤5,000 SF, ≤1,000 SF in mudflats and/or natural rocky habitat, and not located in saltmarsh and tidal vegetated shallows.

3. Minor deviations in the repair, rehabilitation, or replacement of previously authorized, currently serviceable structures or fills.

4. Bulkhead replacement in tidal and non-tidal waters via installation of new bulkhead within 18 inches of the existing bulkhead and associated backfill.

5. Drawdown of an impoundment for dam/levee repair provided it does not exceed 18 months and one growing season (April through September).

Pre-Construction Notification Required

1. Discharges associated with removal of accumulated sediments and debris in the vicinity of existing structures, including intake and outfall structures and associated canals.

2. The removal of sediment outside the immediate vicinity of existing structures (e.g., bridges, culverted road crossings, water intake structures, etc.) that is ≥200 linear feet. This activity is limited to the minimum necessary to restore the waterway in the vicinity of the structure to the approximate dimensions existing when the structure was built.

3. Dam and flood control or levee repair, rehabilitation, or replacement involves:
   a. A change in the flood elevation or permanent water surface elevation of the impoundment; or
   b. Drawdown of impoundment for construction exceeding one growing season (see SV eligible #5);
   c. Any modification that changes the character, scope, or size of the original fill design; or
   d. Does not meet SV eligible 1-7.

4. Installation of steel piles, including steel sheet piles, that cannot be done in the dry and where NOAA-ESA listed species are mapped as present.

[1] Some maintenance activities may not be subject to regulation under Section 404 of the CWA in accordance with 33 CFR 323.4(a)(2). Per 33 CFR 330.3, Vested dates are: a) Work performed and structures installed before December 18, 1968 (Section 10); and b) Fill placed before July 25, 1975 (Section 404).
[2] This excludes dam projects that may require a temporary drawdown with impacts >5,000 SF in non-tidal waters. Instead, the drawdown shall comply with SV #5 to be eligible under Self-Verification.

6. Any stream channel modification is limited to the minimum necessary for the repair, rehabilitation, or replacement of the structure or fill; such modifications, including the removal of material from the stream channel, must be immediately adjacent to the project or within the boundaries of the structure or fill. 7. Work to previously approved tide gates not affecting upstream tidal resource areas.	5. Activities located in the Connecticut River or Merrimack River, unless they are completed in the dry or when the tide is waterward of the work area. 6. Activities on USACE properties & USACE-controlled easements. 7. Activities that do not require an IP. Activities that do not require a PCN or an IP may be SV eligible.
Notes: 1. This authorizes the repair, rehabilitation, or replacement of any previously authorized structure or fill that does not qualify for the CWA §404(f) exemption for maintenance. See 33 CFR 323.4(a)(2). Prior USACE permits may have included authorization to maintain the activity, in which case authorization under this GP is not necessary. 2. See GC 22 for information on temporary construction mats.	

GP 3. MOORINGS (Authority: §10)

New moorings and mooring fields; the relocation of previously authorized moorings; expansions, boundary reconfigurations or modifications of previously authorized mooring fields; and maintenance and replacement of moorings.

Not authorized under GP 3 (IP required): (a) Moorings or mooring fields converted to or associated with a new boating facility[1]; or (b) Moorings in a USACE Federal Navigation Anchorage or USACE Federal Navigation Channel, except municipal-operated mooring fields.

Self-Verification Eligible	Pre-Construction Notification Required
1. New or relocated moorings that meet all the following terms: a. Authorized by a local harbormaster/ municipality under MGL Chapter 91 §10A; and b. No interference with navigation; and c. Single boat, single-point and non-commercial; and d. Not associated with a boating facility, and e. Neither placed within nor impact tidal vegetated shallows (e.g., eelgrass); and f. Not located within a USACE Federal navigation project (FNP) or the FNP buffer zone. 2. Existing, authorized moorings are converted from traditional moorings to low impact mooring technology (see note below) and/or helical anchors. 3. Maintenance and replacement of moorings authorized by the USACE.	1. New mooring fields; or expansions, boundary reconfigurations or modifications of existing, authorized mooring fields. 2. Moorings located such that they, and/or vessels docked or moored at them, are within the buffer zone of the horizontal limits of a Federal Anchorage. The buffer zone is equal to 3 times the authorized depth of that channel (see GC 15). 3. New individual moorings located in saltmarsh, mudflats, natural rocky habitat, and tidal vegetated shallows. Locating moorings these areas should be avoided to the maximum extent practicable. If these areas cannot be avoided, plans should show conservation mooring or low-impact mooring systems that prevent mooring chains from resting or dragging on the bottom substrate at all tides, where practicable. USACE may require a survey in areas previously mapped as containing eelgrass or within 100 ft. of existing eelgrass beds to document presence or absence of eelgrass and to determine the appropriate type and amount of compensatory mitigation for impacts to eelgrass. 4. Replacement moorings located in tidal vegetated shallows. 5. Moorings that are not SV eligible and do not require an IP.

Notes:

1. Low impact mooring systems, including conservation moorings, are encouraged to minimize impacts of chain scouring from conventional moorings during the tidal cycle.
2. An SVN submittal to USACE is not required for work authorized under SV #2-3 above.

[1] Boating facilities are marinas, yacht clubs, boat clubs, boat yards, dockominiums, town facilities, land/homeowner's associations, etc. that provide for a fee, rent or sell mooring or docking space. Not classified as boating facilities are municipal moorings or municipal mooring fields that charge an equitable user fee based only on the actual costs incurred.

GP 4. STRUCTURES IN NAVIGABLE WATERS OF THE U.S. (Authority: §10 & §404)

New, expansions, reconfigurations or modifications of structures for navigational access in waters of the U.S. including but not limited to temporary/seasonal or permanent pile and pole-supported piers, floats, stairs, shore outhauls, and boat and float lifts.

Not authorized under GP 4 (IP required): (a) Structures associated with a new boating facility; (b) Structures in a USACE Federal anchorage or channel; or (c) Artificial reefs.

Self-Verification Eligible

1. Private, non-commercial piers, floats and lifts that meet all the following terms:

a. Piers and floats in: (i) Tidal waters total ≤600 SF combined; and (ii) Non-tidal navigable waters of the U.S. total ≤600 SF combined; and

b. Piers are ≤4 feet wide and ≥6 feet above the marsh substrate (the height is measured from the marsh substrate to the bottom of the lowest longitudinal support); and

c. Floats and lifts in tidal waters and non-tidal navigable waters of the U.S. are ≥24 inches above the substrate during all tidal cycles. Float stops are preferred when site conditions warrant them (i.e., low tide exposes substrate), and skids can only be used in areas where piles are not feasible and on sandy or hard bottom substrates; and

d. Piers, floats and lifts: (i) Are ≥25 feet from previously mapped or existing vegetated shallows, or riparian property line extensions; (ii) Extend ≤25% of the waterway width in non-tidal navigable waters of the U.S. or MHW in tidal navigable waters of the U.S.

e. Installation of ≤12-inch diameter timber piles. Installation of ≥12-inch diameter piles of any material type when installed in the dry.

2. Fenders and similar structures.

Pre-Construction Notification Required

1. Shore outhauls.
2. Expansions, modifications, or new reconfiguration zones at any authorized boating facility.
3. New, expansions, reconfigurations, reconfiguration zones, or modifications of structures that provide public, community or government recreational uses such as boating, fishing, swimming, access, etc.
4. Installation of steel piles, including steel sheet piles, that cannot be done in the dry and where NOAA-ESA listed species are mapped as present.
5. Located within the buffer zone of the horizontal limits of an FNP (GC 15).
6. Miscellaneous structures.
7. Impacts in tidal vegetated shallows.
8. Structures that are not SV eligible and do not require an IP.

Notes:

1. See GC 19 regarding pile driving and pile removal in navigable waters and
2. See GC 20 regarding time of year restrictions in tidal waters.
3. Boating facilities are facilities that provide for a fee, rent, or sell mooring space, such as marinas, yacht clubs, boat clubs, boat yards, town facilities, dockominiums, etc. Pile supported structures with no discharges of dredged or fill material are not regulated by USACE in non-navigable waters.
4. A SVN submittal to USACE is not required for SV #2 above.

GP 5. BOAT RAMPS AND MARINE RAILWAYS (Authorities: §10 and §404)

Activities required for the construction of boat ramps and marine railways, including excavation and fill.

Not authorized under GP 5 (IP required): (a) Permanent impacts that are >1 acre in non-tidal waters of the U.S., >½ acre in tidal waters; >1000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF in tidal vegetated shallows; (b) Temporary impacts in tidal waters that are >1 acre; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows[1]; or (c) dredging in navigable waters of the U.S. (see GP 7).

Self-Verification Eligible	Pre-Construction Notification Required
1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, and (b) not located in riffle and pool complexes and non-tidal vegetated shallows.	1. Boat ramps are located within 25 feet of property line extensions unless the properties are owned by the same owner. The USACE may require a letter of no objection from the abutter(s).
2. In tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, (b) ≤1,000 SF in mudflats and/or natural rocky habitat, and (c), not located in saltmarsh and tidal vegetated shallows.	2. Activities that are not eligible for SV and do not require an IP.

GP 6. UTILITY LINES, OIL OR NATURAL GAS PIPELINES, OUTFALL OR INTAKE STRUCTURES, AND APPURTENANT FEATURES (Authorities: §10 & §404)

Activities required for: (a) The construction, maintenance, repair or removal of utility lines, oil or natural gas pipelines[1], outfall or intake structures[2], and appurtenant features including the associated excavation, backfill, or bedding for these structures. (b) The construction, maintenance, or expansion of substations and other appurtenant facilities associated with a utility line, oil or natural gas pipeline, and outfall or intake structure in non-tidal waters of the U.S.; and (c) The construction and maintenance of foundations for overhead utility line towers, poles, and anchors in tidal and non-tidal waters of the U.S., provided the foundations are the minimum size necessary and separate footings for each tower leg (rather than a larger single pad) are used where feasible. This GP authorizes the construction of access roads to facilitate construction of the above activities provided the activity, in combination with all other activities included in one single and complete project, does not exceed the thresholds identified below (IP required). Access roads used solely for construction of the utility line must be removed upon completion of the work. This GP also authorizes temporary structures, fills, and work, including the use of temporary mats, necessary to conduct the activities above.[3]

Not authorized under GP 6 (IP required): (a) Permanent impacts for any single and complete project that are >1 acre in non-tidal waters of the U.S.; >½ acre in tidal waters; >1000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF in tidal vegetated shallows; (b) Temporary impacts in tidal waters that are >1 acre; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows; (c) Stormwater treatment or detention systems, or subsurface sewage disposal systems in waters of the U.S.; or (d) New tide gates that do not meet SV criteria below.

Self-Verification Eligible	Pre-Construction Notification Required
1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, and (b) not located in riffle and pool complexes and non-tidal vegetated shallows. 2. In tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, (b) ≤1,000 SF in mudflats and/or natural rocky habitat, and (c), not located in saltmarsh and tidal vegetated shallows. 3. Intake structures that are dry hydrants used exclusively for firefighting activities with no stream impoundments. 4. New tide gates on outfall structures for pipes conveying stormwater and/or industrial NPDES-permitted discharges from waters that are not waters of the U.S.	1. New outfall and/or intake structures. 2. Unconfined work or silt producing activities in streams with diadromous fish. 3. Submarine cables, conduits, or pipelines that occur in, over or under navigable waters of the U.S. 4. Stream channelization, relocation, impoundment, or loss of streambed occurs. 5. The activity is placed within and runs parallel to or along a streambed within waters of the U.S. 6. There is a permanent change in preconstruction contours in waters of the U.S. 7. Installation of utility lines or gas/oil pipelines using trench excavation where material is temporarily sidecast into waters of the U.S. for >3 months. Applicants must demonstrate how the material would not be dispersed by currents or other forces. 8. Activities that are not SV eligible and do not require an IP.

[1] See the definitions of a “utility line” and “oil or natural gas pipeline” in Section VII.
[2] Outfall structures must be in compliance with regulations issued under the National Pollutant Discharge Elimination System Program (Section 402 of the Clean Water Act).
[3] Temporary impacts shall comply with all GCs, including GC 32 Utility Line Installation and Removal.

GP 7. DREDGING (Authority: §10), DISPOSAL OF DREDGED MATERIAL (Authorities: §10, §404), BEACH NOURISHMENT (Authorities: §10 & §404), ROCK REMOVAL (Authority: §10) AND ROCK RELOCATION (Authorities: §10 & §404)

New, improvement and maintenance dredging (see notes below) including: (a) Disposal of dredged material at a confined aquatic disposal cell, beach nourishment location, near shore site, or ocean disposal site selected under Section 404 of the Clean Water Act pursuant to the 404(b)(1) Guidelines, provided the dredged material meets the requirements for such disposal; (b) Beach nourishment not associated with dredging; and (c) Rock removal and relocation for navigation.

Not authorized under GP 7 (IP required): (a) Dredging where ocean disposal is required for the disposal of dredged material (Section 103); New dredging >½ acre; ≥10,000 CY; >1000 SF permanent impacts to intertidal areas, saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF permanent impacts to tidal vegetated shallows; (b) Maintenance or improvement dredging and/or disposal with >1 acre of impacts to intertidal areas, saltmarsh, mudflats, riffle and pool complexes, or non-tidal vegetated shallows; (c) New dredging where the primary purpose is sand mining for beach nourishment; (d) Beach scraping; (e) Boulder removal and relocation for navigation >½ acre; or (f) Blasting.

Self-Verification Eligible

1. Maintenance dredging of previously dredged areas, with upland disposal, that meet all of the following terms:
   a. Dredged area ≤1/2 acre; and
   b. Activities comply with GC 20, TOY Restrictions. The time-of-year restriction(s) stated in Appendix B of the MA Division of Marine Fisheries (DMF) Technical Report TR-47[1] can apply instead if the general TOY restriction if a TOY is provided for a specific waterbody and is less restrictive. This is to protect endangered species, EFH, and other species; and
   c. The dredge footprint is located >25' from salt marsh or >100' from vegetated shallows; and
   d. Combined permanent and temporary impacts that are (i) ≤1,000 SF in mudflats or natural rocky habitat, or (ii) ≤5,000 SF within intertidal habitat and areas containing shellfish (an area contains shellfish unless: it is verified that minimal shellfish are present per the local shellfish constable or a shellfish survey; or it is not mapped as a MassGIS shellfish suitability area).
   e. No return water from upland disposal areas.

2. Boulder relocation with ≤1,000 SF of impacts, relocated to a similar depth and substrate.

Pre-Construction Notification Required

1. Maintenance dredging where the primary purpose is sand mining for beach nourishment.

2. New dredging and associated disposal ≤1/2 acre or <10,000 cubic yards.

3. Improvement dredging.

4. Beach nourishment in waters of the U.S. not associated with dredging.

5. Activities that are located in saltmarsh and tidal vegetated shallows.

6. Dredging in a Federal Navigation Project or within the buffer zone (see GC 15).

7. Activities that are not eligible for SV and do not require an IP.

Notes:

1. See Section VII for definitions of improvement and maintenance dredging.
2. For PCN activities, the USACE may waive or adjust the time of year requirement on a case-by-case basis after consultation with resource agencies.
3. Disposal site of any dredged material must be identified prior to obtaining USACE authorization.
4. Contact the USACE if a ten-year authorization to maintain an area is desired.

[1] The MA DMF Technical Report TR-47: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/

GP 8. U.S. COAST GUARD APPROVED BRIDGES (Authorities: §404)

Discharges of dredged or fill material incidental to the construction and modification of bridges across navigable waters of the U.S., including cofferdams, abutments, foundation seals, piers, and temporary construction and access fills provided that the USCG authorizes the construction of the bridge structure under Section 9 of the Rivers and Harbors Act of 1899 or other applicable laws. A USCG Authorization Act Exemption or a Surface Transportation and Uniform Relocation Assistance Act (STURRA) (144h) exemption do not constitute USCG authorization.

Not authorized under GP 8 (IP Required): Causeways and approach fills (see GP 23).

Self-Verification Eligible	**Pre-Construction Notification Required**
1. Discharges of dredged or fill material that are incidental to the construction of bridges across navigable waters and meet all of the following: a. Combined permanent and temporary impacts that are ≤5,000 SF. b. Combined permanent and temporary impacts that are ≤1,000 SF in mudflats and natural rocky habitat. c. Not located in saltmarsh and tidal vegetated shallows.	1. Activities on USACE properties & USACE controlled easements.2. Installation of steel piles, including steel sheet piles, that cannot be done in the dry and where NOAA-ESA listed species are mapped as present. 3. Activities that are not eligible for SV and do not require an IP.

Notes:

1. GP 8 is not applicable to bridges over inland waters or wetlands that are not tidally influenced or regulated as navigable under Section 10.
2. See eligibility criteria for GPs 2 & 23 for projects that are not subject to USCG regulations.

GP 9. BANK AND SHORELINE STABILIZATION (Authorities: §10 & §404)

Bank stabilization activities necessary for erosion protection along the banks of lakes, ponds, streams, estuarine and ocean waters, and any other open waters. Includes bulkheads, seawalls, riprap, revetments, living seawalls, or slope protection & similar structures, specifically for the purpose of shoreline protection. This GP also authorizes temporary structures, fills, and work, including the use of temporary mats, necessary to conduct the activities above.

Activities must meet the following criteria: (a) No material is placed in excess of the minimum needed for erosion protection; (b) No material is of a type, or is placed in any location, or in any manner, that will impair surface water flow into or out of any waters of the U.S.; (c) No material is placed in a manner that will be eroded by normal or expected high flows (properly anchored native trees and treetops may be used in low energy areas); (d) Native plants appropriate for current site conditions, including salinity, must be used for bioengineering or vegetative bank stabilization; (e) The activity is not a stream channelization activity; and (f) The activity must be properly maintained, which may require repairing it after severe storms or erosion events. This GP authorizes those maintenance and repair activities if they require authorization. This GP also authorizes temporary structures, fills, and work, including the use of temporary mats, necessary to construct the bank stabilization activity. See GP 20 for living shoreline stabilization structures or fills.

Not authorized under GP 9 (IP required): (a) New bank stabilization >500 feet in total length (>1,000 linear feet in total length when necessary to protect transportation infrastructure) or permanent loss of saltmarsh >1,000 SF, unless the District Engineer waives this criterion by making a written determination concluding that the discharge of dredged or fill material will result in no more than minimal adverse environmental effects (an exception is for bulkheads – the district engineer cannot issue a waiver for a new bulkhead that is >1,000 feet in length along the bank); (b) Stream channelization or relocation activities; or (c) Breakwaters, groins or jetties.

Self-Verification Eligible

1. Activities in tidal and non-tidal waters that are:
   a. <200 feet in length.
   b. <400 feet in length when necessary to protect transportation infrastructure.
   c. ≤1 cubic yard of fill per linear foot average along the bank waterward of the plane of OHW or HTL.
   d. Not located in non-tidal wetlands, saltmarsh, vegetated shallows.

Pre-Construction Notification Required

1. Activities in tidal and non-tidal waters that are:
   a. ≥200 feet to ≤500 feet in total length. Activities >500 feet in total length must have a written waiver from USACE.
   b. ≥400 feet to ≤1,000 feet in total length when necessary to protect transportation infrastructure. Activities >1,000 feet in total length must have a written waiver from USACE.
   c. >1 cubic yard of fill per linear foot average along the bank waterward of the plane of OHW or HTL.
   d. Located in non-tidal wetlands, saltmarsh, vegetated shallows.
2. Activities with permanent loss of tidal or non-tidal waters that is (a) ≥5,000 SF or (b) ≥1,000 SF in mudflats and natural rocky habitat.
3. Activities that are (a) located in the Connecticut River or Merrimack River and/or (b) require installation of steel piles/steel sheet piles that cannot be done in the dry where NOAA ESA-listed species are mapped as present.
4. Activities on USACE properties & USACE-controlled easements.
5. Activities that require grouted riprap and/or poured/unformed concrete.
6. Activities that are not eligible for SV and do not require an IP.

Note: The applicant shall comply with GC 24. This includes utilization of bioengineering techniques in lieu of hard armoring to the maximum extent practicable as site conditions allow.

GP 10. AQUATIC HABITAT RESTORATION, ENHANCEMENT, AND ESTABLISHMENT ACTIVITIES (Authorities: §10 and §404)

Activities for the restoration, enhancement and establishment of non-tidal and tidal wetlands and riparian areas, including invasive, non-native or nuisance species control; the restoration and enhancement of non-tidal streams and other non-tidal open waters; the relocation of non-tidal waters, including non-tidal streams & associated wetlands for reestablishment of a natural stream morphology and reconnection of the floodplain; the restoration and enhancement of shellfish, finfish and wildlife; and the rehabilitation or enhancement of tidal streams, tidal wetlands and tidal open waters; provided those activities result in net increases in aquatic resource functions and services. See GP 9 for bank and shoreline stabilization. See GP 20 for living shorelines.

Not authorized under GP 10 (IP required): Stream channelization activities and artificial reefs.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. In tidal and non-tidal waters excluding tidal vegetated shallows, the combined permanent and temporary impacts are ≤5,000 SF. 2. Eelgrass (vegetated shallows) planting and transplanting ≤100 SF in tidal waters.	1. In tidal and non-tidal waters excluding tidal vegetated shallows, the combined permanent and temporary impacts are >5,000 SF. 2. Eelgrass (vegetated shallows) planting and transplanting >100 SF in tidal waters. 3. Permanent water impoundments, dam removal, fish ladders, or tide gates. 4. Stream relocation, impoundment, or loss of streambed occurs. 5. Runneling projects with the purpose of restoring saltmarsh by removing excess water that ponds on the saltmarsh surface. 6. The conversion of: (a) a stream or natural wetlands to another aquatic habitat type (e.g., stream to wetland or vice versa, wetland to pond, etc.) or uplands, (b) one wetland type to another (e.g., forested wetland to an emergent wetland). 7. Activities in the Connecticut River from the Turners Falls Dam to the MA/CT border, or Merrimack River from the Essex Dam to the mouth, involving permanent or temporary impacts unless they are performed <5 feet waterward from OHW or HTL and in the dry. This is to protect endangered species. 8. Activities on USACE properties & USACE-controlled easements. 9. Activities that are not eligible for SV and do not require an IP.

Notes:

1. Changes in wetland plant communities that occur when wetland hydrology is more fully restored during wetland rehabilitation activities are not considered a conversion to another aquatic habitat type.
2. See RGL 18-01 for guidance on removal of obsolete dams and other structures from rivers and streams. https://www.usace.army.mil/missions/civil-works/regulatory-program-and-permits/guidance-letters/
3. An ecological reference site may be used for a design basis of the restoration activity. The reference site should possess characteristics of an intact aquatic habitat or riparian area that exists in the region. The reference site shall represent the target habitat type of the proposed activity. A reference site may be required at the discretion of USACE.

GP 11. FISH AND WILDLIFE HARVESTING AND ATTRACTION DEVICES AND ACTIVITIES (Authorities: §10 and §404)

Fish and wildlife harvesting and attraction devices and activities in waters of the U.S. such as pound nets, crab traps, crab and shellfish dredging, eel pots, lobster traps, duck blinds, clam and oyster digging, fish aggregating devices, and small fish attraction devices such as open-water fish concentrators (sea kites, etc.).

Not authorized under GP 11 (IP required): Artificial reefs; or new, or expansions of, impoundments and semi-impoundments of waters of the U.S. for the culture or holding of motile species such as lobster with an impounded area >½ acre.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≤1/2 acre, and (b) not located in riffle and pool complexes and non-tidal vegetated shallows. 2. Fish and wildlife harvesting and attraction devices and activities that do not require a PCN or IP.	1. Pound nets, impoundments or semi-impoundments of waters of the U.S. for the culture or holding of motile species such as lobster with an impounded area ≤½ acre, fish aggregating devices, or small fish attraction devices. 2. Devices and activities that are located in tidal vegetated shallows, mud flats, or saltmarsh. 3. Devices and activities that do not require an IP.

Note: An SVN submittal to USACE is not required for work authorized under GP 11.

GP 12. RESPONSE OPERATIONS, OIL AND HAZARDOUS SUBSTANCES (Authorities: §10 & §404)

(a) Activities conducted in response to a discharge or release of oil and hazardous substances that are subject to the National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR 300) including containment, cleanup, and mitigation efforts, provided that the activities are done under either: (i) The Spill Prevention, Control and Countermeasure Plan required by 40 CFR 112.3; (ii) The direction or oversight of the Federal on-scene coordinator designated by 40 CFR 300; or (iii) Any approved existing State, regional or local contingency plan provided that the Regional Response Team concurs with the proposed response efforts or does not object to the response effort; (b) Activities required for the cleanup of oil releases in waters of the U.S. from electrical equipment that are governed by EPA's polychlorinated biphenyl (PCB) spill response regulations at 40 CFR 761; (c) Booms placed in navigable waters of the U.S. for oil and hazardous substance containment, absorption and prevention; and (d) The use of structures and fills for spill response training exercises. Wetlands, vegetated shallows, mudflats, and riffle and pool complexes should be restored in place at the same elevation.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. Activities are conducted in accordance with (a) or (b) above that are not planned or scheduled, but an emergency response (see Note 1). 2. Booms placed in navigable waters of the U.S. for oil and hazardous substance containment, absorption and prevention. 3. Temporary impacts for spill response training exercises ≤5000 SF in non-tidal waters and ≤1000 SF in tidal waters with no impacts to wetlands, saltmarsh, mudflats, or vegetated shallows. 4. Temporary structures in tidal waters with no impacts to wetlands, saltmarsh, mudflats, vegetated shallows, or riffle and pool complexes and in place ≤30 days.	1. Activities (a) or (b) above are planned or scheduled, not an emergency response; or 2. Activities that are not eligible for SV and do not require an IP.

Notes:

1. For emergency response activities in the Connecticut River from the Turners Falls Dam to the MA/CT border, Merrimack River from the Essex Dam to the mouth, and remaining tidal waters that are not rivers, the permittee must contact the USACE at (978) 318-8338 before or as soon as possible after the work authorized under GP 12(a) - (c) commences for the USACE to address effects under the Endangered Species Act.
2. An SVN submittal to USACE is not required for booms used for spill prevention, or properly contained and cleaned de minimus oil or hazardous substance discharges into navigable waters of the U.S.

GP 13. CLEANUP OF HAZARDOUS AND TOXIC WASTE (Authorities: §10 and §404)

Specific activities required to affect the containment, stabilization, or removal of hazardous or toxic waste materials, including court ordered remedial action plans or related settlements, which are performed, ordered or sponsored by a government agency with established legal or regulatory authority.

Not authorized under GP 13: (a) Establishment of new disposal sites; or (b) Expansion of existing sites used for the disposal of hazardous or toxic waste.

Self-Verification Eligible	Pre-Construction Notification Required
1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, and (b) not located in vegetated shallows and riffle and pool complexes.	1. In non-tidal waters, the combined permanent and temporary impacts are (a) >5,000 SF, and (b) located in vegetated shallows and riffle and pool complexes. 2. Permanent and temporary impacts in tidal waters or navigable waters of the U.S. 3. Stream channelization, relocation, impoundment, or loss of streambed occurs. 4. Activities that are not eligible for SV and do not require an IP.

Notes:

1. Wetlands, vegetated shallows, mudflats, and riffle and pool complexes should be restored in place at the same elevation to the maximum extent practicable.
2. Activities undertaken entirely on a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) site by authority of CERCLA, are not required to obtain permits under Section 404 of the CWA or Section 10 of the Rivers and Harbors Act.

GP 14. SCIENTIFIC MEASUREMENT DEVICES (Authorities: §10 and §404)

Scientific measurement devices for measuring and recording scientific data, such as staff gauges, tide and current gauges, meteorological stations, water recording and biological observation devices, water quality testing and improvement devices, and similar structures. Also eligible are small weirs and flumes constructed primarily to record water elevation, flow and/or velocity. Upon completion of the use of the device to measure and record scientific data, the measuring device and any other structures or fills associated with that device (e.g., foundations, anchors, buoys, lines, etc.) must be removed to the maximum extent practicable and the site restored to preconstruction elevations.

Not authorized under GP 14 (IP required): (a) Permanent impacts that are >5,000 SF in tidal and non-tidal waters of the U.S.; >1000 SF in tidal saltmarsh, mud flats, riffle and pool complexes; or >100 SF in tidal vegetated shallows; or (b) Temporary impacts in tidal waters that are >1 acre, unless the District Engineer waives this criterion by making a written determination concluding that the discharge of dredged or fill material will result in no more than minimal adverse environmental effects; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows.

Self-Verification Eligible

1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, (b) not located in riffle and pool complexes and non-tidal vegetated shallows.

2. In tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, (b) ≤1,000 SF in mudflats and/or natural rocky habitat, (c) not located in saltmarsh and tidal vegetated shallows.

3. Temporary, non-biological sampling devices in waters that do not restrict or concentrate movement of aquatic organisms and will not adversely affect the course, condition, or capacity of a waterway for navigation.

4. Scientific measurement devices, and small weirs and flumes constructed primarily to record water quantity and velocity provided the discharge of fill is limited to 25 cubic yards. These cannot obstruct or restrict the waterway course, condition, capacity, and location.

5. Temporary measuring devices and associated structures (e.g., anchors, buoys, etc.) in tidal and non-tidal waters that do not require a PCN or IP.

Pre-Construction Notification Required

1. Biological sampling devices, weirs or flumes, or the activity restricts or concentrates movement of aquatic organisms.

2. Permanent towers located in navigable waters that record and measure scientific data.

3. Devices that are not eligible for SV and do not require an IP.

Note: An SVN submittal to USACE is not required for temporary measuring devices with a footprint of <10 SF, with a profile of <3 feet high measured from the substrate and located in water deeper than -10 feet MLW.

GP 15. SURVEY ACTIVITIES (Authorities: §10 and §404)

Survey activities such as soil borings, core sampling, seismic exploratory operations, plugging of seismic shot holes and other exploratory-type bore holes, exploratory trenching, soil surveys, sampling, sample plots or transects for wetland delineations, and historic resources surveys.

Not authorized under GP 15 (IP required): (a) Permanent impacts that are >1 acre in tidal and non-tidal waters; >1000 SF in tidal saltmarsh, mud flats, or riffle and pool complexes; or >100 SF in tidal vegetated shallows; or (b) Temporary impacts in tidal waters that are >1 acre, unless the District Engineer waives this criterion by making a written determination concluding that the discharge of dredged or fill material will result in no more than minimal adverse environmental effects; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, (b) not located in riffle and pool complexes and non-tidal vegetated shallows. 2. In tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, (b) ≤1,000 SF in mudflats and/or natural rocky habitat, (c) not located in saltmarsh and tidal vegetated shallows.	1. Exploratory trenching (see Note 2) occurs in waterways (e.g., streams, tidal waters). 2. Activities associated with the recovery of historic resources, and the drilling and discharge of excavated material from test wells for oil and gas exploration. 3. Seismic exploratory operations occur in tidal waters, the Connecticut River from the Turners Falls Dam to the MA/CT border, or the Merrimack River from the Essex Dam to the mouth. This is to protect endangered species. 4. Activities that are not eligible for SV and do not require an IP.

Notes:

1. An SVN submittal is not required for wetland delineations, and core sampling conducted for preliminary evaluation of dredge project analysis.
2. For the purposes of GP 15, the term “exploratory trenching” means mechanical land or underwater clearing of the upper soil profile to expose bedrock or substrate for the purpose of mapping or sampling the exposed material.
3. The discharge of drilling mud and cuttings may require a permit under §402 of the CWA.

GP 16. LAND AND WATER-BASED RENEWABLE ENERGY GENERATION FACILITIES (Authorities: §10 and §404), AND HYDROPOWER PROJECTS (Authority: §10 and §404)

Structures and work in tidal waters and discharges of dredged or fill material into tidal and non-tidal waters for the construction, expansion, modification or removal of: (a) Land-based renewable energy production facilities (e.g., solar, wind, biomass, geothermal) and their attendant features; (b) Water-based wind or hydrokinetic renewable energy generation projects and their attendant features; and (c) Discharges of dredged or fill material associated with hydropower projects. Attendant features may include, but are not limited to, land-based collection and distribution facilities, control facilities, and parking lots. For each single and complete project in (b) above, no more than 10 generation units (e.g., wind turbines or hydrokinetic devices) are authorized in navigable waters of the U.S. Upon completion of the pilot project (see note 2), the generation units, transmission lines, and other structures or fills associated with the pilot project must be removed to the maximum extent practicable.

Not authorized under GP 16 (IP required): (a) Permanent impacts that are >1 acre in non-tidal waters, >½ acre in tidal waters; >1000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF in vegetated shallows; or (b) Temporary impacts in tidal waters that are >1 acre; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows.

Self-Verification Eligible	**Pre-Construction Notification Required**
In non-tidal waters, the combined permanent and temporary impacts for land-based activities are (a) ≤5,000 SF, (b) not located in riffle and pool complexes and non-tidal vegetated shallows.	1. In non-tidal waters, the combined permanent and temporary impacts for land-based activities are (a) >5000 SF, or (b) located in vegetated shallows or riffle and pool complexes. 2. Permanent and temporary impacts in tidal waters. 3. Water-based wind or hydrokinetic renewable energy generation projects, and hydropower projects. 4. For all activities eligible for authorization under GP 16: a. The activity occurs in tidal waters or in, over or under navigable waters. b. Stream channelization, relocation, impoundment, or loss of streambed occurs. 5. Activities that are not eligible for SV and do not require an IP.

Notes:

1. Utility lines constructed to transfer the energy from the land-based renewable generation or collection facility to a distribution system, regional grid, or other facility may be authorized by GP 6.
2. For the purposes of this GP, the term “pilot project” means an experimental project where the renewable energy generation units will be monitored to collect information on their performance and environmental effects at the project site.

GP 17. RESIDENTIAL, COMMERCIAL AND INSTITUTIONAL DEVELOPMENTS AND RECREATIONAL FACILITIES (AUTHORITIES: §404)

Discharges of dredged or fill material into non-tidal waters for the construction or expansion of: (a) Residences and residential subdivisions; (b) Residential, commercial and institutional building foundations and building pads; and (c) Recreational facilities such as playgrounds, playing fields, bikeways, trails, etc. This GP also authorizes attendant features that include, but are not limited to, roads, parking lots, garages, yards, and utility lines, and stormwater management facilities. This GP authorizes attendant features if they are necessary for the use of the project purpose.

Not authorized under GP 17 (IP required): (a) Permanent impacts that result in loss of non-tidal waters >1/2 acre; >1000 SF in riffle and pool complexes or vegetated shallows; or (b) Subsurface sewerage disposal systems in non-tidal waters.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. In non-tidal waters, the combined permanent and temporary impacts are (a) <5,000 SF, and (b) not located in riffle and pool complexes and non-tidal vegetated shallows. 2. Stream channelization or relocation resulting in loss of streambed that is <200 LF.	1. In non-tidal waters, the combined permanent and temporary impacts are (a) ≥5,000 SF, or (b) located in riffle and pool complexes or non-tidal vegetated shallows. 2. Stream and wetland crossings that require a PCN per GCs 20 TOY Restrictions and GC 31 Stream Work and Crossings & Wetland Crossings. 3. Stream channelization or relocation resulting in loss of streambed that is ≥200 LF. Stream impoundment activities of any kind. 4. Activities on USACE properties & USACE-controlled easements. 5. Activities that are not SV eligible and do not require an IP.

Notes:

1. Stream and wetland crossings (permanent and temporary), including those built with construction mats; and modifications (including sliplining), replacements or extensions to existing crossings.
2. See GC 22 for information on temporary construction mats.
3. Subdivisions: For residential subdivisions, the aggregate total loss of waters of United States authorized by this GP cannot exceed 1/2-acre. This includes any loss of waters of the United States associated with development of individual subdivision lots.

GP 18. AQUACULTURE (Authorities: §10 and §404)

(a) The installation of buoys, floats, racks, trays, nets, lines, tubes, containers, and other structures into navigable waters of the U.S.; (b) Discharges of dredged or fill material into tidal and non-tidal waters necessary for shellfish seeding, rearing, cultivating, transplanting, and harvesting activities; and (c) Shellfish seeding or brushing the flats projects. Any fill material imported to the project from offsite (this is limited to mineral growth medium used in culture trays) shall be clean and of comparable grain size to the native substrate. Activities authorized under this GP must have (a) their MA DMF Aquaculture Certificate letter for licensed shellfish aquaculture sites, (b) documentation that the applicant has coordinated with the U.S. Coast Guard regarding USCG Private Aids to Navigation standards, (c) their MEPA Certificate (if required), and (d) documentation that the applicant has contacted their local authorities (ex. harbormaster, select board, shellfish constable) for authorization of their facility.

Not authorized under GP 18 (IP required): (a) New, or expansions of, impoundments and semi-impoundments of tidal and non-tidal waters for the culture or holding of motile species such as lobster with an impounded area >½ acre; (b) Cultivation of a nonindigenous species (see Note 1) unless that species has been previously cultivated in the waterbody; (c) Cultivation of an aquatic nuisance species (see Note 1); (d) Attendant features such as docks, piers, boat ramps (see GP 4); (e) stockpiles, staging areas, or the deposition of shell material back into tidal and non-tidal waters as waste.

Self-Verification Eligible

1. In tidal waters, a new lease site area is (a) ≤2-acre, (b) not located in salt marsh, natural rocky habitat, or tidal vegetated shallows.

2. In tidal waters, *expansions* of existing lease sites not to exceed 2 acres for the entire site (e.g. 1 acre lease site increasing to a 2 acre lease site may qualify as SV). A PCN is required for expansions in salt marsh, natural rocky habitat, and tidal vegetated shallows.

3. Cages, racks that are elevated ≥2 feet above the ocean floor with legs within a lease site with ≤4 buoys marking the corners.

4. Floating cage strings with a single connecting line, ≤2 anchors and ≤2 end marker buoys per string within a lease site with ≤4 buoys marking the corners.

5. No activities located within 25 feet of tidal vegetated shallows.

6. Culture only indigenous species.

7. Not located in FNP or within a distance of three times the authorized depth of an FNP (see GC 15).

8. Not located in or impinge upon the value of any National Lands or Federal Properties.

9. Floating upweller docks that total ≤600 SF in area.

Pre-Construction Notification Required

1. Discharges of fill material associated with aquaculture >5,000 SF.

2. Research, educational, commercial-viability or experimental aquaculture gear activities >1,000 SF.

3. Kelp or finfish aquaculture.

4. Land-based hatchery intakes >3 inches in diameter.

5. Activities in water depths >10 feet mean low lower water (MLLW).

6. Activities with in-water lines, ropes or chains that are not SV eligible (see #3-4).

7. Activities occur in the Connecticut River from the Turners Falls Dam to the MA/CT border or the Merrimack River from the Essex Dam to the mouth. This is to protect endangered species.

8. New, or expansions of, impoundments and semi-impoundments for the culture or holding of motile species such as lobster with an impounded area ≤1/2 acre.

9. Activities that do not require an IP. Activities that do not require a PCN or an IP may be SV eligible.

Note: The Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990 defines: (a) nonindigenous species as “any species or other viable biological material that enters an ecosystem beyond its historic range, including any such organism transferred from one country into another”; and (b) aquatic nuisance species as “a nonindigenous species that threatens the diversity or abundance of native species or the ecological stability of infested waters, or commercial, agricultural, aquacultural, or recreational activities dependent on such waters.”

GP 19. MINING ACTIVITIES (Authorities: §10 and §404)

Discharges of dredged or fill material into non-tidal waters for mining activities, except for coal mining and metallic mineral mining activities.

Not authorized under GP 19 (IP required): (a) Permanent impacts >1 acre in non-tidal waters; or (b) Activities in tidal waters.

Self-Verification Eligible	Pre-Construction Notification Required
In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, and (b) not located in riffle and pool complexes, non-tidal vegetated shallows, and streams.	1. In non-tidal waters, the combined permanent and temporary impacts are (a) >5,000 SF, or (b) located in riffle and pool complexes, non-tidal vegetated shallows, and streams. 2. The activity occurs in non-tidal navigable waters of the U.S. 3. Stream channelization, relocation, impoundment, loss of streambed, or discharge of tailings into streams occurs. 4. Work on USACE properties & USACE-controlled easements. 5. Activities that are not eligible for SV and do not require an IP.

GP 20. LIVING SHORELINES[1] (Authorities: §10 and §404)

Construction and maintenance of living shorelines to stabilize banks and shores in tidal waters. In non-tidal waters that are not subject to the ebb and flow of the tide, nature-based bank stabilization techniques such as bioengineering and vegetative stabilization may be authorized by GP 9. This GP authorizes those maintenance and repair activities in-kind that are necessary to address changing environmental conditions.

The following terms must be met for both SVs and PCNs as applicable: (a) Coir logs, coir mats, stone, native oyster shell, native wood debris, and other structural materials must be adequately anchored, of sufficient weight, or installed in a manner that prevents relocation in most wave action or water flow conditions, except for extremely severe storms; (b) For living shorelines consisting of tidal fringe wetlands, native plants appropriate for current site conditions, including salinity and elevation, must be used if the site is planted by the permittee; (c) Discharges of dredged or fill material into waters of the U.S., and oyster or mussel reef structures in navigable waters, must be the minimum necessary for the establishment and maintenance of the living shoreline; (d) If sills or other structural materials per PCN #4 must be constructed to protect fringe wetlands for the living shoreline, those structures must be the minimum size necessary to protect those fringe wetlands; (e) The activity must be designed, constructed, and maintained so that it has no more than minimal adverse effects on water and sediment movement between the waterbody and the shore and the movement of aquatic organisms between the waterbody and the shore; and (f) The living shoreline must be properly maintained and monitored, which may require periodic repair of sills, bioengineered components, or replacing sand fills after severe storms or erosion events. Vegetation may be replanted to maintain the living shoreline.

Not authorized under GP 20 (IP required): (a) The activity is ≥1000 feet in length along the bank (≥2000 LF both banks) unless waived by the District Engineer; or (b) The activity is >30 feet channel ward of mean low water in tidal waters; or (c) Upland reclamation activities; or (d) Stream channelization or relocation activities; or (e) Breakwaters, groins, jetties, or artificial reefs; or (f) Permanent impacts >1,000 SF in existing saltmarsh; >100 SF in existing tidal vegetated shallows.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. Tidal and non-tidal living shorelines ≤100 LF for each bank (≤200 LF for both banks). 2. Combined permanent and temporary impacts ≤5,000 SF in tidal waters, excluding existing salt marsh, tidal vegetated shallows, natural rocky habitat, and mudflats.	1. Tidal and non-tidal living shorelines >100 LF to <1000 LF (>200 LF to <2000 LF for both banks). 2. Permanent and temporary impacts in existing salt marsh, tidal vegetated shallows, or mudflats. 3. Work on USACE properties & USACE-controlled easements. 4. Use of stone sills, native oyster shell, native wood debris, or other structural materials.

Notes:

1. PCNs require monitoring for a minimum of 5 years in accordance with an approved restoration plan, unless otherwise determined by the USACE. The first year of monitoring will be the first year that the site has been through a full growing period after completion of construction and planting.
2. Applicants are encouraged to obtain a MEPA certificate prior to submitting a USACE permit application.

[1] A living shoreline has a footprint that is made up mostly of native material. It incorporates vegetation or other living, natural “soft” elements alone or in combination with some type of harder shoreline structure (e.g., oyster or mussel reefs or rock sills) for added protection and stability. Living shorelines should maintain the natural continuity of the land-water interface and retain or enhance shoreline ecological processes. Living shorelines must have a substantial biological component, either tidal or lacustrine fringe wetlands or oyster or mussel reef structures.

GP 21. AGRICULTURAL ACTIVITIES (Authority: §404)

Discharges of dredged or fill material in non-tidal waters for agricultural activities, including the construction of building pads for farm buildings. Authorized activities include: (a) installation, placement, or construction of drainage tiles, ditches, or levees; mechanized land clearing; land leveling; the relocation of existing serviceable drainage ditches; and similar activities; (b) construction of farm ponds, excluding perennial streams, provided the farm pond is used solely for agricultural purposes; and (c) discharges of dredged or fill material to relocate existing serviceable drainage ditches constructed in non-tidal streams.

Not authorized under GP 21 (IP required): (a) Permanent impacts that are >1 acre in non-tidal waters; or >1000 SF in riffle and pool complexes, or non-tidal vegetated shallows; (b) Work in tidal waters; or (c) Construction of farm ponds in perennial streams.

Self-Verification Eligible	**Pre-Construction Notification Required**
In non-tidal waters, the combined permanent and temporary impacts are (a) ≤5,000 SF, and (b) not located in riffle and pool complexes and non-tidal vegetated shallows.	1. In non-tidal waters, the combined permanent and temporary impacts are (a) >5,000 SF, or (b) located in riffle and pool complexes and non-tidal vegetated shallows. 2. Activities occur in non-tidal navigable waters of the U.S. 3. Stream channelization, relocation, impoundment, loss of streambed, or farm ponds in non-perennial streams occurs. 4. Activities that are not eligible for SV and do not require an IP.

Note: Some discharges for agricultural activities may qualify for an exemption under Section 404(f) of the CWA (see 33 CFR 323.4). This GP authorizes the construction of farm ponds that do not qualify for the CWA §404(f)(1)(C) exemption because of the recapture provision at §404(f)(2).

GP 22. RESHAPING EXISTING DRAINAGE DITCHES, CONSTRUCTION OF NEW DITCHES, AND MOSQUITO MANAGEMENT (Authorities: §10 and §404)

Discharges to modify the cross-sectional configuration of currently serviceable drainage ditches constructed in tidal and non-tidal waters, for the purpose of improving water quality by regrading the drainage ditch with gentler slopes, which can reduce erosion, increase growth of vegetation, and increase uptake of nutrients and other substances by vegetation. Also authorized are mosquito reduction activities.

Not authorized under GP 22 (IP required): Stream channelization, relocation, impoundments, or loss of streambed.

Self-Verification Eligible	**Pre-Construction Notification Required**
≤500 linear feet of drainage ditch will be reshaped provided excavated material is deposited in an upland area.	1. >500 linear feet of drainage ditch will be reshaped, excavated material is deposited in a water of the U.S., or the reshaping of the ditch increases the drainage capacity beyond the original as-built capacity or expands the area drained by the ditch as originally constructed (i.e., the capacity of the ditch is not the same as originally constructed or drains additional wetlands or other waters of the U.S.). 2. Permanent and temporary impacts in tidal vegetated shallows. 3. New ditches or relocation of drainage ditches constructed in waters of the U.S. (i.e., the location of the centerline of the reshaped drainage ditch is not approximately the same as the location of the centerline of the original drainage ditch). 4. Activities that are not eligible for SV and do not require an IP.

Note: Some ditch activities are exempt under Section 404(f) of the CWA (see 33 CFR 323.4).

GP 23. LINEAR TRANSPORTATION PROJECTS AND WETLAND/STREAM CROSSINGS (Authorities: §10 & §404)

Activities[1] required for the construction, expansion, modification, or improvement of linear transportation projects (e.g., driveways, roads, highways, railways, trails, airport runways, and taxiways) and attendant features. This GP also authorizes temporary structures, fills, and work, including the use of temporary mats (see Note 1), necessary to construct the linear transportation project.

Not authorized under GP 23 (IP required): (a) Permanent impacts for any single and complete project that are >1 acre in non-tidal waters; >½ acre in tidal waters; >1000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF in tidal vegetated shallows; (b) Temporary impacts in tidal waters that are >1 acre; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows; (c) Non-linear features commonly associated with transportation projects, such as vehicle maintenance or storage buildings, parking lots, train stations, or aircraft hangars (see GP 17); or (d) New tide gates.

Self-Verification Eligible

1. In non-tidal waters, the combined permanent and temporary impacts are a) ≤5,000 SF; b) not located in riffle and pool complexes and non-tidal vegetated shallows; and c) meet the Massachusetts River and Stream Crossing Standards

2. Existing crossings (e.g., culverts, elliptical or arch pipes, etc.) are not modified by (a) decreasing the diameter of the crossing or (b) changing the friction coefficient, such as through slip lining (retrofitting an existing culvert by inserting a smaller diameter pipe), culvert relining or invert lining.

3. Stream channelization or relocation resulting in loss of streambed that is <200 LF.

Pre-Construction Notification Required

1. In non-tidal waters, the combined permanent and temporary impacts are a) >5,000 SF; b) located in vegetated shallows or riffle and pool complexes; or c) do not meet the Massachusetts River and Stream Crossing Standards (see note 4).

2. The activity occurs in tidal waters, salt marsh, or in, over or under navigable waters of the U.S.

3. Stream and wetland crossings that require a PCN per GC 20 TOY Restrictions and GC 31 Stream Work and Crossings & Wetland Crossings.

4. Stream channelization or relocation resulting in loss of streambed that is ≥200 LF. Stream impoundment activities of any kind.

5. Work on USACE properties & USACE-controlled easements.

6. Activities that are not eligible for SV and do not require an IP.

Notes:

1. See GC 22 for information on temporary construction mats.
2. Discharges of dredged or fill material incidental to the construction of bridges across navigable waters of the U.S. may be authorized under GP 8.
3. Loss of streambed does not require a PCN when bridge piers or similar supports are used.
4. In their PCN application submission to the USACE, applicants must explain why they are unable to meet the Massachusetts River and Stream Crossing Standards.
5. For tidal crossings, modeling is encouraged as a method to verify the proposed crossing would not be undersized and resilient to the effects of sea level rise.

[1] Stream crossings must conform with the MA Stream Crossing Guidelines when practicable and comply with all applicable GCs of this document (Section IV).

GP 24. TEMPORARY CONSTRUCTION, ACCESS, AND DEWATERING (Authorities: §10 and §404)

Temporary structures, work, and discharges, including cofferdams, necessary for construction activities or access fills or dewatering of construction sites that are not authorized under another GP activity.

Not authorized under GP 24 (IP required): (a) Permanent structures or impacts; (b) Temporary impacts in tidal waters that are >1 acre; >5000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1000 SF in vegetated shallows; (c) Use of cofferdams to dewater wetlands or other aquatic areas to change their use; (d) Temporary stream crossings (see GPs 6, 17, 23); (e) Structures or fill left in place after construction is completed.

Self-Verification Eligible	**Pre-Construction Notification Required**
1. In non-tidal waters, temporary impacts are a) ≤5,000 SF; b) not located in riffle and pool complexes and non-tidal vegetated shallows. 2. In tidal waters, temporary impacts are a) ≤5,000 SF, b) ≤1,000 SF in mudflats and/or natural rocky habitat, and c) not located in saltmarsh and tidal vegetated shallows. 3. Structures in navigable waters of the U.S. provided impacts do not require a PCN and they are left in place ≤30 days.	1. In non-tidal waters, temporary impacts are a) >5,000 SF; b) located in riffle and pool complexes or non-tidal vegetated shallows. 2. In tidal waters, temporary impacts are a) >5,000 SF; b) >1,000 SF in mudflats and/or natural rocky habitat, or (c) located in saltmarsh and tidal vegetated shallows. 3. Activities in the Connecticut River from the Turners Falls Dam to the MA/CT border, or Merrimack River from the Essex Dam to the mouth, involving temporary impacts unless they are performed <5 feet waterward from OHW or HTL and in the dry. This is to protect endangered species; or 4. Activities not eligible for SV and do not require an IP.

Notes:

1. Turbidity or sediment resuspension is generally not considered to occur when properly using management techniques to work in dry conditions. See GC 25.
2. Total impact areas under SV Eligible 1-2 exclude use of temporary construction mats. See GC 22 for information on temporary construction mats.
3. An SVN submittal to USACE is not required for SV #3 above.

GP 25. EMERGENCY SITUATIONS (Authorities: §10 and §404)

Structures or work in or affecting navigable waters of the U.S. and the discharge of dredged or fill material into waters of the U.S., including wetlands, necessary for repair or protection measures associated with an emergency situation[1], MassDEP Emergency Declaration/Certification, or FEMA Declared Disaster. The activity shall be the minimum necessary to alleviate the immediate emergency unless that additional work would result in no more than minimal effects to aquatic environment and is necessary to reduce the potential for future failure or loss of the structure or site. Typical activities authorized under this GP include, but are not limited to, restoration of damaged areas; bank stabilization; temporary fills for staging, access, and dewatering; and, repair, replacement, or rehabilitation of existing structures and/or fills (i.e., roads, bridges, utility pipelines and flood control structures, including attendant features, and other existing structures located in waters of the U.S.).

For the restoration of areas damaged by storms floods, or other discrete events: (a) The restored area must not extend waterward of the ordinary high-water mark or high tide line that existed prior to the damage. (b) The slope of the restored area below the ordinary high-water mark or high tide line must not exceed the slope that existed prior to the damage. (c) The bottom elevation of the restored area must not exceed the bottom elevation that existed prior to the damage (i.e., the restored area must not result in a reduction in the depth of the waterbody that existed prior to the damage). (d) Except in cases of FEMA reimbursement, the activity must be initiated, under contract to commence, or funds shall be allocated for the activity within 30 days of authorization under GP 25.

Not authorized under GP 25 (IP required): (a) Permanent impacts for a single and complete project >1/2 acre in tidal waters, unless the district engineer waives this criterion by making a written determination concluding that the activity will result in no more than minimal adverse environmental effects; >1,000 SF in saltmarsh, mud flats, riffle and pool complexes, or non-tidal vegetated shallows; or >100 SF in tidal vegetated shallows; (b) Temporary impacts in tidal waters that are >5,000 SF in saltmarsh, mud flats, or riffle and pool complexes; or >1,000 SF in vegetated shallows; (c) New structures or fills that did not previously exist before the storm event or other discrete event (see other GPs).

Self-Verification Eligible	**Pre-Construction Notification Required**
1. Activities that qualify under a Severe Weather Emergency Declaration pursuant to 310 CMR 10.06(8) and/or receive an Emergency Certification pursuant to 310 CMR 10.06 and/or meet the requirements of 314 CMR 9.12(2) or (3); and 2. Activities eligible under a FEMA Declared Disaster that also comply with #1 above.	1. Activities that are eligible under a FEMA Declared Disaster and do not qualify under SV #1. 2. Minor deviations in the structure or fill area, including those to existing structures or fills are authorized due to changes in materials, construction techniques, requirements of other regulatory agencies, or current construction codes or safety standards that are necessary to alleviate the emergency. 3. Activities that are not eligible for SV and do not require an IP.

Notes:

1. Review the GCs (Section IV) to confirm if a PCN is not required elsewhere in this document.
2. If the activity is not a MassDEP Emergency Declaration/Certification, does not meet the requirements of 314 CMR 9.12(2) or (3), or is not a FEMA Declared Disaster, applicants must explain in writing why their activity qualifies as an emergency (see footnote) to be eligible under GP 25.
3. SV eligible activities qualify under the general 401 WQC MassDEP issued for the 2023 MA GPs (GC 9).

[1] An emergency, as determined by this office and 33 CFR 325.2(e)(4), is one which would result in an unacceptable hazard to life, a significant loss of property, or an immediate, unforeseen, and significant economic hardship if corrective action requiring a Department of the Army permit is not undertaken within a time period less than the normal time to process the request under standard processing procedures.

SECTION IV. GENERAL CONDITIONS:

To qualify for GP authorization, the applicant must comply with the following general conditions, as applicable, in addition to authorization-specific conditions imposed by the division or district engineer.

1. Other Permits
2. Federal Jurisdictional Boundaries
3. Single and Complete Projects
4. Use of Multiple General Permits
5. Suitable Material
6. Tribal Rights & Burial Sites
7. Avoidance, Minimization, and Compensatory Mitigation
8. Water Quality & Stormwater Management
9. Coastal Zone Management
10. Federal Threatened and Endangered Species
11. Essential Fish Habitat
12. National Lands
13. Wild and Scenic Rivers
14. Historic Properties
15. USACE Property and Federal Projects (§408)
16. Navigation
17. Permit/Authorization Letter On-Site
18. Storage of Seasonal Structures
19. Pile Driving and Pile Removal in Navigable Waters
20. Time of Year Restrictions
21. Heavy Equipment in Wetlands
22. Temporary Fill & Construction Mats
23. Restoration of Wetland Areas
24. Bank Stabilization
25. Soil Erosion and Sediment Controls
26. Aquatic Life Movements and Management of Water Flows
27. Spawning, Breeding, and Migratory Areas
28. Vernal Pools
29. Invasive Species
30. Fills Within 100-Year Floodplains
31. Stream Work and Crossings & Wetland Crossings
32. Utility Line Installation and Removal
33. Water Supply Intakes
34. Coral Reefs
35. Blasting
36. Inspections
37. Maintenance
38. Property Rights
39. Transfer of GP Verifications
40. Modification, Suspension, and Revocation
41. Special Conditions
42. False or Incomplete Information
43. Abandonment
44. Enforcement Cases
45. Previously Authorized Activities
46. Duration of Authorization

1. Other Permits. Authorization under these GPs does not obviate the need for the permittee to obtain other Federal, State, or local permits, approvals, or authorizations required by law. Permittees are responsible for obtaining all required permits, approvals, or authorizations. Activities that are not regulated by the State, but subject to USACE jurisdiction, may still be eligible for these GPs.

2. Federal Jurisdictional Boundaries.
a. Applicability of these GPs shall be evaluated with reference to Federal jurisdictional boundaries. Activities shall be evaluated with reference to "waters of the U.S." under the CWA (33 CFR 328) and "navigable waters of the U.S." under §10 of the Rivers and Harbors Act of 1899 (33 CFR 329). Permittees are responsible for ensuring that the boundaries used satisfy the Federal criteria defined at 33 CFR 328-329. These sections prescribe the policy, practice, and procedures to be used in determining the extent of the USACE jurisdiction. Note: Waters of the U.S. includes all waters pursuant to 33 CFR 328.3(a), and adjacent wetlands as the term is defined in 33 CFR 328.3(c).
b. Wetlands shall be delineated in accordance with the USACE Wetlands Delineation Manual and the most recent Northcentral/Northeast Regional Supplement. Wetland delineation and jurisdiction information is located at: www.nae.usace.army.mil/missions/regulatory/jurisdiction-and-wetlands and maps are located at www.nae.usace.army.mil/missions/regulatory/state-general-permits/massachusetts-general-permit.
c. Vegetated shallows shall be delineated when present on the project site. Vegetated shallow survey guidance and maps are located at: www.nae.usace.army.mil/missions/regulatory/state-general-permits/massachusetts-general-permit.
d. Natural rocky habitats shall be delineated when present on the project site. The definition of natural rocky habitats is in Section VII of the MA GP. Natural rocky habitat survey guidance and maps are located at: www.nae.usace.army.mil/ missions/regulatory/state-general-permits/massachusetts-general-permit.

3. Single and Complete Projects. The MA GP shall not be used for piecemeal work and shall be applied to single and complete projects. The term "single and complete project" is defined at 33 CFR 330.2(i) as the total project proposed or accomplished by one owner/developer or partnership or other association of owners/developers.
a. For non-linear projects, a single and complete project must have independent utility. Portions of a multi-phase project that depend upon other phases of the project do not have independent utility. Phases of a project that would be constructed, even if the other phases were not built, can be considered as separate single and complete projects with independent utility.
b. Unless USACE determines the activity has independent utility, all components of a single project and/or all planned phases of a multi-phased project (e.g., subdivisions should include all work such as roads, utilities, and lot development) shall be evaluated as one single and complete project.
c. For linear projects such as power lines or pipelines with multiple crossings, a "single and complete project" is all crossings of a single water of the U.S. (i.e., single waterbody) at a specific location. For linear projects crossing a single waterbody several times at separate and distant locations, each crossing is considered a single and complete project. However, individual channels in a braided stream or river, or individual arms of a large, irregularly shaped wetland or lake, etc., are not separate waterbodies, and crossings of such features cannot be considered separately. If any crossing requires a PCN review or an individual permit review, then the entire linear project shall be reviewed as one project under PCN or the individual permit procedures.

4. Use of Multiple General Permits. The use of more than one GP for a single and complete project is prohibited, except when the acreage loss of waters of the U.S. authorized by the GPs does not exceed the acreage limit of the GPs with the highest specified acreage limit. For example, if a road crossing over waters is constructed under GP 23, with an associated utility line

crossing authorized by GP 6, if the maximum acreage loss of waters of the U.S. for the total project is ≥1 acre it shall be evaluated as an IP.

5. Suitable Material & Discharge of Pollutants. No activity may use unsuitable material (e.g., trash, debris, car bodies, asphalt, etc.). All activities involving any discharge into waters of the U.S. authorized under these GPs shall be consistent with applicable water quality standards, effluent limitations, standards of performance, prohibitions, and pretreatment standards and management practices established pursuant to the CWA (33 U.S.C. 1251), and applicable state and local laws. If applicable water quality standards, limitations, etc., are revised or modified during the term of this GP, the authorized work shall be modified to conform with these standards within six months from the effective date of such revision or modification, or within a longer period of time deemed reasonable by the District Engineer in consultation with the Regional Administrator of the EPA. Unless monitoring data indicates otherwise, applicants may presume that their activity complies with state water quality standards provided they are in compliance with the Section 401 WQC (Applicable only to the Section 404 activity).

6. Tribal Rights & Burial Sites

a. For all SV and PCN applications, prospective permittees shall follow the guidance set forth in Appendix A, Guidance for NHPA Section 106 Compliance in Massachusetts.

b. No activity or its operation may impair reserved tribal rights, including, but not limited to, reserved water rights and treaty fishing and hunting rights.

c. Many tribal resources are not listed on the National Register of Historic Places (NRHP) and may require identification and evaluation in collaboration with the identifying tribe and by qualified professionals. The Tribal Historic Preservation Officer (THPO) and State Historic Preservation Officer (SHPO) may be able to assist with locating information on:

i. Previously identified tribal resources; and
ii. Areas with potential for the presence of tribal resources.

d. Discovery of Previously Unknown Remains and Artifacts: If any previously unidentified human remains, cultural deposits, or artifacts are discovered while accomplishing the activity authorized by this permit, you must immediately notify the USACE of what you have found, and to the maximum extent practicable, cease work and avoid construction activities that may affect the remains and artifacts until the required coordination has been completed. The USACE will initiate the appropriate the Federal, Tribal, and state coordination required to determine if the items or remains are eligible for listing in the NRHP and warrant a recovery effort or can be avoided.

e. Burial Sites: Burial sites, marked or unmarked, are subject to state law (Massachusetts Unmarked Burial Law). Native American burial sites on federal or tribal land are subject to the provisions of Native American Graves Protection and Repatriation Act (NAGPRA). Regulated activities may not result in disturbance or removal of human remains until disposition of the remains has been determined by the appropriate authority under these laws, and the work is authorized by the USACE. Regulated activities which result in an inadvertent discovery of human remains must stop immediately, and the USACE, as well as the appropriate state and tribal authority, must be notified. Regulated work at inadvertent discovery sites requires compliance with state law or NAGPRA, as appropriate, prior to re-starting work.

7. Avoidance, Minimization, and Compensatory Mitigation. To qualify under the MA GP, activities must comply with Section V Mitigation Standards and the following as applicable:

a. Avoid and Minimize: Activities must be designed and constructed to avoid and minimize adverse effects, both temporary and permanent, to waters of the U.S. to the maximum extent practicable at the project site. Avoidance and minimization are required to the extent necessary to ensure that the adverse effects to the aquatic environment (both area and function) are no more than minimal.

b. Compensatory mitigation for unavoidable impacts to waters of the U.S., including direct, indirect, secondary, and temporal loss, will generally be required for permanent impacts that exceed the thresholds identified in Section V, and may be required for temporary impacts, to offset unavoidable impacts which remain after all appropriate and practicable avoidance and minimization has been achieved and to ensure that the adverse effects to the aquatic environment are no more than minimal. Proactive restoration projects or temporary impact work with no secondary effects may generally be excluded from this requirement.
c. Mitigation proposals shall follow the guidelines found in the Compensatory Mitigation for Losses of Aquatic Resources; Final Rule April 10, 2008; 33 CFR 332. Prospective permittees may purchase mitigation credits in-lieu of permittee-responsible mitigation as compensation for unavoidable impacts to waters of the U.S. in the Commonwealth of Massachusetts.

8. Water Quality & Stormwater Management. The 401 WQC requirement applies to all activities listed under GPs 1-25, unless determined otherwise by MassDEP. Permittees shall also satisfy stormwater management requirements in Massachusetts.

a. General 401 WQC: MassDEP issued a WQC on April 21, 2023 which conditionally certifies all activities in GPs 1 – 24 eligible for SV and PCN so long as the activity is described in 314 CMR 9.03, and is not an activity described in 314 CMR 9.04, and so long as the activity meets all other requirements, terms and conditions of the WQC. The MassDEP WQC also conditionally certifies activities described in GP 25 so long as the activity meets all other conditions of the WQC. Emergency projects described in GP 25 must obtain an emergency certification or otherwise be authorized pursuant to 310 CMR 10.06, qualify under a Severe Weather Emergency Declaration pursuant to 310 CMR 10.06(8) issued by the MassDEP, or meet the requirements of 9.12(2) or (3) in order to be certified under the WQC. Prospective permittees may refer to the following link to determine if their activity is eligible: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/ Massachusetts-General-Permit/. The General 401 WQC is located here, and it provides detailed information regarding what activities are certified and the conditions for certification. Activities listed in 314 CMR 9.03 that are not exempt from the Wetland Protection Act must have a valid Final Order of Conditions (OOC) or Final Restoration Order of Conditions pursuant to 310 CMR 10.00 to be eligible under the General 401 WQC.
b. Individual 401 WQC: Prospective permittees shall contact MassDEP and apply for an individual 401 WQC if their activity does not qualify for a General 401 WQC as outlined above. MassDEP may issue, waive, or deny the individual 401 WQC on a case-by-case basis. All activities listed in 314 CMR 9.04 must obtain an individual 401 WQC from MassDEP to be eligible under these GPs. When an Individual 401 WQC is required for *PCN activities*, the prospective permittee shall submit their Individual 401 WQC application concurrently to MassDEP and USACE to comply with 40 CFR 121.
c. The prospective permittee is responsible for determining the appropriate 401 WQC requirement and submitting this information to the USACE at the time of their PCN application or when completing their SVN. Prospective permittees that are unsure of whether their activity has been certified should contact MassDEP for a determination.
d. As applicable, all activities shall be compliant with the Massachusetts Stormwater Handbook. The Stormwater Handbook can be accessed on the NAE Regulatory website here: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/.
e. No work requiring authorization under Section 404 of the CWA may be performed unless (1) the prospective permittee qualifies for coverage under the April 21, 2023 General 401 WQC, (2) the prospective permittee receives an individual Section 401 WQC from the MassDEP, or (3) the MassDEP waives individual Section 401 WQC.

9. Coastal Zone Management. The permittee must obtain CZM consistency concurrence when an activity is located in the coastal zone in order to be eligible under the MA GP. This requirement

shall be satisfied by acquiring one of the following from the Massachusetts Office of Coastal Zone Management (MA CZM):

a. General CZM Federal Consistency Concurrence (General Concurrence): MA CZM has granted General Concurrence for all SV and PCN activities for GPs 1-25. The prospective permittee must obtain all applicable permits and approvals before construction of the authorized activity begins (e.g., before work begins on site). For SVs, General Concurrence is automatically granted and no further action is required from the prospective permittee. For PCNs, the USACE will coordinate with MA CZM to acquire General Concurrence as part of the PCN application review.
b. Individual CZM Federal Consistency Concurrence (Individual Concurrence): In certain cases, MA CZM may elevate any GP activity 1-25 and require Individual Concurrence. The prospective permittee must contact MA CZM and follow the procedures to obtain Individual Concurrence as determined appropriate by MA CZM.
c. Permittees must obtain CZM consistency concurrence as outlined above before commencing work authorized under these GPs.

10. Federal Threatened and Endangered Species

a. No activity is authorized under any GP which is likely to directly or indirectly jeopardize the continued existence of a threatened or endangered species or a species proposed for such designation, as identified under the Federal Endangered Species Act (ESA), or which will directly or indirectly destroy or adversely modify designated critical habitat or critical habitat proposed for such designation. No activity is authorized under any GP which “may affect” a listed species or critical habitat, unless ESA section 7 consultation addressing the consequences of the proposed activity on listed species or critical habitat has been completed. See 50 CFR 402.02 for the definition of “effects of the action” for the purposes of ESA section 7 consultation, as well as 50 CFR 402.17, which provides further explanation under ESA section 7 regarding “activities that are reasonably certain to occur” and “consequences caused by the proposed action.”
b. Other Federal agencies should follow their own procedures for complying with the requirements of the ESA (see 33 CFR 330.4(f)(1)). If a PCN is required for the proposed activity, the Federal permittee must provide USACE with the appropriate documentation to demonstrate compliance with those requirements. The USACE will verify that the appropriate documentation has been submitted. If the appropriate documentation has not been submitted, additional ESA section 7 consultation may be necessary for the activity and the respective federal agency would be responsible for fulfilling its obligation under section 7 of the ESA.
c. USFWS ESA-Listed Species: Non-federal applicants shall use the USFWS website, Information for Planning and Consultation (IPAC), to determine if their activity is located within the ESA-listed species range. The IPAC website can be accessed on the NAE Regulatory website: https://www. nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/. Applicants shall ensure they have an updated, valid species list before construction begins. This may require applicants to update their species list in IPAC before the start of construction. Note: Applicants should refer to the NAE Regulatory Website at the link above to determine if they have been designated as a non-federal representative. Applicants shall complete Section 7 consultation according to the guidance document located on the NAE Regulatory Website. After completing the Rangewide Determination Key and reaching the outcome “may affect, not likely to adversely affect”, you may be required to wait up to 15 days before that outcome is final and compliance under Section 7 of the ESA is fulfilled.

i. *Self-Verification Criteria*: The activity is SV-eligible if:
   1) The activity is not located within the ESA-listed species range;
   2) Another (lead) Federal agency has completed Section 7 consultation; or
   3) The activity is located within the ESA-listed species range ***and*** USACE has designated the applicant as a non-federal representative under 50 CFR 402.08 of the ESA for all

species within the project's action area. As the non-federal representative, the applicant shall complete consultation through IPAC and reach the outcome of "no effect" or "not likely to adversely affect".

ii. *Pre-Construction Notification Criteria*: The activity requires a PCN if:

1) The activity is located within the ESA-listed species range ***and*** USACE has NOT designated the applicant as a non-federal representative under 50 CFR 402.08 of the ESA for all species within the project's action area;

2) The activity is located in designated or proposed critical habitat; or

3) The activity is located within the ESA-listed species range and completion of the IPAC determination key has resulted in the outcome of "may affect" or "may affect, likely to adversely affect"; or

4) A PCN is required elsewhere in this document.

d. NOAA-Listed Species: Non-federal applicants shall refer to the Section 7 Mapper for federally listed species to determine if any species are mapped as present. When NOAA-listed species are present, the applicant shall generate a species report through the mapper and submit this document as part of their PCN or SVN submission. The NOAA Fisheries' Section 7 Mapper can be accessed here on the NAE Regulatory website here: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/.

e. Authorization of an activity by an GP does not authorize the "take" of a threatened or endangered species as defined under the ESA. In the absence of separate authorization (e.g., an ESA Section 10 Permit, a Biological Opinion with "incidental take" provisions, etc.) from the FWS or the NMFS, the Endangered Species Act prohibits any person subject to the jurisdiction of the United States to take a listed species, where "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. The word "harm" in the definition of "take" means an act which actually kills or injures wildlife. Such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering.

11. Essential Fish Habitat (EFH).

a. SV eligible activities have been determined to result in no more than minimal adverse effects, provided the permittee complies with all terms and conditions of the MA GP as appliable to the activity. NMFS has granted General Concurrence [50 CFR 600.920(g)] for all SV eligible activities. These activities do not require project specific EFH consultation.

b. For PCN required activities, the applicant is required to describe and identify potential adverse effects to EFH and should refer to NOAA Fisheries' EFH Mapper (http://www.fisheries.noaa.gov/resource/map/essential-fish-habitat-mapper) and Omnibus Essential Fish Habitat Amendment 2 Volume 2: EFH and HAPC Designation Alternatives and Environmental Impacts (https://www.habitat.noaa.gov/application/efhmapper/oa2_efh_hapc.pdf). If an activity is located within EFH, the PCN application must contain:

1. A description of the action located in EFH.
2. An analysis of the potential adverse effects of the action on EFH and the managed Species.
3. Conclusions regarding the effects of the action on EFH.
4. Proposed mitigation, if applicable (refer to the mitigation thresholds located in Section V).

c. Federal agencies shall follow their own procedures for complying with the EFH requirements of the Magnuson-Stevens Fishery Conservation and Management Act. For activities requiring a PCN, the applicant is responsible for furnishing documentation that demonstrates consultation for EFH has been completed.

d. For PCN activities, no work may commence until EFH consultation as required by the Magnuson-Stevens Act has been completed.

12. National Lands. Activities that impinge upon the value of any National Wildlife Refuge, National Forest, National Marine Sanctuary, National Historic Landmarks or any other area administered by the National Park Service, U. S. Fish and Wildlife Service (USFWS) or U.S. Forest Service (USFS) require a PCN or Individual Permit. Federal land managers seeking authorization for activities located in the above listed National Lands may proceed under SV, unless a PCN is required elsewhere in this document.

13. Wild and Scenic Rivers. The following activities in designated river or study river segments in the National Wild and Scenic River (WSR) System require a PCN unless the Federal agency with direct management responsibility for such river, in Massachusetts this is generally the National Park Service, has determined in writing to the proponent that the proposed work will not adversely affect the WSR designation or study status:

a. Activities that occur in WSR segments, in and 0.25 miles up or downstream of WSR segments, or in tributaries within 0.25 miles of WSR segments;
b. Activities that occur in wetlands within 0.25 miles of WSR segments;
c. Activities that have the potential to alter free-flowing characteristics in WSR segments.

No GP activity may occur in a component of the National Wild and Scenic River System, or in a river officially designated by Congress as a “study river” for possible inclusion in the system while the river is in an official study status, unless the appropriate Federal agency with direct management responsibility for such river, has determined in writing that the proposed activity will not adversely affect the Wild and Scenic River designation or study status.

As of May 10, 2023, affected rivers in Massachusetts include: the Taunton River (40 miles), Sudbury River (16.6 miles), Assabet River (4.4 miles), Concord River (8 miles), Nashua River (27 miles), Squannacook River (16.3 miles), Nissitissit River (4.7 miles), and the Westfield River, including West Branch, Middle Branch, Gendale Brook, East Branch, Drowned Land Brook, Center Brook, Windsor Jambs Brook, Shaker Mill Brook, Depot Brook, Savery Brook, Watson Brook, Center Pond Brook (78.1 miles). The most up to date list of designated and study rivers and their descriptions may be obtained from the appropriate Federal land management agency responsible for the designated Wild and Scenic River or study river (e.g., National Park Service, U.S. Forest Service, Bureau of Land Management, U.S. Fish and Wildlife Service). Information on these rivers is also available at: http://www.rivers.gov/.

14. Historic Properties

a. For all SV and PCN applications, permittees shall follow the guidance set forth in Appendix A, Guidance for NHPA Section 106 Compliance in Massachusetts.

b. No undertaking authorized by these GPs shall cause effects[1] (defined in 36 CFR Part 800 and 33 CFR Part 325, Appendix C, and its Interim Guidance) on properties listed on, determined to be eligible for listing on, or potentially eligible for listing on the National Register of Historic Places (NRHP)[2], including previously unknown historic properties within the permit area, unless the USACE or another Federal action agency has satisfied the consultation requirements of Section 106 of the National Historic Preservation Act (Section 106). If another Federal agency is determined the lead federal agency for compliance with Section 106, applicant must obtain the appropriate documentation and provide this information to the USACE to demonstrate compliance with Section 106. The applicant shall not begin the activity until the USACE notifies them in writing that the documentation provided satisfies Section 106 requirements.

[1] Effect means the alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register of Historic Properties.
[2] See the NAE Regulatory website, National Register of Historic Places link here: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/.

c. Many historic properties are not listed on the NRHP and may require identification and evaluation by qualified historic preservation and/or archaeological consultants. The State Historic Preservation Officer (SHPO), Massachusetts Board of Underwater Archaeological Resources (BUAR), local historical societies, certified local governments, general public, and NRHP may also be able to assist with locating information on:

i. Previously identified historic properties; and
ii. Areas with potential for the presence of historic properties.

d. Discovery of Previously Unknown Remains and Artifacts: If any previously unidentified human remains, cultural deposits, or artifacts are discovered while accomplishing the activity authorized by this permit, you must immediately notify the USACE of what you have found, and to the maximum extent practicable, cease work and avoid construction activities that may affect the remains and artifacts until the required coordination has been completed. The USACE will initiate the Federal, State and tribal coordination required to determine if the items or remains warrant a recovery effort and/or if the site is eligible for listing in the National Register of Historic Places.

e. Section 110k: Prospective permittees should be aware that section 110k of the NHPA (54 U.S.C. § 306113) prevents the USACE from granting a permit or other assistance to an applicant who, with intent to avoid the requirements of Section 106, has intentionally significantly adversely effected a historic property to which the permit would relate, or having legal power to prevent it, allowed such significant adverse effect to occur, unless the USACE, after consultation with the Advisory Council on Historic Preservation (ACHP), determines that circumstances justify granting such assistance despite the adverse effect created or permitted by the applicant. If circumstances justify granting the assistance, the USACE is required to notify the ACHP and provide documentation specifying the circumstances, the degree of damage to the integrity of any historic properties effected, and proposed mitigation. This documentation must include any views obtained from the applicant, SHPO/THPO, appropriate Indian tribes if the undertaking occurs on or effects historic properties on tribal lands or effects properties of interest to those tribes, and other parties known to have a legitimate interest in the impacts to the permitted activity on historic properties.

f. Underwater Archaeological Resources: Under Massachusetts General Law Ch. 6, s.'s 179-180, and Ch. 91, s. 63, the BUAR has statutory jurisdiction within state waters and is the sole trustee of the Commonwealth's underwater heritage, charged with the responsibility of encouraging the discovery and reporting, as well as the preservation and protection, of underwater archaeological resources. Underwater archaeological resources located within the waters of the Commonwealth of Massachusetts are property of the Commonwealth, which holds title to these resources and retains regulatory authority over their use. Under Massachusetts General Law, no person, organization or corporation may "remove, displace, damage, or destroy" any underwater archaeological resources located within the Commonwealth's submerged lands except through consultation with the BUAR and in conformity with the permits it issues. https://www.mass.gov/orgs/board-of-underwater-archaeological-resources.

15. USACE Property and Federal Projects. (33 USC §408)

a. USACE projects and property can be found at: https://www.nae.usace.army.mil/Missions/Civil-Works/.

b. In addition to any authorization under these GPs, prospective permittee shall contact the USACE Real Estate Division (https://www.nae.usace.army.mil/Missions/Real-Estate-Division/) at (978) 318-8585 for work occurring on or potentially affecting USACE properties and/or USACE-controlled easements. Work may not commence on USACE properties and/or USACE-controlled easements until they have received any required USACE real estate documents evidencing site-specific permission to work.

c. Any proposed temporary or permanent occupation or alteration of a Federal project (including, but not limited to, a levee, dike, floodwall, channel, anchorage, breakwater, seawall, bulkhead, jetty, wharf, pier, or other work built or maintained but not necessarily owned by the United States),

is not eligible for SV and requires a PCN. This includes all proposed structures and work in, over, or under a USACE federal navigation project (FNP) or in the FNP's buffer zone. The buffer zone is an area that extends from the horizontal limits of the FNP to a distance of three times the FNP's authorized depth. The activity also requires review and approval by the USACE pursuant to 33 USC 408 (Section 408 Permission). The prospective permittee may reach out to the POCs located here: https://www.nae.usace.army.mil/ Missions/Section-408/.
d. Any structure or work constructed in a FNP or its buffer zone shall be subject to removal at the owner's expense prior to any future USACE dredging or the performance of periodic hydrographic surveys.
e. Where a Section 408 permission is required, written verification for the PCN will not be issued prior to the decision on the Section 408 permission request.

16. Navigation
a. No activity may cause more than a minimal adverse effect on navigation.
b. Any safety lights and signals prescribed by the U.S. Coast Guard, must be installed, and maintained at the permittee's expense on authorized facilities in navigable waters of the U.S.
c. There shall be no unreasonable interference with navigation by the existence or use of the activity authorized herein, and no attempt shall be made by the permittee to prevent the full and free use by the public of all navigable waters at or adjacent to the activity authorized herein.
d. The permittee understands and agrees that if future U.S. operations require the removal, relocation, or other alteration of the structure or work herein authorized, or if, in the opinion of the Secretary of the Army or his authorized representative, said structure or work shall cause unreasonable obstruction to the free navigation of the navigable waters, the permittee will be required, upon due notice from USACE, to remove, relocate, or alter the structural work or obstructions caused thereby, without expense to the U.S. No claim shall be made against the U.S. on account of any such removal or alteration.

17. Permit/Authorization Letter On-Site. For PCNs, the permittee shall ensure that a copy of these GPs and the accompanying authorization letter are at the work site (and the project office) whenever work is being performed, and that all personnel with operational control of the site ensure that all appropriate personnel performing work are fully aware of its terms and conditions. The entire permit authorization shall be made a part of any and all contracts and sub-contracts for work that affects areas of USACE jurisdiction at the site of the work authorized by these GPs. This shall be achieved by including the entire permit authorization in the specifications for work. The term "entire permit authorization" means these GPs, including GCs and the authorization letter (including its drawings, plans, appendices, special conditions, and other attachments), and any permit modifications. If the authorization letter is issued after the construction specifications, but before receipt of bids or quotes, the entire permit authorization shall be included as an addendum to the specifications. If the authorization letter is issued after receipt of bids or quotes, the entire permit authorization shall be included in the contract or sub-contract as a change order. Although the permittee may assign various aspects of the work to different contractors or sub-contractors, all contractors and sub-contractors shall be obligated by contract to comply with all environmental protection provisions contained within the entire authorization letter, and no contract or sub-contract shall require or allow unauthorized work in areas of USACE jurisdiction. For SVs, the permittee shall ensure that a complete and signed copy of the SVN is present on site during construction and is made available for review at any time by USACE and other Federal, State, & Local regulatory agencies. A complete and signed copy of the SVN must be submitted to USACE Regulatory within 30 days of initiating construction of the authorized activity, unless stated otherwise in the applicable GP.

18. Storage of Seasonal Structures. Coastal structures such as pier sections, floats, etc., that

are removed from the waterway for a portion of the year (often referred to as seasonal structures) shall be stored in an upland location, located above MHW and not in tidal wetlands. These seasonal structures may be stored on the fixed, pile-supported portion of the structure that is seaward of MHW. This is intended to prevent structures from being stored on the marsh substrate and the substrate seaward of MHW.

19. Pile Driving and Pile Removal in Navigable Waters.
a. Derelict, degraded or abandoned piles and sheet piles in navigable waters of the U.S., except for those inside existing work footprints for piers, must be completely removed, cut and/or driven to 3 feet below the substrate to prevent interference with navigation, and existing creosote piles that are affected by project activities shall be completely removed if practicable. In areas of fine-grained substrates, piles must be removed by the direct, vibratory or clamshell pull method[1] to minimize sedimentation and turbidity impacts and prevent interference with navigation from cut piles. Removed piles shall be disposed of in an upland location landward of MHW or OHW and not in wetlands, tidal wetlands or mudflats.
b. A PCN is required for the installation or removal of structures with jetting techniques.
c. A PCN is required for the installation of >12 inch-diameter piles of any material type or steel piles of any size in tidal waters, unless they are installed in the dry. If piles are not installed in the dry:
i. Impact pile driving shall commence with an initial set of three strikes by the hammer at 40% energy, followed by a one-minute wait period, then two subsequent 3-strike sets at 40% energy, with one minute waiting periods, before initiating continuous impact driving.
ii. Vibratory pile driving shall be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period shall be repeated two more times, followed immediately by pile-driving at full rate and energy.
iii. In addition to using a soft start at the beginning of the workday for pile driving as described in 19c(i-ii), a soft start must also be used at any time following a cessation of pile driving for a period of 30 minutes or longer.
d. Bubble curtains may be used to reduce sound pressure levels during vibratory or impact hammer pile driving.

20. Time-of-Year (TOY) Restrictions. Activities that include in-water work must comply with the TOY Restrictions below to be SV eligible, otherwise a PCN is required. PCN submittals shall contain written justification for deviation from the TOY Restrictions. The term “in-water work” does not include conditions where the work site is “in-the-dry” (e.g., intertidal areas exposed at low tide). The term “in-the-dry” includes work contained within a cofferdam so long as the cofferdam is installed and subsequently removed outside the TOY Restriction. The TOY restrictions stated in Appendix B of the MA DMF Technical Report TR-47[2] can apply instead for activities in tidal waters if (1) TOYs are provided for a specific waterbody where the activity is proposed and (2) the TOYs are less restrictive than below. The activity must also not require a PCN elsewhere in this document to be SV eligible.

[1] Direct Pull: Each piling is wrapped with a choker cable or chain that is attached at the top to a crane. The crane then pulls the piling directly upward, removing the piling from the sediment. Vibratory Pull: The vibratory hammer is a large mechanical device (5-16 tons) that is suspended from a crane by a cable. The vibrating hammer loosens the piling while the crane pulls up. Clamshell Pull: This can remove intact, broken or damaged pilings. The clamshell bucket is a hinged steel apparatus that operates like a set of steel jaws. The bucket is lowered from a crane and the jaws grasp the piling stub as the crane pulls up. The size of the clamshell bucket is minimized to reduce turbidity during piling removal.
[2] The MA DMF Technical Report TR-47: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/

	TOY Restriction (No work)
Non-tidal Waters	Defer to TR-47
Tidal Waters	January 15 – November 15

Alternate work windows proposed under a PCN will generally be coordinated with the USFWS and NMFS. Resulting written verifications may include species-specific work allowed windows.

21. Heavy Equipment in Wetlands. Operating heavy equipment (drill rigs, fixed cranes, etc.) within wetlands shall be minimized, and such equipment shall not be stored, maintained, or repaired in wetlands, to the maximum extent practicable. Where construction requires heavy equipment operation in wetlands, the equipment shall:

i. Have low ground pressure (typically ≤3 psi);

ii. Be placed on swamp/construction/timber mats (herein referred to as "construction mats" or "mats") that are adequate to support the equipment in such a way as to minimize disturbance of wetland soil and vegetation. See GC 22 for information on the placement of construction mats; or

iii. Be operated on adequately dry or frozen wetlands such that shear pressure does not cause subsidence of the wetlands immediately beneath the equipment and upheaval of adjacent wetlands. Construction mats are to be placed in the wetland from the upland or from equipment positioned on mats if working within a wetland. Dragging construction mats into position is prohibited. Other support structures that are capable of safely supporting equipment may be used with written USACE authorization.

22. Temporary Fill, Work & Construction Mats.

a. *Construction mats in non-tidal waters*: Temporary construction mats shall be in place ≤1 year *and* for one growing season or less to be SV eligible. A PCN is required if construction mats are in place >1 year *or* for more than one growing season. Construction mats can be placed in an area of any size in non-tidal waters. The activity may occur in segments to ensure the requirements for SV above are met, otherwise a PCN is required.

b. *Construction mats in tidal waters*: Temporary construction mats placed in an area <5,000 SF in tidal waters are SV eligible, provided those mats are in place ≤6 months. Temporary construction mats placed in an area ≥5,000 SF or in place >6 months in tidal waters require a PCN.

c. *Management of construction mats:* At a minimum, construction mats shall be managed in accordance with the following construction mat best management practices (BMPs):

1. Mats shall be in good condition to ensure proper installation, use, and removal.
2. As feasible, mats shall be placed in a location that will minimize the amount of mats needed for the wetland crossing(s).
3. Inspect mats prior to their re-use and remove any plant debris. Mats are to be thoroughly cleaned before re-use to prevent the spread of invasive plant species.
4. Impacts to wetland areas shall be minimized during installation, use, and removal of the mats.
5. Adequate erosion & sediment controls shall be installed at approaches to mats to promote a smooth transition to, and minimize sediment tracking onto, the mats.
6. In most cases, mats should be placed along the travel area so that the individual boards are resting perpendicular to the direction of traffic. No gaps should exist between mats. Place mats far enough on either side of the resource area to rest on firm ground.

d. A PCN is required for temporary fills in place >2 years. All temporary fills and disturbed soils shall be stabilized to prevent the material from eroding into waters of the U.S. where it is not authorized. Work shall include phased or staged development to ensure only areas under active development are exposed and to allow for stabilization practices as soon as practicable. Temporary fill must be placed in a manner that will prevent it from being eroded by expected high flows.

e. Activities that require unconfined temporary fill and are authorized for discharge into waters of the U.S. shall consist of material that minimizes effects to water quality.
f. Appropriate measures must be taken to maintain normal downstream flows and minimize flooding to the maximum extent practicable when temporary structures, work, and discharges of dredged or fill material, including cofferdams, are necessary for construction activities, access fills, or dewatering of construction sites. Materials shall be placed in a location and manner that does not adversely impact surface or subsurface water flow into or out of the wetland. Temporary fill authorized for discharge into wetlands shall be placed on geotextile fabric or other appropriate material laid on the pre-construction wetland grade where practicable to minimize impacts and to facilitate restoration to the original grade. Construction mats are excluded from this requirement.
g. Construction debris and deteriorated materials shall not be located in waters of the U.S.
h. Temporary fills, construction mats, and corduroy roads shall be entirely removed as soon as they are no longer needed to construct the authorized activity and the disturbed areas be restored to pre-construction contours and conditions.
i. Construction equipment, such as temporary barges in tidal waters, shall provide clearance above the substrate to avoid grounding onto the substrate during all tides.

23. Restoration of Wetland Areas.
a. Upon completion of construction, all disturbed wetland areas shall be stabilized with a wetland seed mix or plant plugs containing only plant species native to New England, and be appropriate for site conditions, including salinity and frequency of inundation, and shall not contain any species listed in the “Invasive and Other Unacceptable Plant Species” Appendix K of the New England District “Compensatory Mitigation Standard Operating Procedures” found at https://www.nae.usace.army.mil/Missions/Regulatory/Mitigation.aspx.
b. The introduction or spread of invasive plant species in disturbed areas shall be prevented and controlled. Equipment shall be thoroughly cleaned before and after project construction to prevent the spread of invasive species. This includes, but is not limited to, tire treads and construction mats.
c. In areas of authorized temporary disturbance, if trees are cut in USACE jurisdiction, they shall be cut at or above ground level and not uprooted in order to prevent disruption of any kind to the wetland soil structure and to allow stump sprouts to revegetate the work area, unless otherwise authorized.
d. Wetland areas where permanent disturbance is not authorized shall be restored to their original condition and elevation, which under no circumstances shall be higher than the pre-construction elevation. Original condition means careful protection and/or removal of existing soil and vegetation, and replacement back to the original location such that the original soil layering and vegetation schemes are approximately the same, unless otherwise authorized.

24. Bank Stabilization.
a. Projects involving construction or reconstruction/maintenance of bank stabilization within USACE jurisdiction shall be designed to minimize environmental effects, effects to neighboring properties, scour, conversion of natural shoreline to hard armoring, etc. to the maximum extent practicable.
b. Projects involving the construction of new bank stabilization within USACE jurisdiction shall use bioengineering techniques and natural materials in the project design to the maximum extent practicable. Use of hard structures shall be eliminated or minimized unless the prospective permittee can demonstrate that use of bioengineering techniques is not practicable due to site conditions.
c. Where possible, bank stabilization projects shall optimize the natural function of the shoreline, including self-sustaining stability to attenuate flood flows, fishery, wildlife habitat and water quality protection, while protecting upland infrastructure from storm events that can cause erosion as well as impacts to public and private property.
d. No material shall be placed in excess of the minimum needed for erosion protection.
e. No material shall be placed in a manner that will be eroded by normal or expected high flows (properly anchored native trees and treetops may be used in low energy areas).

f. Native plants appropriate for current site conditions, including salinity, must be used for bioengineering or vegetative bank stabilization.
g. The activity must be properly maintained, which may require repairing it after severe storms or erosion events.

25. Soil Erosion and Sediment Controls.
a. Appropriate soil erosion and sediment controls[1] (hereinafter referred to as "controls") must installed prior to earth disturbance and maintained in effective operating condition during construction. Biodegradable wildlife friendly erosion controls should be used whenever practicable to minimize effects to water quality.
b. Activities in streams (rivers, streams, brooks, etc.) and tidal waters that are capable of producing sedimentation or turbidity should be done during periods of low-flow or no-flow, when the stream or tide is waterward of the work area. Controls may also be used to obtain dry work conditions (e.g., coffer dam, turbidity curtain). The prospective permittee must demonstrate in the project plans where the controls are proposed and how these controls would avoid and/or minimize turbidity or sedimentation.
c. A PCN is required for controls that encroach: i) >25% of the stream width measured from OHW in non-tidal diadromous streams from March 15 to June 30; or ii) >25% of the waterway width measured from MHW in tidal waters from Feb. 1 to June 30, or >50% of the waterway width measured from MHW in tidal waters from July 1 to Jan. 14. This is to protect upstream fish passage. Proponents must also maintain downstream fish passage throughout the project.
d. No dewatering shall occur with direct discharge to waters or wetlands. Excess water in isolated work areas shall be pumped or directed to a sedimentation basin, tank or other dewatering structures in an upland area adequately separated from waters or wetlands. Suspended solids shall be removed prior to discharge back into waters or wetlands from these dewatering structures. All discharge points back into waters and wetlands shall use appropriate energy dissipaters and erosion and sedimentation control BMPs.
e. Temporary controls shall be removed upon completion of work, but not until all exposed soil and other fills, as well as any work waterward of OHW or the HTL, are permanently stabilized at the earliest practicable date. Sediment and debris collected by these devices shall be removed and placed at an upland location in a manner that will prevent its later erosion into a waterway or wetland. Controls may be left in place if they are biodegradable and flows and aquatic life movements are not disrupted.

26. Aquatic Life Movements and Management of Water Flows.
a. No activity may substantially disrupt the necessary life cycle movements of those species of aquatic life indigenous to the waterbody, including those species that normally migrate through the area, unless the activity's primary purpose is to impound water. All permanent and temporary crossings of waterbodies and wetlands shall be:
i. Suitably spanned, bridged, culverted, or otherwise designed and constructed to maintain low flows to sustain the movement of those aquatic species; and
ii. Properly aligned and constructed to prevent bank erosion or streambed scour both adjacent to and inside the crossing.

[1] Appropriate soil erosion, sediment and turbidity controls include cofferdams, bypass pumping around barriers immediately up and downstream of the work footprint (i.e., dam and pump), installation of sediment control barriers (i.e., silt fence, vegetated filter strips, geotextile silt fences, filter tubes, erosion control mixes, hay bales or other devices) downhill of all exposed areas, stream fords, retention of existing vegetated buffers, application of temporary mulching during construction, phased construction, and permanent seeding and stabilization, etc.

b. To avoid adverse impacts on aquatic organisms, the low flow channel/thalweg shall remain unobstructed during periods of low flow, except when necessary to perform the authorized work.
c. For work in tidal waters, in-stream controls (e.g., cofferdams) should be installed in such a way as to not obstruct fish passage.
d. Riprap and other stream bed materials shall be installed in a manner that avoids organism entrapment in rock voids or water displaced to subterranean flow with crushed stone and riprap.
e. To the maximum extent practicable, the preconstruction course, condition, capacity, and location of open waters must be maintained for each activity, including stream channelization, storm water management activities, and temporary and permanent road crossings, except as provided below. The activity must be constructed to withstand expected high flows. The activity shall not restrict or impede the passage of normal or high flows unless the primary purpose of the activity is to impound water or manage high flows. The activity may alter the pre-construction course, condition, capacity, and location of open waters if it benefits the aquatic environment (e.g., stream restoration or relocation activities).

27. Spawning, Breeding, and Migratory Areas.
a. Activities in spawning areas during spawning seasons must be avoided to the maximum extent practicable. Activities that result in the physical destruction (e.g., through excavation, fill, or downstream smothering by substantial turbidity) of an important spawning area are not authorized under these GPs.
b. Activities in waters of the U.S. that serve as breeding areas for migratory birds must be avoided to the maximum extent practicable.
c. The applicant is responsible for obtaining any "take" permits required under the USFWS's regulations governing compliance with the Migratory Bird Treaty Act or the Bald and Golden Eagle Protection Act. The applicant should contact the appropriate local office of the USFWS to determine if such "take" permits are required for a particular activity.
d. Information on spawning habitat for species managed under the Magnuson-Stevens Fishery Conservation and Management Act (i.e., EFH for spawning adults) can be obtained from NAE Regulatory website, Essential Fish Habitat section, at: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/.
e. Information regarding diadromous fish habitat can be obtained from the following DMF website at: https://www.mass.gov/info-details/massgis-data-diadromous-fish.

28. Vernal Pools.
a. A PCN is required if a discharge of dredged or fill material is proposed within a vernal pool depression that is also a water of the U.S.
b. Vernal pools must be identified on the plans that show aquatic resource delineations.
c. Adverse impacts to vernal pools shall be avoided & minimized to the maximum extent practicable.

29. Invasive Species.
a. The introduction, spread or the increased risk of invasion of invasive plant or animal species on the project site, into new or disturbed areas, or areas adjacent to the project site caused by the site work shall be avoided. Construction mats shall be thoroughly cleaned before reuse to avoid spread of invasive species.
b. Unless otherwise directed by USACE, all applications for PCN non-tidal projects proposing fill in USACE jurisdiction shall include an Invasive Species Control Plan. Additional information can be found at: https://www.nae.usace.army.mil/Missions/Regulatory/Invasive-Species/, https://www.nae.usace.army.mil/Missions/Regulatory/Mitigation/.

30. Fills Within 100-Year Floodplains. The activity shall comply with applicable Federal Emergency Management Agency (FEMA) approved, Massachusetts Emergency Management

Agency (MEMA) approved and/or local floodplain management requirements. Applicants should contact FEMA and/or MEMA regarding floodplain management requirements.

31. Stream Work and Crossings & Wetland Crossings.
a. When feasible, all temporary and permanent crossings of waterbodies and wetlands (hereinafter referred to as "crossings") shall conform to the "Massachusetts River and Stream Crossing Standards" located at: https://www.mass.gov/doc/massachusetts-river-and-stream-crossing-standards/download or https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/. Projects that do not conform to these guidelines shall be reviewed under PCN or IP procedures.
b. Crossings shall be suitably culverted, bridged, or otherwise designed to withstand and to prevent the restriction of high flows, to maintain existing low flows, maintain water quality, and not obstruct the movement of aquatic life indigenous to the waterbody beyond the duration of construction.
c. Crossings shall be installed in such a manner as to preserve hydraulic capacity and flow, sediment transport, and organism passage at its present level, between the wetlands on either side of the road. The applicant shall take necessary measures to correct any wetland damage resulting from deficiencies in hydraulic capacity, sediment transport and organism passage.
d. Stream crossings shall utilize a natural mixed grain-size streambed material composition that matches upstream and downstream substrates to create a stable streambed. Substrate should function appropriately during normal and high flows without washing out. If natural streambed material is not utilized, a PCN is required.
e. Activities involving open trench excavation in flowing waters require a PCN. Work should not occur in flowing waters (requires using management techniques such as temporary flume pipes, culverts, cofferdams, etc.). Normal flows should be maintained within the stream boundary's confines when practicable. Projects utilizing these management techniques must meet all applicable terms and conditions of the GP, including the GCs in Section IV.

32. Utility Line Installation and Removal
a. Subsurface utility lines must be installed at a sufficient depth to avoid damage from anchors, dredging, etc., and to prevent exposure from erosion and stream adjustment.
b. When utility lines are installed via horizontal directional drilling, a frac-out contingency plan shall be present on site for the duration of construction. As necessary, the applicant shall immediately contain, control, recover, and remove drilling fluids released into the environment.
c. Abandoned or inactive utility lines must be removed and faulty lines (e.g., leaking hazardous substances, petroleum products, etc.) must be removed or repaired. A written verification from the USACE is required if they are to remain in place, e.g., to protect sensitive areas or ensure safety.
d. Utility lines shall not adversely alter existing hydrology, and trenches cannot be constructed or backfilled in such a manner as to drain waters of the U.S. (e.g., backfilling with extensive gravel layers, creating a French drain effect). In wetland areas, structures such as ditch plugs, cut-off walls, clay blocks, bentonite, or other suitable material shall be used within utility trenches to ensure that the trench through which the utility line is installed does not drain waters of the U.S. including wetlands.
e. Stockpiling of tree debris, to the extent where it has the effect of fill material, shall not occur in waters of the U.S. Tree debris shall be removed from waters of the U.S. and placed in uplands without causing additional disturbance to aquatic resources. Failure to meet this condition could change the bottom elevation of the wetland and be considered a discharge of fill material, and depending on the area of alteration, may require a PCN or IP.

33. Water Supply Intakes. No activity may occur in the proximity of a public water supply intake, except where the activity is for the repair or improvement of public water supply intake structures or adjacent bank stabilization.

34. Coral Reefs. Impacts to coral reefs are not authorized under these GPs. Coral reefs consist of the skeletal deposit, usually of calcareous or silicaceous materials, produced by the vital activities of anthozoan polyps or other invertebrate organisms present in growing portions of the reef.

35. Blasting. Blasting in waters of the U.S. associated with work such as dredging, trenching, pile installation, etc. is not authorized under these GPs.

36. Inspections. The permittee shall allow USACE to make periodic inspections at any time deemed necessary to ensure that the work is being or has been performed in accordance with the terms and conditions of this permit. To facilitate these inspections, for activities requiring a PCN, the permittee shall complete and return the Certificate of Compliance when it is provided with a PCN verification letter. For SV-eligible activities, the permittee shall complete and submit the SVN to USACE within 30 days of initiating project construction, at which point, USACE may opt to inspect the activity to verify compliance with the terms and conditions of the GP. Post-construction engineering drawings may be required by USACE for completed work. This includes post-dredging survey drawings for any dredging work.

37. Maintenance. The permittee shall maintain the activity authorized by these GPs in good condition and in conformance with the terms and conditions of this permit. Some maintenance activities may not be subject to federal regulation under Section 404 in accordance with 33 CFR 323.4(a)(2). This condition is not applicable to maintenance of dredging projects. Prospective permittees should contact USACE to inquire about maintenance of dredging projects, and its eligibility under these GPs. Maintenance dredging is subject to the review thresholds in GP #7 as well as any conditions included in a written USACE authorization. Maintenance dredging includes only those areas and depths previously authorized and dredged.

38. Property Rights. Per 33 CFR 320.4(g)(6), these GPs do not convey any property rights, either in real estate or material, or any exclusive privileges, nor do they authorize any injury to property or invasion of rights or any infringement of Federal, State, or local laws or regulations.

39. Transfer of GP Verifications. When the work authorized by these GPs is still in existence at the time the property is transferred, the terms and conditions of these GPs, including any special conditions, will continue to be binding on the entity or individual who received the GP authorizations, as well as the new owner(s) of the property. If the permittee sells the property associated with a GP authorization, the applicant may transfer the GP authorization to the new owner by submitting a letter to USACE to validate the transfer. A copy of the GP authorization letter must be attached to the letter, and the letter must include the following statement: “The terms and conditions of these general permits, including any special conditions, will continue to be binding on the new owner(s) of the property.” This letter shall be signed by both the seller and new property owner(s).

40. Modification, Suspension, and Revocation. These GPs and any individual authorization issued thereof may be either modified, suspended, or revoked in whole or in part pursuant to the policies and procedures of 33 CFR 325.7; and any such action shall not be the basis for any claim for damages against the U.S.

41. Special Conditions. The USACE may impose other special conditions on a project authorized pursuant to these GPs that are determined necessary to minimize adverse navigational and/or environmental effects or based on any other factor of the public interest. Failure to comply with all conditions of the authorization, including special conditions, constitutes a permit violation and may subject the applicant to criminal, civil, or administrative penalties or restoration.

42. False or Incomplete Information. If USACE makes a determination regarding the eligibility of a project under these GPs, and subsequently discovers that it has relied on false, incomplete, or inaccurate information provided by the applicant, the authorization will not be valid, and the U.S. Government may institute appropriate legal proceedings.

43. Abandonment. If the permittee decides to abandon the activity authorized under these GPs, unless such abandonment is merely the transfer of property to a third party, he/she/they may be required to restore the area to the satisfaction of USACE.

44. Enforcement cases. These GPs do not apply to any existing or proposed activity in USACE jurisdiction associated with an on-going USACE or EPA enforcement action, until such time as the enforcement action is resolved or USACE or EPA determines that the activity may proceed independently without compromising the enforcement action.

45. Previously Authorized Activities.

a. Completed projects that received prior authorization from USACE (SV or PCN), shall remain authorized in accordance with the original terms and conditions of those authorizations, including their terms, GCs, and any special conditions provided in a written verification.

b. Activities authorized pursuant to 33 CFR 330.3 (activities occurring before certain dates) are not affected by these GPs.

46. Duration of Authorization.

These GPs expire on June 1, 2028. Activities authorized under these GPs will remain authorized until the GPs expire, unless discretionary authority has been exercised on a case-by-case basis to modify, suspend, or revoke the authorization in accordance with 33 CFR 325.2(e)(2). Activities authorized under GPs 1-25 that have either commenced (i.e., are under construction) or are under contract to commence in reliance upon this authorization will have until June 1, 2029 to complete the work. If requested by USACE, the permittee shall furnish documentation that demonstrates the project was under construction or under contract to commence by June 1, 2028. If work is not completed before June 1, 2029, the permittee must contact USACE. The USACE may issue a new authorization provided the project meets the terms and conditions of the MA GPs in effect at the time. Activities completed under the SV or PCN authorizations of these GPs will continue to be authorized after their expiration date.

SECTION V: MITIGATION STANDARDS

1. Mitigation Types

For all activities, applicants must (a) demonstrate how the project has been designed to avoid or minimize impacts to aquatic resources; and (b) describe measures taken to avoid or minimize impacts to aquatic resources through construction techniques and/or site access. Please see https://www.nae.usace.army.mil/Missions/Regulatory/Mitigation/ for assistance with preparing mitigation in accordance with the 2008 Compensatory Mitigation for Losses of Aquatic Resources; Final Rule (33 CFR 332.3), hereafter referred to as "2008 Mitigation Rule."

Avoidance - Avoidance of impacts (direct and indirect) to aquatic resources means that project activities would not result in the placement of fill material or installation of a structure that could impact the resource area. Avoidance can include, but is not limited to, designing the project to avoid impacts to all or a portion of the aquatic resource areas.

Minimization - Minimization of impacts (direct and indirect) to aquatic resources means that measures are taken to ensure the amount and duration of impacts are limited to the maximum extent practicable. There are many minimization measures that could be implemented, prior to, during, or after the proposed activity, to ensure impacts are minimized. Examples include, but are not limited to:

- Permanent preservation of avoided aquatic features and buffer zone, in perpetuity. In these cases, the preserved area would be under a conservation easement and managed by conservation oriented third-party manager.
- Utilization of best management practices (BMPs) to ensure impacts are limited, and do not result in adverse impacts to the integrity and long-term functions of preserved/avoided features.

Compensatory Mitigation - Compensatory mitigation is generally required for PCN activities in which the impacts to the aquatic resources have been avoided and minimized to the maximum extent practicable but would still result in unavoidable adverse effects to the environment that are considered more than minimal or are contrary to the public interest. *Whatever the case may be, compensatory mitigation is no substitute for avoidance and minimization.*

2. Thresholds for Compensatory Mitigation

The basic objective of compensatory mitigation in the USACE Regulatory Program is to offset environmental losses resulting from unavoidable impacts to waters of the U.S. authorized by Department of the Army permits. **The following compensatory mitigation thresholds apply to all PCN activities that result in loss[1] of the resource area types listed below. Activities[2] in waters of the U.S. associated with the restoration, enhancement, and establishment of tidal and non-tidal aquatic resources are not considered loss and are not subject to the thresholds below.** Thresholds for different resource areas may not be combined to exceed 5,000 SF of total loss of all waters. The USACE will continue to evaluate projects on a case-by-case basis, and may in some cases require compensatory mitigation below these thresholds (e.g. minor impacts that add to a cumulative loss).

[1] See definition of loss in Section VII.
[2] These activities must result in net increases in aquatic resource functions and services to be exempted from the thresholds above.

Compensatory Mitigation Thresholds in Massachusetts		
Resource Area	**Non-Tidal Threshold**	**Tidal Threshold**
Stream	200 LF	200 LF
Bank Stabilization	500 LF	500 LF
Open Water	Project Dependent	Project Dependent
Wetland	5,000 SF	500 SF
Vernal Pool	All	N/A
SAV	Project dependent	25 SF
Mudflat	N/A	1,000 SF
Intertidal	N/A	1,000 SF

These thresholds can be utilized to determine at what point compensatory mitigation is required but are not used to determine how much mitigation may be needed to offset impacts to resources. Per the 2008 Mitigation Rule (33 CFR 332.3(f)(1)) "the amount of required compensatory mitigation must be, to the extent practicable, sufficient to replace lost aquatic resource functions. In cases where appropriate functional or condition assessment methods or other suitable metrics are available, these methods should be used where practicable to determine how much compensatory mitigation is required. If a functional or condition assessment or other suitable metric is not used, a minimum one-to-one acreage or linear foot compensation ratios must be used."

3. Compensatory Mitigation Hierarchy

Compensatory mitigation should follow the hierarchy as outlined in 33 CFR 332.3(b)(2-6) or current regulation. This hierarchy in order of preference includes: (1) Mitigation Bank credits, (2) In-Lieu Fee program credits, (3) permittee-responsible mitigation under a watershed approach, (4) permittee-responsible mitigation through on-site and in-kind mitigation, and (5) permittee-responsible mitigation through off-site and/or out-of-kind mitigation. If the proposed mitigation deviates from this mitigation hierarchy, the applicant **must** justify in writing why the proposed mitigation is environmentally preferable to the preferred method of compensatory mitigation (See 2008 Mitigation Rule). **In order for your application to be considered complete, you must provide a statement that discusses how your project will compensate for the loss or impact to aquatic resources.** If you are proposing permittee responsible mitigation, the 12 components of a mitigation plan (33 CFR 332.4(c)(2-14) must be addressed for your application to be considered complete. Prospective applicants are encouraged to contact USACE with questions at any time. Addressing the 12 components of a mitigation plan is commensurate with the amount of compensatory mitigation required, and USACE can assist prospective applicants with the level of information needed to satisfy each component.

For activities resulting in the loss of marine or estuarine resources, permittee-responsible mitigation may be environmentally preferable if there are no mitigation banks or in-lieu fee programs in the area that have marine or estuarine credits available for sale or transfer to the permittee.

4. In-Lieu Fee (ILF)

The purchase of credits from the Massachusetts In-Lieu Fee Program (MA ILFP) is the ***preferred*** method of compensatory mitigation in Massachusetts since, as of the issuance date of this GP, there are no mitigation banks available in Massachusetts. The applicant shall develop a mitigation plan that addresses the baseline conditions at the impact site and the number of credits to be provided (see 33 CFR 332.4(c)(1)(ii)).

The MA ILFP is administered by the Massachusetts Department of Fish & Game (DFG) in accordance with the 2008 Mitigation Rule at 33 CFR 332. The Mitigation Rule governs in-lieu fee compensatory mitigation associated with USACE permits under §404 of the Clean Water Act and/or §9 or §10 of the Rivers and Harbors Act of 1899.

MA ILFP Website: https://www.mass.gov/in-lieu-fee-program

Acceptance of an ILF payment into the ILFP established by the 2014 MA ILFP Instrument (link below) is an acknowledgement by DFG that it assumes all legal responsibility for satisfying the mitigation requirements of the USACE (i.e., the implementation, performance, and long-term management and monitoring of the compensatory mitigation project(s) approved under this Instrument and subsequent Compensatory Mitigation Plans). This transfer of legal responsibility is established by: 1) the approval of this In-Lieu Fee Instrument; 2) receipt by the district engineer of a Notice of Credit Sale and Transfer of Legal Responsibility to DFG that is signed by the DFG and the permittee and dated; and 3) the transfer of fees from the permittee to DFG.

MA ILFP Fact Sheet: https://www.mass.gov/files/documents/2017/01/sj/ilfp-fact-sheet-ma-ilfp-fees.pdf

MA ILFP Instrument: https://www.mass.gov/files/documents/2016/08/nd/ilfp-final-instrument-dfg.pdf

5. Permittee-Responsible

The USACE may determine that the proposed permittee-responsible compensatory mitigation is appropriate on a case-by-case basis. As described in the Compensatory Mitigation Hierarchy section above, applicants must justify in writing why the proposed mitigation is environmentally preferable to the purchase of ILF credits. Applicants are encouraged to contact the USACE prior to submission of a permit application to seek further guidance regarding USACE mitigation requirements.

Applicants will demonstrate their proposed compensatory mitigation in writing by addressing the 12 components of a mitigation plan (33 CFR 332.4(c)(2-14). *Please note that all elements must be addressed, or the permit application will be deemed incomplete.* In certain circumstances, the district engineer may determine that prior approval of the final mitigation plan is not practicable or not necessary to ensure timely completion of the required compensatory mitigation (see 33 CFR 332.3(k)(3)). Guidance on how to address these components can be found on the New England District Mitigation webpage: https://www.nae.usace.army.mil/Missions/Regulatory/Mitigation/

Performance standards will be used to measure the successfulness of the mitigation project. A successful mitigation project is one that is self-sustaining. For a mitigation project that will restore, enhance, or create wetlands, proper performance standards must address hydrology, hydric soils, and hydrophytic vegetation. The mitigation proposal must include an explanation of quantitative methods used to measure the success of performance standards (i.e., percent cover may be measured using vegetation plots, hydrology may be measured using data loggers, soil cores may be taken and evaluated for hydric soil indicators).

Monitoring methods should include quantitative sampling methods following established, scientific protocols. Sampling documentation, as part of monitoring reports, should include maps and coordinates (also shapefiles, if available) showing locations of sampling points, transects, quadrats, etc. In addition, permanent photo stations should be established coincident with sampling locations.

SECTION VII: Definitions & Acronyms

Artificial or Living Reef: A structure which is constructed or placed in waters for the purpose of enhancing fishery resources and commercial and recreational fishing opportunities.
Attendant Features: Occurring with or as a result of; accompanying.
Biodegradable: A material that decomposes into elements found in nature within a reasonably short period of time and will not leave a residue of plastic or a petroleum derivative in the environment after degradation. In contrast, degradable plastics break down into plastic fragments that remain in the environment after degradation. Examples of biodegradable materials include jute, sisal, cotton, straw, burlap, coconut husk fiber (coir) or excelsior. In contrast, degradable plastics break down into plastic fragments that remain in the environment after degradation. Photodegradable, UV degradable or Oxo-(bio)degradable plastics are not considered biodegradable under this GP.
Boating facilities: These provide, rent or sell mooring space, such as marinas, yacht clubs, boat yards, dockominiums, municipal facilities, land/home owners, etc. Not classified as boating facilities are piers shared between two abutting properties or municipal mooring fields that charge an equitable user fee based on the actual costs incurred.
Compensatory mitigation: The restoration (re-establishment or rehabilitation), establishment (creation), enhancement, and/or in certain circumstances preservation of aquatic resources for the purposes of offsetting unavoidable adverse impacts which remain after all appropriate and practicable avoidance and minimization has been achieved. Must comply with the applicable provisions of 33 CFR 332. See also the New England District Compensatory Mitigation Guidance at http://www.nae.usace.army.mil/Missions/Regulatory/Mitigation.aspx.
Construction mats: Constructions, swamp and timber mats (herein referred to as “construction mats”) are generic terms used to describe structures that distribute equipment weight to prevent wetland damage while facilitating passage and providing work platforms for workers and equipment. They are comprised of sheets or mats made from a variety of materials in various sizes. A timber mat consists of large timbers bolted or cabled together. Corduroy roads, which are not considered to be construction mats, are cut trees and/or saplings with the crowns and branches removed, and the trunks lined up next to one another. Corduroy roads are typically installed as permanent structures. Like construction mats, they are considered as fill whether they are installed temporarily or permanently.
Cumulative Impacts: The impact on the environment, which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time (40 CFR 1508.1). Although the impact of a particular discharge may constitute a minor change in itself, the cumulative effect of numerous such piecemeal changes can result in a major impairment of the water resources and interfere with the productivity and water quality of existing aquatic ecosystems. See 40 CFR 230.11(g).
Currently serviceable: Useable as is or with some maintenance, but not so degraded as to essentially require reconstruction.
Dredging:
Improvement Dredging: For the purposes of these GPs, this is dredging deeper than previously authorized by the USACE and dredged under that authorization.
Maintenance Dredging: For the purposes of these GPs, this is dredging from an area previously authorized by the USACE and dredged under that authorization. The USACE may require proof of authorization and dredging. Maintenance dredging typically refers to the routine removal of accumulated sediment to maintain the design depths of serviceable navigation channels, harbors, marinas, boat launches and port facilities. Maintenance dredging is conducted for navigational purposes and does not include any expansion of the previously dredged area. The USACE may

review a maintenance dredging activity as new dredging if sufficient time has elapsed to allow for the colonization of SAS, shellfish, etc.
New Dredging: For the purposes of these GPs, this is a) first time the USACE authorizes dredging of a particular location or b) dredging has not occurred for an extended period of time, and this has allowed for aquatic resources (i.e., eelgrass, shellfish, etc.) to redevelop in the area.
Dredged material & discharge of dredged material: These are defined at 33 CFR 323.2(c) and (d). The term dredged material means material that is excavated or dredged from waters of the U.S.
Enhancement: The manipulation of the physical, chemical, or biological characteristics of an aquatic resource to heighten, intensify, or improve a specific aquatic resource function(s). Enhancement results in the gain of selected aquatic resource function(s) but may also lead to a decline in other aquatic resource function(s). Enhancement does not result in a gain in aquatic resource area.
Ephemeral stream: A stream with flowing water only during, and for a short duration, after precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.
Erosion Controls: Appropriate soil erosion, sediment and turbidity controls include cofferdams, bypass pumping around barriers immediately up and downstream of the work footprint (i.e., dam and pump), installation of sediment control barriers (i.e., silt fence, vegetated filter strips, geotextile silt fences, filter tubes, erosion control mixes, hay bales or other devices) downhill of all exposed areas, stream fords, retention of existing vegetated buffers, application of temporary mulching during construction, phased construction, and permanent seeding and stabilization, etc.
Establishment (creation): The manipulation of the physical, chemical, or biological characteristics present to develop an aquatic resource that did not previously exist at an upland site. Establishment results in a gain in aquatic resource area (33 CFR 332.2).
Expansions: Work that increases the footprint of fill, structures, depth of basin or drainage features, or floats, or slip capacity.
Essential Fish Habitat (EFH): The Federal Magnuson-Stevens Fishery Management and Conservation Act broadly defines EFH to include those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity. See www.greateratlantic.fisheries.noaa.gov/habitat for more information.
Fill material & discharge of fill material: Material placed in waters of the U.S. where the material has the effect of either replacing any portion of a water of the U.S. with dry land or changing the bottom elevation of any portion of a water of the U.S. Fill material does not include any pollutant discharged into the water primarily to dispose of waste. These are defined at 33 CFR 323.2 (e) & (f).
Federal navigation projects (FNPs): These areas are maintained by the USACE; authorized, constructed and maintained on the premise that they will be accessible and available to all on equal terms; and comprised of USACE Federal anchorages, Federal channels and Federal turning basins. The buffer zone is equal to three times the authorized depth of a FNP. The following are FNPs in MA and more information, including the limits, is provided at www.nae.usace.army.mil/missions/navigation >> Navigation Projects:

- Andrews River, Harwich, MA
- Aunt Lydia's Cove
- Beverly Harbor
- Boston Harbor
- Buttermilk Bay Channel
- Canapitsit Channel
- Cape Cod Canal
- Chatham Harbor
- Cohasset Harbor
- Cross Rip Shoals, Nantucket Sound
- Cuttyhunk Harbor
- Dorchester Bay and Neponset River
- Duxbury Harbor
- Edgartown Harbor
- Essex River
- Fall River Harbor
- Falmouth Harbor
- Gloucester Harbor and Annisquam River
- Green Harbor
- Hingham Harbor
- Hyannis Harbor
- Ipswich River
- Island End River (Chelsea, MA)
- Kingston Harbor
- Lagoon Pond
- Little Harbor Woods Hole

Lynn Harbor
Malden River
Menemsha Creek
Merrimack River
Mystic River
Nantucket Harbor of Refuge
New Bedford and Fairhaven Harbor
Newburyport Harbor
Oak Bluffs Harbor
Pigeon Cove Harbor
Plymouth Harbor
Pollock Rip Shoals, Nantucket Sound
Provincetown Harbor
Red Brook Harbor
Rockport Harbor
Salem Harbor
Sandy Bay Harbor of Refuge
Saugus River
Scituate Harbor
Sesuit Harbor
Taunton River
Vineyard Haven Harbor
Wareham Harbor
Wellfleet Harbor
Westport River and Harbor
Weymouth Back River
Weymouth Fore and Town Rivers
Winthrop Harbor
Woods Hole Channel

Flume: An open artificial water channel, in the form of a gravity chute, which leads water from a diversion dam or weir alongside a natural flow. A flume can be used to measure the rate of flow.
FNP buffer zone: The buffer zone of a USACE Federal Navigation Project (FNP) is equal to three times the authorized depth of the FNP.
Frac out: During horizontal directional drilling (HDD) operations, drilling fluid travels up the borehole into a pit. When the borehole becomes obstructed or the pressure becomes too great inside the borehole, the ground fractures and fluid escapes to the surface and may affect surface waters.
Ground disturbance: Any activity that compacts, relocates, overturns, removes, mixes, or otherwise disturbs the ground, including under water. Ground disturbance can be caused by the use of hand tools (shovels, pick axe, posthole digger, etc.), heavy equipment (excavators, backhoes, bulldozers, dredgers, trenching and earthmoving equipment, etc.), and heavy trucks (large four wheel drive trucks, dump trucks and tractor trailers, etc.). Trenching, bulldozing, dredging, excavating, scraping, and plowing are typical examples of ground disturbance activities.
Height:width ratio: The height of structures shall at all points be equal to or exceed the width of the deck. For the purpose of this definition, height shall be measured from the marsh substrate to the bottom of the longitudinal support beam.
High Tide Line (HTL): The line of intersection of the land with the water's surface at the maximum height reached by a rising tide. The high tide line may be determined, in the absence of actual data, by a line of oil or scum along shore objects, a more or less continuous deposit of fine shell or debris on the foreshore or berm, other physical markings or characteristics, vegetation lines, tidal gages, or other suitable means that delineate the general height reached by a rising tide. The line encompasses spring high tides and other high tides 58 that occur with periodic frequency but does not include storm surges in which there is a departure from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds. (33 CFR 328). Refer to the highest predicted tide for the current year at the nearest NOAA tide gage. https://tidesandcurrents.noaa.gov/map/index.html
Historic Property: Any prehistoric or historic site (including archaeological sites), district, building, structure, or other object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria (36 CFR part 60).
Impacts:
Direct Impacts: Effects that are caused by the activity and occur at the same time and place (40 CFR 1508.7).
Indirect impacts: Effects that are caused by the activity and are later in time or farther removed in distance, but are still reasonably foreseeable.
Secondary impacts: Effects on an aquatic ecosystem that are associated with a discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material.

Information about secondary effects on aquatic ecosystems shall be considered prior to the time final section 404 action is taken by permitting authorities. Some examples of secondary effects on an aquatic ecosystem are: aquatic areas drained, flooded, fragmented; fluctuating water levels in an impoundment and downstream associated with the operation of a dam; septic tank leaching and surface runoff from residential or commercial developments on fill; and leachate and runoff from a sanitary landfill located in waters of the U.S. See 40 CFR 230.11(h).

Incidental Fallback: Incidental fallback is the redeposit of small volumes of dredged material that is incidental to excavation activity in waters of the U.S. when such material falls back to substantially the same place as the initial removal (33 CFR 323.2(d)(2)(iii)).

In the dry: Work that is done under dry conditions, e.g., work behind cofferdams or when the stream or tide is waterward of the work.

Independent utility: A test to determine what constitutes a single and complete non-linear project in the USACE Regulatory Program. A project is considered to have independent utility if it would be constructed absent the construction of other projects in the project area. Portions of a multi-phase project that depend upon other phases of the project do not have independent utility. Phases of a project that would be constructed even if the other phases were not built can be considered as separate single and complete projects with independent utility.

Individual permit: A Department of the Army authorization that is issued following a case-by-case evaluation of a specific structure or work in accordance with the procedures of 33 CFR 322, or a specific project involving the proposed discharge(s) in accordance with the procedures of 33 CFR 323, and in accordance with the procedures of 33 CFR 325 and a determination that the proposed discharge is in the public interest pursuant to 33 CFR 320.

Intermittent stream: An intermittent stream has flowing water during certain times of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow.

Intertidal: The area in between mean low water and the high tide line.

Living reef: See the definition of “artificial or living reef.”

Living shoreline: A term used to describe a low-impact approach with a substantial biological component to shoreline protection and restoration along coastal shores, riparian zones, lacustrine fringe wetlands, or oyster or mussel reef structures. This approach integrates natural features to restore, enhance, maintain, or create habitat, functions, and processes while also functioning to mitigate flooding or shoreline erosion. Living shorelines may stabilize banks and shores with small fetch and gentle slopes that are subject to low-to mid-energy waves. A living shoreline has a footprint that is made up mostly of native material. It incorporates vegetation or other living, natural “soft” elements alone or in combination with some type of harder shoreline structure (e.g., oyster or mussel reefs or rock sills) for added protection and stability. Living shorelines should maintain the natural continuity of the land-water interface and retain or enhance shoreline ecological processes.

Loss of waters of the United States: Waters of the U.S. that are permanently adversely affected by filling, flooding, excavation, or drainage because of the regulated activity. The loss of stream bed includes the acres of stream bed that are permanently adversely affected by filling or excavation because of the regulated activity. Permanent adverse effects include permanent discharges of dredged or fill material that change an aquatic area to dry land, increase the bottom elevation of a waterbody, or change the use of a waterbody. The acreage of loss of waters of the U.S. is a threshold measurement of the impact to jurisdictional waters or wetlands for determining whether a project may qualify for a GP; it is not a net threshold that is calculated after considering compensatory mitigation that maybe used to offset losses of aquatic functions and services. Waters of the U.S. temporarily filled, flooded, excavated, or drained, but restored to pre-construction contours and elevations after construction, are not included in the measurement of loss of waters of the U.S. Impacts resulting from activities that do not require Department of the Army authorization, such as activities eligible for exemptions under section 404(f) of the Clean Water Act, are not considered when calculating the loss of waters of the U.S.

Maintenance: The repair, rehabilitation, or in-kind replacement of any previously authorized, currently serviceable structure or fill, or of any currently serviceable structure or fill authorized by 33 CFR 330.3 – "Activities occurring before certain dates," provided that the structure or fill is not to be put to uses differing from those uses specified or contemplated for it in the original permit or the most recently authorized modification. Maintenance includes minor deviations in the structure's configuration or filled area, including those due to changes in materials, construction techniques, or current construction codes or safety standards that are necessary to make repair, rehabilitation, or replacement are authorized. Currently serviceable means useable as is or with some maintenance, but not so degraded as to essentially require reconstruction.
Maintenance Exemption: In accordance with 33 CFR 323.4(a)(2), any discharge of dredged or fill material that may result from any of the following activities is not prohibited by or otherwise subject to regulation under Section 404 of the CWA: "Maintenance, including emergency reconstruction of recently damaged parts, of currently serviceable structures such as dikes, dams, levees, groins, riprap, breakwaters, causeways, bridge abutments or approaches, and transportation structures. Maintenance does not include any modification that changes the character, scope, or size of the original fill design."
Mean high water: Line on the shore reached by the plane of the average high water. Where precise determination of the actual location of the line becomes necessary, it must be established by survey with reference to the available tidal datum, preferably averaged over a period of 18.6 years. Less precise methods, such as observation of the "apparent shoreline" which is determined by reference to physical markings, lines of vegetation, or changes in type of vegetation, may be used only where an estimate is needed of the line reached by the mean high water.
Mechanized land clearing: Land clearing activities using mechanized equipment such as backhoes or bulldozers with sheer blades, rakes or discs constitute point source discharges and are subject to section 404 jurisdiction when they take place in wetlands or waters of the U.S (Regulatory Guidance Letter 90-05).
Metallic mineral: Any ore or material to be excavated from the natural deposits on or in the earth for its metallic mineral content to be used for commercial or industrial purposes. "Metallic mineral" does not include thorium or uranium.
Minor deviations: Deviations in the structure's configuration or filled area, including those due to changes in materials, construction techniques, or current construction codes or safety standards, which are necessary to make repair, rehabilitation, or replacement are permitted, provided the adverse environmental effects resulting from such repair, rehabilitation, or replacement are minimal.
Natural Rocky Habitats: Intertidal and subtidal substrates of pebble-gravel, cobble, boulder, or rock ledge and outcrops. Manufactured stone (e.g., cur or engineered riprap) is not considered a natural rocky habitat. Natural rocky habitats are either found as pavement (consolidated pebble-gravel, cobble, or boulder areas) or as a mixture with fines (i.e., clay and sand) and other substrates. Rocky habitats as EFH are defined as follows: (1) All pebble-gravel, cobble, or boulder pavements; (2) Pebble-gravel mixed with fines: mixed substrate of pebble-gravel and fines where pebble-gravel is an evident component of the substrate (either through visual observation or within sediment samples). Sediment samples with a content of 10% or more of pebble-gravel in the top layer (6-12 inches) should be delineated; (3) Scattered cobble, scattered boulder, scattered cobble/boulder: mixed substate of cobble and/or boulder and other substrates. The aerial extent of cobbles and/or boulders should be delineated; and (4) All rock ledge outcrops: area should be delineated along the edge of the ledge/outcrop (as defined by NMFS Habitat and Ecosystems Services Branch, Gloucester, MA).
Navigable waters or Navigable waters of the U.S.: These waters are subject to section 10 of the Rivers and Harbors Act of 1899 and are defined as those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce (33 CFR Part 329). Work or structures in navigable

waters require permits pursuant to §9 and §10 of the Rivers and Harbors Act of 1899. Also see the definition of “waters of the U.S.” below.
Note: Currently the following non-tidal waters have been determined to be navigable waters of the U.S. subject to permit jurisdiction in Massachusetts: Merrimack River, Connecticut River, and Charles River to the Watertown Dam.
Nearshore disposal: This is defined in the USACE Coastal Engineering Manual as “(1) In beach terminology an indefinite zone extending seaward from the shoreline well beyond the breaker zone. (2) The zone which extends from the swash zone to the position marking the start of the offshore zone, typically at water depths of the order of 20m.” A nearshore berm is an artificial berm built in shallow water using dredged material. Often, the berm is intended to renourish the adjacent and downdrift shore over time under the influence of waves and currents.
Non-regulated activity: Only structures or fills that were previously authorized and are in compliance with the terms and condition of the original authorization can be maintained as a non-regulated activity under 33 CFR 323.4(a)(2). Minor deviations from the previously authorized footprint do not qualify as a non-regulated activity and require new authorization from the USACE. The state’s maintenance provisions may differ from the USACE and a project may require reporting and written authorization from the state.
Non-tidal wetlands: A non-tidal wetland is a wetland that is not subject to the ebb and flow of tidal waters. Non-tidal wetlands contiguous to tidal waters are located landward of the HTL (*i.e.,* spring HTL). Also see the definition of “Waters of the U.S.” below.
Oil or natural gas pipeline: Any pipe or pipeline for the transportation of any form of oil or natural gas, including products derived from oil or natural gas, such as gasoline, jet fuel, diesel fuel. heating oil, petrochemical feedstocks, waxes, lubricating oils, and asphalt.
Ordinary High Water Mark (OHWM): A line on the shore established by the fluctuations of water and indicated by physical characteristics, or by other appropriate means that consider the characteristics of the surrounding areas. See 33 CFR 328.3(e).
Overall project: The overall project, for purposes of these GPs, includes all regulated activities that are reasonably related and necessary to accomplish the project purpose. Also see the definition of “single and complete linear project.”
Perennial stream: A perennial stream has flowing water year-round during a typical year. The water table is located above the stream bed for most of the year. Groundwater is the primary source of water for stream flow. Runoff from rainfall is a supplemental source of water for stream flow.
Practicable: Available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes.
Permanent impacts: Permanent impacts means waters of the U.S. that are permanently affected by filling, flooding, excavation, or drainage because of the regulated activity. Permanent impacts include permanent discharges of dredged or fill material that change an aquatic area to dry land, increase the bottom elevation of a waterbody, or change the use of a waterbody.
Preconstruction notification (PCN): A request submitted by the applicant to the USACE for confirmation that a particular activity is authorized by these GPs. The request may be a permit application, letter, or similar document that includes information about the proposed work and its anticipated environmental effects. Preconstruction notification may be required by the terms and conditions of these GPs. A PCN may be voluntarily submitted in cases where PCN is not required and the applicant wants confirmation that the activity is authorized under these GPs.
Preservation: The removal of a threat to, or preventing the decline of, aquatic resources by an action in or near those aquatic resources. This term includes activities commonly associated with the protection and maintenance of aquatic resources through the implementation of appropriate legal and physical mechanisms. Preservation does not result in a gain of aquatic resource area or functions (33 CFR 332.2).
Real estate subdivision: Includes circumstances where a landowner or developer divides a tract of land into smaller parcels for the purpose of selling, conveying, transferring, leasing, or

developing said parcels. This would include the entire area of a residential, commercial or other real estate subdivision, including all parcels and parts thereof

Reconfiguration zone: A USACE authorized area in which permittees may rearrange pile-supported structures and floats without additional authorizations. A reconfiguration zone does not grant exclusive privileges to an area or an increase in structure or float area.

Re-establishment: The manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning natural/ historic functions to a former aquatic resource. Re-establishment results in rebuilding a former aquatic resource and results in again in aquatic resource area and functions (33 CFR 332.2).

Reference Site: Reference sites - Compensatory restoration, rehabilitation, and creation mitigation projects should seek to duplicate the features of reference aquatic resources or enhance connectivity with adjacent natural upland and aquatic resource landscape elements. Performance standards related to reference sites are encouraged. Mitigation project sites must be selected based on their ability to be, and continue to be, resistant to disturbance from the surrounding landscape, by locating them adjacent to refuges, buffers, green spaces, and other preserved natural elements of the landscape. In general, aquatic resource mitigation projects must be designed to be self-sustaining, natural systems within the landscape and climate in which they are located, with little or no ongoing maintenance and/or hydrologic manipulation.

Rehabilitation: The manipulation of the physical, chemical, or biological characteristics of a site with the goal of repairing natural/historic functions to a degraded aquatic resource. Rehabilitation results in a gain in aquatic resource function, but does not result in a gain in aquatic resource area (33 CFR 332.2).

Restoration: The manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning natural/historic functions to a former or degraded aquatic resource. For the purpose of tracking net gains in aquatic resource area, restoration is divided into two categories: re-establishment and rehabilitation (33 CFR 332.2).

Riffle and pool complex: Riffle and pool complexes are special aquatic sites under the 404(b)(1) Guidelines. Riffle and pool complexes sometimes characterize steep gradient sections of streams. Such stream sections are recognizable by their hydraulic characteristics. The rapid movement of water over a course substrate in riffles results in a rough flow, a turbulent surface, and high dissolved oxygen levels in the water. Pools are deeper areas associated with riffles. A slower stream velocity, a streaming flow, a smooth surface, and a finer substrate characterize pools.

Sedimentation: Sedimentation is defined as the process of deposition of a solid material from a state of suspension. Deposited sediments may accumulate and have temporal impacts to aquatic resource areas. See secondary effects definition above. For the purposes of this document, “greater than minimal sedimentation” is generally not considered to occur when using proper erosion controls (GC 25) or when sedimentation is considered “de minimis” 33 CFR 323.2(d)(5).

Single and complete linear project: A linear project is a project constructed for the purpose of getting people, goods, or services from a point of origin to a terminal point, which often involves multiple crossings of one or more waterbodies at separate and distant locations. The term “single and complete project” is defined as that portion of the total linear project proposed or accomplished by one owner/ developer or partnership or other association of owners/developers that includes all crossings of a single water of the U.S. (i.e., a single waterbody) at a specific location. For linear projects crossing a single or multiple waterbodies several times at separate and distant locations, each crossing is considered a single and complete project for the purposes of these GPs. However, individual channels in a braided stream or river, or individual arms of a large, irregularly shaped wetland or lake, etc., are not separate waterbodies, and crossings of such features cannot be considered separately.

Single and complete non-linear project: For non-linear projects, the term “single and complete project” is defined at 33 CFR 330.2(i) as the total project proposed or accomplished by one owner/developer or partnership or other association of owners/developers. A single and complete

non-linear project must have independent utility (see the definition of “independent utility”). Single and complete non-linear projects may not be “piecemealed” to avoid the limits in a GP authorization.
Special aquatic sites (SAS): These include inland and saltmarsh wetlands, mud flats, vegetated shallows, sanctuaries and refuges, coral reefs, and riffle and pool complexes. These are defined at 40 CFR 230.3 and listed in 40 CFR 230 Subpart E.
Streambed: The stream substrate between the OHW marks on each side. The substrate may be bedrock or inorganic particles that range in size from clay to boulders. Wetlands contiguous to the streambed, but outside of the OHW marks, are not considered part of the streambed.
Stream channelization: The manipulation of a stream’s course, condition, capacity, or location that causes more than minimal interruption of normal stream processes. A channelized stream remains a water of the U.S.
Structure: An object that is arranged in a definite pattern of organization. Examples of structures include, without limitation, any pier, boat dock, boat ramp, wharf, dolphin, weir, boom, breakwater, bulkhead, revetment, riprap, jetty, artificial island, artificial reef, permanent mooring structure, power transmission line, permanently moored floating vessel, piling, aid to navigation, or any other manmade obstacle or obstruction.
Temporal loss: The time lag between the loss of aquatic resource functions caused by the permitted impacts and the replacement of aquatic resource functions at the compensatory mitigation site(s) (33 CFR 332.2).
Temporary impacts: Temporary impacts include, but are not limited to, jurisdictional waters that are temporarily filled, flooded, excavated, or drained because of the regulated activity. Impacts are considered temporary when they are removed immediately upon completion of the activity. Note: An impact is considered temporary when the aquatic resource is restored to pre-project conditions, but effects to archaeological and/or cultural resources may be permanent in duration.
Tidal wetlands: A wetland that is subject to the ebb and flow of the tide. See the definition of “Waters of the U.S.” below.
Tide gates: Structures such as duckbills, flap gates, manual and self-regulating tide gates, etc. that regulate or prevent upstream tidal flows.
Turbidity: A measure of the level of particles such as sediment, plankton, or organic by-products, in a body of water. As the turbidity of water increases, it becomes denser and less clear due to a higher concentration of these light-blocking particles. Suspended solids are more likely to carry toxic chemicals, and can also negatively affect aquatic organisms, water temperature, and dissolved oxygen levels.
Utility line: Any pipe or pipeline for the transportation of any gaseous, liquid, liquescent, or slurry substance, for any purpose that is not oil, natural gas, or petrochemicals. A utility line also includes any cable, line, or wire for the transmission for any purpose of electrical energy, telephone, and telegraph messages, and radio and television communication. The term ‘utility line’ does not include activities that drain a water of the U.S., such as drainage tile or French drains, but it does apply to pipes conveying drainage from another area.
Vegetated shallows: Permanently inundated areas that under normal circumstances support communities of rooted aquatic vegetation, such as eelgrass *(Zostera marina)* and widgeon grass (*Rupia maritima*) in marine systems (does not include salt marsh) as well as a number of freshwater species in rivers and lakes. These are a type of SAS defined at 40 CFR 230.43. Vegetated shallows are commonly referred to as submerged aquatic vegetation or SAV. Vegetated shallow survey guidance is located at www.nae.usace.army.mil/missions/regulatory /jurisdiction-and-wetlands. Maps of vegetated shallows in Massachusetts are located at www.nae.usace.army.mil/missions/regulatory/state-general-permits/massachusetts-general-permit.
Vernal pools: For the purposes of these GPs, vernal pools are depressional wetland basins that typically dry up in most years and may contain inlets or outlets, typically of intermittent flow. Vernal pools range in both size and depth depending upon landscape position and parent material(s). In

most years, vernal pools support one or more of the following obligate indicator species: wood frog, spotted salamander, blue-spotted salamander, marbled salamander, Jefferson's salamander and fairy shrimp. However, they should preclude sustainable populations of predatory fish.

Water diversions: Water diversions are activities such as bypass pumping (e.g., "dam and pump") or water withdrawals. Temporary flume pipes, culverts or cofferdams where normal flows are maintained within the stream boundary's confines aren't water diversions. "Normal flows" are defined as no change in flow from pre-project conditions.

Waters of the United States (U.S.) These waterbodies are the waters where permits are required for the discharge of dredged or fill material pursuant to §404 of the CWA. These waters include but are not limited to navigable waters of the U.S. and tidal wetlands and include many non-tidal wetlands and other waterbodies. See definitions for navigable waters of the U.S., tidal wetlands, waterbody, and non-tidal wetlands. (33 CFR 328)

Waterbody: Examples of "waterbodies" include oceans, coastal waters, rivers, streams, ditches, lakes, ponds, and wetlands. If a wetland is adjacent to a waterbody determined to be a water of the U.S., that waterbody and any adjacent wetlands are considered together as a single aquatic unit (see 33 CFR 328.4(c)(2)).

Weir: A barrier across a river designed to alter the flow characteristics. In most cases, weirs take the form of a barrier, smaller than most conventional dams, across a river that causes water to pool behind the structure and allows water to flow over the top. Weirs are commonly used to alter the flow regime of a river, prevent flooding, measure discharge and help render a river navigable.

Wetland: Wetlands are areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas. The Corps of Engineers Wetlands Delineation Manual in conjunction with the associated regional supplement should be used to determine if a wetland is present and delineate wetland boundaries.

Appendix A: Guidance for NHPA Section 106 Compliance in Massachusetts

1. Purpose & Applicability

Section 106 of the National Historic Preservation Act of 1966, as amended (NHPA) (54 U.S.C § 306108), requires Federal agencies to take into account the effects of their undertakings on Historic Properties and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment on such undertakings. Therefore, in order for an activity to be eligible for authorization under the 2023 Massachusetts General Permit, the USACE must consider the effect the activity may have on historic properties. Historic properties may include, but are not limited to, historic districts, archaeological districts, sites, buildings, structures, objects, sacred sites, traditional cultural places, and traditional cultural landscapes that are included in, or eligible for inclusion in, the National Register of Historic Places (NRHP).

This guidance applies to projects that require authorization under Section 404 of the Clean Water Act (33 U.S.C. § 1344) and/or Section 10 of the Rivers and Harbors Act (33 U.S.C. §403) and will assist applicants when evaluating and documenting the presence of historic properties within or near their project site(s). The prospective applicant will evaluate their proposed project using the criteria below to determine if their project has the potential to affect historic properties and if so, whether or not historic properties are present or are likely to be present. All activities authorized under these GPs shall follow the terms outlined in General Condition 14: Historic Properties and General Condition 6: Tribal Rights & Burial Sites. Prospective applicants shall complete their due diligence according to the procedures below for their application to be deemed complete.

2. No Potential to Affect Historic Properties

Certain activities do not have the potential to cause effects on historic properties, assuming such historic properties were present, based on the nature of the activity and site-specific conditions. Therefore, these activities **do not** require historic property identification efforts or notification of the SHPO, THPOs, and/or BUAR under Section 106. The USACE has determined the following activities within the stated parameters have no potential to affect historic properties:

General Permit	Activity Parameters
1	Temporary buoys, markers and similar structures that are placed during winter events on ice and removed before spring thaw.
2	Repair or rehabilitation of structures that are less than 45 years in age. Any temporary structures or fills or work necessary to complete repairs or rehabilitation must not result in any ground disturbance.
3	Maintenance and replacement of moorings that are less than 45 years in age.
6	Maintenance, repair, replacement, or removal of utility lines, oil or natural gas pipelines, outfall or intake structures, and/or appurtenant features that are less than 45 years in age when all access, staging, and ground disturbance is strictly limited to previously disturbed areas (including any previous ground disturbance). Replacement must be in kind or smaller in size. Installation of tide gates on outfall structures that are less than 45 years in age.
7	Maintenance dredging of previously dredged areas where dredging does not extend beyond the original bottom elevations.

	Disposal of dredged material at an existing established and USACE-approved confined aquatic disposal cell. Beach nourishment in ongoing existing nourishment areas.
11	Fish and wildlife harvesting and attraction devices and activities.
13	Cleanup of hazardous and toxic waste materials, including contaminated sediments, that are less than 45 years in age.
16	Removal of land-based and water-based renewable energy generation facilities and hydropower projects that are less than 45 years in age.
18	Installation of buoys, floats, racks, trays, nets, lines, tubes, containers, and other structures for previously authorized by the USACE and ongoing aquaculture activities. Discharges of dredged or fill material into tidal or non-tidal waters necessary for shellfish seeding, rearing, cultivating, transplanting, and harvesting activities for previously authorized and ongoing aquaculture activities.
20	Maintenance activities for existing living shorelines excluding maintenance activities that require new ground disturbance such as excavation or re-sloping of the bank/shoreline.
22	Reshaping or maintenance of existing drainage ditches less than 45 years in age excluding ditch enlargement.
23	Placement of temporary and removable linear transportation and wetland/stream crossings that have no ground disturbance prior to placement, during placement, and during removal (i.e., placed on the surface and subsequently removed within one year of placement).
24	Placement of temporary and removable crossings and cofferdams that have no ground disturbance prior to placement, during placement, and during removal (i.e., placed on the surface and subsequently removed within one year of placement).
25	Emergency repair of existing structures and/or fills less than 45 years in age.

3. Historic Property Identification

If the activity does not fit under the criteria above, the following historic property identification efforts must be completed to demonstrate compliance with Section 106 of the NHPA. This includes documenting previously identified and unidentified historic properties in the project area.

a. Previously Identified Historic Properties: The prospective applicant shall document if previously identified historic properties are present on or adjacent to the project site by notifying the Massachusetts Historical Commission (MHC) and the Massachusetts Board of Underwater Archaeological Resources (BUAR), as appropriate, of the proposed project. The MHC and BUAR will check their records for the presence of any previously identified historic properties. The following outlines how prospective applicants should notify the MHC and BUAR.

i. The prospective applicant will notify the SHPO and BUAR to identify any previously recorded cultural resources. Applicants shall mail a completed Project Notification Form[18], project narrative, location (coordinates), plans, soil maps, and information on known cultural resources to the MHC. The MHC does not accept submissions via email. Applicants shall email or mail this information to the BUAR when the activity is located in lakes, ponds, rivers, and/or navigable waters in MA. Emailed file attachments should be <10MB. Any files >10MB shall be delivered via a file exchange system or the hard copy documents shall be mailed. Preferred contact information is listed below.

ii. **When sending this information, applicants must also document proof of receipt OR proof the information was delivered.** Proof of receipt constitutes a certified mail receipt, read email receipt, or other mail/email/online tracking services that document the information has reached the intended recipient(s). Proof the information was delivered constitutes a certificate of mailing, email delivery receipt, or other mail/email/online services that document the information was sent at a particular time. When using proof of delivery such (e.g., certificate of mailing), applicants should add 5 days to the 30-day notification period so the mail has time to reach its intended recipient. When using proof of receipt, the applicant may begin the 30-day notification period from the date received by the intended recipient.

iii. When mailing or emailing the application materials, applicants should include the following statement: “Please send responses to this notification directly to the USACE via email: cenae-r-ma@usace.army.mil or address regular mail responses to: Regulatory Division, U.S. Army Corps of Engineers, New England District, 696 Virginia Road, Concord, Massachusetts 01742-2751.” Email responses to the USACE are strongly preferred. The SHPO and BUAR will contact the USACE and cc the applicant(s) within 30 days of receiving the notification if their records indicate that historic properties are located in the project vicinity, and if additional review and/or surveys are recommended to ensure NHPA compliance. If the SHPO and/or BUAR do not respond within 30 days of receiving the notification, is it presumed that no known historic properties are present.

b. Previously Unidentified Historic Properties: The prospective applicant shall evaluate the project site and determine the sensitivity for the presence of historic properties if the project site has not been previously surveyed for cultural resources within the last 10 years. If the sensitivity is determined to be moderate to high, an intensive archaeological and/or architectural survey is required to investigate the potential presence of historic properties. The individual conducting this survey must meet the Secretary of the Interior’s Standards for Professional Qualifications (48 FR 44738-44739) in the discipline relevant to a particular resource type. For example, archeologists should not document and evaluate buildings or structures and architectural historians should not document and evaluate archaeological sites. The identification and qualifications for those participating in any survey and evaluation of resources should be included with the survey results. The criteria listed below are indicators of low sensitivity for the presence of historic properties for consideration when determining if an archaeological or architectural survey is needed.

Low sensitivity indicators:

- Previous archaeological and/or architectural survey within the last 10 years with negative results.
- In a location created in modern times (i.e., built on fill placed within the last 45 years or within an area excavated within the last 45 years).
- USACE has reviewed the project description and determined that a survey is not warranted based on the proposed activity and its location.

State survey guidance and standards are provided in the September 1995 Historic Properties Survey Manual Guidelines for the Identification of Historical and Archaeological Resources in Massachusetts available. State survey guidance and standards for underwater surveys are provided

[18] https://www.sec.state.ma.us/mhc/mhcform/formidx.htm

in the Board of Underwater Archaeological Resources' 2022 Policy Guidance on Archaeological Investigations and Related Survey Standards for the Discovery of Underwater Archaeological Resources. This guidance is available on the NAE Regulatory website: https://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/Massachusetts-General-Permit/.

Please note, a negative result from MHC and/or BUAR does not necessarily mean no historic properties are present. Often proposed project sites have not been previously subject to a survey, so historic properties which may be present have not been previously recorded.

4. Tribal Coordination

Prospective applicants shall mail the Project Notification Form, project narrative, location (coordinates), plans with locus map, soil maps, and information on cultural resources to the Wampanoag Tribe of Gay Head (Aquinnah), Mashpee Wampanoag Tribe, Narragansett Indian Tribe, and/or Stockbridge-Munsee Community Band of Mohican Indians with interests in the project location. Preferred tribal contact information, including their respective areas of interest, can be found below. Applicants shall follow the same procedures as identified in Section 3(a)i-iii above when notifying Tribes of the proposed activity. Applicants shall provide the USACE with any responses received from the tribe(s) with their PCN application. If a tribe does not respond within 30 days of receiving the notification, the applicant shall provide USACE with all documentation of tribal outreach with their SV or PCN submission (e.g., emails, letters, phone call log, etc.). If the tribe indicates the presence of a previously unrecorded cultural resource, including a traditional cultural property (TCP) or traditional cultural landscape (TCL), a PCN is required.

5. Effect Determination

The project may have the potential to affect historic properties and/or tribal resources if 1) notification recipients respond within 30 calendar days of notification with concerns, 2) historic properties eligible for listing, or potentially eligible for listing in the NRHP, are present or 3) tribal resources are known to be present. The USACE may need to further review the project to confirm potential effects to historic properties and/or tribal resources. A PCN is required for any activity that may affect a historic property.

The USACE may determine the project will have 'no effect' on historic properties (i.e., no historic properties affected) when procedures outlined in Section 3 above are followed and no cultural resources are identified. Similarly, if historic properties are identified and will be completely avoided, the USACE may determine 'no effect.'

6. Contact Information:

Massachusetts Historical Commission

The Massachusetts Archives Building
220 Morrissey Boulevard
Boston, Massachusetts 02125

No email. Applicants or their representatives must send project information via certified mail and submit the certified mail receipt to the USACE or send via regular mail and submit proof of delivery.

Area of concern: All of Massachusetts.

Massachusetts Board of Underwater Archaeological Resources (BUAR)

100 Cambridge Street, Suite 900
Boston, Massachusetts 02114
Email: david.s.robinson@mass.gov

Applicants or their representatives must send project information via email (***strongly preferred***) or regular mail and provide proof of receipt or proof of delivery.

Area of concern: All waterbodies in Massachusetts.

Wampanoag Tribe of Gay Head (Aquinnah)

Bettina Washington
Tribal Historic Preservation Officer (THPO)
20 Black Brook Road
Aquinnah, Massachusetts 02535
Email: thpo@wampanoagtribe-nsn.gov

Applicants or their representative must send project information via email (***preferred***) or regular mail and provide proof of receipt or proof of delivery.

Area of concern: All of Massachusetts.

Mashpee Wampanoag Tribe

ATTN: David Weeden
Tribal Historic Preservation Officer (THPO)
483 Great Neck Road South
Mashpee, Massachusetts 02649
Email: 106review@mwtribe-nsn.gov
Cc: David.weeden@mwtribe-nsn.gov

Applicants or their representative must send project information via email (***preferred***) or regular mail and provide proof of receipt or proof of delivery.

Area of concern: All of Massachusetts.

Narragansett Indian Tribe

ATTN: John Brown
Tribal Historic Preservation Officer (THPO)
Narragansett Indian Longhouse
4425 South County Trail
Charlestown, Rhode Island 02813
Email: tashtesook@aol.com

Applicants or their representative must send project information via email (***preferred***) or regular mail and provide proof of receipt or proof of delivery.

Area of concern: Massachusetts east of the Connecticut River.

Stockbridge-Munsee Community Band of Mohican Indians

ATTN: Jeff Bendremer
Tribal Historic Preservation Manager
Stockbridge-Munsee Community
Tribal Historic Preservation Extension office
86 Spring Street
Williamstown, Massachusetts 01267
Email: thpo@mohican-nsn.gov

Applicants or their representative must send project information via email (***preferred***) or regular mail and provide proof of receipt or proof of delivery.

Area of concern: West of the Connecticut River and Northfield, Montague, Miller's Falls, Turner's Falls, Sunderland, Amherst, Hadley, South Hadley, Chicopee, Springfield and Longmeadow.

APPENDIX B PRE-CONSTRUCTION NOTIFICATION

U.S. Army Corps of Engineers (USACE), New England District (NAE)

PRE-CONSTRUCTION NOTIFICATION (PCN)

DATA REQUIRED BY THE PRIVACY ACT OF 1974

Authority Rivers and Harbors Act, Section 10, 33 USC 403; Clean Water Act, Section 404, 33 USC 1344; Regulatory Programs of the Corps of Engineers; Final Rule 33 CFR 320-332.

Principal Purpose The information provided will be used in evaluating activities under Pre-Construction Notification procedures within New England.

Routine Uses This information may be shared with other federal, state, and local government agencies during the application review process. Submission

Disclosure of requested information is voluntary. However, if information is not provided the PCN application cannot be fully evaluated nor can USACE render a permit decision.

Instructions The applicant must complete ALL required sections of this document before their submission to USACE. The PCN submission to USACE shall include one set of drawings which show the location and character of the proposed activity, statements that address each required field below, and documentation that supports each field (e.g., emails, letters, description/narrative, phone calls, surveys, reports, etc.). Electronic submissions to the following address are strongly preferred: cenae-r-ma@usace.army.mil. The email subject line shall contain the following: General Permit #, PCN, City/Town, and date submitted. An application that is not completed in full will be returned.

(ITEMS 1 THRU 4 TO BE FILLED BY USACE)

STATEMENT OF AUTHORIZATION

11. I hereby authorize, _____ to act on my behalf as my agent in the processing of this general permit PCN application and to furnish, upon request, supplemental information in support of this general permit PCN application.

_____ _____

SIGNATURE OF APPLICANT DATE

NAME, LOCATION, AND DESCRIPTION OF PROJECT OR ACTIVITY

12. PROJECT NAME or TITLE (*see instructions*)

13. NAME OF WATERBODY, IF KNOWN (*if applicable*)	14. PROPOSED ACTIVITY STREET ADDRESS (*if applicable*)
15. LOCATION OF PROPOSED ACTIVITY (*see instructions*)	City: State: Zip:
Latitude: °N Longitude: °W	

16. OTHER LOCATION DESCRIPTIONS, IF KNOWN (*see instructions*)

State Tax Parcel ID: Municipality:

Section: Township: Range:

17. DIRECTIONS TO THE SITE.

18. IDENTIFY THE SPECIFIC GENERAL PERMIT(S) YOU PROPOSE TO USE:

19. DESCRIPTION OF PROPOSED GENERAL PERMIT ACTIVITY (*see instructions*)

20. DESCRIPTION OF PROPOSED MITIGATION MEASURES (*see instructions*)

21. PURPOSE OF GENERAL PERMIT ACTIVITY (*Describe the reason or purpose of the project, see instructions*)

22. Quantity of Wetlands, Streams, or Other Types of Waters Directly Affected by Proposed General Permit Activity (*see instructions*)

Area (square feet)	Length (linear feet)	Volume (cubic yards)	Duration	Purpose

Each PCN must include a delineation of wetlands, other special aquatic sites, and other waters, such as lakes and ponds, and perennial, intermittent, and ephemeral streams, on the project site.

23. List any other GP(s), regional general permit(s), or individual permit(s) used or intended to be used to authorize any part of the proposed project on any related activity (*see instructions*)

24. If the proposed activity will result in the loss of aquatic resources that exceed those identified in the New England District Compensatory Mitigation Thresholds, explain how the compensatory mitigation requirement will be satisfied. (*see instructions*)

25. Is Any Portion of the General Permit Activity Already Complete? ☐ Yes ☐ No If Yes, describe the completed work:

26. List the name(s) of any species listed as endangered or threatened under the Endangered Species Act that might be affected by the proposed GP activity or utilize the designated critical habitat that might be affected by the proposed GP activity. (*see instructions*)

27. List any historic properties that have the potential to be affected by the proposed GP activity or include a vicinity map indicating the location of the historic property or properties. Attach relevant project information, along with any responses received from project notifications to this submittal. (*see instructions*)

28. For a proposed GP activity that will occur in a component of the National Wild and Scenic River System, or in a river officially designated by Congress as a "study river" for possible inclusion in the system while the river is in an official study status, identify the Wild and Scenic River or the "study river":

29. If the proposed GP activity also requires permission from the USACE pursuant to 33 U.S.C. 408 because it will alter or temporarily or permanently occupy or use a U.S. Army Corps of Engineers federally authorized civil works project, have you submitted a written request for section 408 permission from the USACE district having jurisdiction over that project? ☐ Yes ☐ No

If "yes", please provide the date your request was submitted to the USACE District:

30. Does the activity require a 401 Water Quality Certification (WQC)? If so, specify the type of 401 WQC that is required (general or individual). In cases where an individual 401 WQC is required, provide the date the 401 WQC certification request was submitted to the certifying authority and their contact information.

31. If the terms of the GP(s) you want to use require additional information to be included in the PCN (i.e. sampling and analysis plan), please include that information in this space or provide it on an additional sheet of paper marked Block 30. (*see instructions*)

32. I certify that the information in this pre-construction notification is complete and accurate. I further certify that I possess the authority to undertake the work described herein or am acting as the duly authorized agent of the applicant.

SIGNATURE OF APPLICANT	DATE	SIGNATURE OF AGENT	DATE

The Pre-Construction Notification must be signed by the person who desires to undertake the proposed activity (applicant) and, if the statement in block 11 has been filled out and signed, the authorized agent.

18 U.S.C. Section 1001 provides that: Whoever, in any manner within the jurisdiction of any department or agency of the United States knowingly and willfully falsifies, conceals, or covers up any trick, scheme, or disguises a material fact or makes any false, fictitious or fraudulent statements or representations or makes or uses any false writing or document knowing same to contain any false, fictitious or fraudulent statements or entry, shall be fined not more than $10,000 or imprisoned not more than five years or both.

Instructions for Preparing a

Department of the Army

General Permit (GP) Pre-Construction Notification (PCN)

Blocks 1 through 4. To be completed by the U.S. Army Corps of Engineers.

Block 5. Applicant' Name. Enter the name and the e-mail address of the responsible party or parties. If the responsible party is an agency, company, corporation, or other organization, indicate the name of the organization and responsible officer and title. If more than one party is associated with the PCN, please attach a sheet of paper with the necessary information marked Block 5.

Block 6. Address of Applicant. Please provide the full address of the party or parties responsible for the PCN. If more space is needed, attach an extra sheet of paper marked Block 6.

Block 7. Applicant Telephone Number(s). Please provide the telephone number where you can usually be reached during normal business hours.

Blocks 8 through 11. To be completed, if you choose to have an agent.

Block 8. Authorized Agent's Name and Title. Indicate name of individual or agency, designated by you, to represent you in this process. An agent can be an attorney, builder, contractor, engineer, consultant, or any other person or organization. Note: An agent is not required.

Blocks 9 and 10. Agent's Address and Telephone Number. Please provide the complete mailing address of the agent, along with the telephone number where they can be reached during normal business hours.

Block 11. Statement of Authorization. To be completed by the applicant, if an agent is to be employed.

Block 12. Proposed General Permit Activity Name or Title. Please provide a name identifying the proposed GP activity, e.g., Windward Marina, Rolling Hills Subdivision, or Smith Commercial Center.

Block 13. Name of Waterbody. Please provide the name (if it has a name) of any stream, lake, marsh, or other waterway to be directly impacted by the GP activity. If it is a minor (no name) stream, identify the waterbody the minor stream enters.

Block 14. Proposed Activity Street Address. If the proposed GP activity is located at a site having a street address (not a box number), enter it in Block 14.

Block 15. Location of Proposed Activity. Enter the latitude and longitude of where the proposed GP activity is located. Indicate whether the project location provided is the center of the project or whether the project location is provided as the latitude and longitude for each of the "corners" of the project area requiring evaluation. If there are multiple sites, please list the latitude and longitude of each site (center or corners) on a separate sheet of paper and mark as Block 15.

Block 16. Other Location Descriptions. If available, provide the Tax Parcel Identification number of the site, Section, Township, and Range of the site (if known), and / or local Municipality where the site is located.

Block 17. Directions to the Site. Provide directions to the site from a known location or landmark. Include highway and street numbers as well as names. Also provide distances from known locations and any other information that would assist in locating the site. You may also provide a description of the location of the proposed GP activity, such as lot numbers, tract numbers, or you may choose to locate the proposed GP activity site from a known point (such as the right descending bank of Smith Creek, one mile downstream from the Highway 14 bridge). If a large river or stream, include the river mile of the proposed GP activity site if known. If there are multiple locations, please indicate directions to each location on a separate sheet of paper and mark as Block 17.

Block 18. Identify the Specific General Permit(s) You Propose to Use. List the number(s) of the General Permit(s) you want to use to authorize the proposed activity (e.g., GP 4).

Block 19. Description of the Proposed General Permit Activity. Describe the proposed GP activity, including the direct and indirect adverse environmental effects of the proposed activity. The description of the proposed activity should be sufficiently detailed for USACE to determine that the adverse environmental effects of the activity will be no more than minimal. Identify the materials to be used in construction, as well as the methods by which the work is to be done.

Provide drawings to show that the proposed GP activity complies with the terms of the applicable GP(s). Drawings should contain sufficient detail to provide an illustrative description of the proposed GP activity, but do not need to be detailed engineering plans. The written descriptions and illustrations are an important part of the application. Please describe, in detail, what you wish to do. If more space is needed, attach an extra sheet of paper marked Block 19.

Block 20: Description of Proposed Mitigation Measures. Describe any proposed mitigation measures intended to reduce the adverse environmental effects caused by the proposed GP activity. The description of any proposed mitigation measures should be sufficiently detailed for USACE to determine how the measures would avoid and minimize adverse environmental effects. If adverse effects exceed the New England District compensatory mitigation thresholds, you must document how compensatory mitigation would be satisfied in Block 24.

Block 21. Purpose of General Permit Activity. Describe the purpose and need for the proposed GP activity. What will it be used for and why? Also include a brief description of any related activities associated with the proposed project. Provide the approximate dates you plan to begin and complete all work.

Block 22. Quantity of Wetlands, Streams, or Other Types of Waters Directly Affected by the Proposed General Permit Activity. For discharges of dredged or fill material into Waters of the U.S., provide the amount of wetlands, streams, or other types of waters filled, flooded, excavated, or drained by the proposed GP activity. For structures or work in Navigable Waters of the U.S. subject to Section 10 of the Rivers and Harbors Act of 1899, provide the amount of navigable waters filled, dredged, occupied by one or more structures (e.g., aids to navigation, mooring buoys) by the proposed GP activity. The area of impact includes the structures or fills with direct or indirect effects to waters of the U.S. The length of impact includes the length of a stream, including is banks, that are directly affected by the structures or fills. The duration of impact should be identified as temporary (xx days) or permanent. The impact purpose should briefly describe what structure or fill is responsible for the impact.

Block 23. Identify Any Other General Permit(s), Regional General Permit(s), or Individual Permit(s) Used to Authorize Any Part of Proposed Activity or Any Related Activity. List any other GP(s) or individual permit(s) used or intended to be used to authorize any part of the proposed project or any related activity. For linear projects, list other separate and distant crossings of waters and wetlands authorized by these GPs that do not require PCNs. If more space is needed, attach an extra sheet of paper marked Block 23.

Block 24. Compensatory Mitigation Statement for Losses Greater Than the New England District Compensatory Mitigation Thresholds. New England District requires compensatory mitigation at a minimum one for one replacement ratio or greater for all aquatic resource losses that require a PCN and exceed the New England District Compensatory Mitigation Thresholds, unless USACE determines in writing that either some other form of mitigation is more environmentally appropriate or the adverse environmental effects of the proposed GP activity are no more than minimal without compensatory mitigation, and provides an activity specific waiver of this requirement. Describe the proposed compensatory mitigation for wetland losses greater than the New England District Compensatory Mitigation Thresholds or provide an explanation of why USACE should not require wetland compensatory mitigation for the proposed GP activity. If more space is needed, attach an extra sheet of paper marked Block 24.

Block 25. Is Any Portion of the General Permit Activity Already Complete? Describe any work that has already been completed for the GP activity.

Block 26. List the Name(s) of Any Species Listed As Endangered or Threatened under the Endangered Species Act that Might be Affected by the General Permit Activity. If you are not a federal agency, and if any listed species or designated critical habitat might be affected or is in the vicinity of the proposed GP activity, or if the proposed GP activity is located in designated critical habitat, list the name(s) of those endangered or threatened species that might be affected by the proposed GP activity or utilize the designated critical habitat that might be affected by the proposed GP activity. If you are a Federal agency, and the proposed GP activity requires a PCN, you must provide documentation demonstrating compliance with Section 7 of the Endangered Species Act.

Block 27. List Any Historic Properties that Have the Potential to be Affected by the General Permit Activity. If you are not a federal agency, and if any historic properties have the potential to be affected by the proposed GP activity, list the name(s) of those historic properties that have the potential to be affected by the proposed GP activity. Provide all relevant documentation about these historic properties in the PCN submittal. If you are a Federal agency, and the proposed GP activity requires a PCN, you must provide documentation demonstrating compliance with Section 106 of the National Historic Preservation Act.

Block 28. List the Wild and Scenic River or Congressionally Designated Study River if the General Permit Activity Would Occur in such a River. If the proposed GP activity will occur in a river in the National Wild and Scenic River System or in a river officially designated by Congress as a “study river” under the Wild and Scenic Rivers Act, provide the name of the river. For a list of Wild and Scenic Rivers and study rivers, please visit http://www.rivers.gov/

Block 29. General Permit Activities that also Require Permission from the USACE Under 33 U.S.C. 408. If the proposed GP activity also requires permission from the USACE under 33 U.S.C. 408 because it will temporarily or permanently alter, occupy, or use a USACE federal authorized civil works project, indicate whether you have submitted a written request for section 408 permission from the USACE district having jurisdiction over that project.

Block 30. 401 Water Quality Certification. As described above, specify if the activity requires a 401 WQC from the certifying authority.

Block 31. Other Information Required For General Permit Pre Construction Notifications. The terms of some of the General Permits include additional information requirements for preconstruction notifications:

* Maintenance – information regarding the original design capacities and configurations of the outfalls, intakes, small impoundments, and canals.
* Temporary Construction, Access, and Dewatering – a restoration plan showing how all temporary fills and structures will be removed and the area restored to pre-project conditions.
* Repair of Uplands Damaged by Discrete Events – documentation, such as a recent topographic survey or photographs, to justify the extent of the proposed restoration.
* Commercial Shellfish Aquaculture Activities – (1) a map showing the boundaries of the project area, with latitude and longitude coordinates for each corner of the project area; (2) the name(s) of the species that will be cultivated during the period this GP is in effect; (3) whether canopy predator nets will be used; (4) whether suspended cultivation techniques will be used; and (5) general water depths in the project area (a detailed survey is not required).Dredging – (1) a proposed sampling and analysis plan shall be provided to USACE for approval prior to its execution. Pre-application meetings are encouraged.
* Beach Nourishment – sediment grain size should be determined for the length of the beach where nourishment is proposed. The frequency and locations of sediment sampling shall be sufficient to identify the sediment composition of the beach profile. This data shall be consolidated to generate a sediment gradation curve for each sampled transect. Each sampled transect should also be identified on the project plans (drawings).

If more space is needed, attach an extra sheet of paper marked Box 31.

Block 32. Signature of Applicant or Agent. The PCN must be signed by the person proposing to undertake the GP activity, and if applicable, the authorized party (agent) that prepared the PCN. The signature of the person proposing to undertake the GP activity shall be an affirmation that the party submitting the PCN possesses the requisite property rights to undertake the GP activity (including compliance with special conditions, mitigation, etc.).

DELINEATION OF WETLANDS, OTHER SPECIAL AQUATIC SITES, AND OTHER WATERS

Each PCN must include a delineation of wetlands, other special aquatic sites, and other waters, such as lakes and ponds, and perennial, intermittent, and ephemeral streams, on the project site. Wetland delineations must be prepared in accordance with the current wetland delineation manual and regional supplement published by the USACE. The permittee may ask the USACE to delineate the special aquatic sites and other waters on the project site, but there may be a delay if the USACE does the delineation, especially if the project site is large or contains many wetlands, other special aquatic sites, and other waters. The 60-day PCN review period will not start until a delineation has been completed.

DRAWINGS AND ILLUSTRATIONS

General Information.

Three types of illustrations are needed to properly depict the work to be undertaken. These illustrations or drawings are identified as a Vicinity Map, a Plan View or a Typical Cross Section Map. Identify each illustration with a figure or attachment number. For linear projects (e.g. roads, subsurface utility lines, etc.) gradient drawings should also be included. Please submit one copy of all drawings on 8½ x 11 inch plain white paper (electronic submissions preferred). Use the fewest number of sheets necessary for your drawings or illustrations. Each illustration should identify the project, the applicant, and the type of illustration (vicinity map, plan view, or cross section). While illustrations need not be professional (many small, private project illustrations are prepared by hand), they should be clear, accurate, and contain all necessary information.

ADDITIONAL INFORMATION AND REQUIREMENTS

For proposed GP activities that involve discharges into waters of the United States, water quality certification from the State, Tribe, or EPA must be obtained or waived. Some States, Tribes, or EPA have issued water quality certification for one or more GPs. Please check the New England District website to see if water quality certification has already been issued for the GP(s) you wish to use. For proposed GP activities in coastal states, state Coastal Zone Management Act consistency concurrence must be obtained, or a presumption of concurrence must occur. Some States have issued Coastal Zone Management Act consistency concurrences for one or more GPs. Please check the New England District website to see if Coastal Zone Management Act consistency concurrence has already been issued for the GP(s) you wish to use.

APPENDIX C SELF-VERIFICATION NOTIFICATION

U.S. Army Corps of Engineers (USACE)

SELF-VERIFICATION NOTIFICATION (SVN)

DATA REQUIRED BY THE PRIVACY ACT OF 1974

Authority Rivers and Harbors Act, Section 10, 33 USC 403; Clean Water Act, Section 404, 33 USC 1344; Regulatory Programs of the Corps of Engineers; Final Rule 33 CFR 320-332.

Principal Purpose This information will be used in evaluating activities under Self-Verification procedures within Massachusetts.

Routine Uses Routine uses will include: (1) Documenting compliance with the terms and conditions of the General Permit (GP) for activities that may require authorization pursuant to one or more of USACE's Regulatory authorities. (2) Records may be referred to other Federal, State, and local agencies for evaluation and enforcement purposes.

Disclosure Failure to fully comply and abide by the GP terms and conditions prior to commencing work and after completion project may result in formal enforcement action, up to and including monetary penalties and/or legal action, pursuant to 33 CFR Part 326.

Instructions The permittee must complete ALL required sections of this document before commencing USACE-regulated activities. A copy of this completed SVN must be kept on site during construction and be made available for review by USACE and other Federal, State, & Local regulatory authorities at any time. Within 30 days of initiating project construction, the permittee shall submit the completed SVN to USACE. The SVN shall be submitted to USACE as **ONE signed document** that includes project plans and documentation that supports each field (e.g., emails, letters, description, phone calls, surveys). Electronic submissions to the following address are strongly preferred: cenae-r-ma-sv@usace.army.mil. The email subject line shall contain the following: GP #, SVN, City/Town, and date submitted.

(ITEMS 1 THRU 3 TO BE FILLED BY USACE)

1. APPLICATION NO.	2. FIELD OFFICE CODE	3. DATE RECEIVED

NAME, LOCATION, AND DESCRIPTION OF PROJECT SITE

10. PROJECT NAME OR TITLE

11. FILE NUMBER(S) OF PREVIOUS USACE ACTIONS ON THE SITE (if applicable)	12. NAME OF WATERBODY
13. PROJECT COORDINATES (in decimal degrees)	14. PROJECT STREET ADDRESS (if applicable)
Latitude: ◦N Longitude: ◦W	Address
	City - State - Zip -

ACTIVITY TYPE, PROJECT IMPACTS, AVOIDANCE & MINIMIZATION

15. GENERAL PERMIT ACTIVITIES (CHECK ALL THAT APPLY)

1 ☐	6 ☐	11 ☐	16 ☐	21 ☐
2 ☐	7 ☐	12 ☐	17 ☐	22 ☐
3 ☐	8 ☐	13 ☐	18 ☐	23 ☐
4 ☐	9 ☐	14 ☐	19 ☐	24 ☐
5 ☐	10 ☐	15 ☐	20 ☐	25 ☐

16. SUMMARY OF PROJECT IMPACTS (*see instructions*)

Area (square feet)	Length (linear feet)	Volume (cubic yards)	Duration

17. PROJECT PLANS (BY CHECKING THE BOXES BELOW, YOU CERTIFY THESE ITEMS ARE COMPLETE) (*see instructions*)

- ☐ a. Plans shall at least contain the following: Vicinity Map, Plan View, and Typical Cross Section View of the proposed activity.
- ☐ b. All direct, indirect and secondary impacts from USACE regulated activities are shown on the project plans.
- ☐ c. The size of the impact area for each activity (acre, square feet, linear feet) are shown on the project plans.
- ☐ d. For discharges of fill material (§404), the volume of fill material is identified on the project plans.
- ☐ e. The duration of each impact, permanent or temporary (X days), is identified on the project plans.
- ☐ f. Do activities with permanent impacts result in the loss of waters? If so, this is identified on the project plans.
- ☐ g. All aquatic resources in the vicinity of the USACE regulated activities are delineated on the project plans.

18. AVOIDANCE & MINIMIZATION (BY CHECKING THE BOXES BELOW, YOU CERTIFY THESE CRITERIA ARE MET) (*see instructions*)

- ☐ a. The project has been designed to avoid and minimize impacts to aquatic resources.
- ☐ b. The footprint of activities in waters of the U.S. has been reduced to only what is necessary to achieve the overall project purpose.
- ☐ c. All practicable measures have been taken to avoid and minimize impacts to aquatic resources through construction techniques and site access (e.g., Best Management Practices, Time of Year Restrictions).
- ☐ d. All temporary impacts from USACE regulated activities will be restored upon completion of construction and the project area will be returned to pre-construction contours and conditions.

COMPLIANCE WITH FEDERAL REGULATIONS & SUPPLEMENTAL INFORMATION

19. DUE DILIGENCE (*see instructions*)

Complete the entries below to document compliance with the following Federal requirements. Construction may NOT begin if a PCN is/may be required, and you must contact USACE to determine permitting requirements. Documentation that demonstrates how the activity complies with each field below shall be submitted to the USACE as noted in the instructions block. See each General Condition (GC) in the GP for how to comply with each requirement.

a. State Historic Preservation Officer	Select Option		
b. Massachusetts BUAR	Select Option		
c. Tribal Historic Preservation Officers	Select Option		
d. Endangered Species Act - NOAA	Select Option		
e. Endangered Species Act - USFWS	Select Option		
f. Northern Long Eared Bat (ESA)	Select Option		
g. Essential Fish Habitat	Select Option		
h. Wild & Scenic Rivers	Select Option		
i. 401 Water Quality Certification 401	Select Option		
	401 WQC/OOC File Number:	OOC issued:	401 issued:
j. Section 408 Permission	Select Option		
k. Coastal Zone	Select Option		
l. Construction Mats	Select Option		
m.Time of Year Restrictions	Select Option		
n. Vernal Pools	Select Option		
o. Sediment & Erosion Controls	Select Option		
p. Stream/Wetland Crossings	Select Option		

20. AQUACULTURE ACTIVITIES - GP 18 (*see instructions*)

- ☐ a. If required, an Aquaculture Certification from the Massachusetts Division of Marine Fisheries was obtained prior to commencing work.
- ☐ b. Coordination with the U.S. Coast Guard pursuant to Private Aids to Navigation has occurred prior to commencing work.
- ☐ c. If required, a MEPA Certificate was obtained from the Massachusetts Environmental Protection Agency prior to commencing work. Select Option
- ☐ d. The prospective permittee contacted local authorities (e.g. harbormaster, select board, shellfish constable) for authorization of their facility prior to commencing work.

21. ADDITIONAL INFORMATION/ATTACHMENTS (*see instructions*)

- ☐ a. The project plans are enclosed in this SVN submittal (see block 17).
- ☐ b. The activity Select Option funded through the Bipartisan Infrastructure Bill (also known as the Infrastructure Investment and Jobs Act).
- ☐ c. All required state, local and federal approvals were acquired prior to starting construction in USACE jurisdiction.
- ☐ d. After construction of the activity is completed, a complete Certificate of Compliance will be submitted to USACE.

22. IS THERE ANOTHER LEAD FEDERAL AGENCY:

☐ YES ☐ NO

23. STATEMENT OF AUTHORIZATION *(see instructions)*

I certify that I possess the authority to undertake the work described herein or am acting as the duly authorized agent of the applicant.

SIGNATURE OF APPLICANT	DATE	SIGNATURE OF AGENT	DATE

24. SIGNATURES *(see instructions)*

I hereby certify that the information in this Self-Verification Notification is complete and accurate. As the applicant or their duly authorized agent, I certify the activity was completed in accordance with the terms and conditions of the GP. This includes all applicable terms, general conditions, and activity-specific GP criteria. I agree to allow the duly authorized representatives of the Corps of Engineers Regulatory Program and other regulatory or advisory agencies to enter upon the premises of the project site at reasonable times to evaluate inspect and photograph site conditions. This consent to enter the property is superior to, takes precedence over, and waives any communication to the contrary. For example, if the property is posted as “no trespassing” this consent specifically supersedes and waives that prohibition and grants permission to enter the property despite such posting.

SIGNATURE OF APPLICANT	DATE	SIGNATURE OF AGENT	DATE

18 U.S.C. Section 1001 provides that: Whoever, in any manner within the jurisdiction of any department or agency of the United States knowingly and willfully falsifies, conceals, or covers up any trick, scheme, or disguises a material fact or makes any false, fictitious or fraudulent statements or representations or makes or uses any false writing or document knowing same to contain any false, fictitious or fraudulent statements or entry, shall be fined not more than $10,000 or imprisoned not more than five years or both.

Instructions for Preparing a
Department of the Army
General Permit (GP) Self-Verification

Blocks 1 through 3. To be completed by the Corps of Engineers.

Block 4. Applicant' Name. Enter the name and the e-mail address of the responsible party or parties. If the responsible party is an agency, company, corporation, or other organization, indicate the name of the organization and responsible officer and title. If more than one party is associated with the self-verification, please attach a sheet of paper with the necessary information marked Block 4.

Block 5. Address of Applicant. Please provide the full address of the party or parties responsible for the self-verification. If more space is needed, attach an extra sheet of paper marked Block 5.

Block 6. Applicant Telephone Number(s). Please provide the telephone number where you can usually be reached during normal business hours.

Blocks 7 through 9. To be completed, if you choose to have an agent.

Block 7. Authorized Agent's Name and Title. Indicate name of individual or agency, designated by you, to represent you in this process. An agent can be an attorney, builder, contractor, engineer, consultant, or any other person or organization. Note: An agent is not required.

Blocks 8 and 9. Agent's Address and Telephone Number. Please provide the complete mailing address of the agent, along with the telephone number where they can be reached during normal business hours.

Block 10. Proposed General Permit Activity Name or Title. Please provide a name identifying the proposed GP activity, e.g., Windward Marina, Rolling Hills Subdivision, or Smith Commercial Center.

Block 11. File Number(s) of Previous USACE Actions on the Site Please provide any known USACE file number. If the activity does not have a known USACE file number, you may state N/A.

Block 12. Name of Waterbody. Please provide the name (if it has a name) of any stream, lake, marsh, or other waterway to be directly impacted by the GP activity. If it is a minor (no name) stream, identify the waterbody the minor stream enters.

Block 13. Proposed Activity Coordinates. Please enter the latitude and longitude of where the proposed GP activity is located. Indicate whether the project location provided is the center of the project or whether the project location is provided as the latitude and longitude for each of the "corners" of the project area. If there are multiple sites, please list the latitude and longitude of each site (center or corners) on a separate sheet of paper and mark as Block 13.

Block 14. Proposed Activity Street Address. If the proposed activity is located at a site having a street address (not a box number), enter it in Block 14.

Block 15. General Permit Activity Type. Please select all GP activity types that apply to the proposed activity. A list of GP activity types can be found in Section III of the GP.

Block 16. Summary of Project Impacts. Please provide ALL proposed impacts, both temporary and permanent in duration, that are located in Waters of the United States. The area of impact shall be provided in square feet (SF). When applicable, impacts that result in conversion of stream bank or shoreline must also be identified in linear feet (LF). Dredging or the discharge of dredged or fill material shall also include the volume, cubic yards (CY), of material removed from or placed into Waters of the U.S. If more entries are required, please attach a table matching the desired format in Block 16.

Block 17. Project Plans. Please verify that items a-g are included in the project plans. Three types of illustrations are necessary to properly depict the proposed work. These illustrations or drawings are identified as a Vicinity Map, a Plan View (Aerial view) and a Cross Section Map. For linear projects (e.g. roads, subsurface utility lines, etc.) gradient drawings (longitudinal profile) should also be included. Plans must accurately depict the existing conditions and all aspects of the proposed activity located in waters of the U.S. Please submit one copy of all drawings formatted to print on 8½ x 11 inch or 11 x 17 inch plain white paper. Use the fewest number of sheets necessary for your drawings or illustrations. Each illustration should identify the project, the applicant, and the type of illustration (vicinity map, plan view, or cross section). While illustrations need not be certified engineering sheets; they should be clear, accurate, contain all necessary information, and depict all proposed work. Each submission must also include a delineation of wetlands, other special aquatic sites, and other waters, such as lakes and ponds, and perennial, intermittent, and ephemeral streams, on the project site. Wetland delineations must be prepared in accordance with the current wetland delineation manual and regional supplement published by USACE.

Block 18. Avoidance & Minimization. Please verify that items a-d have been implemented for the proposed activity.

Block 19. Due Diligence. Please complete all the fields and submit documentation to USACE to demonstrate compliance with the above requirements. This Documentation may include emails, letters, meeting notes, phone call log, project narrative, project plans, a species list from the NOAA Section 7 Mapper, a completed copy of the IPAC determination keys, etc. Documentation should be limited to what is necessary to demonstrate how the proposed activity meets each requirement. Refer to the MA GP, Appendix A, for specific guidance on the identification of previously identified historic properties and previously unidentified historic properties. Endangered Species: *The applicant must be designated as the non-federal representative for the purposes of Section 7 consultation to select the Rangewide D-Key options. Otherwise, the applicant shall select the following option when IPAC indicates the NLEB is present: "The activity IS located within the NLEB Species Range (PCN Required)."

Block 20. Aquaculture Activities. Please verify that items a-d have been obtained or completed prior to commencing work in waters of the U.S.

Block 21. Additional Information/Attachments. Please verify that items a-d have been completed prior to commencing work in waters of the U.S.

Block 22. Lead Federal Agency. Please identify if there is another lead federal agency involved with the proposed activity. Enter the lead federal agency name (e.g., the Federal Emergency Management Agency, FEMA) and the agency's designated person of contact for the activity.

Block 23. Statement of Authorization. The applicant shall sign this section for all activities. If an agent is to be employed, the agent shall sign this section.

Block 24. Signatures. The SVN must be signed by the person proposing to undertake the GP activity, and if applicable, the authorized party (agent) that prepared the SVN. The signature of the person proposing to undertake the GP activity shall be an affirmation that the party submitting the SVN possesses the requisite property rights to undertake the GP activity.

US Army Corps of Engineers®
New England District

APPENDIX D: PCN APPLICATION CHECKLIST

The following information shall be submitted for all PCNs for USACE to properly evaluate your application. Some applications may require more information and this checklist is offered as a tool to assist applicants with submitting a complete application.

SECTION 1: GENERAL APPLICATION INFORMATION

1. ☐ Complete the Pre-Construction Notification document (Appendix B).
2. ☐ Specify which local/state/federal authorizations are required for the project and if any have been obtained or applied for at the time of USACE application submittal.
3. ☐ Identify all funding sources the project will receive or has received to date. Provide any relevant information in the application submission.
4. ☐ Is this part of a larger project that is being implemented in phases? If so, describe the project schedule and how each phase will be implemented.
5. ☐ Describe the existing conditions on the site and the general land use in the vicinity of the project at the time application submittal.
6. ☐ Provide any historic information available that you may have of project area, e.g., existing USACE permit numbers, the names under which the permits were obtained if the permit numbers are unknown, construction dates and proof of prior existence (aerials, photos, town hall records, affidavits, state or local permits, etc.) to verify that the project predates regulation and is "vested".[19]
7. ☐ The anticipated start and end dates for construction.

SECTION 2: WETLAND DELINEATION

8. ☐ Data used to support aquatic resource boundary determinations (delineation forms, delineation map(s) that show the locations of each aquatic resource in the project area, aerial and ground photographs, LIDAR imagery, national wetland inventory maps, soil maps, national hydrography dataset maps, floodplain maps, historical imagery, etc.).
9. ☐ Photographs of the wetland(s) and/or waterway(s) where impacts are proposed. Photos at low tide are preferred for work in tidal waters.
10. ☐ Indicate the relationship of the project area to waters of the U.S., i.e., adjacent wetlands, tidal influence or hydraulic connectivity through culverts, or other conveyances, etc.
11. ☐ At minimum the delineation map/figure should include the following:
    a. Contour lines showing topography.
    b. North arrow.
    c. Bar and text scale.
    d. Legend.
    e. Drawn project boundary.
    f. High tide line, mean high water, mean low water, ordinary high water mark, and/or wetland boundaries.
    g. Captions with a unique name for each aquatic resource and the area or length of the aquatic resource within the project area.

[19] Vested is exempt (someone or something) from a new law or regulation.

h. Appropriate landmarks and features (e.g., culverts, special aquatic sites, etc.).
i. Points showing the paired upland and wetland delineation locations for tidal and non-tidal wetlands only.

SECTION 3: AVOIDANCE & MINIMIZATION

12. ☐ Describe specific measures taken to avoid impacts to aquatic resources or describe why aquatic resources could not be avoided while achieving the project purpose and need.
13. ☐ For impacts to aquatic resources that could not be avoided, describe specific considerations/ measures taken to minimize the area of proposed impacts to aquatic resources in designing the project.
14. ☐ Describe specific measures taken to avoid and minimize the proposed direct, indirect, and secondary impacts to aquatic resources and their functions through construction techniques and timing.
15. ☐ If applicable, provide a restoration plan that describes how all temporary fills and structures will be removed and the area restored to pre-impact conditions (see GC 22).
16. ☐ If applicable, provide an Invasive Species Control Plan (see GC 29). For sample control plans, see www.nae.usace.army.mil/missions/regulatory/invasive-species.
17. ☐ If applicable, describe how the proposed wetland/waterbody crossing is compliant with GC 31, Stream Work and Crossings, and Wetland Crossings.

SECTION 4A: PROJECT IMPACTS

18. ☐ Describe the overall project and the activities located in Waters of the U.S. (WOTUS) that you are seeking authorization for.
19. ☐ Identify the following for project impacts in WOTUS:
    a. ☐ Direct, indirect, secondary impacts[20] within WOTUS.
    b. ☐ The size of each impact (square feet or acres, or linear feet).
    c. ☐ For discharges of fill material (§404), specify the volume of fill material to be discharged (cubic yards).
    d. ☐ The impact duration from each activity, permanent or temporary (X days).

SECTION 4B: PROJECT PLANS

20. ☐ Submit project plans that depict all impacts in WOTUS. On the project plans, applicants shall provide:

General Information

    a. ☐ Plan view and typical cross-section view sheets that show the existing and proposed conditions. These illustrations should each be identified with a figure number, date of the map, the project title, the name of the applicant and the type of illustration (vicinity map, plan view, or cross section).
    b. ☐ Drawings, sketches, or plans that are legible, reproducible (color is encouraged, but features must be distinguishable in black and white), drawn to scale, and no larger than 11”x17” and 10 MB when submitted in digital format. Numeric and graphic/bar scales must agree, and plan details must be measurable using a standard engineer’s scale on printed plans. Reduced plans are not acceptable.
    c. ☐ The north arrow and remove miscellaneous non-wetland or water project related features such as conduits, utility poles, guardrails, etc.

[20] See definitions section for the definitions of direct, indirect, secondary impacts.

d. ☐ Clearly draw the overall limits of work, staging areas, disposal sites, access routes, and any permittee responsible mitigation sites. These areas may include both aquatic resources and upland areas.
e. ☐ Names or numbers of all roads in the site's vicinity and ownership and numbers of abutting parcels.
f. ☐ Datum in plan and elevation views. The horizontal datum shall be in the NAD 83 Massachusetts State Plane Coordinate System (INSERT) in U.S. survey feet. The vertical data in coastal projects shall be referenced to either MLLW or the North American Vertical Datum of 1988 (NAVD 88). Both the distance and depth units shall be U.S. survey feet and specified on the project plans.

Aquatic Resources & Project Impacts

g. ☐ Delineation of all aquatic resource types on site including salt marsh; other special aquatic sites (vegetated shallows, mudflats, riffles and pools, coral reefs, and sanctuaries and refuges); other waters, such as lakes, ponds, vernal pools, natural rocky habitat (tidal only), and perennial, intermittent, and ephemeral streams.
h. ☐ Identify the substrate type (cobble/gravel, organic detritus, sand/shell, silt, mud) and the approximate percentage of each substrate type on site. Grain sizes shall be based on Wentworth grain size classification scale for granules, pebbles, cobbles, and boulders. Sediment samples with a content of 10% or more of pebble-gravel-cobble and/or boulder in the top layer (6-12 inches) should be delineated and material with epifauna/macroalgae should be differentiated from bare pebble-gravel-cobble and boulder.
i. ☐ The direction of ebb and flood in tidal waters and direction of flow in non-tidal waters.
j. ☐ In tidal waters, the project boundary distance from special aquatic sites identified in 20g above if within 25 feet from that resource.
k. ☐ USACE jurisdictional boundaries including ordinary high-water mark (OHWM), high tide line (HTL), mean high water (MHW). Other boundaries include mean low water (MLW), mean lower low water (MLLW), as applicable.
   - Non-tidal: OHWM and/or wetland boundaries.
   - Tidal (structures/work only): MHW, MLW.
   - Tidal (Fill and Structures/work): HTL, MHW, MLW.
   - Tidal (Dredging/Beach Nourishment): HTL, MHW, MLW, MLLW.
l. ☐ Identification of each aquatic resource with a unique name (ex. Wetland 1, Wetland 2, Tributary 1, Beaver Brook, Atlantic Ocean) and the size of each aquatic resource within the project area (square feet or acres).
m. ☐ Impacts to each aquatic resource with captions denoting the size of each impact (square feet, acres, or linear feet) and the duration of the impact (ex. Permanent, Temporary (X days).

SECTION 4C: PROJECT PLANS - SPECIFIC PROJECT INFORMATION

21. ☐ For projects involving Navigation, Structures, Dredging, and/or Beach Nourishment, the applicant shall also address the following:

Navigation

a. ☐ Identify the locations of adjacent Federal navigation project (FNP) and/or state/local navigation projects on the project plans.
b. ☐ Specify the distance between the FNP and proposed project boundary, the authorized depths of the FNP, and state plane coordinates of seaward end(s) of project structures near an FNP.

Structures

a. ☐ Identification of the piling type (steel, timber, concrete) and diameter to be removed and/or installed.
b. ☐ Specify the minimal height of the structures' frame over saltmarsh. To meet the SV threshold, piers must be ≤4 feet in width and this minimal height must achieve a 1.5:1 ratio (i.e., a 4-foot-wide pier is 6 feet above a saltmarsh).
c. ☐ For floats, the methods of securing them (piles, bottom anchors) and for keeping them off substrate (skids, stops) at low water. To meet the SV threshold, a minimum depth of 18-inches of water should be maintained below a floating dock/structure at lower tide levels.

Dredging

a. ☐ The area (SF, acre) and volume (CY) of material to be dredged waterward of MHW for each dredge location.
b. ☐ Dredge boundaries.
c. ☐ Bathymetry for existing, proposed, and historical (include dates and USACE permits) dredge depths.
d. ☐ The likely final angle of repose of the side cuts based on the physical characterization of the material to be dredged and based upon the high/ medium/low, wave or current energy of the location.
e. ☐ Label area whether the dredging is new, maintenance, improvement, or a combination.
f. ☐ Location of the disposal site (include location sheet). NOTE: For projects proposing open water, nearshore disposal, or beach nourishment, contact USACE as early as possible for sampling and testing protocols. Sediment testing, including physical (e.g., grain-size analysis), chemical and biological testing may be required. Sampling/testing of sediments without such contact should not occur and if done, will be at the applicant's risk.
g. ☐ The methods and areas used to retain or prevent dredged material from running back into the wetland or waterway. Provide the capacity of the storage area and points of runback, including the overflow route, into the aquatic system.
h. ☐ For open-water disposal, explain why inland or beneficial reuse sites are not practicable.
i. ☐ Show the finished top elevation of the disposal site.

Beach Nourishment

a. ☐ For beach nourishment, identify the disposal footprint, existing and proposed nourishment profiles (multiple profiles are appropriate if the site is more than 150 feet long or non-contiguous), total fill area (SF) and volume (CY), fill area and volume waterward of the HTL, and delineation of dunes, banks, existing beach vegetation, and contours.
b. ☐ For beach nourishment identify the substrate type (fine sand, sand, cobble, boulder) and/or grain-size of existing material.

SECTION 5: STRUCTURES

22. ☐ For projects with the removal of existing pilings identify the number, type (steel, timber, concrete) and diameter of pilings to be removed and the methodology for removal (cut off at mud line, pulling, vibratory, etc.).
23. ☐ For projects with the installation of new pilings identify the number, type (steel, timber, concrete) and diameter of pilings to be installed and the methodology for installation (vibratory hammer, impact hammer etc.).
24. ☐ Identify any existing structures and moorings in waters adjacent to the proposed activity, their dimensions, and the distance to the limits and coordinates of any proposed mooring field or reconfiguration zone. For reconfiguration zone and mooring fields, provide the coordinates for all

corners based on the Massachusetts State Plane Coordinate System. Specify the maximum number of slips and/or moorings within proposed reconfiguration zones or anchorage areas.

25. ☐ The dimensions of the structure or work and extent of encroachment waterward of MHW and from affixed point on the shoreline or upland.
26. ☐ Shoreline of adjacent properties and property boundary offset for structures. In narrow waterbodies, the distance to opposite shoreline, waterway width, and structures across from proposed work.
27. ☐ For new commercial boating facilities, anchorage areas or reconfiguration zones, provide a description of the type of vessels that would use the facility, and any plans for sewage pump-out facilities, fueling facilities and contingency plans for oil spills.
28. ☐ See Sections 4A-C above.

SECTION 6: AQUACULTURE

29. ☐ Identify the coordinates for lease area corners and gear configuration area on the project plans.
30. ☐ Identify the proposed aquaculture gear type (buoys, floats, racks, trays, nets, lines, tubes, cages, containers, and other structures). Provide the impacts for each aquaculture gear type (see Section 4A 19a-d).
31. ☐ For a GP 18 to be valid, applicants must have (a) their MA DMF Aquaculture Certification letter for licensed shellfish aquaculture sites, (b) documentation that the applicant has coordinated with the U.S. Coast Guard regarding USCG Private Aids to Navigation standards, (c) their MEPA Certificate (if required), and (d) documentation that the applicant has contacted their local authorities (ex. harbormaster, select board, shellfish constable) for authorization of their facility.
32. Provide information on site the operation, maintenance, and access. Will the site be accessed via boat, kayak, etc.? Will cages be removed in the winter? How often will gear be checked on? Is there an operations plan for the proposed aquaculture area?
33. ☐ See Sections 4A-C above.

SECTION 7: DREDGING

34. ☐ Sampling plan requests for new, improvement or maintenance dredging must submit completed **Dredged Material Evaluation checklist found at Dredged Material Evaluation Checklist, Sampling and Analysis Plan Requirements from Applicant (army.mil)** and identify the method of handling/transporting the dredged material.
35. ☐ Identify grain-size of material to be dredged (e.g., silty sand) and provide any existing sediment grain size and bulk sediment chemistry data from the proposed project or nearby projects. Include information on any recent spills of oil and/or other hazardous materials and/or nearby outfalls. Document the information source, e.g., EPA database, the harbormaster or fire chief. If there are none, state “none”.
36. ☐ See Section 4A, 4B and 4C, Dredging 21(a-i) above.

SECTION 8: WETLAND/WATERBODY CROSSINGS

37. ☐ For the stream crossing, identify the crossing methodology on the project plan (e.g., dam and pump, dry, wet, etc.). Submit a waterway crossing sequencing plan with the application.
38. ☐ If the project includes a permanent crossing of a tidal waterway, your project design should be modified to match the velocity, depth, cross-sectional area, and substrate of the existing waterbody adjacent to the crossing and provide documentation (hydraulic analysis including low lying property analysis) that the size of the crossing will not restrict tidal flow over the full natural tide range and will not adversely affect abutting infrastructure.

39. ☐ If the work includes a permanent crossing of a non-tidal stream, your project design should be modified to match the culvert gradient of the existing stream channel profile, provide clearance for ≥1.2 times bank full width and conveyance should be embedded ≥1-2 feet for box culverts and pipe arches or ≥1-2 feet and at least 25 percent for rounded pipes/culverts in accordance with the Massachusetts Stream Crossing Standards. Provide the basis for any variation to this requirement.
40. ☐ If the work includes a permanent crossing of a non-tidal stream, the structure should be designed to include a natural bottom substrate within the conveyance that matches the characteristics of the substrate in the natural stream channel and the character of the banks (mobility, slope, stability, confinement, grain and rock size). The conveyance should be designed with a minimum openness ratio ≥0.82-feet (0.25-meters). For how to calculate openness ratio and stream simulation ecological approach for road and stream crossings, see https://www.nae.usace.army.mil/Missions/Regulatory/Stream-and-River-Continuity/.

SECTION 9: COMPENSATORY MITIGATION

41. ☐ Does the project require Compensatory Mitigation[21] for impacts to Waters of the U.S.? (See Section V in the 2023 Massachusetts General Permit)
42. ☐ If the project requires mitigation, does the selected compensatory mitigation option (i.e., In-Lieu Fee, permittee-responsible mitigation) deviate from the order of the options presented in §332.3(b)(2)-(6)? If so, please explain why. https://www.ecfr.gov/current/title-33/chapter-II/part-332/section-332.3
43. ☐ For any compensatory mitigation that involves preservation, the applicant must use a site protection instrument to preserve the parcel in perpetuity. (Conservation Easement, Deed Restriction, etc.) https://www.mass.gov/service-details/conservation-restriction-review-program.

SECTION 10: HISTORIC PROPERTIES & NOTIFICATIONS TO SHPO, THPOs, BUAR

44. ☐ Notify the SHPO, Massachusetts Historical Commission, of the Project via Certified Mail and include proof of delivery or receipt in the application package (See Appendix A).
45. ☐ As applicable, notify the THPOs, Narragansett Indian Tribe, Wampanoag Tribe of Gay Head (Aquinnah), and Mashpee Wampanoag Tribe, of the Project via email OR mail and include proof of delivery or receipt in the application package (See Appendix A).
46. ☐ As applicable, notify the BUAR via email (*strongly preferred*) OR mail and include proof of delivery or receipt in the application package (See Appendix A).
47. ☐ Include responses to this notification in the permit application.
48. ☐ As applicable, information on historic properties (Tribal and Archaeological) within the project area should be provided in the permit application.

SECTION 11: ENDANGERED SPECIES & ESSENTIAL FISH HABITAT

49. ☐ Provide a USFWS Information for Planning and Consultation (IPaC) Official Species List from https://ecos.fws.gov/ipac and the email of the individual who generated the list (see GC 10 of the 2023 Massachusetts General Permit for more information).
50. ☐ Provide a species list from the NMFS Section 7 Endangered Species Act mapper at https://noaa.maps.arcgis.com/apps/webappviewer/index.html.
51. ☐ Provide a species list from the NMFS Essential Fish Habitat Mapper at https://www.habitat.noaa.gov/apps/efhmapper/?page=page_3.

[21] Your mitigation proposal must be consistent with the December 29, 2020 Compensatory Mitigation Standard Operating Procedures at https://www.nae.usace.army.mil/Portals/74/docs/regulatory/Mitigation/Compensatory-Mitigation-SOP-2020.pdf and 2008 Mitigation Rule.

52. ☐ If the project will generate turbidity, describe the extent of turbidity and if erosion controls will be used to contain turbidity. If turbidity controls are not operationally feasible, explain the basis for your conclusion and identify any other measures that you will implement to minimize resuspension of sediment.
53. ☐ Identify the substrate type and any aquatic resources that will be affected by the proposed action. (SAV, salt marsh, sand, silt/clay, rocky/hard bottom)
54. ☐ For projects which will include the installation of pilings/sheet-piles, identify the substrate at the project site (sand, cobble, silt/mud/clay), the installation method (vibratory hammer, impact hammer, combination) and indicate whether the following “soft start” procedures at beginning of the workday and after a 30-minute period of rest will be deployed:
    a. ☐ Vibratory Pile Installation: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.
    b. ☐ Impact Pile Installation: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one-minute wait period, then two subsequent 3-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving.
55. ☐ If the project involves dredging, describe any dredge history, number of dredge events to be covered by the permit, erosion/sediment controls, dredge type, intake structures (mesh screen size), dredged material disposal site.
56. ☐ For project activities associated with structures, identify the number, type (drill barge, work boat, tugboat, etc.), and size of any temporary vessels that will be used. Specify measures that will be implemented to ensure vessels are not berthed in shallow water or will “ground out” at low tide.
57. ☐ For aquaculture projects identify whether any component of the gear is seasonal (will be removed annually) or will be in place year-round. If gear will be present year-round and will be variably managed (e.g., floating in summer, bottom in winter) identify month/date for such configurations.
58. ☐ For aquaculture projects identify whether the project will involve use of an existing vessel or new vessel. Identify the length for all work vessels and identify the distance round trip from vessel berthing location and aquaculture area.
59. ☐ For project activities associated with docking structures (either commercial, industrial, or recreational) identify the number, type (motorized/non-motorized, jet-ski, sailboat, kayak, canoe, other that will be berthed there and the sizes of each.
60. ☐ Information required for Section 305(b)(2) of the Magnuson-Stevens Fishery Conservation and Management Act:
    a. Results of an eelgrass survey completed per the INSERT.
    b. Essential Fish Habitat Assessment to determine project-related impacts to essential fish habitat, using guidance developed by the National Marine Fisheries Service.
61. ☐ A document containing the following information (requirements of 50 CFR §600.920(e)(3)):
    a. Description of proposed action.
    b. Analysis of potential adverse effects on essential fish habitat.
    c. Conclusions regarding the effects of the action on essential fish habitat.
    d. If applicable, proposed mitigation.
    e. Analysis of alternatives to the proposed action.
    f. Other:

Project Number:	Not Specified	**Report Date:**	05/31/24

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Number: Not Specified **Report Date:** 05/31/24

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L2423658-01,-02 and -03: The sample was frozen upon receipt in order to arrest the holding time.

PAHs/PCB Congeners

L2423658-01: The surrogate recovery is outside the individual acceptance criteria for dbob (43%), but within the overall method allowances.

Total Metals

The WG1926511-3 MS recovery for lead (189%), performed on L2423658-01, does not apply because the sample concentration is greater than four times the spike amount added.

The WG1926511-4 Laboratory Duplicate RPD for lead (32%), performed on L2423658-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

Total Organic Carbon

The WG1922112-1 Method Blank, associated with L2423658-01 through -03, has a concentration above the reporting limit for Total Organic Carbon. Since the associated sample concentrations are greater than 10x the blank concentration for this analyte, no corrective action is required.

Grain Size Analysis

The WG1921942-1 Laboratory Duplicate RPD for % gravel (22%), performed on L2423658-02, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	PEABODY BIKEWAY	**Lab Number:**	L2423658
Project Number:	Not Specified	**Report Date:**	05/31/24

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Chlordane: The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Gasoline Range Organics (GRO): Gasoline Range Organics (GRO) results include all chromatographic peaks eluting from Methyl tert butyl ether through Naphthalene, with the exception of GRO analysis in support of State of Ohio programs, which includes all chromatographic peaks eluting from Hexane through Dodecane.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. For MassDEP DW compliance analysis only, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL. Note: If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively

Report Format: DU Report with 'J' Qualifiers

Project Name:	PEABODY BIKEWAY	**Lab Number:**	L2423658
Project Number:	Not Specified	**Report Date:**	05/31/24

Data Qualifiers

Identified Compounds (TICs). For calculated parameters, this represents that one or more values used in the calculation were estimated.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

V - The surrogate associated with this target analyte has a recovery outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Z - The batch matrix spike and/or duplicate associated with this target analyte has a recovery/RPD outside the QC acceptance limits. (Applicable to MassDEP DW Compliance samples only.)

Report Format: DU Report with 'J' Qualifiers

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

ASTM D6913/D7928

GRAIN SIZE ANALYSIS

These results are for the exclusive use of the client for whom they were obtained. They apply only to the samples tested and are not indicitive of apparently identical samples.

Project Number:	Green No. 17118
Subject:	**Response to MassDEP Administrative Completeness and Technical Deficiency Review letter for 401 Application No: 24-WW26-0034-APP**

This memorandum provides the responses to DEP Administrative Completeness and Technical Deficiency Letter for 401 WQC Transmittal No: 24-WW26-0034-APP (Fill and Dredge).

Comments from the letter are noted below with responses to each technical review comment noted below in **Bold**.

1. Some of the helical piles proposed to support the boardwalk over Proctor Brook and its associated wetlands are located directly within the channel of Proctor Brook. MassDEP is concerned that the helical piles and associated cross bars have the potential to accumulate debris and cause an obstruction. Please provide an evaluation of alternative methods to support the boardwalk over Proctor Brook that would remove the helical piles from the channel itself.

The removal of helical piles within Proctor Brook would require a structure that spans over the channel. A structure spanning over Proctor Brook would require a much more robust beam system and support pier on the east side where the boardwalk continues through the wetlands and uplands towards Endicott Street. The beams would need to be steel or composite glulam beams that are much deeper than the current sawn timber beams. Increased beam depth would increase the height of the trail vertical profile over the brook; therefore, increasing the fill for the west approach trail into the wetlands area. The more robust pier on the east side would require either a concrete footing or drilled/driven deep piles. Both of these elements would require excavation within the wetlands and a larger footprint of the final structure. Additionally, construction would require much larger equipment. Another consideration regarding the foundation type was the existing 42" diameter City-owned sewer main just south of the boardwalk in this area. A larger pier structure

could impact the existing sewer line and require a relocation of the critical utility. Over 200' length of the sewer main could need to be relocated between the manhole structures, requiring additional excavation within Proctor Brook and the wetlands. As a result, taking steps to avoid relocation of the sewer line within this area also contributed to the decision to use the helical piles as shown on the Plans.

The proposed layout and the use of helical piles was selected to minimize impacts on the natural resources of the site. The helical piles are screwed into place using small equipment and require no excavation. All that remains in the final condition is a ~2" diameter shaft exposed above grade. The proposed spacing is based on the required loading for the boardwalk and the typical load carrying capacity of the sawn timber elements and the helical piles themselves. The longitudinal bracing piles were minimized as much as possible, and only one of these bracing piles is within the limits of Proctor Brook. Regarding the potential for debris collection, there are relatively small culverts both upstream and downstream of the proposed boardwalk crossing which would stop or limit larger debris. Therefore, debris getting caught in the helical piles is only of concern for the short stretch between these two culverts, decreasing the likelihood for significant issues with accumulation. In addition, a hydraulic study was done of this area to demonstrate there will be no rise in the Base Flood Elevation of Proctor Brook at this crossing as is include with this response letter.

We have used both helical piles and timber piles in a similar application for a previous project for the Town of Ashland. For the Sudbury Riverwalk pedestrian trail an observation platform and bridge were constructed within the limits of the Sudbury River floodway. At both locations, the pile spacing, and configuration was similar to the proposed layout for the Peabody Bikeway Extension boardwalk. This project was permitted in 2019 through the Town of Ashland Conservation Commission and built in 2020. To date there have been no issues regarding debris accumulation that Green has been made aware of by the Town.

2. MassDEP is aware that scour analyses at two of the replacement stream crossings (approximate Stations 329+75 and 346+25) determined that the placement of riprap is required for scour protection. Per 314 CMR 9.06 (1), no discharge of fill material shall be permitted if there is a practicable alternative that would have less impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences. Per 314 CMR 9.06(2), no discharge of fill material shall be permitted unless appropriate and practicable steps have been taken which will avoid and minimize potential adverse impacts to Bordering Vegetated Wetlands or Land Under Water (LUW). As discussed during the June 3, 2024 meeting, the amount of riprap proposed appears excessive and it has not been demonstrated that 314 CMR 9.06 (1) and (2) have been met with the current design. Potentially practicable alternatives discussed during the meeting included reshaping the riprap fill areas to follow more natural drainage patterns, removing riprap from adjacent BVWs to the extent practicable, and natural a bank stabilization measures in strategic locations. Please provide this evaluation for MassDEP review and incorporate any practicable measures to achieve less riprap fill. A reduction in BVW alteration may result in a commensurate reduction in the required BVW mitigation.

We evaluated alternative options for scour protection based on the Federal Highway Administration (FHWA) standards, specifically the Hydraulic Engineering Circular No. 23, "Bridge Scour and Stream Instability Countermeasures: Experience, Selection, and Design Guidance-Third Edition." According to Table 2.1 of this guidance, biotechnical countermeasures are unsuitable or rarely used for contraction scour in floodplain and channel environments and for overtopping flow

at approach embankments. Alternative methods described in this table, such as those constructed from concrete, are more intrusive to the environment compared to riprap. To mitigate the environmental impact beyond what was originally proposed, the design has been revised to include proposed vegetated riprap with a layer of compost material on top. In all areas where vegetated stakes will be proposed within riprap in the BVW area, a layer of compost and seed mix will be added over the rip rap such that the compost fills the voids and is at or slightly below the surface of the stones. The addition of compost soil to the vegetated riprap will benefit vegetation re-establishment and aid in restoring the area to natural conditions. A revised detail for Compost and Seed over Vegetated Riprap is included as an attachment to this letter.

Our design follows the FHWA's Hydraulic Engineering Circular No. 14, Third Edition, "Hydraulic Design of Energy Dissipators for Culverts and Channels." The riprap aprons do not significantly dissipate energy but are crucial for spreading the flow and ensuring a smooth transition to natural drainage paths or sheet flow where applicable. Ineffectively designed or too-short aprons could increase erosion downstream, which our proposed design aims to prevent. Key design elements, including the size, length, width, and depth of the riprap apron, have been considered to address the water flow dynamics on the channel and at the embankments. These crossings occur at angles that generate turbulence, contraction flow, and increased velocity around the inlet and outlet of the culverts, necessitating our proposed approach. Signs of existing scour were present and considered for the extents of the riprap placement. These culverts have failed in the past, making scour countermeasures crucial to avoid further failures of the culverts at these locations.

We identified a location downstream of the culvert at approximately Station 329+75 where we're able to reduce the amount of riprap while still providing adequate scour protection. The limits of the initially proposed riprap limits were conservative due to the factors previously mentioned and the signs of existing scour in the area; however, given DEP's comment, this area was reviewed for any possible reduction. Considering the topography at the culvert outlet, the eastern extents of the riprap have been reduced to the local high point at the end of the existing scour hole. Up to this point, the riprap will mitigate the risk of scour downstream of the culvert. Additionally, the shape of the riprap apron was revised to provide protection in a more natural flow pattern by adding curvature to the riprap layout while still maintaining the necessary dimensions to protect against scour. Riprap impacts shown at the culvert at station 346+20 shows the minimum amount of scour protection and cannot be reduced. The reduction of rip rap at Culvert I resulted in a reduction in permanent LUW impacts from a total of 10,343 SF to 8,287 SF as well as a reduction in permanent bank impacts from 618 LF to 588 LF, as shown on the revised WQC/ACOE Impacts Plans included as an attachment to this memorandum. Even though there is a minor increase in temporary LUW impacts at Culvert I, the cumulative permanent and temporary impacts at this locations are decreased as a result of the design changes.

Although the highest velocities in the channel are along the center of the channel, significant turbulence still occurs at the edges creating erosion and scour. Due to the shape of the channel and concerns about turbulence at the toe of the embankments due to high velocities through the culverts, scour protection within the wetlands was not reduced. This is similar to the potential for abutment scour on a bridge. For this reason, the scour protection along the banks and within adjacent wetlands is necessary to protect the embankments.

3. As discussed during the June 3, 2024 meeting, placement of crushed stone filter strips should be evaluated at strategic low points along the shared use path. Although credit may not be given for Stormwater Management Standards 2, 3, or 4, they would provide some totals suspended solids

removal and groundwater recharge functions and would be considered an improvement of existing conditions as required for redevelopment projects.

The proposed shared use path consists of a 10-foot-wide paved hot mix asphalt (HMA) path with 2-foot-wide stone dust shoulders on both sides over an 8-inch subbase of gravel borrow. Per the MassDOT Project Development and Design Guide (PDDG), 10 feet is the minimum width for a two-directional shared use path and a minimum of 2-foot-wide graded shoulders must be maintained adjacent to both sides of the path. The path is impervious, but the stone dust shoulders are pervious and will provide some infiltration along the entire length of the pathway.

Stone dust was considered as an alternative to the HMA for the path but, due to the expected users, flooding concerns in the area, and regional uniformity with the other sections of the Independence Greenway, a paved HMA path is the preferred alternative. The other existing and proposed segments of the Independence Greenway, as well as the segments of the greater Border to Boston Trail, are paved, so for continuity, this segment is proposed to be paved as well. A paved path provides accessibility to the most vulnerable users of the path, such as wheelchair users and young children. Additionally, there is a history of flooding in the area and overtopping of the path during major storm events. There is a reasonable concern that future flooding in the area could wash out the stone dust path and associated erosion would contaminate the nearby wetlands and Proctor Brook.

4. Alternatives to the proposed paved waterway from Stations 289+50 to 290+00 need to be evaluated including redesigning it to be a Stormwater Control Measure per Volume 2, Chapter 2 of the Stormwater Handbook to receive credit; or at a minimum redesigning it to be a rock-lined conveyance swale to better prevent potential erosive flows.

The proposed stone filled paved waterway at Sta. 289+50 to 290+00 has been revised to a stone waterway rather than a paved waterway. See the revised Construction Plans and Profile – 1 Sheet attached to this memorandum for the revised stone waterway.

5. It appears the shading for permanent and temporary LUW impacts may be reversed on the plans in some areas. Please confirm and correct the plans if needed.

The shading for permanent and temporary LUW impacts was reversed on the Boardwalk Impacts Sheets and has been revised. See revised Boardwalk Impacts Sheets 1-3 attached to this memorandum.

6. Please note sediment chemistry results indicate concentrations of lead in Sample SS-3 that exceed the Massachusetts Contingency Plan RCS-1 criteria. As such, MassDEP intends to condition the WQC accordingly.

So noted.

Wetland Replication - Proposed new wetland replication area

Additionally, the wetland replication area has been relocated to address DEP concerns about the previously shown replication area. Included as attachments to this memorandum are a revised wetland replication plan for a new replication area located north of Gilmore Terrace as well as the wetland delineation memorandum including DEP data forms and a photo log of the area. This area

is a more natural extension of the wetland than the previously shown replication area, and we believe addresses DEP's concerns with the original location. While this area does require a small access road, it is off of a public ROW, proposes timber matting for the temporary access, and the access route was designed to avoid existing trees; thereby minimizing impacts. In addition, the buffer zone associated with this replication area does not extend into any private property.

Enclosed with this letter response are the following documents:

NOTES:

1. IMPACTS TO EXISTING TREES AND SOILS SHALL BE MINIMIZED TO THE EXTENT POSSIBLE.
2. CONTACT THE REPRESENTATIVE FROM MASSDOT LANDSCAPE DESIGN SECTION PRIOR TO THE START OF CONSTRUCTION. THE REPRESENTATIVE FOR THIS PROJECT IS MAXWELL R. MCNULTY MAXWELL.R.MCNULTY@DOT.STATE.MA.US.
3. FINAL GRADES TO BE TO MATCH ADJACENT WETLAND. MINOR ADJUSTMENTS IN FINAL GRADES SHALL BE MADE IN THE FIELD BY THE WETLAND SPECIALIST.
4. REPLICATION AREA SHALL BE EXCAVATED BELOW PROPOSED GRADES TO ALLOW FOR THE PLACEMENT OF WETLAND SOILS. THE DEPTH OF WETLAND SOILS SHALL BE 18" MAXIMUM AND SHALL MATCH THE DEPTH OF WETLAND SOIL IN THE ADJACENT WETLAND. DEPTH OF WETLAND SOIL SHALL BE DETERMINED BY THE WETLAND SPECIALIST. THE SALVAGED TOPSOIL MATERIAL AND B-HORIZON SUBSOIL MATERIAL EXCAVATED FROM THE WETLAND IMPACT AREAS SHALL BE PLACED IN SEPARATE STOCKPILES TO BE REUSED IN THE PROPOSED REPLICATION AREA IF SUITABLE.
5. REPLICATION AREA GRADES SHALL MATCH THE ELEVATIONS OF THE ABUTTING WETLAND TO MAINTAIN A HYDROLOGIC CONNECTION. WETLAND SPECIALIST SHALL INSPECT THE SUB-GRADE OF THE REPLICATION AREA TO ENSURE THAT THE PROPER HYDROLOGY HAS BEEN ESTABLISHED. MINOR MODIFICATIONS TO THIS GRADING PLAN MAY BE MADE IN THE FIELD BY THE QUALIFIED WETLAND SPECIALIST IN RESPONSE TO SUBSURFACE HYDROLOGIC CONDITIONS.
6. TREES AND SHRUBS IN THE REPLICATION AREA AND ADJACENT UPLAND AREA SHALL BE FIELD LOCATED BY THE WETLAND SPECIALIST.

PLANTING & SEEDING NOTES:

1. SEED SHALL BE MANUALLY BROADCAST. LIMITS SHOWN ARE APPROXIMATE. ACTUAL LIMITS SHALL BE AS DIRECTED BY THE WETLAND SPECIALIST.

Wetland Delineation Memo for new Wetland Replication Area

June 4, 2024

To:	Danielle Spicer, P.E. Oxana Fartushnaya
Cc:	
From:	Brandon Faneuf, PWS
Date:	June 5, 2024
Project Name:	609211 Peabody – Independence Greenway Extension Proposed Wetland Replication Area
Project Number:	Green No. 17118
Subject:	Wetland Description - Independence Greenway Extension Proposed Wetland Replication Area, Peabody, MA

Introduction

This memo is to describe the types and extents of wetlands and wetland jurisdictional areas at the proposed wetland replication area site located at 265 Lowell St (A), Peabody, MA (see attached Locus Map Figure). Investigations were conducted on May 23, 2024 to identify, and delineate if present, the extent and location of jurisdictional wetlands and "Waters of the U.S." within the Project Area pursuant to the Federal Clean Water Act (Sections 401 and 404), and in Massachusetts, activities regulated under the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40) regulations. In conjunction with the U.S. Army Corps of Engineers (USACE), this program is administered by the Massachusetts Department of Environmental Protection (MassDEP). Jurisdictional wetlands were defined using the 1987 *U.S. Army Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory 1987) and subsequent guidance documents including the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (Version 2.0)* (US Corps of Engineers, January 2012). Waters of the U.S., which include all streams, adjacent wetlands, and other waterbodies, are defined in 33 CFR 328.3(a). Peabody has promulgated a local Wetlands & Rivers Protection Ordinance (The Ordinance) and Wetlands and Rivers Protection Regulations (Chapter 32) that exceed jurisdictional areas and performance standards of the WPA and 310 CMR 10.00.

The above-referenced proposed wetland replication area site is located at 265 Lowell St (A), Peabody, MA with site access off Gilmore Terrace. Investigations were conducted in order to determine a suitable place for the construction of a wetland replication area in accordance with 310 CMR 10.55 (4)(b) provisions. This proposed work will be conducted on and adjacent to a Bordering Vegetated Wetland (BVW) associated with Proctor Brook, making portions of the project subject to the Wetlands Protection Act (WPA).

Area of Interest (AOI)

Investigations were conducted at the parcel located at 265 Lowell St (A), Peabody, MA. The area of the AOI contains medium density residential single-family homes and wooded areas and abutted by non-forested wetland area associated with Proctor Brook to the north.

The land along the southern bank of Proctor Brook was investigated for wetland resource areas. Dominant non-native vegetation present in the AOI includes Norway maple (*Acer platanoides*), black locust (*Robinia pseudoacacia*), common buckthorn (*Rhamnus cathartica*), Oriental bittersweet (*Celastrus orbiculatus*), and garlic mustard (*Alliaria petiolata*). Associated native vegetation includes box elder (Acer negundo), black cherry (*Prunus serotina*), sugar maple (*Acer saccharum*), common elderberry (*Sambucus canadensis*), silky dogwood (*Cornus amomum*), smooth sumac (*Rhus glabra*), Virginia creeper (*Parthenocissus quinquefolia*), skunk cabbage (*Symplocarpus foetidus*), jewelweed (*Impatiens capensis*), and sensitive fern (*Onoclea sensibilis*). Soil samples revealed that the extant topsoil is likely fill. There is trash scattered throughout the AOI.

Wetland Resource Areas

A Bordering Vegetated Wetland (BVW) exists in the northern half of 265 Lowell St (A) parcel, south of Proctor Brook. The BVW is hydrologically connected with Proctor Brook, and is the sole wetland resource area present on the project site. The BVW was delineated using alpha-numerical flags. Each delineated section of the BVW retains a one-hundred foot (100') buffer zone per 310 CMR 10.00.

The following Wetland Resource Areas are present on site:

- Bordering Vegetated Wetland ("BVW"), as delineated in the field with 'RA' - series flags. These flags represent the edge of the BVW where it changes from vegetated wetland to upland. Per 310 CMR 10.00 , these receive 100' Buffer Zones.

- Bordering Land Subject to Flooding ("BLSF") associated with Proctor Brook. This is the 100-year floodplain as delineated by FEMA (see attached FEMA FIRMETTE). This follows Proctor Brook and includes contiguous portions of the delineated BVW. However, BLSF is not present in the AOI.200' Riverfront Area ("RFA") associated with Proctor Brook. The RFA extends perpendicularly from the Bank of the brook without regard for topography. The entire proposed replication area is located within a Riverfront Area.

Table 1. Delineated Wetland Resource Areas

Flag Series	Wetland Type	Approx. Location
RA1 – RA12 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	200' from the end of Gilmore Terrace. Bisecting the 265 Lowell St (A) parcel from the parcel boundary with 4 Karelitz Road to the parcel boundary with 10 Castle Circle.

Other Resources

A desktop analysis of the Project Area was conducted prior to performing field surveys and included the entire defined area of investigation. A search of other critical resources within the project area was conducted using GIS software and data available through various governmental agencies (FEMA, DEP, and others). The results of our search are listed in the table below.

Table 2. Selected MASSGIS Environmental Data Layers

Mapped Resource On or Within Proximity to Site	Yes	No
Area of Critical Environmental Concern		✓
NHESP Certified Vernal Pool		✓
NHESP Potential Vernal Pool		✓
NHESP Estimated Habitat of Rare Wildlife		✓
NHESP Priority Habitat of Rare species		✓
Outstanding Resource Waters		✓
FEMA Flood Zones (BLSF)		✓[1]
Surface Water Protection Area		✓
Interim Wellhead Protection Area		✓
Zone I Wellhead Protection Area		✓
Zone II Wellhead Protection Area		✓
Mass DFW Designated Coldwater Fisheries		✓

✓[1] BLSF follows Proctor Brook and includes contiguous portions of the delineated BVW. However, BLSF is not present in the AOI, which is limited to the outlined limit of work associated with the replication area.

Regulatory Jurisdiction

The wetland resource areas described above are regulated by the Massachusetts Wetlands Protection Act (WPA) and 310 CMR 10.00 which is administered by the City of Peabody Conservation Commission or (upon appeal) by Massachusetts Department of Environmental Protection (MassDEP).

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 6/5/2024 at 9:22 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Hydraulic and Scour Reports

HYDRAULIC AND SCOUR ANALYSIS
SUMMARY REPORT

Independence Greenway Extension
Over Proctor Brook
Peabody, Massachusetts

Prepared for

massDOT Massachusetts Department of Transportation Highway Division

Massachusetts Department of Transportation

November 2023

Prepared by

GREEN INTERNATIONAL AFFILIATES, INC.
Civil and Structural Engineers

Building Strong Client Relationships Through Engineering Excellence

1.0 EXECUTIVE SUMMARY

1.1 Purpose

The purpose of this report is to present the results of a Hydraulic and Scour Study performed by Green International Affiliates, Inc. (Green) for MassDOT for Proctor Brook along the Independence Greenway Extension. The proposed bikeway crosses Proctor Brook at three (3) locations. The Hydraulic Report submitted to MassDOT in February 2021 described the proposed bridge located approximated 800' west of Endicott Street. This study evaluates the hydraulic performance of the existing and proposed conditions for the remaining project area upstream of this proposed bridge, including the two (2) crossing locations that weren't discussed in the previous report.

This study was conducted in a manner consistent with the American Association of State Highway Officials (AASHTO), Federal Highway Administration (FHWA), and Massachusetts Highway Department of Transportation (MassDOT) guidelines for preparation of hydraulic studies at brook crossing sites.

1.2 Scope of Work

The Scope of Work for this study included a review of available hydrologic and hydraulic data for Proctor Brook from the City of Peabody Flood Insurance Study (FIS) dated November 1978, a detailed hydraulic analysis for the brook; and a scour/stability analysis. Pertinent data and the hydraulic computer modeling output are contained in the attachments of this report.

Section 2 of this report contains a project description. Section 3 outlines the data collected and applications used in the study. Section 4 describes the Engineering methods used in the hydrologic and hydraulic analyses, as well as the scour/stability analysis. Section 5 contains conclusions and recommendations.

This project involves the construction of two (2) new culverts that will cross over Proctor Brook in the City of Peabody, Massachusetts. There were previous culvert structures that used to carry railroad over Proctor Brook, the railroad was abandoned, along with the culverts, and the culvert structures have been washed away over time. The purpose of this report is to present the results of a study conducted for the subject culvert sites to evaluate the hydraulic performance of the proposed structures for these crossings.

The scope of this investigation consists of a review of pertinent hydrologic analysis data for the Proctor Brook at the project site and a detailed hydraulic analysis. Data collected, hydraulic model input/output and scour calculations are presented in the appendices of this report. A project description, engineering methods, as well as conclusions of the hydraulic study follows.

2.0 PROJECT DESCRIPTION

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is 1.45 miles.

The proposed project is located along the abandoned railroad right-of-way that has not seen any

improvements since the rails were removed. Existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed will be replaced with new culverts designed to address, to the maximum extent possible, the Massachusetts State Stream Crossings Standards.

In place of the former railroad bridge over Proctor Brook that has been washed away, a new light duty timber boardwalk on helical piles structure is proposed in order to make the abandoned railroad right-of-way usable for a bicycle/pedestrian path. The proposed 8-span structure will be approximately 60'-0" long with an out-to-out width of 12'-0" and will provide a clear width of 11'-0" to accommodate two 5-0" wide travel lanes, one in each direction.

2.1 Existing Conditions

Proctor Brook originates in western Peabody, Massachusetts and flows southeast until it joins Goldthwait Brook to form the North River. Historical flood data is not available for this waterway. The subject locations are within NFIP SFHA Zone AE and spans a section of the river's NFIP regulatory floodway.

Refer to Figure 1 for a locus map of the project area.

The remnants of two (2) culverts remain in the channel. There are no existing trail, roadway, or railroad tracks at the crossing location. The area surrounding the remains of the culverts are currently wooded and includes Bordering Vegetated Wetlands.

The existing culverts were studied during FEMA's 1978 FIS study. At the time of the study the culverts had not been washed out and were functioning as hydraulic connections to convey Proctor Brook under the railroad bed. More detailed description of the culverts are as follows:

Culvert at Station 329+85

This culvert is located at cross section H of the FEMA FIS study. The existing culvert is a 25' long double 42" barrel RCP culvert. The culvert hasn't been maintained and the railbed above the culvert has been washed away. The culvert piping has remained in place. Remnants of granite guidebanks remain at the upstream entrance to the culvert and remnants of a granite headwall remain on the downstream end of the culvert.

Culvert at Station 346+20

This culvert is located at cross section F of the FEMA FIS study. Review of the FEMA's HEC-2 hydraulic model indicates that the culvert was originally a 6'-5" box culvert. Due to a lack of maintenance along the abandoned railroad bed, the culvert has collapsed, and the remnants remain in the channel.

2.2 Proposed Conditions

Although the culvert crossings have failed to varying degrees, the horizontal alignment of Proctor Brook has remained. The culverts are being replaced at the same locations as the original structures in order to maintain the alignment of Proctor Brook at these crossings. The channel elevation will remain although some sediment will be removed to facilitate construction.

Both of the culverts will be replaced with 8'x4' concrete box culverts. The bottom 1' of each culvert will be filled with streambed material to provide a more natural wildlife habitat. This hydraulic study examines the impact of providing an 8'x3' hydraulic opening at both of these crossings.

3.0 DATA COLLECTION

The following data and reports on the study area were available and were used as guidance during the hydraulic and hydrologic model development and Analysis:

- Federal Highway Administration: Hydraulic Toolbox 5.1.4.0 Computer Program

4.0 ENGINEERING METHODS

Proctor Brook was studied for its entire length within the City of Peabody, MA by FEMA using detailed methods as part of the FIS for the City of Peabody. To ensure compliance with FEMA requirements (44 CFR 60.3) and the requirements of the Massachusetts Wetlands Protection Act (310 CMR 10.0), the proposed conditions of the culverts have been analyzed to ensure that existing flood elevations will not increase underproposed conditions. In addition, a hydraulic analysis was also performed to calculate the potential for scour.

Figure 3 shows the project location in the flood insurance rate map.

In this hydraulic and scour summary report, peak flow rates from the effective FEMA FIS were used in the analysis.

4.1 Hydrologic Analysis

Peak 10-, 50-, 100- and 500-year flood discharges for Proctor Brook were adopted from Table 6, Essex County FIS, and are presented below in Table 4.1. Please consult the Essex County Effective FIS, last revised July 2018, for information regarding hydrologic computational procedures. As further described in the Stormwater Report prepared for this project, the peak flow rates have been adjusted to account for the proposed increase in impervious area. Table 4.1 also presents the proposed flow projections for the project area.

Table 4.1 – Summary of Discharges

Description	Alternative	10% Annual Chance [10-yr] (CFS)	4% Annual Chance [25-yr] (CFS)	2% Annual Chance [50-yr] (CFS)	1% Annual Chance [100-yr] (CFS)	0.2% Annual Chance [500-yr] (CFS)
North River and Proctor Brook Upstream of Goldthwait Brook	FEMA FIS	240	285	360	420	610
	Proposed Conditions	243	290	366	428	618

4.2 Hydraulic Analysis

Green used a combination of the topographical survey and the proposed design of the brook crossings to create a proposed conditions hydraulic model in HEC-RAS. Cross sections were cut approximately every 100 to 200 ft and then imported into HEC-RAS. Backwater analyses using the USACE HEC-RAS computer program were performed for the 10-, 50-, and 100-, and 500-year return events in a manner consistent with the standards used to develop water surface profiles under the National Flood Insurance Program (NFIP).

The computed water surface elevations of this HEC-RAS analysis were compared to water surface elevations listed on the HEC-2 output received from FEMA.

Table 4.2 shows a comparison between the results of the HEC-2 data received from FEMA and Green's proposed model.

Table 4.2 – Comparison of FEMA and Proposed Base Flood Elevations (BFE - referenced to NAVD88) at several cross sections near the Proposed Structures

Table 4.3 b– Summary of Hydraulic Performance at Culvert at Sta 346+20

AEP [%]	Existing			Proposed		
	Peak Flow (CFS)	WSEL (FT) Sta. 26 FEMA Sta. F	Velocity* (FT/S) (Max. at Bridge)	Peak Flow (CFS)	WSEL (FT) Sta. 26 FEMA Sta. F	Velocity* (FT/S) (Max. at Bridge)
10%	240	40.41	3.31	243	40.86	5.80
4%	285	40.71	3.58	290	41.03	5.68
2%	360	41.17	3.93	366	41.25	5.62
1%	420	41.53	4.11	428	41.39	5.57
0.2%	610	42.29	4.75	618	41.77	4.70

In Table 4.3a and Table 4.3b, the hydraulic performance of the culverts at station 329+85 and Sta 346+20 is depicted. The velocities and elevations shown in the tables for existing conditions were obtained from the model developed on HEC-RAS by Green. This model was created using survey data and did not account for functioning culverts. The velocities and water surface elevations are anticipated to increase with the restoration of the culverts.

4.3 Scour Safety/Stability Analyses

We calculated the scour hole dimensions (length, width, and depth) using the Hydraulic Engineering Circular

(HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 5:

"Estimating Scour at Culvert Outlets" and using equation 5.1 for cohesionless soils shown below:

$$\left[\frac{h_s}{R_c}, \frac{W_s}{R_c}, \frac{L_s}{R_c}, \frac{V_s}{R_c^3}\right] = C_s C_h \left(\frac{\alpha}{\sigma^{1/3}}\right)\left(\frac{Q}{\sqrt{g}(R_c^{2.5})}\right)^{\beta}\left(\frac{t}{316}\right)^{\theta}$$

The equations are based on tests that were conducted to determine the maximum scour for the given condition and therefore represent what might be termed worst case scour geometries.

We utilized the flows with the highest exit velocities for analyzing the scour hole dimensions of each culvert. No scour potential under current conditions was assessed, as one of the structures has washed away and based on evidence, there are no indications of vertical or horizontal instability.

Soil samples were taken at points within the brook, upstream of the culverts and the banks of the brook. These samples were analyzed, and the results are included in Attachment C. The grain size (D_x) was estimated for each soil sample. The D_x results of the samples were used in the scour analysis.

The results of the scour analyses are shown on Table 4.3.

Table 4.3 – Summary of Calculated Scour at Proposed Culverts

Alternative	Return Frequency	Scour Hole Depth (Feet)	Scour Hole Width (Feet)	Scour Hole Length (Feet)	Scour Hole Volume (Cubic Feet)	Location of Maximum Scour (Feet)
Sta 329+85	Peak Velocity Flow (100-year)	5.89	32.00	57.82	8,133.98	23.13
Sta 346+20	Peak Velocity Flow (100-year)	4.69	23.64	44.11	3,527.78	17.65

Scour Countermeasures

The scour/stability analyses were performed using Hydraulic Engineering Circular (HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 10: "Riprap Basins and Aprons" and using equation 10.4 shown below:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right)$$

Table 4.4 displays dimensions for riprap apron at the proposed culverts.

Table 4.4 – Summary of Scour Countermeasure Design at Proposed Culverts

Alternative	Riprap Size D_{50} (Inches)	Riprap Class	Riprap Apron Length (Feet)	Riprap Apron Depth (Feet)	Riprap Apron Width (Feet)
Sta 329+85	12	3	57.82	3.0	34
Sta 346+20	12	3	44.11	3.0	31

Attachment D includes the scour analyses, and computations.

5.0 CONCLUSIONS

A. The HEC-RAS model under proposed conditions resulted in lower elevations than the effective FEMA FIS. Therefore, the project implementation will result in no increase to the waterway's Base (100-year) Flood Elevation (BFE) profile, and it will not necessitate alteration of the waterway's floodway delineation, anywhere within the affected community.
B. The natural stream bed will result in a scour depth at culvert at Station 329+85 of 5.89' during peak velocity flow.
C. The natural stream bed will result in a scour depth at culvert at Station 340+26 of 4.69' during peak velocity flow.
D. The dimensions calculated represent worst-case scour geometries, and consideration of site and environmental constraints were considered when designing the riprap apron.
E. Riprap Countermeasures are proposed to mitigate against the risk of scour. The proposed riprap size has been chosen to exceed the minimum size calculated but readily available MassDOT specified material. Depth of riprap apron is sized in accordance with HEC-23 methodology for chosen riprap material.
F. By placing riprap revetment at the ends of the culvert, it is anticipated that the scour depth will be negligible.

Table 5.1a – Hydraulic Data for Culvert at Sta 329+85

HYDRAULIC DESIGN DATA	
DRAINAGE AREA:	2.31 SQUARE MILES
DESIGN FLOOD DISCHARGE:	243 CUBIC FEET PER SECOND
DESIGN FLOOD FREQUENCY:	10 YEARS
DESIGN FLOOD VELOCITY:	11.56 FEET PER SECOND
DESIGN FLOOD ELEVATION AT UPSTREAM OF BRIDGE:	45.01 FEET, NAVD 88
BASE (100-YEAR) FLOOD DATA	
BASE FLOOD DISCHARGE:	428 CUBIC FEET PER SECOND
BASE FLOOD ELEVATION AT UPSTREAM OF BRIDGE:	46.33 FEET, NAVD 88

DESIGN SCOUR DATA (Peak Velocity Flow)	
DESIGN SCOUR FLOOD DISCHARGE:	277 CUBIC FEET PER SECOND
DESIGN FLOOD SCOUR DEPTH	5.89 FEET
FLOOD OF RECORD	
DISCHARGE:	UNKNOWN
FREQUENCY (IF KNOWN):	UNKNOWN
MAXIMUM ELEVATION:	UNKNOWN
DATE:	UNKNOWN
HISTORY OF ICE FLOES:	UNKNOWN
EVIDENCE OF SCOUR AND EROSION:	UNKNOWN

Table 5.1b – Hydraulic Data for Culvert at Sta 346+20

HYDRAULIC DESIGN DATA	
DRAINAGE AREA:	2.48 SQUARE MILES
DESIGN FLOOD DISCHARGE:	243 CUBIC FEET PER SECOND
DESIGN FLOOD FREQUENCY:	10 YEARS
DESIGN FLOOD VELOCITY:	5.80 FEET PER SECOND
DESIGN FLOOD ELEVATION AT UPSTREAM OF BRIDGE:	40.86 FEET, NAVD 88
BASE (100-YEAR) FLOOD DATA	
BASE FLOOD DISCHARGE:	428 CUBIC FEET PER SECOND
BASE FLOOD ELEVATION AT UPSTREAM OF BRIDGE:	41.39 FEET, NAVD 88

DESIGN SCOUR DATA (Peak Velocity Flow)	
DESIGN SCOUR FLOOD DISCHARGE:	134 CUBIC FEET PER SECOND
DESIGN FLOOD SCOUR DEPTH	4.69 FEET
FLOOD OF RECORD	
DISCHARGE:	UNKNOWN
FREQUENCY (IF KNOWN):	UNKNOWN
MAXIMUM ELEVATION:	UNKNOWN
DATE:	UNKNOWN
HISTORY OF ICE FLOES:	UNKNOWN
EVIDENCE OF SCOUR AND EROSION:	UNKNOWN

SPECIAL FLOOD HAZARD AREAS
- Without Base Flood Elevation (BFE) *Zone A, V, A99*
- With BFE or Depth *Zone AE, AO, AH, VE, AR*
- Regulatory Floodway

OTHER AREAS OF FLOOD HAZARD
- 0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile *Zone X*
- Future Conditions 1% Annual Chance Flood Hazard *Zone X*
- Area with Reduced Flood Risk due to Levee. See Notes. *Zone X*
- Area with Flood Risk due to Levee *Zone D*

OTHER AREAS
- NO SCREEN — Area of Minimal Flood Hazard *Zone X*
- Effective LOMRs
- Area of Undetermined Flood Hazard *Zone D*

GENERAL STRUCTURES
- Channel, Culvert, or Storm Sewer
- Levee, Dike, or Floodwall

OTHER FEATURES
- 20.2 — Cross Sections with 1% Annual Chance
- 17.5 — Water Surface Elevation
- Coastal Transect
- 513 — Base Flood Elevation Line (BFE)
- Limit of Study
- Jurisdiction Boundary
- Coastal Transect Baseline
- Profile Baseline
- Hydrographic Feature

MAP PANELS
- Digital Data Available
- No Digital Data Available
- Unmapped

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 5/24/2019 at 9:07:12 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Hydraulic Engineering Circular No. 14 - Estimating Scour at Culvert Outlets

5.1 COHESIONLESS SOILS

The general expression for determining scour geometry in a cohesionless soil at the culvert outlet is:

$$\left[\frac{h_s}{R_c}, \frac{W_s}{R_c}, \frac{L_s}{R_c}, \frac{V_s}{R_c^3}\right] = C_s C_h \left(\frac{\alpha}{\sigma^{1/3}}\right)\left(\frac{Q}{\sqrt{g(R_c^{2.5})}}\right)^{\beta}\left(\frac{t}{316}\right)^{\theta} \quad (5.1)$$

where,

- h_s = depth of scour, m (ft)
- W_s = width of scour, m (ft)
- L_s = length of scour, m (ft)
- V_s = volume of scour, m^3 (ft^3)
- R_c = hydraulic radius at the end of the culvert (assuming full flow)
- Q = discharge, m^3/s (ft^3/s)
- g = acceleration of gravity, 9.81 m/s^2 (32.2 ft/s^2)
- t = time in minutes
- σ = $(D_{84}/D_{16})^{0.5}$, material standard deviation
- α, β, θ are coefficients, see Table 5.1
- C_s = slope correction coefficient, see Table 5.2
- C_h = drop height adjustment coefficient, see Table 5.3

Hydraulic Engineering Circular No. 14, Third Edition

Several relationships have been proposed for riprap sizing for culvert aprons and several of these are discussed in greater detail in Appendix D. The independent variables in these relationships include one or more of the following variables: outlet velocity, rock specific gravity, pipe dimension (e.g. diameter), outlet Froude number, and tailwater. The following equation (Fletcher and Grace, 1972) is recommended for circular culverts:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right) \qquad (10.4)$$

where,

- D_{50} = riprap size, m (ft)
- Q = design discharge, m^3/s (ft^3/s)
- D = culvert diameter (circular), m (ft)
- TW = tailwater depth, m (ft)
- g = acceleration due to gravity, 9.81 m/s^2 (32.2 ft/s^2)

Tailwater depth for Equation 10.4 should be limited to between 0.4D and 1.0D. If tailwater is unknown, use 0.4D.

D=	5.97	ft		
g=	32.2	ft/s^2		
Q=	277	cfs		
TW=	0.9	ft

1.0 EXECUTIVE SUMMARY

1.1 Purpose

The purpose of this report is to present the results of a Hydraulic and Scour Study performed by Green International Affiliates, Inc. (Green) for MassDOT for the Independence Greenway Extension, Bridge No. TBD, a pedestrian bridge over the Proctor Brook in Peabody, Massachusetts. This study evaluates the hydraulic performance of the existing and proposed conditions. This study was conducted in a manner consistent with the American Association of State Highway Officials (AASHTO), Federal Highway Administration (FHWA), and Massachusetts Highway Department of Transportation (MassDOT) guidelines for preparation of hydraulic studies at bridge sites.

1.2 Scope of Work

The Scope of Work for this study included a review of available hydrologic and hydraulic data for Proctor Brook from the City of Peabody Flood Insurance Study (FIS) dated November 1978, a detailed hydraulic analysis for the bridge; and a scour/stability analysis. Pertinent data and the hydraulic computer modeling output are contained in the attachments of this report.

Section 2 of this report contains a project description. Section 3 outlines the data collected and applications used in the study. Section 4 describes the Engineering methods used in the hydrologic and hydraulic analyses, as well as the scour/stability analysis. Section 5 contains conclusions and recommendations. Lastly, Section 6 outlines the references.

This project involves the construction of a timber boardwalk on helical piles that will cross over Proctor Brook in the City of Peabody, Massachusetts. There was a previous bridge structure that used to carry railroad over Proctor Brook, the railroad was abandoned, along with the bridge, and the bridge structure has been washed away over time. The purpose of this report is to present the results of a study conducted at the subject bridge site to evaluate the hydraulic performance of the proposed alternative for this crossing.

The scope of this investigation consisted of review of pertinent hydrologic analysis data for the Proctor Brook at the project site and a detailed hydraulic analysis. Data collected, hydraulic model input/output and scour calculations are presented in the appendices of this report. A project description, engineering methods, as well as conclusions of the hydraulic study follows.

2.0 PROJECT DESCRIPTION

2.1 Existing Conditions

A railroad, now abandoned, once crossed Proctor Brook in the city of Peabody, Essex County, Massachusetts (Figure 1).

Scattered blocks of granite in the channel and remnants of stone wingwalls are the only indication that a bridge had once been at this location (Figure 2). There are no existing trail, roadway, or railroad tracks at the crossing location. The area surrounding the remains of the bridge is currently wooded and includes Bordering Vegetated Wetlands.

Crossed Waterway at the Bridge Location

Proctor Brook originates in western Peabody, Massachusetts and flows southeast until it joins Goldthwait Brook to form the North River. Historical flood data is not available for this waterway. The subject location is within a NFIP SFHA Zone AE and spans a section of the river's NFIP regulatory floodway.

2.2 Proposed Conditions

The design loading criteria will be pedestrian loading only. No vehicular access will be permitted on the trail, and bollards will be installed at roadway intersections and access points to prevent any vehicular access. The boardwalk will not be maintained in the winter for snow removal.

The proposed structure over the brook will be a 64'-0" long timber framed boardwalk with helical piles spaced 8'-0" center-to-center. The proposed boardwalk will have a 13'-0" out-to-out width and 12'-0" clear width to accommodate two (2) 5'-0" travel lanes and two (2) 1'-0" shoulders. 4" x 4" timber posts will be spaced 4'-0" apart with a top rail height of 3'-6" with timber pickets between each post. Top and bottom rails will be 2" x 4" timber boards. The proposed boardwalk will also consist of 8" x 1" timber planking or composite wood decking over 2" x 8" timber joists.

Within this present hydraulic study, the existing and proposed bridge waterway openings were evaluated for hydraulic adequacy and scour safety. More alternative bridge opening geometries will be evaluated at the request of the State Bridge Engineer.

3.0 DATA COLLECTION

The following data and reports on the study area were available and were used as guidance during the hydraulic and hydrologic model development and Analysis:

Sources

- Federal Emergency Management Agency, Flood Insurance Study, City of Peabody, Essex County, Massachusetts, November 1978.
- Federal Emergency Management Agency, Flood Insurance Study, Essex County, MA, July 19, 2018.
- Federal Emergency Management Agency, Original HEC-2 Model for Flood Insurance Study-Peabody, MA, November 1976.
- Topographic field survey prepared by Green, March 2018.
- Particle Size Analysis included in Geotechnical Engineering Report by GZA GeoEnvironmental, Inc., April 22, 2019.
- Massachusetts Department of Transportation: LRFD Bridge Manual, January 2020 Revision.
- FHWA; Hydraulic Engineering Circular Number 23, HEC-23. Bridge Scour and Stream Instability Countermeasures, Volumes 1 and 2, 2009.

Green also used the following computer applications and/or design guidelines for this study:

Applications

- U.S. Army Corps of Engineers: HEC-RAS River Analysis System, Computer Program and User's Manual, Version 5.0.7, March 2019.
- U.S. Dept. of Transportation, Federal Highway Administration: Hydraulic Engineering Circular No. 18 Evaluating Scour at Bridges, Fifth Edition, April 2012.

4.0 ENGINEERING METHODS

Proctor Brook was studied for its entire length within the City of Peabody, MA by FEMA using detailed methods as part of the FIS for the City of Peabody. To ensure compliance with FEMA requirements (44 CFR 60.3) and the requirements of the Massachusetts Wetlands Protection Act (310 CMR 10.0), the proposed conditions of the bridge have been analyzed to ensure that existing flood elevations will not increase under proposed conditions. In addition, a hydraulic analysis was also performed to calculate the potential for scour.

Proctor Brook flows west to east in the vicinity of the crossing. Using the U.S. Geological Survey (USGS) Massachusetts StreamStats, the Proctor Brook's watershed basin area at the crossing site is estimated to be 2.5 square miles (Figure 3). Figure 4 shows the project location in the flood insurance rate map.

In this hydraulic and scour report, peak flow rates from the effective FEMA FIS were used in the analysis.

4.1 Hydrologic Analysis

Peak 10-, 50-, 100- and 500-year flood discharges for Proctor Brook were adopted from Table 6, Essex County FIS, and are presented below in Table 4.1. Please consult the Essex County Effective FIS, last revised July 2018, for information regarding hydrologic computational procedures. The brook's drainage area at the Proctor Brook crossing was delineated using the USGS StreamStats Website. Refer to Figure 3 for drainage area at the bridge.

Table 4.1 – Summary of Discharges from 2018 Essex County FIS

Description	Drainage Area (mi^2)	10% Annual Chance [10-yr] (CFS)	4% Annual Chance [25-yr] (CFS)	2% Annual Chance [50-yr] (CFS)	1% Annual Chance [100-yr] (CFS)	0.2% Annual Chance [500-yr] (CFS)
North River and Proctor Brook Upstream of Goldthwait Brook	3.52	240	285	360	420	610

4.2 Duplicate Effective Analysis

The Duplicate Effective HEC-RAS Model was developed using the HEC-2 model obtained from FEMA. The HEC-2 inputs between FIS cross sections at river sta. 1.402 upstream of the bridge to river sta. 1.127 downstream of the bridge were imported into HEC-RAS. After making minor edits, Green was able to run the imported HEC-2 data in HEC-RAS. The duplicate effective model reproduced relatively close values that are less than 1 ft for the cross sections near the bridge when compared to the current effective Base Flood Elevation (BFE) profile. The variation in BFE is attributed to using different hydraulic programs. The summary of the WSEL's from FIS is presented in Table 4.2.

Table 4.2 – Summary of Duplicate Effective Analysis

River Station HEC-RAS/HEC-2	FIS Cross-Section	[1] Published Data* (FEET, NAVD)	[2] Duplicate Effective Model (FEET, NAVD)	[2] – [1]

25/1.393	-	41.95	41.28	-0.67
24/1.389	-	40.97	41.12	0.15
23/1.380	-	40.99	41.14	0.15
22/1.276	E	40.84	40.97	0.13
21/1.267	-	39.85	40.46	0.61
21.5	Bridge			
20/1.263	-	39.65	39.85	0.20
19/1.254	-	39.40	39.20	-0.20
18/1.127	D	39.60	39.60	0.00

4.3 Hydraulic Analysis

Green used the topographical survey to create an existing conditions hydraulic model in HEC-RAS. Cross sections were cut approximately every 100 to 200 ft and then imported into HEC-RAS. Backwater analyses using the USACE HEC-RAS computer program were performed for the 10-, 50-, and 100-, and 500-year return events in a manner consistent with the standards used to develop water surface profiles under the National Flood Insurance Program (NFIP).

The computed water surface elevations of this HEC-RAS analysis were compared to water surface elevations listed on the HEC-2 output received from FEMA, and Green's existing and proposed conditions HEC-RAS models.

The HEC-RAS model parameters such as channel and overbank roughness coefficients (Manning's 'n'), ineffective flow areas, bank stations, and expansion and contraction coefficients were modified to reflect current conditions. Pertinent computational results of the existing and proposed conditions flood simulations performed for the subject bridge in this project hydraulic study are presented in Table 4.3. The table show a comparison between the results of Green's model using the HEC-2 data received from

FEMA, Green's existing model built with the recent topographic survey, and the proposed post construction model. Figure 5 shows the cross sections locations.

Table 4.3 – Comparison of FEMA, Existing and Proposed Base Flood Elevations (BFE - referenced to NAVD 88) at several cross sections near the Bridge

HEC-RAS Model Cross Sections	FIS Cross-Section	[1] Existing Condition Model (FEET)	[2] Proposed Condition Model (FEET)	[2] – [1] No – Rise Evaluation
26	F	41.97	41.69	-0.28
25	-	41.97	41.69	-0.28
24.7	-	41.77	41.45	-0.32
24.6	-	41.73	41.46	-0.27
24.4	-	40.41	40.29	-0.12
24.3	-	40.09	40.06	-0.03
24	-	40.38	40.36	-0.02
23	-	40.32	40.29	-0.03
22	E	40.19	40.19	0.00
21.7	-	40.07	40.06	-0.01
21.6	-	40.10	40.10	0.00
21.5	Bridge			
21.4	-	39.89	39.84	-0.05
21.35	-	39.77	39.76	-0.01
21.3	-	39.86	39.85	-0.01
20	-	39.62	39.62	0.00
19	-	39.67	39.67	0.00
18	D	39.60	39.60	0.00

As shown in Tables 4.2 and 4.3, there are variations in the elevations obtained from the existing conditions Green's HEC-RAS model compared to the HEC-2 Imported HEC-RAS model, the FEMA FIS flood elevations. The variations in flood elevations can be explained and justified due to the following reasons:

- Different hydraulic programs were used, and the HEC-2 coding of the bridge is different than its coding in HEC-RAS.
- Ineffective areas were added and modified to ignore ineffective flow areas.
- More cross sections are added in the HEC-RAS model to depict the geometry of the channel and riverbed.
- Based on site observations, the manning (n) coefficients were adjusted to reflect actual conditions.

Because of the above, Green's HEC-RAS model under existing conditions was used as a design base to compare flood elevations under the proposed conditions.

Table 4.4 compares Hydraulic Performance at the Bridge under existing and proposed conditions. The peak head water elevations and the maximum velocity for each return event at the bridge location are shown in the table.

Table 4.4 – Summary of Hydraulic Performance at the Bridge

AEP [%]	Peak Flow (CFS)	Existing		Proposed	
		WSEL (FT) Sta. 22 FEMA Sta. E	Velocity* (FT/S) (Max. at Bridge)	WSEL (FT) Sta. 22 FEMA Sta. E	Velocity* (FT/S) (Max. at Bridge)
10%	240	39.25	5.90	39.33	5.97
4%	285	39.44	6.14	39.53	6.25
2%	360	39.73	6.58	39.82	6.59
1%	420	40.19	3.97	40.19	4.34
0.2%	610	40.95	3.83	40.88	5.01

As shown in Table 4.4, the proposed bridge will not have an increase in the Water Surface Elevation (WSEL) at the upstream face of the bridge for the FEMA Base Flood Elevation.

Note that the velocities decrease for the 100-year and 500-year storms as compared to the more frequent storms. The 100-year and 500-year storms are approaching a backwater condition as demonstrated by a flattening of the energy grade line.

The analysis also shows that the proposed bridge deck is above the 100-year flood elevation and the only components impacting the hydraulics are the western abutment and the piers.

Attachment A includes the output of Green's Existing Conditions HEC-RAS analysis for the Independence Greenway Extension over Proctor Brook. Attachment B includes the output of Green's Proposed Conditions HEC-RAS analyses for the proposed bridge scenario for a new Independence Greenway Extension boardwalk over Proctor Brook. Attachment C includes the 1977 HEC-2 model input/output report received from FEMA Headquarters.

4.4 Scour Safety/Stability Analyses

Scour potential at the crossing site under proposed conditions was analyzed using the guidelines set forth in Reference 4, Sections 1.3 and 3.2.9 and AASHTO LRFD Bridge Design Specifications, Sections 2.6.4.4.2 and 3.7.S. In accordance with Section 1.3.4 of Reference 4, we used the river's 25-year and 50-year floods as the scour design and scour check events, respectively, in this analysis. Scour potential under existing conditions was not analyzed because there is no existing structure in place. As said in section 2.1, scattered blocks of granite in the channel and remnants of stone wingwalls are the only indication that a bridge had once been at this location.

Peak 50-year flood discharge used in this analysis was taken from Table 4.1. The peak 25-year flood discharge (285 cfs) was interpolated from 10- and 50-year flood discharge rates presented in the same table and was used as the "Design Scour Event" in the scour analysis.

Soil samples were taken at points within the brook, upstream of the bridge and the banks of the brook. These samples were analyzed, and the results are included in Attachment D. The grain size (D50) was estimated for each soil sample. The D50 results of the samples varied widely from 0.51 to 2.78 mm from left of bank to right of bank, which were used in the scour analysis.

The scour/stability analyses for the 25- and 50-year floods were performed using the equations from FHWA Hydraulic Engineering Circular No. 18 (HEC-18), Evaluation Scour at Bridges. Calculations to determine scour potential were performed according to HEC-18 live-bed equation for the bridge types associated with existing and proposed conditions.

The local scour was calculated for the piers using the HEC-18 pier scour equations (HEC-18, equations 7.1 – 7.4). The variables are based on the results from the HEC-RAS model for the 25-year storm. The scour calculation was also performed for the 50-year design storm as a check. Pressure scour is not applicable at this bridge because the low chord is above the design storms being considered for these calculations.

The results of the scour analyses are shown on Table 4.5.

Table 4.5 – Summary of Calculated Scour at Bridge

Alternative	Return Frequency (year)	[1] Contraction Scour (Feet)	[2] Maximum Local Pier Scour (Feet)	[3]* Long Term Degradation (Feet)	[4] Abutment Scour (Feet)	[3] + [4] Design Total Abutment Scour (Feet)	[1] + [2] + [3] Design Total Pier Scour (Feet)
Existing Condition	Design 25-yr	n/a	n/a	n/a	n/a	n/a	n/a
	Check 50-yr	n/a	n/a	n/a	n/a	n/a	n/a
Proposed Condition	Design 25-yr	0.0	1.17	n/a	1.95	1.95	1.17
	Check 50-yr	0.0	1.22	n/a	2.28	2.28	1.22

*Long Term Degradation Calculations were not computed for this bridge

The HEC-RAS method uses the Froelich equation that has been identified by MassDOT as being too conservative in calculating scour at the abutments. Therefore, the abutment scour depths calculated in the HEC-RAS analysis should not be held for design purposes. Instead, the scour depths for the abutments were

computed using the NCHRP 24-40 Abutment Scour Approach in the FHWA HEC-18, Evaluating Scour at Bridges Section 8.6.3 and shown below.

$$y_{max} = \alpha_A y_c \text{ or } y_{max} = \alpha_B y_c$$

$$y_s = y_{max} - y_0$$

The computed abutment scour depths using the above equation are listed below and should be used for design.

Table 4.6 – Abutment Scour Depths at Bridge

Alternative	Return Frequency (year)	Design Abutment Scour (Feet)	Design Pier Scour (Feet)
Existing Condition	Design 25-yr	n/a	n/a
	Check 50-yr	n/a	n/a
Proposed Condition	Design 25-yr	1.95	1.17
	Check 50-yr	2.28	1.22

Scour Countermeasures

The natural stream bed will result in a scour depth at the left abutment of 1.95' during the 25 year design storm. By placing riprap revetment around the abutment it is anticipated that the scour depth will be negligible as shown in Table 4.7. The proposed right abutment is located on the eastern end of the boardwalk and outside of the flow of the channel. For this reason scour protection is not needed at the right abutment.

The calculated contraction, and pier scour depths resulted in a value of less than 1.5 ft. For this reason, scour countermeasures are not required within the main channel, and are only required at the left abutment.

The scour countermeasure design at the left abutment were computed using HEC-23, Bridge Scour and Stream Instability Countermeasures: Experience, Selection, and Design Guidance-Third Edition, Volume 2, Section 4, Design Guideline 14 and shown below.

Table 4.7 – Summary of Scour Countermeasure Design at Bridge Abutments

Alternative	Riprap Size D_{50} (Inches)	Riprap Size D_{100} (Inches)	Riprap Thickness (Feet)	Riprap Apron Extend from toe (Feet)	Riprap Extend along u/s and d/s face of the Embankment (Feet)	Vertical Extend up Abutment Slope (Feet)
Existing	n/a	n/a	n/a	n/a	n/a	n/a
Proposed (left abutment)	6	12	1	10	25	10
Proposed (right abutment)	n/a	n/a	n/a	n/a	n/a	n/a

Attachment D includes the scour analyses, and computations.

5.0 CONCLUSIONS

A. The project hydraulic model indicates that proposed replacement bridge will safely convey the 10-year design flood event.

B. To minimize the environmental impacts of the western approach on the adjacent wetlands, 1.5 ft of freeboard was maintained over the 10-year design flood event. Although this does not meet the recommended 2 feet of freeboard between the hydraulic design flood water surface elevation and the proposed superstructure low chord, we consider that 1.5 ft of freeboard will be appropriate because it is a recreational pedestrian bridge.

C. HEC-RAS models under existing and proposed conditions resulted in lower elevations than the effective FEMA FIS. Therefore, the project implementation will result in no increase to the waterway's Base (100-year) Flood Elevation (BFE) profile and it will not necessitate alteration of the waterway's floodway delineation, anywhere within the affected community.

D. The natural stream bed will result in a scour depth at the abutment of 1.95' during the 25 year design storm. By placing riprap revetment around the abutment it is anticipated that the scour depth will be negligible.

E. The calculated contraction, and pier scour depths resulted in a value of less than 1.5ft. For that reason, scour countermeasures are only required at the left abutment for this bridge.

F. The information in Table 5.1 should be presented within the Hydraulic Data Tables in the General Notes of the Bridge Sketch Plans.

* (no specification provided)

Material Description

Brown m-c SAND, some fine Gravel, trace Silt

Atterberg Limits (ASTM D 4318)

PL= NP **LL=** NV **PI=** NP

Classification

USCS (D 2487)= SP **AASHTO (M 145)=** A-1-a

Coefficients

D_{90}= 9.4954 D_{85}= 8.0567 D_{60}= 3.7970
D_{50}= 2.7818 D_{30}= 1.4137 D_{15}= 0.7552
D_{10}= 0.5709 C_u= 6.65 C_c= 0.92

Remarks

Date Received: 1/4/19 **Date Tested:** 1/10/19

Tested By: AV

Checked By: Rebecca Roth

JOB	17118 Peabody Bikeway		
SHEET NO.	1	OF	1
CALCULATED BY	JRM	DATE	10/13/2020
CHECKED BY	AGF	DATE	10/13/2020
DESCRIPTION			
SCALE			

Using HEC-18 Evaluation of Scour at Bridges
Chapter 5 General Scour
Live-Bed Equation
25 YEAR DESIGN FLOW RATE

Live Bed Contraction Scour calculations:

$$y_2/y_1 = (Q_2/Q_1)^{6/7}(W_1/W_2)^{k1}$$

$y_s = y_2 - y_0$ = (average contraction scour depth)

Where:
y_1= Average depth in the upstream main channel (ft)
y_2= Average depth in the contracted section (ft)
y_0= Existing depth in the contracted section before scour (ft)
Q_1= Flow in the upstream channel transporting sediment (ft^3/s)
Q_2= Flow in the contracted channel (ft^3/s)
W_1= Bottom width of the upstream main channel that is transporting bed material (ft)
W_2= Bottom width of the main channel in the contracted section less pier width(s) (ft)
K_1= Exponent determined below

V*/w	K_1	Mode of Bed Material Transport
<0.50	0.59	Mostly contact bed material discharge
0.50 to 2.0	0.64	Some suspended bed material discharge
>2.0	0.69	Mostly suspended bed material discharge

For D_{50} = 2.7818 mm

y_1 =	y_0	Q_1	Q_2	W_1	W_2	K_1	y_2	y_s	
2.02	3.65	285	247	134	101	0.64	2.14	**-1.51**	*NO SCOUR*

Where,

$$V^* = (t/q)^{1/2} = (gy_1s_1)^{1/2}$$

s_1	Slope of energy grade line of main channel (ft/ft)
y_1	Average depth in the upstream main channel (ft)
g	Acceleration of Gravity(32.2 ft/s^2)
w	Fall velocity of bed material based on D_{50}, m/s (figure 5.8, HEC-18) (for velocity in english units (ft/s), multiply w in m/s by 3.28
t	Shear stress on the bed, Pa (N/m^2) (lb/ft^2)
q	Density of water (1000 Kg/m^3) (1.94 $slug/ft^3$)

Then for s_1 = 0.0034

V* = 0.47 ft/s

And for D_{50} = 2.7818 mm

w = 0.7872 ft/s (from figure 5.8 for temperature between 0 and 20 C degree)

V*/w = 0.6 then K_1 = 0.64

Date:	March 19, 2025
Project Name:	Independence Greenway Extension, Peabody, MA
Project Number:	Green No. 17118
Subject:	**401 Water Quality Certification - MassDEP 24-WW26-0034-APP (Fill and Dredge) Independence Greenway Extension from Essex Center Drive to Endicott Street, Peabody, MA MassDOT Project #609211**

Dear Ms. Davis:

This Request is being submitted to MassDEP Wetlands Program by Green Internation al Affiliates, Inc. on behalf of the Applicant, the City of Peabody, for the issued 401 Water Quality Certification (WQC) Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge).

The Applicant and MassDOT have reviewed the 401 Water Quality Certification issued for the Independence Greenway Extension project in Peabody, MA and respectfully request that MassDEP review the following clarifications and requested changes to the issued 401 Water Quality Certification, Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge):

Condition 31: *"All sediment management activities authorized by this WQC shall be conducted under the supervision of a Licensed Site Professional (LSP). Prior to the Pre-Construction Meeting required in Condition 5, the applicant shall provide MassDEP with the name and contact information of the LSP."*

> **Comments:** "Management" in this context is vague. Clarification on the scope of "management" is necessary to ensure compliance and avoid potential misinterpretations. The Contractor's LSP typically determines the activities that require monitoring, as well as the amount of monitoring needed, based on the known/suspected nature of the materials being excavated and the project conditions. Requiring an LSP to oversee all sediment management activities seems overly burdensome and may not provide significant value.

Recommended Language: MassDOT requests that management activities be better defined in this special condition to ensure compliance with this Special Condition.

Condition #32*: "A Health & Safety Plan shall be required for handling of sediment which has been characterized as exceeding MCP RCS-1 criteria. A copy shall be provided to MassDEP within six weeks of the effective of this WQC or two weeks prior to the commencement of the dredging operation, whichever comes first."*

Comments:

1. The Contractor is responsible for preparing an Environmental Health and Safety Plan that protects workers from any exposure to known/suspect contaminants present in environmental media (including sediment) within the project limits. We expect that an all-encompassing safety plan will be adequate and that a separate plan specifically for sediment will not be required. Please confirm.
2. Please confirm that the plan needs to be submitted for MassDEP records only.
3. There needs to be flexibility in the submission deadline to accommodate unforeseen delays.

Recommended Language: "An Environmental Health & Safety Plan shall be required for the protection of workers from any exposure to known/suspect contaminants present in environmental media (including sediment) within the project limits. A copy shall be provided to MassDEP for records at least two weeks prior to the commencement of the dredging operation."

Condition #33: *"Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001-Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. MassDEP will review the data to determine if the sediment will require offsite disposal. Under no circumstances shall the material be transported until MassDEP has reviewed the data and approved disposal methods."*

Comments: Facilitating the efficient movement of soil from the project site to the disposal site is crucial for maintaining the construction schedule and avoiding logistical constraints within limited Right of Way construction projects. MassDOT proposes a system where the Contractor will share the electronic test results with MassDEP at the earliest opportunity, and MassDEP will render a formal approval within seven business days to ensure efficient construction operations and prevent costly delay claims from the contractor.

In addition to the comment above, the meaning of "determining whether the material requires offsite disposal" as stated by MassDEP is not entirely clear. This requires further clarification. Does this imply that the sediment exceeds the COMM 97 criteria for reuse as daily cover, thereby potentially necessitating disposal at an out-of-state facility?

Recommended Language: "Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC

data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001-Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. MassDEP will review the data to determine if the sediment exceeds these criteria and requires disposal, at an out-of-state facility, within seven calendar days to ensure efficient construction operations. Under no circumstances shall the material be transported until MassDEP has reviewed the data and approved disposal methods as consistent with the aforementioned timeframes."

Condition #34: *"Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined and securely covered with wind tear resistance tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down. Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted daily and more frequently immediately before, during and after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner."*

Comments:

1. It is generally not mandatory to bottom line stockpiles if they are placed on a paved surface, as the paved surface can serve as an adequate barrier to prevent contamination and runoff.
2. The requirement to place stockpiles at least 10 feet away from temporary construction access roads can be challenging, especially in confined project sites and laydown yards.
3. The requirement for immediate inspection and correction of deficiencies during and after storm events is impractical, especially during severe weather.

Recommended Language: "Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined if not placed on paved surfaces, and securely covered with wind tear resistance tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down. Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls whenever possible. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted in line with the frequency stated in Special Condition 20. Any observed deficiency shall be corrected or repaired in a timely manner."

Condition #36: *"Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation."*

Comments: The 90-day limit on stockpiling may be restrictive, particularly if there are delays in transportation or approval from disposal facilities or facility shutdowns. Extension provisions should be included to account for such delays.

Recommended Language: "Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation. Extensions can be requested to accommodate unforeseen delays."

Condition #43: *"BMPs shall be implemented during transportation of the dredged material to the licensed receiving facility. At a minimum, when transported upon public roadways, all dredged material shall have no free liquid as determined by the Paint Filter Test or other suitably analogous methodology acceptable to MassDEP, and a tarpaulin or other means shall be used to cover the dredged material during transport."*

Comments: Visual observation is sufficient to determine whether the dredged material contains any free liquids prior to shipment. The receiving facilities have physical acceptance criteria, ensuring that no material containing free liquids is accepted. The Contractor ensures that the material does not contain any liquids, but typically testing is not required as the determination is based on visual observation. Requiring additional testing is redundant and burdensome, given that visual assessment has proven reliable and effective in these situations.

Recommended Language: MassDOT requests that visual observation and receiving facility criteria be sufficient to facilitate transport of dredged material without any free liquids.

If you have any questions or would like to discuss further, please contact me at (978) 843-5276 or by email at ofartushnaya@greenintl.com.

Sincerely,

Oxana Fartushnaya

RE: 401 WATER QUALITY CERTIFICATION
BRP WW 10, Major Fill Project
BRP WW 08, Minor Dredge Project
Independence Greenway Extension
Peabody, MA

401 WQC Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge)
USACE Application No. NAE-2024-01390
MassDOT File Number: 609211

Dear Mr. Callahan:

The Massachusetts Department of Environmental Protection (MassDEP) has reviewed your application for a Water Quality Certification (WQC), as referenced above; this application was deemed complete on June 11, 2024. In accordance with the provisions of MGL Ch. 21, §§26-53 and Section 401 of the Federal Clean Water Act as amended (33 U.S.C. §1251 et seq.), it has been determined there is reasonable assurance the proposed project will be conducted in a manner which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law.

The City of Peabody, in coordination with the Massachusetts Department of Transportation (MassDOT), proposes to extend the existing Independence Greenway rail trail from Essex Center Drive to Endicott Street along an existing former railroad right-of-way owned and maintained by the City of Peabody (the Project). The Project includes construction of a paved shared-use pathway (SUP) along the existing abandoned railroad right-of-way; construction of a light duty timber boardwalk structure supported on helical piles over Proctor Brook and associated wetlands; replacement of culverts that convey Proctor Brook and its tributaries beneath the railroad bed; stormwater infrastructure improvements; construction of a compensatory flood storage area; and modifications required for connections to the existing paths at either end including sidewalk reconstruction and drainage improvements. The Project purpose is to provide a continuation and connection of the existing rail trail facilities to be utilized by pedestrians and bicyclists.

This information is available in alternate format. Please contact Melixza Esenyie at 617-626-1282.
TTY# MassRelay Service 1-800-439-2370
MassDEP Website: www.mass.gov/dep

Printed on Recycled Paper

Existing Conditions

The proposed SUP alignment generally extends in an east/west orientation along an existing abandoned and elevated railroad bed in a forested area. At the west end, a portion of the SUP will also extend along Essex Center Drive and Northshore Road to connect the alignment from the existing terminus of the Independence Greenway to the railroad bed. Essex Center Drive is classified as a local roadway with two 15-foot-wide lanes, a typical pavement width of 30 feet and five-foot-wide paved and concrete sidewalks on each side. Where Essex Center Drive extends under Route 128, it is 23 feet wide with 11-foot-wide and 12-foot-wide lanes, a 9.5-foot-wide raised median, and 3.5-foot-wide paved sidewalks on each side. Northshore Road is classified as a local roadway with two 11-foot-wide lanes, a pavement width of 23 feet, and a 4.5-foot-wide paved sidewalk on the west side.

Proctor Brook, a perennial stream, meanders west to east generally parallel to the railroad bed, crossing it in three locations. The bankfull width of Proctor Brook varies between 19 and 35 feet within the Project area. Two crossings at Stations 329+85 and 346+20 consist of culverts that are obstructed and/or washed out and are no longer functioning. Twin 42-inch culverts are present at Station 329+85 and the crossing at Station 346+20 was formerly a four-foot-high by approximately six-foot-wide concrete culvert that washed out. The third Proctor Brook crossing at Station 351+50 consists of a former railroad bridge that also washed out and is largely no longer present.

Two existing intermittent streams also flow north under the railroad bed at Stations 340+10 and 358+51 via a 30-inch corrugated metal pipe (CMP) and 15-inch ductile iron pipe (DIP), respectively. A 24-inch CMP at Station 342+20 provides a hydrologic connection between Bordering Vegetated Wetlands (BVWs) on either side of the railroad bed. Extensive BVWs are present along Proctor Brook and the railroad bed throughout the corridor.

On Essex Center Drive, Northshore Road, and Endicott Street, stormwater flows to a combination of country drainage and closed drainage systems. The Project will occur within a Federal Emergency Management Agency 1% annual chance of flooding zone (Zone AE) and Regulatory Floodway with a Base Flood Elevation ranging from 47.1 feet at the west end to 39.6 feet at the east end.

Project Description

The Project is approximately 1.3 miles in length. The SUP path will be 10 feet wide carrying two five-foot-wide travel lanes, one in each direction. Two-foot-wide stone dust shoulders will be present on either side along the railroad bed. Portions of Essex Center Drive will be fully reconstructed and/or repaved but will not be widened. Intersection improvements will also occur along Essex Center Drive, Northshore Road, and Endicott Street, and two compensatory flood storage areas will also be constructed along the SUP.

A 56-span light-duty timber boardwalk structure supported on helical piles will replace the previous railroad bridge that washed away. The boardwalk will be approximately 438 feet long and a total of 13 feet wide. It will carry two five-foot-wide travel lanes, one in each direction, with one-foot-wide shoulders on each side. Riprap scour protection will be placed along the abutment at the west end.

A four-foot-high by eight-foot-wide precast concrete box culvert will be installed at each of the Proctor Brook crossings at Stations 329+85 and 346+20. The streams within each box culvert will be restored

with 12 inches of natural streambed substrate and will match the existing invert elevations. Riprap scour protection will be installed within the channels as depicted on the plans approved herein.

The CMP at Station 340+10 will be replaced with a 36-inch DIP and the CMP at Station 342+20 will be replaced with a 24-inch DIP. Both culverts will be embedded 12 inches with a layer of natural streambed substrate and will match the existing invert elevations. The RCP at Station 358+51 will be replaced with a 16-inch DIP but due to its small diameter will not have natural stream substrate.

BVW and LUW Impacts

In total, 17,998 sf of fill impacts to BVWs and LUW are required to construct the Project; 2,344 sf of permanent and 4,681 sf of temporary BVW impacts, and 8,661 sf of permanent and 2,312 sf of temporary LUW impacts. The Project requires 1,491 cubic yards of dredging. Impacts are required to construct the boardwalk, replace the culverts, and install associated scour protection.

Alternatives Analysis

Several alternative alignments and cross sections were evaluated for the SUP. Constructing the SUP along Warren Street Extension rather than constructing the boardwalk over Proctor Brook and associated BVWs was considered but rejected due to safety concerns. The SUP and shoulders are the minimum width required and the side slopes have been narrowed to the extent practicable to avoid and minimize impacts to adjacent BVWs and LUW. Riprap scour protection in BVW and LUW at the culvert replacements is the minimum amount required based on Federal Highway Administration standards. A concrete deck was considered for the boardwalk but would require a more substantial substructure in BVWs and LUW, including the potential need for a pier and foundation. It would also require the use of larger equipment and potentially more temporary impacts. A timber boardwalk allows for the use of helical piles to support the structure, which results in less impacts to BVWs and LUW.

BVW and LUW Replication and Restoration

Permanent BVW impacts will be mitigated through construction of a 2,500 sf BVW replication area under the supervision of a qualified Wetland Scientist. The replication area will be located at the end of Gilmore Terrace along BVWs associated with Proctor Brook. Wetland soil will be installed to a depth of 18 inches to match the existing adjacent BVW elevation, the area will be planted with native trees and shrubs, and a native wetland seed mix will be applied.

Temporary BVW impacts will be restored in place under the supervision of a qualified Wetland Scientist. Where riprap scour protection will be placed in BVWs at the culvert replacements, a layer of compost will be placed over the riprap, native live stakes will be installed, and a native wetland seed mix will be applied. Twelve inches of natural streambed substrate will be placed over the riprap scour protection in LUW at the culvert replacements.

Stormwater Management Standards

The Project will increase impervious surface by 1.1 acres (46,907 sf). The roadway reconstruction portion of the Project qualifies as a redevelopment as defined at 314 CMR 9.02. Per Volume 1, Chapter

1 of the Massachusetts Stormwater Management Standards, the Standards only apply to the SUP portion of the Project to the maximum extent practicable.

Through the installation of deep sump catch basins, an infiltration trench, and a rock-lined drainage swale, the Project will meet Stormwater Management Standards 2, 3, and the structural stormwater best management practice requirements of Standard 4 to the maximum extent practicable. Two-foot-wide stone dust shoulders over eight inches of subbase gravel borrow will also be installed along each side of the SUP to capture and treat stormwater, which will improve existing conditions. A complete evaluation concluded additional Stormwater Control Measures are not practicable within the Project area.

Stream Crossing Standards

The Project will meet the Massachusetts Stream Crossing Standards to the maximum extent practicable in accordance with 314 CMR 9.06(2)(b)4. The boardwalk will meet all Stream Crossing Standards and all stream crossing culvert sizes will be increased from existing conditions. Except for the boardwalk, spans are not practicable for the other stream crossings and would require footings resulting in more impacts to adjacent BVWs and LUW. Both Proctor Brook culverts will exceed the openness ratio Standard. Twelve inches of natural streambed material will be placed within three of the replacement culverts which is the maximum practicable given the constraints. Improved water depths and velocities more consistent with natural conditions are anticipated due to the crossing improvements.

Sediment Chemistry

Sediment sample analytical results were compared to the Reportable Concentration (RC) S-1 criteria of the Massachusetts Contingency Plan (MCP). Results of the sediment samples analyzed indicated the presence of lead in Sample SS-3 in concentrations above the RC S-1 criteria. As conditioned herein, the City of Peabody is required to determine if dredged sediments are suitable for reuse or required to be handled and disposed of at an offsite facility in accordance with all applicable regulations. If required, all materials will be limited to specific pre-approved disposal facilities. MassDEP is to be notified, in writing, of the name and location of the licensed facility accepting the dredged material for disposal or reuse as daily cover material.

Invasive Species

Invasive species will be managed in accordance with an Invasive Plant Management Strategy (IPMS) to be approved by MassDEP.

Based on a review of information provided by the applicant, MassDEP finds that this project complies with the standards described under 314 CMR 9.06 and 9.07. Public notice was provided in the Peabody Weekly News on May 23, 2024, and in the MEPA Environmental Monitor on June 7, 2024. No comment letters were received during the public comment period.

Therefore, based on information currently in the record, MassDEP grants a WQC for this project subject to the following conditions to maintain water quality, to minimize impact on waters and wetlands, and to ensure compliance with appropriate state law. The Department further certifies in accordance with 314 CMR 9.00 that there is reasonable assurance the project or activity will be conducted in a manner

which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law. Finally, the Department has determined that upon satisfying the conditions and mitigation requirements of this approval, the project provides a level of water quality necessary to protect existing uses and accordingly finds that the project to be implemented satisfies the Surface Water Quality Standards at 314 CMR 4.00.

Pursuant to 314 CMR 9.09(1)(d); 314 CMR 9.06(6)(a); 310 CMR 9.06(2); 314 CMR 9.07; 314 CMR 9.07(1); 314 CMR 9.09(7)(5)(c); 314 CMR 9.11; and 314 CMR 9.09(1)(e), the following Special Conditions are necessary to ensure that construction practices and stormwater controls are implemented in such a manner as to prevent degradation to wetlands and waters; ensure that practicable steps have been taken which will avoid and minimize impacts to wetlands and waters; minimize turbidity and sediment caused by construction activities; ensure that water quality is not degraded, and that biology of the waters are not negatively impacted by potential discharges; and/or maintain a record of the dredged material for reference and to ensure accountability in its transportation.

Those Special Conditions that require direct submittals to MassDEP for either review, or review and approval, are denoted by the following notation (Submittal) at the end of the condition and are summarized in Attachment A. In addition, those conditions with the (Submittal) designation shall be included in the Special Provisions and, as applicable, reviewed at the Pre-Construction Meeting.

1. All work shall be performed in accordance with the following documents and plans:

    - Application for Water Quality Certification. Prepared by Green International Affiliates, Inc. on behalf of the City of Peabody, with cover letter and attachments. Dated May 15, 2024. 401 WQC Filing Number: 24-WW26-0034-APP.
    - Plans entitled: “Massachusetts Department of Transportation Highway Division Plan and Profile of Independence Greenway Extension Bridge P-03-020 (CAK) in the City of Peabody, Essex County. PS&E Submittal.” Last revised April 19, 2024.
    - MassDEP Administrative Completeness and Technical Deficiency Review. 401 WQC Transmittal No: 24-WW26-0034-APP (Fill and Dredge). Dated June 5, 2024.
    - Response to MassDEP Administrative Completeness and Technical Deficiency Review letter for 401 WQC Transmittal No: 24-WW26-0034-APP, including attachments. Prepared by Green International Affiliates, Inc. on behalf of the City of Peabody. Dated June 11, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Expanded Environmental Notification Form and Proposed Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated January 29, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Draft Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated May 24, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Final Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated August 5, 2024.

- Order of Conditions issued by the Peabody Conservation Commission. MassDEP File #: 055-0939. Issued July 3, 2024.
- MassDEP Notice of Appeal. MassDEP File #055-0939. Issued July 15, 2024.

Pre-Construction

2. A qualified **Wetland Scientist** (WS) with a minimum of five years of relevant professional experience with wetland and stream replacement and restoration projects shall be employed to oversee all BVW and LUW replacement and restoration activities, including but not limited to grading, placement of substrate, seeding, vegetation plantings, and placement of wildlife habitat features. The name, contact information, and qualifications of the WS shall be provided to MassDEP for approval prior to the Pre-Construction Meeting required in Condition 4. The name and contact information of the approved WS shall be provided to the Peabody Conservation Commission prior to the start of work. **(Submittal)**

3. Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name and contact information of the Resident Engineer (RE) responsible for ensuring that all work complies with the conditions of this WQC. **(Submittal)**

4. A minimum of 21 days prior to the start of work, MassDOT shall contact MassDEP to schedule an onsite Pre-Construction Meeting to review the approved plans and terms and conditions of this WQC. The RE, the Construction Contractor (Contractor), the WS, and a representative from the MassDOT Environmental Section and/or the District Environmental Engineer shall attend the Pre-Construction Meeting.

5. MassDEP shall be copied on applicable submittals to the U.S. Army Corps of Engineers (USACE). These include but are not limited to: Self-Verification Notification Form (SVNF); Pre-Construction Notification (PCN); Work-Start Notification Form; Mitigation Work-Start Notification Form; and Compliance Certification Form. The Work-Start Notification Form shall be submitted at least 14 days before the anticipated start of work and the Compliance Certification Form shall be submitted within 30 days following the completion of the authorized work. **(Submittal)**

6. A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan (CP/PP) shall be developed and implemented as required by 314 CMR 9.06(6)(a)8. A minimum of 14 days prior to the start of work, the City of Peabody or its Contractor shall submit the CP/PP for review and approval. If the U.S. Environmental Protection Agency (EPA) Construction General Permit (CGP) applies, the Stormwater Pollution Prevention Plan (SWPPP) may serve as the CP/PP, providing it includes the measures required to be in the CP/PP per these Special Conditions, in addition to the measures specifically required by the CGP. Any subsequent changes to the Final CP/PP (defined herein as including the construction period SWPPP if applicable) must be approved by MassDEP. **(Submittal)**

7. Training regarding erosion and sedimentation controls is required. The RE, CP/PP Inspector, and any other relevant personnel responsible for erosion and sedimentation controls shall complete the EPA CGP Inspector Training, or other training that meets the CGP requirements, as well as

complete a comprehensive review of the Final CP/PP. Verification of proof of completion of the training shall be submitted to MassDEP prior to the start of work. **(Submittal)**

8. The CP/PP shall identify, but shall not be limited to, staging and laydown areas in relation to BVWs and LUW, proposed dewatering locations, proposed stockpile locations and their proximity to catch basins or other drainage conveyances that discharge to wetland resource areas, and the location of construction-period erosion and sedimentation controls.

9. A minimum of 14 days prior to the start of work, the City of Peabody or its Contractor shall submit a Water Management Plan for review and approval. The Plan shall include proposed methods to manage construction-period water including but not limited to dewatering methods and locations, specifications for any water bypass systems, and dredge and debris material dewatering prior to shipment off site, as applicable. The plan shall meet requirements of the CP/PP and be specific to the Project. Dewatering and water bypasses shall be conducted under the supervision of the RE and comply with the applicable conditions identified herein. **(Submittal)**

10. Prior to the start of work, approved erosion and sedimentation control measures shall be installed per the approved CP/PP and as applicable, the manufacturer specifications. Erosion and sedimentation control measures may consist of, but are not limited to, silt fence, staked straw bales, silt/turbidity curtains, compost filter tubes, etc.

11. Prior to the Pre-Construction Meeting, the boundaries of BVWs and LUW shall be re-flagged where they are within 50 feet of the limits of work. In the event BVWs and LUW boundaries overlap, the outermost boundary (i.e., closest to the proposed work) shall be flagged. All boundary markers, once in place, shall remain in place throughout construction until all disturbed surfaces have been permanently stabilized. Boundary markers shall be fully evaluated annually and refreshed where needed. Implementation of and compliance with this requirement shall be documented by the WS. All construction personnel shall be made aware of these markers.

12. A Flood Contingency Plan shall be submitted to MassDEP for review and approval that addresses areas that fall within the 1% annual chance of flooding zone within project limits. The Plan shall address the potential need for temporary relocation of construction and auxiliary equipment during flood events to designated upland locations above the Base Flood Elevation. The Plan shall be approved by MassDEP prior to any work within the 1% annual chance of flooding zone, including mobilization or storage of equipment and materials. **(Submittal)**

13. The applicant shall develop an Invasive Plant Management Strategy (IPMS) to be submitted to MassDEP for review and approval prior to the Pre-Construction Meeting. The IPMS shall be implemented as approved. **(Submittal)**

14. If needed, use of herbicides to control invasive species shall be implemented in accordance with the approved IPMS and with the following requirements:

    a. Herbicides can only be applied by a Licensed Applicator;

b. Applicant must provide MassDEP Material Safety Data Sheets (MSDS) of the product being used and must also keep MSDS sheets on site;

c. Product registration in MA with Massachusetts Pesticide Product Registration Number must be confirmed with Massachusetts Department of Agricultural Resources Pesticide Division;

d. EPA Registration Number for the product must be identified;

e. Product label restricted use provisions must be followed; and

f. Applicant must contact MassDEP Division of Watershed Planning to determine if a BRP WM 04 herbicide permit is required.

15. Final Construction Plans (the plans provided to the Contractor) shall be submitted for review at least 30 days prior to the Pre-Construction Meeting. Sufficient supporting information, explanation, and documentation shall be provided to MassDEP and the Peabody Conservation Commission for any changes, and MassDEP may at its discretion require additional supporting documentation as a condition of review. Once MassDEP provides written approval, the updated set of plans shall become the "Final Plan of Record." The Plan shall be prepared and signed by a Professional Engineer in the Commonwealth of Massachusetts and shall incorporate all revisions and additions to the original plans that have been approved as discussed herein. **(Submittal)**

Construction Period

16. No more than **2,344 sf** of permanent and **4,681 sf** of temporary impacts to BVWs shall occur. No more than **8,661 sf** of permanent and **2,312 sf** of temporary impacts to LUW shall occur. No more than **1,491 cy** of dredging in LUW shall occur. All work shall avoid unapproved impacts to BVW and LUW.

17. CP/PP inspections shall occur at least once every seven calendar days and within 24 hours of a storm event that produces 0.5 inches or more of rain within a 24-hour period, or at a more stringent frequency if the CP/PP requires.

18. Copies of CP/PP Inspection and Maintenance Log Forms shall be submitted to MassDEP within 14 days upon request.

19. Inspection and maintenance of erosion and sediment controls in active work areas shall be the responsibility of both the Contractor and RE. The project team shall include an individual with at least three years of experience with construction period erosion and sedimentation controls. The RE shall be ultimately responsible for inspection and maintenance of site controls. The RE and/or Contractor shall immediately notify MassDEP and the Peabody Conservation Commission if any unauthorized discharges to BVWs or LUW occur.

20. Disturbed areas shall be stabilized immediately after activities have permanently ceased or will be temporarily inactive for 14 or more calendar days. The installation of stabilization measures

shall be implemented as soon as practicable, but no later than 14 calendar days after stabilization has been initiated.

21. Work within LUW shall be conducted in low or no-flow conditions to the extent practicable. Notice shall be provided to MassDEP and the Peabody Conservation Commission within 24 hours prior to the commencement of dewatering. Dewatering methods and location(s) shall be approved by the RE prior to use, and shall be documented in the CP/PP. There shall be no discharge of untreated dewatered stormwater or groundwater to BVWs or LUW. Any discharges shall be visibly free of sediment.

22. Additional erosion and sedimentation control materials shall be stored on-site at all times for emergency and routine replacement. Materials shall be kept covered, dry, and accessible at all times. The RE shall be responsible for anticipating the need for and installation of additional erosion and sedimentation controls and shall have the authority to require additional erosion control measures to protect wetland resource areas beyond what is shown on the plans if field conditions or professional judgment dictate that additional protection is necessary.

23. The RE shall monitor the National Weather Service forecast for updates, and upon issuance of a flood watch for the 1% annual chance of flooding zone, shall implement the flood contingency plan referenced in Condition 12.

24. Any storm drains with potential to receive discharge from stockpiled materials or construction operations shall be managed to inhibit the inflow of sediment while not increasing the likelihood of roadway flooding during periods of precipitation. Stockpiles shall be located no less than 50 feet from BVWs, LUW, catch basins, or other drainage conveyances that discharge to BVWs or LUW. The CP/PP shall specify measures to implement this. Filter fabric stretched under storm drain inlet grates are not acceptable for this purpose.

25. The contractor shall have designated washout areas for concrete equipment that will be comprised of impermeable material and sized to contain project concrete wastes and wash water. Concrete wash out areas shall be located no less than 50 feet from BVWs, LUW, and catch basins or other drainage conveyances that discharge directly or indirectly to BVWs, or LUW.

26. Refueling, washing, and cleaning of vehicles and other construction equipment shall not take place within 50 feet of BVWs or LUW and any wash water shall be contained such that it does not drain toward BVWs or LUW. MassDEP shall explicitly approve in writing any deviation to this condition for oversized stationary vehicles.

27. The contractor shall have spill containment kits on site. In the event of a release of fuels and/or oils, the local fire department and MassDEP shall be notified.

28. Construction vehicles or other vehicles or heavy equipment are prohibited from traversing over the proposed infiltration Stormwater Control Measures (SCMs) to avoid compaction of soils during construction. These areas shall be demarcated by silt fence with signage, or high visibility fencing. If access through the location of an infiltration SCM is unavoidable, the City of Peabody

or its Contractor shall request written approval from MassDEP to use low ground pressure equipment to complete the work. Following completion of the work, subsoils shall be tilled to a minimum depth of 18 inches prior to placement of final surface dressing materials required by the approved plans. Tilling shall only be conducted when the subsoils are in a friable condition and dry enough so that a clump cannot be formed into a ball shape by hand. No vehicles or heavy equipment shall be permitted within the infiltration SCM following placement of the final materials without written approval from MassDEP. Proposed infiltration SCMs shall remain offline until final stabilization is achieved, unless written approval is obtained from MassDEP.

29. If sheet piles are required, they shall be fully removed from wetland resource areas upon stabilization of the area as required. No portion of sheet piles shall remain unless approved by MassDEP in writing prior to installation. A request to leave sheet piles shall include, but not be limited to, demonstration that full removal of the sheet piles is not feasible or practicable, and an alternatives analysis demonstrating alternative methods to isolate the work area(s) are not feasible or practicable.

Dredging

30. No later than 21 days prior to commencement of dredging activity, a Dredged Material Dewatering Plan shall be submitted to MassDEP for review and approval. At a minimum, the Plan shall include but not be limited to the type of containment, method of dewatering (i.e. mechanical or by gravity), method of collecting the dewatered effluent and method of disposal. **(Submittal)**

31. All sediment management activities authorized by this WQC shall be conducted under the supervision of a Licensed Site Professional (LSP). Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name and contact information of the LSP. **(Submittal)**

32. A Health & Safety Plan shall be required for handling of sediment which has been characterized as exceeding MCP RCS-1 criteria. A copy shall be provided to MassDEP within six weeks of the effective of this WQC or two weeks prior to the commencement of the dredging operation, whichever comes first.

33. Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001-Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. MassDEP will review the data to determine if the sediment will require offsite disposal. Under no circumstances shall the material be transported until MassDEP has reviewed the data and approved disposal methods. **(Submittal)**

34. Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined and securely covered with wind tear resistance

tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down. Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted daily and more frequently immediately before, during and after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner.

35. In the event of a precipitation or storm event, the site shall be secured beforehand in such a way as to protect resource areas and waters on site and downstream of the site, including covering of stockpiles of dredged material. Sediment stockpile areas shall be inspected immediately prior to, during and immediately after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner to prevent discharge from the stockpiled material. If stormwater runoff and erosion is observed from stockpiled dredged material, additional erosion and/or damage prevention controls measures shall be implemented.

36. Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation.

37. Measures shall be in place to prevent turbid waters, due to dredging, demolition, or debris removal activities, from extending past the limits of work into Proctor Brook and its tributaries. These measures can be items such as turbidity curtains and/or sheet piles.

38. MassDEP shall be notified one week prior to the start of dredging so that staff may inspect the work for compliance throughout the project.

39. If visual turbidity escapes the controls in place, work shall stop immediately and MassDEP shall be notified within 24 hours. Work shall not resume until the issue is corrected and MassDEP to the satisfaction of MassDEP.

40. All turbidity controls shall be inspected daily by the RE. If any damage is observed the controls in place will be replaced or repaired immediately.

41. MassDEP shall be notified in writing of the name and location of the upland licensed facilities accepting the dredged material for disposal or reuse for review and approval. If the licensed facility is located out of state, documentation shall be provided to MassDEP that the dredged material disposal/reuse has been approved and will be accepted by the receiving state. The dredged material shall not be transported to the facility without concurrence of MassDEP.

42. Transportation and disposal of the dredged material shall be overseen by the LSP of record. A Bill-of-Lading (BOL) or a Material Shipping Record (MSR) shall be used to track the dredged material to the proposed intermediate (stockpiling /dewatering) facility. A fully executed copy of the BOL or MSR shall be provided to MassDEP within 30 days of final shipment to the reused location or facility.

43. BMPs shall be implemented during transportation of the dredged material to the licensed receiving facility. At a minimum, when transported upon public roadways, all dredged material shall have no free liquid as determined by the Paint Filter Test or other suitably analogous methodology acceptable to MassDEP, and a tarpaulin or other means shall be used to cover the dredged material during transport.

Wetland Mitigation

44. A minimum of 2,500 sf of wetland replication shall be completed in coordination with an approved WS. The WS shall oversee all BVW replication and restoration, including final grading, seeding, and planting. The WS shall confirm that constructed BVW replication and restoration areas have adequate soils and hydrology to promote wetland plant species prior to seeding and installation of plantings and shall recommend measures to amend soils and promote wetland hydrology as needed.

45. Planting and seeding shall not take place between November 15th and April 15th, except as allowed by MassDEP in writing. The WS shall inspect trees and shrubs to ensure they are healthy prior to planting. Trees and shrubs deemed unhealthy in the professional judgment of the WS shall be replaced. Plantings and seed mixes shall consist of native and non-invasive species. Species may be substituted at the recommendation of the WS, and review and approval by MassDEP.

46. At least 75% of the surface area of the BVW replication and restoration areas shall be vegetated with indigenous wetland plant species within two growing seasons, or the period required by the Section 404 permit, whichever is longer. Additionally, evidence of hydrology, including hydric soil formation shall be submitted at the same time. Annual monitoring reports shall be submitted by the WS no later than January 15th each year. Monitoring reports shall include an assessment based on the approved success criteria, representative photos, and recommended corrective actions as needed. **(Submittal)**

47. MassDEP reserves the right to determine the success or failure of the BVW replication and restoration areas, and reserves the right to require additional plantings, regrading, or other measures deemed necessary to promote success.

Stream Mitigation

48. The WS shall oversee all LUW replication and restoration. Placement of streambed materials shall take place in no- or low-flow conditions. The Water Management Plan required in Condition 9 shall include measures to create no-flow conditions for this work such as a pump bypass system or other dewatering method, if needed. Placement of streambed materials during greater than low-flow conditions shall require a placement plan, with a narrative describing turbidity control measures, submitted to MassDEP for review and approval.

49. Water shall be slowly introduced back into the restored and dewatered LUW work areas as to not cause erosion and sedimentation. This work shall be overseen by the WS.

50. MassDEP reserves the right to determine the success or failure of the LUW replication and restoration areas and reserves the right to require additional measures deemed necessary to promote success.

Post-Construction

51. All temporary erosion controls shall be removed at the conclusion of work once the surrounding area has achieved final stabilization.

General Conditions

52. Any proposed alterations, minor plan changes, or amendment requests, as well as any required submittals shall be sent by email for review and approval to heidi.davis@mass.gov and ryan.hale@mass.gov. **(Submittal)**

53. This WQC remains in effect for the same duration as the Section 404 permit that requires it.

54. No Special Condition set forth herein shall be construed or operate to prohibit MassDEP from taking enforcement against the City of Peabody or its contractors for any failure to comply with the terms and requirements of this WQC.

55. No activity authorized by this WQC may begin prior to expiration of the 21-day appeal period, or until a final decision is issued by MassDEP in the event of an appeal.

Failure to comply with this Certification is grounds for enforcement, including civil and criminal penalties, under MGL Ch. 21 §42, MGL Ch. 21A §16, or other possible actions/penalties as authorized by the General Laws of the Commonwealth.

This Certification does not relieve the applicant of the obligation to comply with other appropriate state or federal statutes or regulations.

NOTICE OF APPEAL RIGHTS

a.) Appeal Rights and Time Limits

Certain persons shall have a right to request an adjudicatory hearing concerning certifications by MassDEP when an application is required: (a) the applicant or property owner; (b) any person aggrieved by the decision who has submitted written comments during the public comment period; (c) any ten (10) persons of the Commonwealth pursuant to M.G.L. c.30A where a group member has submitted written comments during the public comment period; or (d) any governmental body or private organization with a mandate to protect the environment which has submitted written comments during the public comment period. Any person aggrieved, any ten (10) persons of the Commonwealth, or a governmental body or private organization with a mandate to protect the environment may appeal without having submitted written comments during the public comment period only when the claim is based on new substantive issues arising from material changes to the scope or impact of the activity and not apparent at the time of public notice. To request an adjudicatory hearing pursuant to M.G.L. c.30A, § 10, a Notice of Claim must be made in writing, provided that the request is made by certified mail or

hand delivery to MassDEP, with the appropriate filing fee specified within 310 CMR 4.10 along with a DEP Fee Transmittal Form within twenty-one (21) days from the date of issuance of this Certificate, and addressed to:

Case Administrator
Department of Environmental Protection
100 Cambridge Street, 9th Floor
Boston, MA 02114

A copy of the request shall at the same time be sent by certified mail or hand delivery to the Department of Environmental Protection at:

Department of Environmental Protection
Commissioner's Office
100 Cambridge Street, Suite 900
Boston, MA 02114

b.) Contents of Hearing Request

A Notice of Claim for Adjudicatory Hearing shall comply with MassDEP's Rules for Adjudicatory Proceedings, 310 CMR 1.01(6), and shall contain the following information pursuant to 314 CMR 9.10(3):

3. the 401 Certification Transmittal Number;
4. the complete name of the applicant and address of the project;
5. the complete name, address, and fax and telephone numbers of the party filing the request, and, if represented by counsel or other representative, the name, fax and telephone numbers, and address of the attorney;
6. if claiming to be a party aggrieved, the specific facts that demonstrate that the party satisfies the definition of "aggrieved person" found at 314 CMR 9.02;
7. a clear and concise statement that an adjudicatory hearing is being requested;
8. a clear and concise statement of (1) the facts which are grounds for the proceedings, (2) the objections to this Certificate, including specifically the manner in which it is alleged to be inconsistent with the MassDEP's Water Quality Regulations, 314 CMR 9.00, and (3) the relief sought through the adjudicatory hearing, including specifically the changes desired in the final written Certification; and
9. a statement that a copy of the request has been sent by certified mail or hand delivery to the applicant, the owner (if different from the applicant), the conservation commission of the city or town where the activity will occur, the Department of Conservation and Recreation (when the certificate concerns projects in Areas of Critical Environmental Concern), the public or private water supplier where the project is located (when the certificate concerns projects in Outstanding Resource Waters), and any other entity with responsibility for the resource where the project is located.

c.) Filing Fee and Address

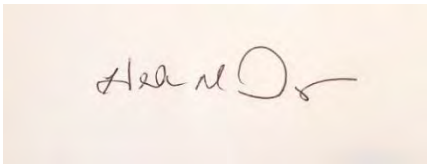
The hearing request along with a DEP Fee Transmittal Form and a valid check or money order payable to the Commonwealth of Massachusetts in the amount of one hundred dollars ($100) must be mailed to:

Commonwealth of Massachusetts
Department of Environmental Protection
Commonwealth Master Lockbox
PO Box 4062
Boston, MA 02211

The request will be dismissed if the filing fee is not paid, unless the appellant is exempt or granted a waiver. The filing fee is not required if the appellant is a city or town (or municipal agency), county, or district of the Commonwealth of Massachusetts, or a municipal housing authority. MassDEP may waive the adjudicatory hearing filing fee pursuant to 310 CMR 4.06(2) for a person who shows that paying the fee will create an undue financial hardship. A person seeking a waiver must file an affidavit setting forth the facts believed to support the claim of undue financial hardship together with the hearing request as provided above.

Should you have any questions relative to this permit, please contact myself or Ryan Hale at heidi.davis@mass.gov and ryan.hale@mass.gov.

Very truly yours,



Heidi M. Davis
Highway Unit Supervisor

ATTACHMENT A
PRE-CONSTRUCTION SUBMITTAL CHECKLIST

Independence Greenway Extension
Peabody, MA

THIS CHECKLIST MUST BE COMPLETED PRIOR TO THE START OF WORK. NOTE THAT SOME CONDITIONS REQUIRE THAT INFORMATION BE SUBMITTED A SPECIFIC NUMBER OF DAYS PRIOR TO THE START OF WORK OR THE PRE-CONSTRUCTION MEETING.

Condition	Required Submittal	Due Date	Date Submitted	Date Approved
PRE-CONSTRUCTION SUBMITTAL REQUIREMENTS				
2	Name, contact information, and qualifications of the WS, including specific experience and years to meet requirement	Prior to Pre-Construction Meeting		
3	Name and contact information of the RE	Prior to Pre-Construction Meeting		
5	USACE Work-Start Notification Form	14 days prior to work start		
6	CP/PP	14 days prior to work start		
7	EM Verification of SWPPP Training	Prior to work start		
9	Water Management Plan	14 days prior to work start		
12	Flood Contingency Plan	Prior to any work within 1% annual chance of flooding zone		
13	Invasive Plant Management Strategy	Prior to Pre-Construction Meeting		
15	Final Construction Plans	30 days prior to Pre-Construction Meeting

RE: 401 WATER QUALITY CERTIFICATION
BRP WW 10, Major Fill Project
BRP WW 08, Minor Dredge Project
Independence Greenway Extension
Peabody, MA

401 WQC Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge)
USACE Application No. NAE-2024-01390
MassDOT File Number: 609211

Dear Mr. Callahan:

The Massachusetts Department of Environmental Protection (MassDEP) has reviewed your application for a Water Quality Certification (WQC), as referenced above; this application was deemed complete on June 11, 2024. In accordance with the provisions of MGL Ch. 21, §§26-53 and Section 401 of the Federal Clean Water Act as amended (33 U.S.C. §1251 et seq.), it has been determined there is reasonable assurance the proposed project will be conducted in a manner which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law.

The City of Peabody, in coordination with the Massachusetts Department of Transportation (MassDOT), proposes to extend the existing Independence Greenway rail trail from Essex Center Drive to Endicott Street along an existing former railroad right-of-way owned and maintained by the City of Peabody (the Project). The Project includes construction of a paved shared-use pathway (SUP) along the existing abandoned railroad right-of-way; construction of a light duty timber boardwalk structure supported on helical piles over Proctor Brook and associated wetlands; replacement of culverts that convey Proctor Brook and its tributaries beneath the railroad bed; stormwater infrastructure improvements; construction of a compensatory flood storage area; and modifications required for connections to the existing paths at either end including sidewalk reconstruction and drainage improvements. The Project purpose is to provide a continuation and connection of the existing rail trail facilities to be utilized by pedestrians and bicyclists.

This information is available in alternate format. Please contact Melixza Esenyie at 617-626-1282.

Printed on Recycled Paper

Existing Conditions

The proposed SUP alignment generally extends in an east/west orientation along an existing abandoned and elevated railroad bed in a forested area. At the west end, a portion of the SUP will also extend along Essex Center Drive and Northshore Road to connect the alignment from the existing terminus of the Independence Greenway to the railroad bed. Essex Center Drive is classified as a local roadway with two 15-foot-wide lanes, a typical pavement width of 30 feet and five-foot-wide paved and concrete sidewalks on each side. Where Essex Center Drive extends under Route 128, it is 23 feet wide with 11-foot-wide and 12-foot-wide lanes, a 9.5-foot-wide raised median, and 3.5-foot-wide paved sidewalks on each side. Northshore Road is classified as a local roadway with two 11-foot-wide lanes, a pavement width of 23 feet, and a 4.5-foot-wide paved sidewalk on the west side.

Proctor Brook, a perennial stream, meanders west to east generally parallel to the railroad bed, crossing it in three locations. The bankfull width of Proctor Brook varies between 19 and 35 feet within the Project area. Two crossings at Stations 329+85 and 346+20 consist of culverts that are obstructed and/or washed out and are no longer functioning. Twin 42-inch culverts are present at Station 329+85 and the crossing at Station 346+20 was formerly a four-foot-high by approximately six-foot-wide concrete culvert that washed out. The third Proctor Brook crossing at Station 351+50 consists of a former railroad bridge that also washed out and is largely no longer present.

Two existing intermittent streams also flow north under the railroad bed at Stations 340+10 and 358+51 via a 30-inch corrugated metal pipe (CMP) and 15-inch ductile iron pipe (DIP), respectively. A 24-inch CMP at Station 342+20 provides a hydrologic connection between Bordering Vegetated Wetlands (BVWs) on either side of the railroad bed. Extensive BVWs are present along Proctor Brook and the railroad bed throughout the corridor.

On Essex Center Drive, Northshore Road, and Endicott Street, stormwater flows to a combination of country drainage and closed drainage systems. The Project will occur within a Federal Emergency Management Agency 1% annual chance of flooding zone (Zone AE) and Regulatory Floodway with a Base Flood Elevation ranging from 47.1 feet at the west end to 39.6 feet at the east end.

Project Description

The Project is approximately 1.3 miles in length. The SUP path will be 10 feet wide carrying two five-foot-wide travel lanes, one in each direction. Two-foot-wide stone dust shoulders will be present on either side along the railroad bed. Portions of Essex Center Drive will be fully reconstructed and/or repaved but will not be widened. Intersection improvements will also occur along Essex Center Drive, Northshore Road, and Endicott Street, and two compensatory flood storage areas will also be constructed along the SUP.

A 56-span light-duty timber boardwalk structure supported on helical piles will replace the previous railroad bridge that washed away. The boardwalk will be approximately 438 feet long and a total of 13 feet wide. It will carry two five-foot-wide travel lanes, one in each direction, with one-foot-wide shoulders on each side. Riprap scour protection will be placed along the abutment at the west end.

A four-foot-high by eight-foot-wide precast concrete box culvert will be installed at each of the Proctor Brook crossings at Stations 329+85 and 346+20. The streams within each box culvert will be restored

with 12 inches of natural streambed substrate and will match the existing invert elevations. Riprap scour protection will be installed within the channels as depicted on the plans approved herein.

The CMP at Station 340+10 will be replaced with a 36-inch DIP and the CMP at Station 342+20 will be replaced with a 24-inch DIP. Both culverts will be embedded 12 inches with a layer of natural streambed substrate and will match the existing invert elevations. The RCP at Station 358+51 will be replaced with a 16-inch DIP but due to its small diameter will not have natural stream substrate.

BVW and LUW Impacts

In total, 17,998 sf of fill impacts to BVWs and LUW are required to construct the Project; 2,344 sf of permanent and 4,681 sf of temporary BVW impacts, and 8,661 sf of permanent and 2,312 sf of temporary LUW impacts. The Project requires 1,491 cubic yards of dredging. Impacts are required to construct the boardwalk, replace the culverts, and install associated scour protection.

Alternatives Analysis

Several alternative alignments and cross sections were evaluated for the SUP. Constructing the SUP along Warren Street Extension rather than constructing the boardwalk over Proctor Brook and associated BVWs was considered but rejected due to safety concerns. The SUP and shoulders are the minimum width required and the side slopes have been narrowed to the extent practicable to avoid and minimize impacts to adjacent BVWs and LUW. Riprap scour protection in BVW and LUW at the culvert replacements is the minimum amount required based on Federal Highway Administration standards. A concrete deck was considered for the boardwalk but would require a more substantial substructure in BVWs and LUW, including the potential need for a pier and foundation. It would also require the use of larger equipment and potentially more temporary impacts. A timber boardwalk allows for the use of helical piles to support the structure, which results in less impacts to BVWs and LUW.

BVW and LUW Replication and Restoration

Permanent BVW impacts will be mitigated through construction of a 2,500 sf BVW replication area under the supervision of a qualified Wetland Scientist. The replication area will be located at the end of Gilmore Terrace along BVWs associated with Proctor Brook. Wetland soil will be installed to a depth of 18 inches to match the existing adjacent BVW elevation, the area will be planted with native trees and shrubs, and a native wetland seed mix will be applied.

Temporary BVW impacts will be restored in place under the supervision of a qualified Wetland Scientist. Where riprap scour protection will be placed in BVWs at the culvert replacements, a layer of compost will be placed over the riprap, native live stakes will be installed, and a native wetland seed mix will be applied. Twelve inches of natural streambed substrate will be placed over the riprap scour protection in LUW at the culvert replacements.

Stormwater Management Standards

The Project will increase impervious surface by 1.1 acres (46,907 sf). The roadway reconstruction portion of the Project qualifies as a redevelopment as defined at 314 CMR 9.02. Per Volume 1, Chapter

1 of the Massachusetts Stormwater Management Standards, the Standards only apply to the SUP portion of the Project to the maximum extent practicable.

Through the installation of deep sump catch basins, an infiltration trench, and a rock-lined drainage swale, the Project will meet Stormwater Management Standards 2, 3, and the structural stormwater best management practice requirements of Standard 4 to the maximum extent practicable. Two-foot-wide stone dust shoulders over eight inches of subbase gravel borrow will also be installed along each side of the SUP to capture and treat stormwater, which will improve existing conditions. A complete evaluation concluded additional Stormwater Control Measures are not practicable within the Project area.

Stream Crossing Standards

The Project will meet the Massachusetts Stream Crossing Standards to the maximum extent practicable in accordance with 314 CMR 9.06(2)(b)4. The boardwalk will meet all Stream Crossing Standards and all stream crossing culvert sizes will be increased from existing conditions. Except for the boardwalk, spans are not practicable for the other stream crossings and would require footings resulting in more impacts to adjacent BVWs and LUW. Both Proctor Brook culverts will exceed the openness ratio Standard. Twelve inches of natural streambed material will be placed within three of the replacement culverts which is the maximum practicable given the constraints. Improved water depths and velocities more consistent with natural conditions are anticipated due to the crossing improvements.

Sediment Chemistry

Sediment sample analytical results were compared to the Reportable Concentration (RC) S-1 criteria of the Massachusetts Contingency Plan (MCP). Results of the sediment samples analyzed indicated the presence of lead in Sample SS-3 in concentrations above the RC S-1 criteria. As conditioned herein, the City of Peabody is required to determine if dredged sediments are suitable for reuse or required to be handled and disposed of at an offsite facility in accordance with all applicable regulations. If required, all materials will be limited to specific pre-approved disposal facilities. MassDEP is to be notified, in writing, of the name and location of the licensed facility accepting the dredged material for disposal or reuse as daily cover material.

Invasive Species

Invasive species will be managed in accordance with an Invasive Plant Management Strategy (IPMS) to be approved by MassDEP.

Based on a review of information provided by the applicant, MassDEP finds that this project complies with the standards described under 314 CMR 9.06 and 9.07. Public notice was provided in the Peabody Weekly News on May 23, 2024, and in the MEPA Environmental Monitor on June 7, 2024. No comment letters were received during the public comment period.

Therefore, based on information currently in the record, MassDEP grants a WQC for this project subject to the following conditions to maintain water quality, to minimize impact on waters and wetlands, and to ensure compliance with appropriate state law. The Department further certifies in accordance with 314 CMR 9.00 that there is reasonable assurance the project or activity will be conducted in a manner

which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law. Finally, the Department has determined that upon satisfying the conditions and mitigation requirements of this approval, the project provides a level of water quality necessary to protect existing uses and accordingly finds that the project to be implemented satisfies the Surface Water Quality Standards at 314 CMR 4.00.

Pursuant to 314 CMR 9.09(1)(d); 314 CMR 9.06(6)(a); 310 CMR 9.06(2); 314 CMR 9.07; 314 CMR 9.07(1); 314 CMR 9.09(7)(5)(c); 314 CMR 9.11; and 314 CMR 9.09(1)(e), the following Special Conditions are necessary to ensure that construction practices and stormwater controls are implemented in such a manner as to prevent degradation to wetlands and waters; ensure that practicable steps have been taken which will avoid and minimize impacts to wetlands and waters; minimize turbidity and sediment caused by construction activities; ensure that water quality is not degraded, and that biology of the waters are not negatively impacted by potential discharges; and/or maintain a record of the dredged material for reference and to ensure accountability in its transportation.

Those Special Conditions that require direct submittals to MassDEP for either review, or review and approval, are denoted by the following notation (Submittal) at the end of the condition and are summarized in Attachment A. In addition, those conditions with the (Submittal) designation shall be included in the Special Provisions and, as applicable, reviewed at the Pre-Construction Meeting.

1. All work shall be performed in accordance with the following documents and plans:

    - Application for Water Quality Certification. Prepared by Green International Affiliates, Inc. on behalf of the City of Peabody, with cover letter and attachments. Dated May 15, 2024. 401 WQC Filing Number: 24-WW26-0034-APP.
    - Plans entitled: “Massachusetts Department of Transportation Highway Division Plan and Profile of Independence Greenway Extension Bridge P-03-020 (CAK) in the City of Peabody, Essex County. PS&E Submittal.” Last revised April 19, 2024.
    - MassDEP Administrative Completeness and Technical Deficiency Review. 401 WQC Transmittal No: 24-WW26-0034-APP (Fill and Dredge). Dated June 5, 2024.
    - Response to MassDEP Administrative Completeness and Technical Deficiency Review letter for 401 WQC Transmittal No: 24-WW26-0034-APP, including attachments. Prepared by Green International Affiliates, Inc. on behalf of the City of Peabody. Dated June 11, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Expanded Environmental Notification Form and Proposed Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated January 29, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Draft Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated May 24, 2024.
    - Certificate of the Secretary of Energy and Environmental Affairs on the Final Environmental Impact Report. Independence Greenway Extension. EEA Number 16778. Dated August 5, 2024.

- Order of Conditions issued by the Peabody Conservation Commission. MassDEP File #: 055-0939. Issued July 3, 2024.
- MassDEP Notice of Appeal. MassDEP File #055-0939. Issued July 15, 2024.

Pre-Construction

2. A qualified **Wetland Scientist** (WS) with a minimum of five years of relevant professional experience with wetland and stream replacement and restoration projects shall be employed to oversee all BVW and LUW replacement and restoration activities, including but not limited to grading, placement of substrate, seeding, vegetation plantings, and placement of wildlife habitat features. The name, contact information, and qualifications of the WS shall be provided to MassDEP for approval prior to the Pre-Construction Meeting required in Condition 4. The name and contact information of the approved WS shall be provided to the Peabody Conservation Commission prior to the start of work. **(Submittal)**

3. Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name and contact information of the Resident Engineer (RE) responsible for ensuring that all work complies with the conditions of this WQC. **(Submittal)**

4. A minimum of 21 days prior to the start of work, MassDOT shall contact MassDEP to schedule an onsite Pre-Construction Meeting to review the approved plans and terms and conditions of this WQC. The RE, the Construction Contractor (Contractor), the WS, and a representative from the MassDOT Environmental Section and/or the District Environmental Engineer shall attend the Pre-Construction Meeting.

5. MassDEP shall be copied on applicable submittals to the U.S. Army Corps of Engineers (USACE). These include but are not limited to: Self-Verification Notification Form (SVNF); Pre-Construction Notification (PCN); Work-Start Notification Form; Mitigation Work-Start Notification Form; and Compliance Certification Form. The Work-Start Notification Form shall be submitted at least 14 days before the anticipated start of work and the Compliance Certification Form shall be submitted within 30 days following the completion of the authorized work. **(Submittal)**

6. A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan (CP/PP) shall be developed and implemented as required by 314 CMR 9.06(6)(a)8. A minimum of 14 days prior to the start of work, the City of Peabody or its Contractor shall submit the CP/PP for review and approval. If the U.S. Environmental Protection Agency (EPA) Construction General Permit (CGP) applies, the Stormwater Pollution Prevention Plan (SWPPP) may serve as the CP/PP, providing it includes the measures required to be in the CP/PP per these Special Conditions, in addition to the measures specifically required by the CGP. Any subsequent changes to the Final CP/PP (defined herein as including the construction period SWPPP if applicable) must be approved by MassDEP. **(Submittal)**

7. Training regarding erosion and sedimentation controls is required. The RE, CP/PP Inspector, and any other relevant personnel responsible for erosion and sedimentation controls shall complete the EPA CGP Inspector Training, or other training that meets the CGP requirements, as well as

complete a comprehensive review of the Final CP/PP. Verification of proof of completion of the training shall be submitted to MassDEP prior to the start of work. **(Submittal)**

8. The CP/PP shall identify, but shall not be limited to, staging and laydown areas in relation to BVWs and LUW, proposed dewatering locations, proposed stockpile locations and their proximity to catch basins or other drainage conveyances that discharge to wetland resource areas, and the location of construction-period erosion and sedimentation controls.

9. A minimum of 14 days prior to the start of work, the City of Peabody or its Contractor shall submit a Water Management Plan for review and approval. The Plan shall include proposed methods to manage construction-period water including but not limited to dewatering methods and locations, specifications for any water bypass systems, and dredge and debris material dewatering prior to shipment off site, as applicable. The plan shall meet requirements of the CP/PP and be specific to the Project. Dewatering and water bypasses shall be conducted under the supervision of the RE and comply with the applicable conditions identified herein. **(Submittal)**

10. Prior to the start of work, approved erosion and sedimentation control measures shall be installed per the approved CP/PP and as applicable, the manufacturer specifications. Erosion and sedimentation control measures may consist of, but are not limited to, silt fence, staked straw bales, silt/turbidity curtains, compost filter tubes, etc.

11. Prior to the Pre-Construction Meeting, the boundaries of BVWs and LUW shall be re-flagged where they are within 50 feet of the limits of work. In the event BVWs and LUW boundaries overlap, the outermost boundary (i.e., closest to the proposed work) shall be flagged. All boundary markers, once in place, shall remain in place throughout construction until all disturbed surfaces have been permanently stabilized. Boundary markers shall be fully evaluated annually and refreshed where needed. Implementation of and compliance with this requirement shall be documented by the WS. All construction personnel shall be made aware of these markers.

12. A Flood Contingency Plan shall be submitted to MassDEP for review and approval that addresses areas that fall within the 1% annual chance of flooding zone within project limits. The Plan shall address the potential need for temporary relocation of construction and auxiliary equipment during flood events to designated upland locations above the Base Flood Elevation. The Plan shall be approved by MassDEP prior to any work within the 1% annual chance of flooding zone, including mobilization or storage of equipment and materials. **(Submittal)**

13. The applicant shall develop an Invasive Plant Management Strategy (IPMS) to be submitted to MassDEP for review and approval prior to the Pre-Construction Meeting. The IPMS shall be implemented as approved. **(Submittal)**

14. If needed, use of herbicides to control invasive species shall be implemented in accordance with the approved IPMS and with the following requirements:

    a. Herbicides can only be applied by a Licensed Applicator;

b. Applicant must provide MassDEP Material Safety Data Sheets (MSDS) of the product being used and must also keep MSDS sheets on site;

c. Product registration in MA with Massachusetts Pesticide Product Registration Number must be confirmed with Massachusetts Department of Agricultural Resources Pesticide Division;

d. EPA Registration Number for the product must be identified;

e. Product label restricted use provisions must be followed; and

f. Applicant must contact MassDEP Division of Watershed Planning to determine if a BRP WM 04 herbicide permit is required.

15. Final Construction Plans (the plans provided to the Contractor) shall be submitted for review at least 30 days prior to the Pre-Construction Meeting. Sufficient supporting information, explanation, and documentation shall be provided to MassDEP and the Peabody Conservation Commission for any changes, and MassDEP may at its discretion require additional supporting documentation as a condition of review. Once MassDEP provides written approval, the updated set of plans shall become the "Final Plan of Record." The Plan shall be prepared and signed by a Professional Engineer in the Commonwealth of Massachusetts and shall incorporate all revisions and additions to the original plans that have been approved as discussed herein. **(Submittal)**

Construction Period

16. No more than **2,344 sf** of permanent and **4,681 sf** of temporary impacts to BVWs shall occur. No more than **8,661 sf** of permanent and **2,312 sf** of temporary impacts to LUW shall occur. No more than **1,491 cy** of dredging in LUW shall occur. All work shall avoid unapproved impacts to BVW and LUW.

17. CP/PP inspections shall occur at least once every seven calendar days and within 24 hours of a storm event that produces 0.5 inches or more of rain within a 24-hour period, or at a more stringent frequency if the CP/PP requires.

18. Copies of CP/PP Inspection and Maintenance Log Forms shall be submitted to MassDEP within 14 days upon request.

19. Inspection and maintenance of erosion and sediment controls in active work areas shall be the responsibility of both the Contractor and RE. The project team shall include an individual with at least three years of experience with construction period erosion and sedimentation controls. The RE shall be ultimately responsible for inspection and maintenance of site controls. The RE and/or Contractor shall immediately notify MassDEP and the Peabody Conservation Commission if any unauthorized discharges to BVWs or LUW occur.

20. Disturbed areas shall be stabilized immediately after activities have permanently ceased or will be temporarily inactive for 14 or more calendar days. The installation of stabilization measures

shall be implemented as soon as practicable, but no later than 14 calendar days after stabilization has been initiated.

21. Work within LUW shall be conducted in low or no-flow conditions to the extent practicable. Notice shall be provided to MassDEP and the Peabody Conservation Commission within 24 hours prior to the commencement of dewatering. Dewatering methods and location(s) shall be approved by the RE prior to use, and shall be documented in the CP/PP. There shall be no discharge of untreated dewatered stormwater or groundwater to BVWs or LUW. Any discharges shall be visibly free of sediment.

22. Additional erosion and sedimentation control materials shall be stored on-site at all times for emergency and routine replacement. Materials shall be kept covered, dry, and accessible at all times. The RE shall be responsible for anticipating the need for and installation of additional erosion and sedimentation controls and shall have the authority to require additional erosion control measures to protect wetland resource areas beyond what is shown on the plans if field conditions or professional judgment dictate that additional protection is necessary.

23. The RE shall monitor the National Weather Service forecast for updates, and upon issuance of a flood watch for the 1% annual chance of flooding zone, shall implement the flood contingency plan referenced in Condition 12.

24. Any storm drains with potential to receive discharge from stockpiled materials or construction operations shall be managed to inhibit the inflow of sediment while not increasing the likelihood of roadway flooding during periods of precipitation. Stockpiles shall be located no less than 50 feet from BVWs, LUW, catch basins, or other drainage conveyances that discharge to BVWs or LUW. The CP/PP shall specify measures to implement this. Filter fabric stretched under storm drain inlet grates are not acceptable for this purpose.

25. The contractor shall have designated washout areas for concrete equipment that will be comprised of impermeable material and sized to contain project concrete wastes and wash water. Concrete wash out areas shall be located no less than 50 feet from BVWs, LUW, and catch basins or other drainage conveyances that discharge directly or indirectly to BVWs, or LUW.

26. Refueling, washing, and cleaning of vehicles and other construction equipment shall not take place within 50 feet of BVWs or LUW and any wash water shall be contained such that it does not drain toward BVWs or LUW. MassDEP shall explicitly approve in writing any deviation to this condition for oversized stationary vehicles.

27. The contractor shall have spill containment kits on site. In the event of a release of fuels and/or oils, the local fire department and MassDEP shall be notified.

28. Construction vehicles or other vehicles or heavy equipment are prohibited from traversing over the proposed infiltration Stormwater Control Measures (SCMs) to avoid compaction of soils during construction. These areas shall be demarcated by silt fence with signage, or high visibility fencing. If access through the location of an infiltration SCM is unavoidable, the City of Peabody

or its Contractor shall request written approval from MassDEP to use low ground pressure equipment to complete the work. Following completion of the work, subsoils shall be tilled to a minimum depth of 18 inches prior to placement of final surface dressing materials required by the approved plans. Tilling shall only be conducted when the subsoils are in a friable condition and dry enough so that a clump cannot be formed into a ball shape by hand. No vehicles or heavy equipment shall be permitted within the infiltration SCM following placement of the final materials without written approval from MassDEP. Proposed infiltration SCMs shall remain offline until final stabilization is achieved, unless written approval is obtained from MassDEP.

29. If sheet piles are required, they shall be fully removed from wetland resource areas upon stabilization of the area as required. No portion of sheet piles shall remain unless approved by MassDEP in writing prior to installation. A request to leave sheet piles shall include, but not be limited to, demonstration that full removal of the sheet piles is not feasible or practicable, and an alternatives analysis demonstrating alternative methods to isolate the work area(s) are not feasible or practicable.

Dredging

30. No later than 21 days prior to commencement of dredging activity, a Dredged Material Dewatering Plan shall be submitted to MassDEP for review and approval. At a minimum, the Plan shall include but not be limited to the type of containment, method of dewatering (i.e. mechanical or by gravity), method of collecting the dewatered effluent and method of disposal. **(Submittal)**

31. All sediment management activities authorized by this WQC shall be conducted under the supervision of a Licensed Site Professional (LSP). Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name and contact information of the LSP. **(Submittal)**

32. A Health & Safety Plan shall be required for handling of sediment which has been characterized as exceeding MCP RCS-1 criteria. A copy shall be provided to MassDEP within six weeks of the effective of this WQC or two weeks prior to the commencement of the dredging operation, whichever comes first.

33. Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001-Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. MassDEP will review the data to determine if the sediment will require offsite disposal. Under no circumstances shall the material be transported until MassDEP has reviewed the data and approved disposal methods. **(Submittal)**

34. Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined and securely covered with wind tear resistance

tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down. Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted daily and more frequently immediately before, during and after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner.

35. In the event of a precipitation or storm event, the site shall be secured beforehand in such a way as to protect resource areas and waters on site and downstream of the site, including covering of stockpiles of dredged material. Sediment stockpile areas shall be inspected immediately prior to, during and immediately after all precipitation and storm events. Any observed deficiency shall be corrected or repaired in a timely manner to prevent discharge from the stockpiled material. If stormwater runoff and erosion is observed from stockpiled dredged material, additional erosion and/or damage prevention controls measures shall be implemented.

36. Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation.

37. Measures shall be in place to prevent turbid waters, due to dredging, demolition, or debris removal activities, from extending past the limits of work into Proctor Brook and its tributaries. These measures can be items such as turbidity curtains and/or sheet piles.

38. MassDEP shall be notified one week prior to the start of dredging so that staff may inspect the work for compliance throughout the project.

39. If visual turbidity escapes the controls in place, work shall stop immediately and MassDEP shall be notified within 24 hours. Work shall not resume until the issue is corrected and MassDEP to the satisfaction of MassDEP.

40. All turbidity controls shall be inspected daily by the RE. If any damage is observed the controls in place will be replaced or repaired immediately.

41. MassDEP shall be notified in writing of the name and location of the upland licensed facilities accepting the dredged material for disposal or reuse for review and approval. If the licensed facility is located out of state, documentation shall be provided to MassDEP that the dredged material disposal/reuse has been approved and will be accepted by the receiving state. The dredged material shall not be transported to the facility without concurrence of MassDEP.

42. Transportation and disposal of the dredged material shall be overseen by the LSP of record. A Bill-of-Lading (BOL) or a Material Shipping Record (MSR) shall be used to track the dredged material to the proposed intermediate (stockpiling /dewatering) facility. A fully executed copy of the BOL or MSR shall be provided to MassDEP within 30 days of final shipment to the reused location or facility.

43. BMPs shall be implemented during transportation of the dredged material to the licensed receiving facility. At a minimum, when transported upon public roadways, all dredged material shall have no free liquid as determined by the Paint Filter Test or other suitably analogous methodology acceptable to MassDEP, and a tarpaulin or other means shall be used to cover the dredged material during transport.

Wetland Mitigation

44. A minimum of 2,500 sf of wetland replication shall be completed in coordination with an approved WS. The WS shall oversee all BVW replication and restoration, including final grading, seeding, and planting. The WS shall confirm that constructed BVW replication and restoration areas have adequate soils and hydrology to promote wetland plant species prior to seeding and installation of plantings and shall recommend measures to amend soils and promote wetland hydrology as needed.

45. Planting and seeding shall not take place between November 15th and April 15th, except as allowed by MassDEP in writing. The WS shall inspect trees and shrubs to ensure they are healthy prior to planting. Trees and shrubs deemed unhealthy in the professional judgment of the WS shall be replaced. Plantings and seed mixes shall consist of native and non-invasive species. Species may be substituted at the recommendation of the WS, and review and approval by MassDEP.

46. At least 75% of the surface area of the BVW replication and restoration areas shall be vegetated with indigenous wetland plant species within two growing seasons, or the period required by the Section 404 permit, whichever is longer. Additionally, evidence of hydrology, including hydric soil formation shall be submitted at the same time. Annual monitoring reports shall be submitted by the WS no later than January 15th each year. Monitoring reports shall include an assessment based on the approved success criteria, representative photos, and recommended corrective actions as needed. **(Submittal)**

47. MassDEP reserves the right to determine the success or failure of the BVW replication and restoration areas, and reserves the right to require additional plantings, regrading, or other measures deemed necessary to promote success.

Stream Mitigation

48. The WS shall oversee all LUW replication and restoration. Placement of streambed materials shall take place in no- or low-flow conditions. The Water Management Plan required in Condition 9 shall include measures to create no-flow conditions for this work such as a pump bypass system or other dewatering method, if needed. Placement of streambed materials during greater than low-flow conditions shall require a placement plan, with a narrative describing turbidity control measures, submitted to MassDEP for review and approval.

49. Water shall be slowly introduced back into the restored and dewatered LUW work areas as to not cause erosion and sedimentation. This work shall be overseen by the WS.

50. MassDEP reserves the right to determine the success or failure of the LUW replication and restoration areas and reserves the right to require additional measures deemed necessary to promote success.

Post-Construction

51. All temporary erosion controls shall be removed at the conclusion of work once the surrounding area has achieved final stabilization.

General Conditions

52. Any proposed alterations, minor plan changes, or amendment requests, as well as any required submittals shall be sent by email for review and approval to heidi.davis@mass.gov and ryan.hale@mass.gov. **(Submittal)**

53. This WQC remains in effect for the same duration as the Section 404 permit that requires it.

54. No Special Condition set forth herein shall be construed or operate to prohibit MassDEP from taking enforcement against the City of Peabody or its contractors for any failure to comply with the terms and requirements of this WQC.

55. No activity authorized by this WQC may begin prior to expiration of the 21-day appeal period, or until a final decision is issued by MassDEP in the event of an appeal.

Failure to comply with this Certification is grounds for enforcement, including civil and criminal penalties, under MGL Ch. 21 §42, MGL Ch. 21A §16, or other possible actions/penalties as authorized by the General Laws of the Commonwealth.

This Certification does not relieve the applicant of the obligation to comply with other appropriate state or federal statutes or regulations.

NOTICE OF APPEAL RIGHTS

a.) Appeal Rights and Time Limits

Certain persons shall have a right to request an adjudicatory hearing concerning certifications by MassDEP when an application is required: (a) the applicant or property owner; (b) any person aggrieved by the decision who has submitted written comments during the public comment period; (c) any ten (10) persons of the Commonwealth pursuant to M.G.L. c.30A where a group member has submitted written comments during the public comment period; or (d) any governmental body or private organization with a mandate to protect the environment which has submitted written comments during the public comment period. Any person aggrieved, any ten (10) persons of the Commonwealth, or a governmental body or private organization with a mandate to protect the environment may appeal without having submitted written comments during the public comment period only when the claim is based on new substantive issues arising from material changes to the scope or impact of the activity and not apparent at the time of public notice. To request an adjudicatory hearing pursuant to M.G.L. c.30A, § 10, a Notice of Claim must be made in writing, provided that the request is made by certified mail or

hand delivery to MassDEP, with the appropriate filing fee specified within 310 CMR 4.10 along with a DEP Fee Transmittal Form within twenty-one (21) days from the date of issuance of this Certificate, and addressed to:

Case Administrator
Department of Environmental Protection
100 Cambridge Street, 9th Floor
Boston, MA 02114

A copy of the request shall at the same time be sent by certified mail or hand delivery to the Department of Environmental Protection at:

Department of Environmental Protection
Commissioner's Office
100 Cambridge Street, Suite 900
Boston, MA 02114

b.) Contents of Hearing Request

A Notice of Claim for Adjudicatory Hearing shall comply with MassDEP's Rules for Adjudicatory Proceedings, 310 CMR 1.01(6), and shall contain the following information pursuant to 314 CMR 9.10(3):

3. the 401 Certification Transmittal Number;
4. the complete name of the applicant and address of the project;
5. the complete name, address, and fax and telephone numbers of the party filing the request, and, if represented by counsel or other representative, the name, fax and telephone numbers, and address of the attorney;
6. if claiming to be a party aggrieved, the specific facts that demonstrate that the party satisfies the definition of "aggrieved person" found at 314 CMR 9.02;
7. a clear and concise statement that an adjudicatory hearing is being requested;
8. a clear and concise statement of (1) the facts which are grounds for the proceedings, (2) the objections to this Certificate, including specifically the manner in which it is alleged to be inconsistent with the MassDEP's Water Quality Regulations, 314 CMR 9.00, and (3) the relief sought through the adjudicatory hearing, including specifically the changes desired in the final written Certification; and
9. a statement that a copy of the request has been sent by certified mail or hand delivery to the applicant, the owner (if different from the applicant), the conservation commission of the city or town where the activity will occur, the Department of Conservation and Recreation (when the certificate concerns projects in Areas of Critical Environmental Concern), the public or private water supplier where the project is located (when the certificate concerns projects in Outstanding Resource Waters), and any other entity with responsibility for the resource where the project is located.

c.) Filing Fee and Address

The hearing request along with a DEP Fee Transmittal Form and a valid check or money order payable to the Commonwealth of Massachusetts in the amount of one hundred dollars ($100) must be mailed to:

Commonwealth of Massachusetts
Department of Environmental Protection
Commonwealth Master Lockbox
PO Box 4062
Boston, MA 02211

The request will be dismissed if the filing fee is not paid, unless the appellant is exempt or granted a waiver. The filing fee is not required if the appellant is a city or town (or municipal agency), county, or district of the Commonwealth of Massachusetts, or a municipal housing authority. MassDEP may waive the adjudicatory hearing filing fee pursuant to 310 CMR 4.06(2) for a person who shows that paying the fee will create an undue financial hardship. A person seeking a waiver must file an affidavit setting forth the facts believed to support the claim of undue financial hardship together with the hearing request as provided above.

Should you have any questions relative to this permit, please contact myself or Ryan Hale at heidi.davis@mass.gov and ryan.hale@mass.gov.

Very truly yours,

RE: **AMENDED** 401 WATER QUALITY CERTIFICATION
BRP WW 10, Major Fill Project
BRP WW 08, Minor Dredge Project
Independence Greenway Extension
Peabody, MA

401 WQC Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge)
USACE Application No. NAE-2024-01390
MassDOT File Number: 609211

Dear Mr. Callahan:

On August 5, 2024, the Massachusetts Department of Environmental Protection (MassDEP) issued a Water Quality Certification (WQC) to the City of Peabody (the City) for extension of the existing Independence Greenway rail trail from Essex Center Drive to Endicott Street along an existing former railroad right-of-way owned and maintained by the City (the Project). The Project includes construction of a paved shared-use pathway along the existing abandoned railroad right-of-way; construction of a light duty timber boardwalk structure supported on helical piles over Proctor Brook and associated wetlands; replacement of culverts that convey Proctor Brook and its tributaries beneath the railroad bed; stormwater infrastructure improvements; construction of a compensatory flood storage area; and modifications required for connections to the existing paths at either end including sidewalk reconstruction and drainage improvements. The WQC contained 55 conditions and addressed impacts to Bordering Vegetated Wetlands and Land Under Water. On March 19, 2025, Green International Affiliates, Inc., submitted a request on behalf of the City to amend Conditions 31, 32, 33, 34, 36, and 43 of the WQC.

The City requested that Condition 31 be revised to better define sediment management activities to be conducted under the supervision of a Licensed Site Professional (LSP). MassDEP is amenable to revising Condition 31 to specify that the handling of contaminated sediment exceeding MCP RCS-1 criteria shall be conducted under the direction of an LSP.

This information is available in alternate format. Please contact MassDEP at 617-292-5500.
TTY# MassRelay Service 1-800-439-2370
MassDEP Website: www.mass.gov/dep

Printed on Recycled Paper

The City requested that Condition 32 be revised to clarify that the Environmental Health and Safety Plan to be prepared by the Contractor will be adequate and that a separate plan specifically for sediment management will not be required. The City also requested confirmation that the plan needs to be submitted for MassDEP records only and flexibility in the submission deadline. MassDEP agrees a separate plan specifically for sediment management is not required so long as the Environmental Health and Safety Plan includes provisions to protect workers from any exposure to known/suspected contaminants. MassDEP hereby confirms the plan needs to be submitted for record keeping purposes only. However, the requirement to submit the Environmental Health and Safety Plan within two weeks prior to the commencement of the dredging operation will remain in the condition.

The City requested that Condition 33 be revised to require MassDEP to review sediment sampling test results within seven days of receipt. MassDEP is amenable to reviewing sediment sampling test results within 10 calendar days of receipt. The City also requested clarification as to what "determining whether the material requires offsite disposal" means in the condition. To clarify, the approved LSP will be required to review the sediment sampling test results to determine if the sediment exceeds the MCP RCS-1 criteria and requires disposal at an out-of-state facility.

The requested revisions to Condition 34 relate to dredged material stockpile management; specifically, the requirement to bottom line stockpiles on paved surfaces, place them at least 10 feet away from temporary construction roads, and inspect and correct deficiencies during and after storm events. MassDEP is amenable to removing the requirement to bottom line stockpiles so long as they are on paved surfaces and properly secured, and also removing the requirement to place stockpiles at least 10 feet from temporary construction roads so long as a DEP-approved barrier is provided. Inspection of stockpiles shall still occur daily, but MassDEP understands the safety concerns associated with inspection and correcting deficiencies during storm events, especially severe weather. As such, inspections will be required within 24 hours of a storm event that produces 0.5 inches or more of rain within a 24-hour period. Deficiencies shall be corrected in accordance with the timelines specified in the approved Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan (CP/PP).

The City requested that Condition 36 be revised to explicitly allow for stockpiles of sediment exceeding the RCS-1 criteria to be stored onsite longer than 90 days in extenuating circumstances. MassDEP is amenable to extensions of this deadline to accommodate unforeseen delays subject to MassDEP approval.

The conditions of this amended WQC will serve as a replacement to Conditions 31, 32, 33, 34, and 36.

MassDEP declines to revise Condition 43 by replacing the requirement to use the Paint Filter Test with visual observation as the means to ensure dredged material shall have no free liquid during transport as MassDEP does not believe that visual observation is an analogous methodology as required by 314 CMR 9.07(5)(a).

In accordance with the provisions of MGL c. 21, s. 26-53 and Section 401 of the Federal Clean Water Act as amended (33 U.S.C. s. 1251 et seq.), MassDEP has reviewed this project change request and has

determined that there is reasonable assurance that the project change will not violate applicable water quality standards. MassDEP hereby approves of the above-mentioned project changes and amends the WQC dated August 5, 2024, by referencing the following documents and subject to the following Special Conditions:

Reference Documents:

1) 401 Water Quality Certification. Independence Greenway Extension. 401 WQC Filing Number: 24-WW26-0034-APP (Combined Fill/Dredge). Issued August 5, 2024.

2) 401 Water Quality Certification Amendment Request. Independence Greenway Extension, Peabody, MA. MassDOT Project #609211. Prepared by Green International Affiliates, Inc. Dated March 19, 2025.

Revised Special Conditions

31. All handling of contaminated sediment exceeding MCP RCS-1 criteria and authorized by this WQC shall be conducted under the direction of a Licensed Site Professional (LSP). Prior to the Pre-Construction Meeting required in Condition 4, the applicant shall provide MassDEP with the name, qualifications, and contact information of the LSP. **(Submittal)**

32. An Environmental Health & Safety Plan shall be required for the protection of workers from any exposure to known/suspected contaminants present in environmental media (including sediment which has been characterized as exceeding MCP RCS-1 criteria). A copy shall be provided to MassDEP within two weeks prior to the commencement of the dredging operation. **(Submittal)**

33. Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001-Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. The approved LSP required by Condition 31 will review the data to determine if the sediment exceeds these criteria and requires disposal at an out-of-state facility within ten calendar days. The data and LSP determination shall be submitted to MassDEP prior to transportation of this material. **(Submittal)**

34. Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined if not placed on paved surfaces and securely covered with wind tear resistance tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down.

Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls; if the 10-foot setback cannot be met, then a MassDEP-approved barrier shall be provided. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted daily and within 24 hours of a storm that produces 0.5 inches or more of rain. Any observed deficiency shall be corrected or repaired in a timely manner. Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation. Extensions may be requested to accommodate unforeseen delays subject to MassDEP approval.

36. Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation. Extensions may be requested to accommodate unforeseen delays subject to MassDEP approval.

All other WQC Special Condition remain in effect as applicable.

Should you have any questions relative to this permit, please contact me at heidi.davis@mass.gov or Ryan Hale at ryan.hale@mass.gov.

Very truly yours,

Failure to comply with this amended certification is grounds for enforcement, including civil and criminal penalties, under MGL Ch. 21 §42, MGL Ch. 21A §16, or other possible actions/penalties as authorized by the General Laws of the Commonwealth.

This amended certification does not relieve the applicant of the obligation to comply with other appropriate state or federal statutes or regulations.

NOTICE OF APPEAL RIGHTS

A) Appeal Rights and Time Limits

Certain persons shall have a right to request an adjudicatory hearing concerning certifications by MassDEP when an application is required: (a) the applicant or property owner; (b) any person aggrieved by the decision who has submitted written comments during the public comment period; (c) any ten (10) persons of the Commonwealth pursuant to M.G.L. c.30A where a group member has submitted written comments during the public comment period; or (d) any governmental body or private organization with a mandate to protect the environment which has submitted written comments during the public comment period. Any person aggrieved, any ten (10) persons of the Commonwealth, or a governmental body or private organization with a mandate to protect the environment may appeal without having submitted written comments during the public comment period only when the claim is based on new substantive issues arising from material changes to the scope or impact of the activity and not apparent at the time of public notice. To request an adjudicatory hearing pursuant to M.G.L. c.30A, § 10, a Notice of Claim must be made in writing, provided that the request is made by certified mail or hand delivery to MassDEP, with the appropriate filing fee specified within 310 CMR 4.10 along with a DEP Fee Transmittal Form within twenty-one (21) days from the date of issuance of this Certificate, and addressed to:

Case Administrator
Department of Environmental Protection
100 Cambridge Street, Suite 900
Boston, MA 02108

A copy of the request shall at the same time be sent by certified mail or hand delivery to the Department of Environmental Protection at:

Department of Environmental Protection
Commissioner's Office
100 Cambridge Street, Suite 900
Boston, MA 02108

B) Contents of Hearing Request

A Notice of Claim for Adjudicatory Hearing shall comply with MassDEP's Rules for Adjudicatory Proceedings, 310 CMR 1.01(6), and shall contain the following information pursuant to 314 CMR 9.10(3):

a.) the 401 Certification Transmittal Number;
b.) the complete name of the applicant and address of the project;
c.) the complete name, address, and fax and telephone numbers of the party filing the request, and, if represented by counsel or other representative, the name, fax and telephone numbers, and address of the attorney;
d.) if claiming to be a party aggrieved, the specific facts that demonstrate that the party satisfies the definition of "aggrieved person" found at 314 CMR 9.02;
e.) a clear and concise statement that an adjudicatory hearing is being requested;

f.) a clear and concise statement of (1) the facts which are grounds for the proceedings, (2) the objections to this Certificate, including specifically the manner in which it is alleged to be inconsistent with the MassDEP's Water Quality Regulations, 314 CMR 9.00, and (3) the relief sought through the adjudicatory hearing, including specifically the changes desired in the final written Certification; and

g.) a statement that a copy of the request has been sent by certified mail or hand delivery to the applicant, the owner (if different from the applicant), the conservation commission of the city or town where the activity will occur, the Department of Environmental Management (when the certificate concerns projects in Areas of Critical Environmental Concern), the public or private water supplier where the project is located (when the certificate concerns projects in Outstanding Resource Waters), and any other entity with responsibility for the resource where the project is located.

C) Filing Fee and Address

The hearing request along with a DEP Fee Transmittal Form and a valid check or money order payable to the Commonwealth of Massachusetts in the amount of one hundred dollars ($100) must be mailed to:

Commonwealth of Massachusetts
Department of Environmental Protection
Commonwealth Master Lockbox
PO Box 4062
Boston, MA 02211

The request will be dismissed if the filing fee is not paid unless the appellant is exempt or granted a waiver. The filing fee is not required if the appellant is a city or town (or municipal agency), county, or district of the Commonwealth of Massachusetts, or a municipal housing authority. MassDEP may waive the adjudicatory hearing filing fee pursuant to 310 CMR 4.06(2) for a person who shows that paying the fee will create an undue financial hardship. A person seeking a waiver must file an affidavit setting forth the facts believed to support the claim of undue financial hardship together with the hearing request as provided above.

Subject: Consistency letter for the '609211-PEABODY- INDEPENDENCE GREENWAY EXTENSION' project under the amended February 5, 2018, FHWA, FRA, FTA Programmatic Biological Opinion (dated March 23, 2023) for Transportation Projects within the Range of the Indiana Bat and Northern Long-eared Bat (NLEB).

To whom it may concern:

The U.S. Fish and Wildlife Service (Service) has received your request dated June 21, 2023 to verify that the **609211-PEABODY- INDEPENDENCE GREENWAY EXTENSION** (Proposed Action) may rely on the amended February 5, 2018, FHWA, FRA, FTA Programmatic Biological Opinion Opinion (dated March 23, 2023) for Transportation Projects within the Range of the Indiana Bat and Northern Long-eared Bat (PBO) to satisfy requirements under section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (87 Stat.884, as amended; 16 U.S.C. 1531 *et seq.*).

Based on the information you provided (Project Description shown below), you have determined that the Proposed Action will have no effect on the endangered Indiana bat (*Myotis sodalis*) or the endangered northern long-eared bat (*Myotis septentrionalis*). If the Proposed Action is not modified, **no consultation is required for these two species.** If the Proposed Action is modified, or new information reveals that it may affect the Indiana bat and/or northern long-eared bat in a manner or to an extent not considered in the PBO, further review to conclude the requirements of ESA section 7(a)(2) may be required.

For Proposed Actions that include bridge/culvert or structure removal, replacement, and/or maintenance activities: If your initial bridge/culvert or structure assessments failed to detect Indiana bats and/or NLEB use or occupancy, yet later detected prior to, or during construction, please submit the Post Assessment Discovery of Bats at Bridge/Culvert or Structure Form (User Guide Appendix E) to this Service Office within 2 working days of the incident. In these instances, potential incidental take of Indiana bats and/or NLEBs may be exempted provided that the take is reported to the Service.

If the Proposed Action may affect any other federally-listed or proposed species and/or designated critical habitat, additional consultation between the lead Federal action agency and this Service Office is required. If the proposed action has the potential to take bald or golden eagles, additional coordination with the Service under the Bald and Golden Eagle Protection Act may also be required. In either of these circumstances, please advise the lead Federal action agency accordingly.

The following species may occur in your project area and **are not** covered by this determination:

- Monarch Butterfly *Danaus plexippus* Candidate

PROJECT DESCRIPTION

The following project name and description was collected in IPaC as part of the endangered species review process.

NAME

609211-PEABODY- INDEPENDENCE GREENWAY EXTENSION

DESCRIPTION

609211-PEABODY- INDEPENDENCE GREENWAY EXTENSION

The proposed Independence Greenway Extension is intended to continue the existing Greenway further eastwards from its present eastern terminus at the North Shore Mall to the Warren Street Extension/Endicott Street intersection in central Peabody. This will extend the Greenway by 7000 feet (1.3 miles). The Greenway Extension will mostly be constructed on an abandoned Boston and Maine Railroad right-of-way along Proctor Brook. The only location where there will be an at-grade crossing of a public road is on the North Shore Road, either at its intersection with the North Shore Mall Driveway, or at the former railroad right-of-way across the road. The existing driveway/North Shore Road intersection signal will be adjusted to accommodate bicycle/pedestrian crossings. The proposed path will provide a 10’- 0” wide two-lane two-way bikeway with 2’- 0” wide shoulders on each side. Where the proposed Greenway Extension runs along Proctor Brook, the waterway’s meandering course crosses under the former track centerline at three locations. New concrete box culverts will be installed at two of these locations, while at bridge crossing for the trail will be needed at the easternmost brook crossing near the City powerplant facility. The bridge will be approximately 80 feet long and will carry a 10’- 0” wide two lane two-way bikeway with 1’- 0” wide shoulders on each side. All stream crossings will meet the Massachusetts Stream Crossing Standards to the best extent practicable.

Monarch Butterfly: Candidate Species only, no conservation measures at this time.

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@42.5341401,-70.94305632766583,14z

DETERMINATION KEY RESULT

Based on the information you provided, you have determined that the Proposed Action will have no effect on the endangered Indiana bat and/or the endangered northern long-eared bat. Therefore, no consultation with the U.S. Fish and Wildlife Service pursuant to Section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended 16 U.S.C. 1531 *et seq.*) is required for these two species.

QUALIFICATION INTERVIEW

1. Is the project within the range of the Indiana bat[1]?

   [1] See Indiana bat species profile

   Automatically answered
   No

2. Is the project within the range of the northern long-eared bat[1]?

   [1] See northern long-eared bat species profile

   Automatically answered
   Yes

3. [Semantic] Does your proposed action intersect an area where Indiana bats and northern long-eared bats are not likely to occur?

   Automatically answered
   Yes

DETERMINATION KEY DESCRIPTION: FHWA, FRA, FTA PROGRAMMATIC CONSULTATION FOR TRANSPORTATION PROJECTS AFFECTING NLEB OR INDIANA BAT

This key was last updated in IPaC on June 14, 2023. Keys are subject to periodic revision.

This decision key is intended for projects/activities funded or authorized by the Federal Highway Administration (FHWA), Federal Railroad Administration (FRA), and/or Federal Transit Administration (FTA), which may require consultation with the U.S. Fish and Wildlife Service (Service) under Section 7 of the Endangered Species Act (ESA) for the endangered **Indiana bat** (*Myotis sodalis*) and the endangered **northern long-eared bat** (NLEB) (*Myotis septentrionalis*).

This decision key should only be used to verify project applicability with the Service's amended February 5, 2018, FHWA, FRA, FTA Programmatic Biological Opinion (dated March 23, 2023) for Transportation Projects. The programmatic biological opinion covers limited transportation activities that may affect either bat species, and addresses situations that are both likely and not likely to adversely affect either bat species. This decision key will assist in identifying the effect of a specific project/activity and applicability of the programmatic consultation. The programmatic biological opinion is not intended to cover all types of transportation actions. Activities outside the scope of the programmatic biological opinion, or that may affect ESA-listed species other than the Indiana bat or NLEB, or any designated critical habitat, may require additional ESA Section 7 consultation.

Subject: **Independence Greenway Extension**
Peabody, MA
MassDOT File No. 609211
Notice of Intent Submittal

Dear Ms. DelNegro:

On behalf of the City of Peabody, with construction funding from the Massachusetts Department of Transportation (MassDOT) Highway Division, Green International Affiliates, Inc. is pleased to submit the enclosed Notice of Intent (NOI) to the Peabody Conservation Commission pursuant to the Massachusetts Wetlands Protection Act (WPA) and 310 CMR 10.00, which is administered by the Peabody Conservation Commission. This NOI Application has been prepared for the Independence Greenway Extension transportation improvement project in the City of Peabody.

This Notice of Intent (NOI) is being submitted to the Peabody Conservation Commission pursuant to the Massachusetts Wetlands Protection Act (WPA) Regulations and its implementing regulations 310 CMR 10.00 for work within the Bordering Vegetated Wetland (BVW), the Land Under Water (LUW), the 100-foot Buffer Zone, the Bordering Land Subject to Flooding (BLSF), Bank, and within the Riverfront Area and pursuant to the City of Peabody local Wetlands and Rivers Protection Regulations.

The proposed project activities associated with the proposed work taking place within WPA jurisdiction will occur within BLSF to Proctor Brook, which flows along the project corridor and has various 100-year flood elevations which drop from 47.1 feet near the western project limit to 39.6 feet at the eastern project limit (NAVD 88).

In addition to the WPA buffers, the Peabody Local Wetlands Bylaw also regulates a “No Disturb Zone” in which the Commission may require that the applicant maintain a strip or buffer of continuous, undisturbed vegetative cover within 200 feet of resource areas defined in Sec. 32-2 Definitions Resource Area (I), and within 100 feet of resource areas defined in Sec. 32-2 Definitions Resource Area (A-H). However, since this project is a public project proposed by the City of Peabody, which also includes replacement of water dependent structures, it falls under the circumstances where limited wetland alteration necessary to accomplish the goals of the project may be permitted under the provisions of

Section 32-36 of the local ordinance. Section 8.1 of this Application demonstrates that acceptable mitigation has been provided to foster the values and interests protected by this ordinance.

The NOI is being submitted for the purpose of receiving an Order of Conditions under the Massachusetts WPA for the proposed work within these resource areas. The project can be categorized as a "Redevelopment" project under the Massachusetts Stormwater Management Standards and meets the Stormwater Standards to the maximum extent practicable.

A majority of the proposed project falls under the following Limited Project Provisions listed under 310 CMR 10.53, which are also depicted on Figure 2 in Appendix C:

- 310 CMR 10.53(6)*: the construction, rehabilitation, and maintenance of footpaths, bike paths, and other pedestrian or nonmotorized vehicle access to or along riverfront areas but outside other resource area.*
- 310 CMR 10.53(3)(i): *The maintenance, repair and improvement (but not substantial enlargement except when necessary to meet the Massachusetts Stream Crossing Standards) of structures, including dams and reservoirs and appurtenant works to such dams and reservoirs, buildings, piers, towers, headwalls, bridges, and culverts.*
- 310 CMR 10.53(3)(j): *The construction and maintenance of catwalks, footbridges, wharves, docks, piers, boathouses, boat shelters, duck blinds, skeet and trap shooting decks and observation decks; provided, however, that such structures are constructed on pilings or posts so as to permit the reasonably unobstructed flowage of water and adequate light to maintain vegetation.*
- 310 CMR 10.53(3)(f): *Maintenance and improvement of existing public roadways, but limited to widening less than a single lane, adding shoulders, correcting substandard intersections, and improving inadequate drainage systems.*

The proposed project will result in permanent and temporary impacts to Bordering Vegetated Wetlands (BVW), Land Under Water Bodies and Waterways (LUW), Bank, Bordering Land Subject to Flooding (BLSF), Riverfront Area, and the 100-foot Buffer Zone. These impacts to resources areas will be mitigated through the construction of a wetland replication area, wetland restoration, a compensatory flood storage area, and removal of invasive species to restore degraded Riverfront area.

Enclosed are the following items included with this submission:

- 2 hard copies of the NOI Report (includes Stormwater Report)
- 2 full size (24x36) plan set of NOI drawings

An electronic copy of this submittal is also being sent to Lucia.DelNegro@peabody-ma.gov.

As required by regulation, one (1) copy of the above submittal is being provided concurrently to the MassDEP Northeast Regional Office located at 150 Presidential Way, Woburn, MA 01801.

We respectfully request that this project be placed on the Conservation Commission agenda for the hearing scheduled on May 8, 2024. Should you have any questions regarding this submittal, please do not hesitate to contact me.

Very Truly Yours,
Green International Affiliates, Inc.

A. General Information (continued)

6. General Project Description:

The project proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, MA for a total project length of approximately 1.3 miles. The proposed project is located along the former railroad right-of-way, which is owned and maintained by the City of Peabody. (see Project Narrative for more details).

7a. Project Type Checklist: (Limited Project Types see Section A. 7b.)

1. ☐ Single Family Home
2. ☐ Residential Subdivision
3. ☐ Commercial/Industrial
4. ☐ Dock/Pier
5. ☐ Utilities
6. ☐ Coastal engineering Structure
7. ☐ Agriculture (e.g., cranberries, forestry)
8. ☒ Transportation
9. ☐ Other

7b. Is any portion of the proposed activity eligible to be treated as a limited project (including Ecological Restoration Limited Project) subject to 310 CMR 10.24 (coastal) or 310 CMR 10.53 (inland)?

1. ☒ Yes ☐ No If yes, describe which limited project applies to this project. (See 310 CMR 10.24 and 10.53 for a complete list and description of limited project types)

310 CMR 10.52 (6), 310 CMR 10.53(3)(i), and 310 CMR 10.53(3)(f)
(see Project Narrative for more details).

If the proposed activity is eligible to be treated as an Ecological Restoration Limited Project (310 CMR10.24(8), 310 CMR 10.53(4)), complete and attach Appendix A: Ecological Restoration Limited Project Checklist and Signed Certification.

8. Property recorded at the Registry of Deeds for:

a. County	b. Certificate # (if registered land)
Peabody	
c. Book	d. Page Number
N/A	N/A

B. Buffer Zone & Resource Area Impacts (temporary & permanent)

1. ☐ Buffer Zone Only – Check if the project is located only in the Buffer Zone of a Bordering Vegetated Wetland, Inland Bank, or Coastal Resource Area.
2. ☒ Inland Resource Areas (see 310 CMR 10.54-10.58; if not applicable, go to Section B.3, Coastal Resource Areas).

Check all that apply below. Attach narrative and any supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

For all projects affecting other Resource Areas, please attach a narrative explaining how the resource area was delineated.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☒ Bank	618 (P); 201 (T) — 1. linear feet	618 will be restored — 2. linear feet
b. ☒ Bordering Vegetated Wetland	2,225 (P); 4,641 (T) — 1. square feet	2,500 will be replaced — 2. square feet
c. ☒ Land Under Waterbodies and Waterways	10,343 (P); 2,082 (T) — 1. square feet 1,142 — 3. cubic yards dredged	4,271 - natural stream bottom will be restored

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
d. ☒ Bordering Land Subject to Flooding	69,340 (includes fill and cut) — 1. square feet 2,982 — 3. cubic feet of flood storage lost	1,630 (comp.flood storage) — 2. square feet 3,472 — 4. cubic feet replaced
e. ☐ Isolated Land Subject to Flooding	1. square feet 2. cubic feet of flood storage lost	3. cubic feet replaced
f. ☒ Riverfront Area	Proctor Brook (inland) — 1. Name of Waterway (if available) - **specify coastal or inland**	

2. Width of Riverfront Area (check one):

☐ 25 ft. - Designated Densely Developed Areas only

☐ 100 ft. - New agricultural projects only

☒ 200 ft. - All other projects

3. Total area of Riverfront Area on the site of the proposed project: 294,400 square feet

4. Proposed alteration of the Riverfront Area:

a. total square feet	b. square feet within 100 ft.	c. square feet between 100 ft. and 200 ft.
103,288	77,465	25,823

5. Has an alternatives analysis been done and is it attached to this NOI? ☐ Yes ☒ No

6. Was the lot where the activity is proposed created prior to August 1, 1996? ☒ Yes ☐ No

3. ☐ Coastal Resource Areas: (See 310 CMR 10.25-10.35)

Note: for coastal riverfront areas, please complete **Section B.2.f**. above.

C. Other Applicable Standards and Requirements

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section C and complete Appendix A: Ecological Restoration Limited Project Checklists – Required Actions (310 CMR 10.11).

Streamlined Massachusetts Endangered Species Act/Wetlands Protection Act Review

1. Is any portion of the proposed project located in **Estimated Habitat of Rare Wildlife** as indicated on the most recent Estimated Habitat Map of State-Listed Rare Wetland Wildlife published by the Natural Heritage and Endangered Species Program (NHESP)? To view habitat maps, see the *Massachusetts Natural Heritage Atlas* or go to http://maps.massgis.state.ma.us/PRI_EST_HAB/viewer.htm.

   a. ☐ Yes ☒ No

   If yes, include proof of mailing or hand delivery of NOI to:

   Natural Heritage and Endangered Species Program
   Division of Fisheries and Wildlife
   1 Rabbit Hill Road
   Westborough, MA 01581

   August 1, 2021
   b. Date of map

   If *yes*, the project is also subject to Massachusetts Endangered Species Act (MESA) review (321 CMR 10.18). To qualify for a streamlined, 30-day, MESA/Wetlands Protection Act review, please complete Section C.1.c, and include requested materials with this Notice of Intent (NOI); *OR* complete Section C.2.f, if applicable. *If MESA supplemental information is not included with the NOI, by completing Section 1 of this form, the NHESP will require a separate MESA filing which may take up to 90 days to review (unless noted exceptions in Section 2 apply, see below).*

   c. Submit Supplemental Information for Endangered Species Review*

      1. ☐ Percentage/acreage of property to be altered:

         (a) within wetland Resource Area _____ percentage/acreage

         (b) outside Resource Area _____ percentage/acreage

      2. ☐ Assessor's Map or right-of-way plan of site

2. ☐ Project plans for entire project site, including wetland resource areas and areas outside of wetlands jurisdiction, showing existing and proposed conditions, existing and proposed tree/vegetation clearing line, and clearly demarcated limits of work **

   (a) ☐ Project description (including description of impacts outside of wetland resource area & buffer zone)

   (b) ☐ Photographs representative of the site

* Some projects **not** in Estimated Habitat may be located in Priority Habitat, and require NHESP review (see https://www.mass.gov/ma-endangered-species-act-mesa-regulatory-review).
Priority Habitat includes habitat for state-listed plants and strictly upland species not protected by the Wetlands Protection Act.

** MESA projects may not be segmented (321 CMR 10.16). The applicant must disclose full development plans even if such plans are not required as part of the Notice of Intent process.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

WPA Form 3 – Notice of Intent

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File Number
Document Transaction Number

C. Other Applicable Standards and Requirements (cont'd)

(c) ☐ MESA filing fee (fee information available at https://www.mass.gov/how-to/how-to-file-for-a-mesa-project-review).
Make check payable to "Commonwealth of Massachusetts - NHESP" and ***mail to NHESP*** at above address

*Projects altering **10 or more acres** of land, also submit:*

(d) ☐ Vegetation cover type map of site

(e) ☐ Project plans showing Priority & Estimated Habitat boundaries

(f) OR Check One of the Following

1. ☐ Project is exempt from MESA review.
Attach applicant letter indicating which MESA exemption applies. (See 321 CMR 10.14, https://www.mass.gov/service-details/exemptions-from-review-for-projectsactivities-in-priority-habitat; the NOI must still be sent to NHESP if the project is within estimated habitat pursuant to 310 CMR 10.37 and 10.59.)

2. ☐ Separate MESA review ongoing. a. NHESP Tracking # b. Date submitted to NHESP

3. ☐ Separate MESA review completed.
Include copy of NHESP "no Take" determination or valid Conservation & Management Permit with approved plan.

3. For coastal projects only, is any portion of the proposed project located below the mean high water line or in a fish run?

a. ☒ Not applicable – project is in inland resource area only b. ☐ Yes ☐ No

If yes, include proof of mailing, hand delivery, or electronic delivery of NOI to either:

South Shore - Cohasset to Rhode Island border, and the Cape & Islands:

Division of Marine Fisheries -
Southeast Marine Fisheries Station
Attn: Environmental Reviewer
836 South Rodney French Blvd.
New Bedford, MA 02744
Email: dmf.envreview-south@mass.gov

North Shore - Hull to New Hampshire border:

Division of Marine Fisheries -
North Shore Office
Attn: Environmental Reviewer
30 Emerson Avenue
Gloucester, MA 01930
Email: dmf.envreview-north@mass.gov

Also if yes, the project may require a Chapter 91 license. For coastal towns in the Northeast Region, please contact MassDEP's Boston Office. For coastal towns in the Southeast Region, please contact MassDEP's Southeast Regional Office.

c. ☐ Is this an aquaculture project? d. ☐ Yes ☐ No

If yes, include a copy of the Division of Marine Fisheries Certification Letter (M.G.L. c. 130, § 57).

4. Is any portion of the proposed project within an Area of Critical Environmental Concern (ACEC)?

   a. ☐ Yes ☒ No If yes, provide name of ACEC (see instructions to WPA Form 3 or MassDEP Website for ACEC locations). **Note:** electronic filers click on Website.

   b. ACEC

5. Is any portion of the proposed project within an area designated as an Outstanding Resource Water (ORW) as designated in the Massachusetts Surface Water Quality Standards, 314 CMR 4.00?

   a. ☐ Yes ☒ No

6. Is any portion of the site subject to a Wetlands Restriction Order under the Inland Wetlands Restriction Act (M.G.L. c. 131, § 40A) or the Coastal Wetlands Restriction Act (M.G.L. c. 130, § 105)?

   a. ☐ Yes ☒ No

7. Is this project subject to provisions of the MassDEP Stormwater Management Standards?

   a. ☒ Yes. Attach a copy of the Stormwater Report as required by the Stormwater Management Standards per 310 CMR 10.05(6)(k)-(q) and check if:

      1. ☐ Applying for Low Impact Development (LID) site design credits (as described in Stormwater Management Handbook Vol. 2, Chapter 3)

      2. ☒ A portion of the site constitutes redevelopment

      3. ☐ Proprietary BMPs are included in the Stormwater Management System.

   b. ☐ No. Check why the project is exempt:

      1. ☐ Single-family house

      2. ☐ Emergency road repair

      3. ☐ Small Residential Subdivision (less than or equal to 4 single-family houses or less than or equal to 4 units in multi-family housing project) with no discharge to Critical Areas.

D. Additional Information

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section D and complete Appendix A: Ecological Restoration Notice of Intent – Minimum Required Documents (310 CMR 10.12).

Applicants must include the following with this Notice of Intent (NOI). See instructions for details.

Online Users: Attach the document transaction number (provided on your receipt page) for any of the following information you submit to the Department.

1. ☒ USGS or other map of the area (along with a narrative description, if necessary) containing sufficient information for the Conservation Commission and the Department to locate the site. (Electronic filers may omit this item.)

2. ☒ Plans identifying the location of proposed activities (including activities proposed to serve as a Bordering Vegetated Wetland [BVW] replication area or other mitigating measure) relative to the boundaries of each affected resource area.

F. Signatures and Submittal Requirements

I hereby certify under the penalties of perjury that the foregoing Notice of Intent and accompanying plans, documents, and supporting data are true and complete to the best of my knowledge. I understand that the Conservation Commission will place notification of this Notice in a local newspaper at the expense of the applicant in accordance with the wetlands regulations, 310 CMR 10.05(5)(a).

I further certify under penalties of perjury that all abutters were notified of this application, pursuant to the requirements of M.G.L. c. 131, § 40. Notice must be made by Certificate of Mailing or in writing by hand delivery or certified mail (return receipt requested) to all abutters within 100 feet of the property line of the project location.

Brendan Callahan	04/09/24
1. Signature of Applicant	2. Date
3. Signature of Property Owner (if different)	4. Date
	4/09/2024
5. Signature of Representative (if any) Danielle Spicer	6. Date

For Conservation Commission:
Two copies of the completed Notice of Intent (Form 3), including supporting plans and documents, two copies of the NOI Wetland Fee Transmittal Form, and the city/town fee payment, to the Conservation Commission by certified mail or hand delivery.

For MassDEP:
One copy of the completed Notice of Intent (Form 3), including supporting plans and documents, one copy of the NOI Wetland Fee Transmittal Form, and a **copy** of the state fee payment to the MassDEP Regional Office (see Instructions) by certified mail or hand delivery.

Other:
If the applicant has checked the “yes” box in any part of Section C, Item 3, above, refer to that section and the Instructions for additional submittal requirements.

The original and copies must be sent simultaneously. Failure by the applicant to send copies in a timely manner may result in dismissal of the Notice of Intent.

B. Fees

To calculate filing fees, refer to the category fee list and examples in the instructions for filling out WPA Form 3 (Notice of Intent).

Fee should be calculated using the following process & worksheet. ***Please see Instructions before filling out worksheet.***

Step 1/Type of Activity: Describe each type of activity that will occur in wetland resource area and buffer zone.

Step 2/Number of Activities: Identify the number of each type of activity.

Step 3/Individual Activity Fee: Identify each activity fee from the six project categories listed in the instructions.

Step 4/Subtotal Activity Fee: Multiply the number of activities (identified in Step 2) times the fee per category (identified in Step 3) to reach a subtotal fee amount. Note: If any of these activities are in a Riverfront Area in addition to another Resource Area or the Buffer Zone, the fee per activity should be multiplied by 1.5 and then added to the subtotal amount.

Step 5/Total Project Fee: Determine the total project fee by adding the subtotal amounts from Step 4.

Step 6/Fee Payments: To calculate the state share of the fee, divide the total fee in half and subtract $12.50. To calculate the city/town share of the fee, divide the total fee in half and add $12.50.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

B. Fees (continued)

Step 1/Type of Activity	Step 2/Number of Activities	Step 3/Individual Activity Fee	Step 4/Subtotal Activity Fee

Step 5/Total Project Fee: _____

Step 6/Fee Payments:

Total Project Fee:	Fee Exempt a. Total Fee from Step 5
State share of filing Fee:	Fee Exempt b. 1/2 Total Fee **less $**12.50
City/Town share of filling Fee:	Fee Exempt c. 1/2 Total Fee **plus** $12.50

C. Submittal Requirements

a.) Complete pages 1 and 2 and send with a check or money order for the state share of the fee, payable to the Commonwealth of Massachusetts.

Department of Environmental Protection
Box 4062
Boston, MA 02211

b.) **To the Conservation Commission:** Send the Notice of Intent or Abbreviated Notice of Intent; a **copy** of this form; and the city/town fee payment.

To MassDEP Regional Office (see Instructions): Send a copy of the Notice of Intent or Abbreviated Notice of Intent; a **copy** of this form; and a **copy** of the state fee payment. (E-filers of Notices of Intent may submit these electronically.)

1.0 PROJECT DESCRIPTION

This Notice of Intent Application has been prepared on behalf of the City of Peabody for the Independence Greenway Extension transportation improvement project in the City of Peabody. The City of Peabody with construction funding from the Massachusetts Department of Transportation, Highway Division (MassDOT) proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, Massachusetts for a total project length of approximately 1.3 miles. The proposed project is located along the former railroad right-of-way, which is owned and maintained by the City of Peabody.

The Independence Greenway Extension project is a continuation of a rail trail facility that can be utilized by pedestrians and bicyclists for recreation or for short-range trips to businesses or other destinations along the Greenway. This project will expand the City's network of bicycle routes and provide a dedicated bike trail between the busy Northshore Mall and residential/commercial areas adjacent to downtown Peabody.

The project will consist of the following improvements:

- Modification of the existing eastern terminus of the Independence Greenway at the Essex Center Drive behind the Northshore Mall, its Route 128 underpass, and a portion of the Northshore Road from the Northshore Mall driveway to Proctor Brook to accommodate the connection to the proposed shared use path;
- Construction of the proposed bituminous shared-use trail along the existing abandoned railroad right-of-way between Northshore Road and Endicott Street;
- Construction of a light duty timber boardwalk structure supported on helical piles;
- Various drainage improvements, including replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed; and
- Construction of modifications at Endicott Street, including sidewalk reconstruction and drainage improvements.

This project transforms the former railroad bed into a shared use pedestrian pathway. As the proposed project is a pathway for pedestrian and/or nonmotorized vehicle access, it is therefore categorized as a "Redevelopment Project" under the Massachusetts Stormwater Management Standards. The project is therefore designed to meet the Standards to the maximum extent practicable. A stormwater report is attached in Appendix F to this Application demonstrating the compliance of the project with the ten state stormwater standards.

The proposed work within Waters of the United States requires a Section 401 Water Quality Certification for Minor Fill and Excavation Projects pursuant to 314 CMR 9.04(1) since the project will result in more than 5,000 square feet cumulatively of temporary and permanent impacts to Bordering Vegetated Wetland and Land Under Water, areas subject to 310 CMR 10.00: Wetlands Protection which is also subject to 33 U.S.C. §1251 et seq. (1972), The Clean Water Act (CWA). The proposed work within Waters of the United States requires a Section 401 Water Quality Certification pursuant to 314 CMR 9.04(1) since the project will result in dredging of more than 100 CY of material and placement of minor fill within Land Under Water. Therefore, a Combined Minor Fill/Dredging Water Quality Certification application package will be submitted to the Department of Environmental Protection (DEP) in association with this project. A filing of a Pre-Construction Notification (PCN) Form in accordance with Section 404 with the U.S. Army Corps of Engineers under GP 7, 17, 23, and 24 will also occur concurrently with the Section 401 WQC filing.

The MassDEP Waterways Program evaluated the site conditions within the limits of the proposed work areas (i.e., culvert crossings and boardwalk crossing), and has identified that Proctor Brook is not practicably navigable within the boundaries of the project footprint due to the bottom topography and shallow water depths. As a result, the portions of the proposed project located in/on/over/under Proctor Brook as identified on the plans do not require authorization pursuant to M.G.L. Chapter 91 or the Waterways Regulations at 310 CMR 9.00.

In addition, the proposed work exceeds the activity thresholds described in 301 CMR 11.03 (3)(b)(1)(f) for alteration of ½ or more acres of any other wetland, 301 CMR 11.03(3)(b)1(d) for alteration of 5,000 or more sf of bordering or isolated vegetated wetlands; and 301 CMR 11.03(3)(b)1(b) for alteration of 500 or more linear feet of inland bank; consequently, an Expanded Environmental Notification Form (EENF) was filed to initiate project review under MEPA by the Executive Office of Energy and Environmental Affairs (EEA). An EENF Certificate for the EEA File No. 16778 was issued on January 29, 2024, determining that the project required the submission of an Environmental Impact Report (EIR). The Draft Environmental Impact Report addressing the comments and scope received in the EENF Certificate was filed with the MEPA Office on April 1, 2024.

This Notice of Intent (NOI) is being submitted to the Peabody Conservation Commission pursuant to the Massachusetts Wetlands Protection Act (WPA) Regulations and its implementing regulations 310 CMR 10.00 for work within the Bordering Vegetated Wetland (BVW), the Land Under Water (LUW), the 100-foot Buffer Zone, the Bordering Land Subject to Flooding (BLSF), Bank and within the Riverfront Area and pursuant to the City of Peabody local Wetlands and Rivers Protection Regulations.

Local Ordinance Provisions

The City of Peabody Wetlands and Rivers Protection Regulations (Chapter 32 of the City of Peabody Code of Ordinances) also established "No Disturb Zones" in the size of the applicable buffer zones (100 - 200 feet), where no grading, planting, site work, construction, or storage of materials is allowed. Vegetation in the No Disturb Zone shall not be cut or trimmed in any manner. However, pursuant to Section 32-36 of the local ordinance, public projects and replacement of water dependent structures fall under circumstances where the Conservation Commission may permit limited wetland alteration if they find that "*…there is no feasible alternative to the proposed project, that the amount of wetland alteration is the minimum necessary to accomplish the goals of the project, and that acceptable mitigation has been provided to foster the values and interests protected by this ordinance*." As this is a Municipal project with construction funding from MassDOT Highway Division, the project is subject to local wetlands bylaw and abutters notification is required.

Limited Project Provisions

A majority of the proposed project falls under the Limited Project Provisions listed under 310 CMR 10.53 (See Figure 2 in Appendix C). The majority of the project within the existing railroad right-of-way falls under 310 CMR 10.53(6): *the construction, rehabilitation, and maintenance of footpaths, bike paths, and other pedestrian or nonmotorized vehicle access to or along riverfront areas but outside other resource areas, provided that adverse impacts from the work are minimized and that the design specifications are commensurate with the projected use and are compatible with the character of the riverfront area.* Culvert replacement components of this project fall under 310 CMR 10.53(3)(i): *The maintenance, repair and improvement (but not substantial enlargement except when necessary to meet the Massachusetts Stream Crossing Standards) of structures, including dams and reservoirs and appurtenant works to such dams and reservoirs, buildings, piers, towers, headwalls, bridges, and culverts which existed on the effective date of 310 CMR 10.51 through 10.60 (April 1, 1983)*. The boardwalk portion of the project qualifies for 310 CMR

10.53(3)(j): *The construction and maintenance of catwalks, footbridges, wharves, docks, piers, boathouses, boat shelters, duck blinds, skeet and trap shooting decks and observation decks; provided, however, that such structures are constructed on pilings or posts so as to permit the reasonably unobstructed flowage of water and adequate light to maintain vegetation.* Lastly, the roadway work along Northshore Road and Essex Center Drive at the western project limit falls under 310 CMR 10.53(3)(f): *Maintenance and improvement of existing public roadways, but limited to widening less than a single lane, adding shoulders, correcting substandard intersections, and improving inadequate drainage systems* (See Figure 2 in Appendix C for the locations of each limited project provision).

1.1 EXISTING CONDITIONS

The existing Independence Greenway was built in 2008 and is functionally classified as a Bike Path, being an exclusive pedestrian/bicycle facility open year-round from dusk until dawn. It currently consists of two discontinuous segments separated by Interstate 95 and Route 1. The overall length of the west section is 2.9 miles, and it starts between Russell Street and the Ipswich River, and the section ends at the Lt. Ross Park. The east section starts from Peabody Road near Proctor Brook and runs for 1.7 miles to end at the Essex Center Drive behind the Northshore Mall. The trail was built on the route of the former Boston and Maine Railroad right-of-way north of Lowell Street. The existing Greenway is owned and maintained by the City of Peabody.

The existing west and east sections of the Independence Greenway provide a 14’-0” wide pavement carrying two-way traffic on two 5’-0” wide travel lanes and two 2’-0” wide shoulders. The present eastern terminus of the Independence Greenway is located at the Essex Center Drive behind the Northshore Mall. The allowed uses on the Greenway include walking/running, bicycling, inline/roller skating, snowshoeing and cross-country skiing. No motorized vehicles, snow mobiles, or horseback riding is allowed on the trail.

Essex Center Drive is classified as a Local Roadway maintained under the private jurisdiction of the Northshore Mall. It serves mostly as a circulating road for the Northshore Mall and its adjacent office and commercial buildings, including Lahey Medical Center. Essex Center Drive is a two-lane, two-way road with a typical pavement width of 30 feet. The travel lanes, separated by a double yellow centerline, are approximately 15 feet wide. There is a consistent 5-foot bituminous sidewalk along the east side of the road and a cement concrete sidewalk on the west side of the road in front of Lahey Medical Center.

The second segment of the Essex Center Drive runs through an underpass under Route 128, connecting the rest of the Essex Center Drive and the mall driveway to the Northshore Road and from Route 128 North. This segment is under the jurisdiction of MassDOT as part of Route 128 above. The roadway is 23 feet wide, with an 11-foot right turn lane and a 12-foot right turn lane in the eastbound direction, with a 9.5-foot-wide raised median between the directions, which contain support columns for the bridge above. There are 3.5-foot-wide sidewalks in the underpass, which do not allow ADA accessible path of travel. In addition, the sidewalks are too narrow for cyclists to comfortably ride on or even walk with a bicycle to pass someone walking in the other direction without one person having to walk in the roadway.

Northshore Road is a local roadway under the City of Peabody jurisdiction south of the Route 128 underpass, and under the jurisdiction of MassDOT north of the underpass. Northshore Road connects the Northshore Mall south entrance with Lowell Street and Route 114, as well as ramps to the Route 128 North. Northshore Road is 23 feet wide with 11-foot-wide lanes separated by a double yellow centerline. There is a 4.5-foot-wide bituminous sidewalk on the west side of the street. The posted speed limit on Northshore Road is 25 mph in both directions.

The former B&M railroad-owned easement between Northshore Road and Endicott Street is currently wooded and is roughly parallel to, and overlaps with, Proctor Brook, which generally flows west to east till its confluence with Goldthwaite Brook near Peabody Square to form the North River, which eventually empties downstream into Salem harbor. There are currently no existing trails, roadways, or railroad tracks at this location.

The project corridor contains a former bridge structure, oriented west to east, that used to carry railroad tracks over Proctor Brook. There are presently granite stone blocks extending across Proctor Brook and granite stone abutments, which remain intact along the Proctor Brook's western bank with remnants of stone wingwalls splayed along the sides of the abutments.

The wetlands and waterbodies exist directly adjacent to the former railroad right-of-way on both sides along the project corridor (see section 2.1 of this report for detailed description of each protected resource area). There are several existing stream crossings and hydrologic connections beneath the former railroad track bed within the project limits:

- The existing twin culverts consisting of 42-inch diameter Reinforced Concrete Pipes (RCPs) at Sta. 329+85 convey Proctor Brook which flows south-to-north at this location. Due to the existing 42-inch twin culverts being obstructed with sediment and debris, the pipes are not able to pass the sufficient flow during larger storm events and the bank overtime became eroded and expanded west of the existing culverts at this location.
- The existing 30-inch diameter Corrugated Metal Pipe (CMP) at Sta. 340+10 conveys an intermittent stream flowing into Proctor Brook on the north side of the former railroad bed. The existing culvert is corroded.
- The existing 24-inch diameter CMP at Sta. 342+20 conveys hydrological connection of Proctor Brook with wetland V-series on the south side of the former railroad tracks. The existing culvert is corroded.
- The former 4'H x 6.4'W concrete culvert at Sta. 346+20 used to convey Proctor Brook beneath discontinued railroad bed; Proctor Brook flows in the north-to-south direction at this location. The culvert was washed out after the railroad was discontinued and the tracks were removed; there are remains of the former culvert in the existing channel at this location.
- The existing remains of the former railroad bridge crossing over Proctor Brook at Sta. 351+50, which crosses the former railroad right-of-way in the south-to-north direction at this location. The bridge was washed out after the railroad was discontinued and track were removed.
- The existing 15-inch RCP culvert conveying intermittent stream at Sta. 358+51 near the eastern limit of the project at Endicott Street. There are no known deficiencies with the existing culvert.

Surface runoff on Essex Center Drive, its Route 128 underpass, Northshore Road and Endicott Street is mainly distributed by "country drainage", where runoff sheet flows into the pervious shoulder, roadside ditches, wetlands, or private front yards. Additionally, there are separate closed drainage systems spread throughout the project, servicing existing watershed areas via catch basin curb inlets and at low points. Where stormwater does not sheet flow off the roadway via country drainage, it travels via curb along the roadway into these closed drainage systems. The existing site can be analyzed as ten (10) watershed areas that contribute runoff to ten (10) discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. There are several culverts that convey Proctor Brook and intermittent streams that provide hydrological connections beneath the existing railroad track bed as described in detail above. The wetland resource areas within and adjacent to the project corridor can be seen on Figure 3, Protected Resource Areas Map.

Per MassGIS online data mapping, there are no stormwater "critical areas" as defined in MassDEP's wetland regulations as Outstanding Resource Waters (ORW), Special Resource Waters, recharge areas for public water supplies or cold-water fisheries either crossing or located adjacent to the project area. There are also no Areas of Critical Environmental Concern (ACECs) within or adjacent to the project area (see Figure 3).

1.2 PROPOSED CONDITIONS

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is approximately 1.3 miles.

The proposed project is located along the former railroad right-of-way that has not seen any improvements since the rails were removed. The proposed bituminous shared-use trail pavement will match the dimensions of the existing discontinued railroad structure. This will include 10'-0" wide hot mix asphalt pavement carrying two 5'-0" wide travel lanes, one in each direction, and two 2'-0" wide stone dust shoulders on both sides.

To make the former railroad right-of-way usable for a bicycle/pedestrian path, and to avoid filling protected wetland resources areas and FEMA-designated 100-year floodplain associated with Proctor Brook, a light duty timber boardwalk structure supported on helical piles is proposed to replace the previous railroad bridge that was washed away.

The proposed 56-span light duty timber boardwalk structure will be approximately 437'- 9" long with an out-to-out width of 13'-00" and will provide a clear width of 12'- 1" to accommodate two 5'- 0" wide travel lanes, one in each direction, and two 1'-0" shoulders on each side to provide service to bikers, pedestrians and and/or nonmotorized vehicle access. The shared use path will support emergency vehicles, but the boardwalk section will not.

The proposed shared-use trail will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Guide for the Development of Bicycle Facilities (Fourth Edition, 2012) and the MassDOT Separated Bike Lane Planning & Design Guide 2015. The proposed bridge will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Standard Specifications for Highway Bridges and the most recent supplemental Specifications, Standard Nomenclature and Engineering Directives.

The project will result in approximately 2.5 acres of clearing and grubbing along the former railroad right-of-way between Northshore Road and Endicott Street.

The project includes drainage improvements, including replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the former track bed.

There are ten discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. The proposed drainage design will add catch basins to replace existing catch basins at certain locations where proposed roadway geometry differs from existing conditions. New catch basins are also proposed where the new Independence Greenway Extension proposes a higher ground elevation than existing conditions and existing headwalls/culverts will no longer be utilized along North Shore Road. The proposed catch basins will have deep sumps to provide additional stormwater

treatment. A stormwater BMP (infiltration trench) is proposed to be installed in the eastern end of the project to help with peak rate attenuation and improve water quality. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge. There are no new untreated point source discharges created as a result of this project (see Stormwater Report in Appendix F for details).

Drainage and structural improvements to the following stream crossings and hydrologic connections are proposed as part of this project:

- The existing 42-inch twin culverts crossing at Sta. 329+85 is proposed to be replaced with a 4'H x 8'W precast reinforced concrete box culvert with a natural stream bottom and will match existing invert elevations.
- The existing corroded 30-inch diameter CMP culvert at Sta. 340+10 is proposed to be replaced with 36-inch DIP and will be embedded 12-inches and will have a layer of natural streambed material to match the existing surface elevations. The Hydraulic opening of this culvert will be maintained. A 12-inch layer of natural streambed material will also be placed on top of stone at the pipe ends on each side of the culvert to restore natural substrate.
- The existing 24-inch diameter CMP at Sta. 342+20 is proposed to be replaced with 24-inch DIP with placement of the riprap at pipe ends for scour protection. A 12-inch layer of natural streambed material will also be placed on top of stone at the pipe ends at the outlet of this culvert within Proctor Brook to restore natural substrate.
- The former 4'H x 6.4'W concrete culvert at Sta. 346+20 is proposed to be replaced with a 4'H x 8'W precast reinforced concrete box culvert with a natural stream bottom and will match existing invert elevations.
- As described above, the proposed light duty timber boardwalk structure will replace the former washed out railroad bridge crossing over Proctor Brook at Sta. 351+50.
- The existing 15-inch RCP culvert conveying the intermittent stream at Sta. 358+51 is proposed to be replaced with a 16-inch DIP to be able to support the H-20 vehicle loading with a shallow depth of cover.

Compliance of the proposed culvert replacements with the Massachusetts River and Stream Crossing Standards are discussed in Section 2.2.2 of this Application.

The proposed drainage will overall maintain historic drainage patterns, distributing runoff to the existing discharge points. All work will be done in a manner that will limit the impacts to adjacent protected wetland resource areas.

1.3 CONSTRUCTION PHASING

Construction phasing will ultimately be determined by the project contractor. The construction phasing is assumed to generally include the following items:

1. Installation of sediment and erosion control measures.
2. Clearing and rough grading of the former railroad right-of-way between Northshore Road and Endicott Street.
3. Construction of wetland replication area.
4. Construction of flood storage compensation area.
5. Reconstruction of existing culverts and other drainage improvements sections along the project corridor.

6. Construction of light duty timber boardwalk structure supported on helical piles.
7. Construction of proposed bituminous shared-use trail along the project corridor.
8. Construction of modifications at Endicott Street, including sidewalk reconstruction and drainage improvements.
9. Construction of modifications at the existing eastern terminus of the Independence Greenway at the Essex Center Drive behind the Northshore Mall, its Route 128 underpass, and a portion of the Northshore Road from the Northshore Mall driveway to Proctor Brook to accommodate the connection to the proposed shared-use path.
10. Completing shared-use path construction, upgrading signage and pavement markings.
11. Installation of landscaping and grassed areas.
12. Maintaining wetland replication area: checking for plantings that are damaged or failing to thrive and adjusting/replacing plantings as recommended by Wetland Specialist.
13. Removal of sediment and erosion control measures and dispose of same.

Equipment that is likely to be utilized for this project includes dump trucks, flatbed trucks, front-end loader(s), backhoe(s), skid steer(s), excavator, hoe rams, drilling rigs, concrete pumpers, boom trucks, air hammers, air compressor(s), and a crane. Equipment can be parked on roadway pavements off-limits for construction staging purposes. Staging equipment in Vegetated Wetland or Waterway resource areas shall be prohibited.

1.4 PROJECT PLAN LIST

The following plan sheets are included with this Notice of Intent in Appendix G:

Sheet	Title	Prepared by	Date

2.0 PROJECT IMPACTS

2.1 WETLAND RESOURCE AREAS

The Wetland Resource Areas on the Project Site are regulated under Federal, State and Local regulatory programs including:

- Section 404 of the Clean Water Act (CWA) which is administered by the U.S. Army Corps of Engineers (ACOE)
- Section 401 of the CWA which is overseen by the Massachusetts Department of Environmental Protection (DEP)
- Massachusetts Environmental Policy Act (MEPA) and 301 CMR 11.00 which is administered by the Executive Office of Energy and Environmental Affairs (EEA)
- Massachusetts Wetlands Protection Act (WPA) and 310 CMR 10.00 which is administered by the Peabody Conservation Commission or (upon appeal) by DEP
- The City of Peabody has its own local Wetlands and Rivers Protection Regulations Wetlands Ordinance (Chapter 32 of the City of Peabody Code of Ordinances), hereinafter referred to as the local ordinance.

The wetlands and waterbodies exist directly adjacent to the former railroad right-of-way on both sides along the project corridor. These areas are identified on the attached Figure 3, Protected Resource Area Map (see Appendix C - Figures).

The Wetlands Protection Act (Massachusetts General Laws (MGL) Chapter 131, Section 40 protects wetlands and the public interests they serve, including protection of public and private water supply and ground water supply, flood control, prevention of storm damage and pollution, land containing shellfish, fisheries, and wildlife habitat.

In addition to the WPA buffers, the Peabody Local Wetlands Bylaw also regulates a “No Disturb Zone” in which the Commission may require that the applicant maintain a strip or buffer of continuous, undisturbed vegetative cover within 200 feet of resource areas defined in Sec. 32-2 Definitions Resource Area (I), and within 100 feet of resource areas defined in Sec. 32-2 Definitions Resource Area (A-H). However, since this project is a public project proposed by the City of Peabody, which also includes replacement of water dependent structures, it falls under the circumstances where limited wetland alteration necessary to accomplish the goals of the project may be permitted under the provisions of Section 32-36 of the local ordinance. Section 2.2.1 of this Application demonstrates that acceptable mitigation has been provided to foster the values and interests protected by this ordinance.

The following sections describe jurisdictional areas associated with the project:

2.1.1 Bordering Vegetated Wetlands (BVW)

Per 310 CMR 10.55(1), Bordering Vegetated Wetlands (BVWs) are likely to be significant to public or private water supply, to ground water supply, to flood control, to storm damage prevention, to prevention of pollution, to the protection of fisheries and to wildlife habitat.

A delineation of the wetland boundaries in the vicinity of the project site was originally completed by Green in February 2018 in accordance with the methodology outlined in the Regulations at 310 CMR 10.55 and the DEP handbook *Delineating Bordering Vegetated Wetlands Under Massachusetts Wetlands Protection Act*. Hydrophytic vegetation was based upon the *US Fish and Wildlife Service National List of Plant Species That Occur in Wetlands*, as well as all plant species listed in the Act. Wetland hydrology includes hydric soils, which were determined based upon the interagency document *Field Indicators for Identifying Hydric Soils in New England*. This methodology is consistent with the three-parameter approach required for the delineation of federal wetlands as outlined in the Corps of Engineers *Wetland Delineation Manual*. The site was reflagged, and the wetland boundaries were reconfirmed on October 5, 2022. The wetlands are identified in further detail in Appendix A and are depicted on Figure 3, Protected Resource Area Map in Appendix C.

2.1.2 Land Under Water Bodies and Waterways (LUW)

Land under Water Bodies and Waterways (under any Creek, River, Stream, Pond or Lake), established through 310 CMR 10.56, is likely to be significant to public and private water supply, to ground water supply, to flood control, to storm damage prevention, to prevention of pollution and to protection of fisheries and wildlife habitat. The main perennial stream present on the project site is Proctor Brook, which is a perennial stream traveling in the west-to-east direction; it has a LUW associated with it. Proctor Brook crosses the project corridor at three (3) locations: at approximate Sta. 329+85, Sta. 346+20 and Sta. 351+50.

2.1.3 Bank

Per 310 CMR 10.54(1), Banks are likely to be significant to public or private water supply, to ground water supply, to flood control, to storm damage prevention, to the prevention of pollution and to the protection of fisheries and wildlife habitat.

There is one (1) perennial stream and two (2) intermittent streams within the project limit, which have an associated Bank.

2.1.4 Bordering Land Subject to Flooding (BLSF)

Per 310 CMR 10.57(1), Bordering Lands Subject to Flooding (BLSF) are likely to be significant to flood control and storm damage prevention, by providing a temporary storage area for flood water which has overtopped the bank of the main channel of a creek, river or stream or the basin of a pond or lake. Certain portions of Bordering Land Subject to Flooding, including those located within 100 feet of the bank or bordering vegetated wetland, are also likely to be significant to the protection of wildlife habitat.

Over time, incremental filling of these areas causes increases in the extent and level of flooding by eliminating flood storage volume or by restricting flows, thereby causing increases in damage to public and private properties.

Per the Flood Insurance Rate Maps (FIRM) for the City of Peabody, Massachusetts, Essex County, Panel 25009C0412F, dated 07/03/2012, and Panels 25009C0416G, 25009C0418G, dated 07/16/2014, portions of the project in the vicinity of Proctor Brook are located within the 100-year floodplain. The floodplain areas are shown on Figure 4 – FEMA Map. The Flood Insurance Study, by the Federal Management Agency and last revised on July 16, 2014, includes a detailed study of the project area, showing the 100-year floodplain elevations in the project vicinity. Sections of Proctor Brook flowing along the project corridor have various 100-year flood elevations which drop from 47.1 feet near the western project limit to 39.6 feet at the eastern project limit (NAVD 88). See Figure 7A-7H in Appendix C for details and exact locations of the FEMA 100-year flood lines and elevations.

2.1.5 Riverfront Area

Per 310 CMR 10.58(1), Riverfront areas are likely to be significant to protect the private or public water supply, to protect groundwater, to provide flood control, to prevent storm damage, to prevent pollution, to protect land containing shellfish, to protect wildlife habitat and fisheries.

Proctor Brook is a perennial stream within the project limits, which has a 200-foot Riverfront Area associated with it.

2.1.6 Buffer Zone

The 100-foot Buffer Zone (established through 310 CMR 10.02) is a 100-foot offset from the BVW line, the inland bank of intermittent streams, lakes and ponds. The Buffer Zones within the project area consist of existing abandoned railroad track bed and some wooded areas surrounding it. Portions of the project are located within the Buffer Zones associated with BVWs and the Bank of intermittent streams. No buildings are proposed as part of this project, but the proposed bituminous shared-use trail with typical pavement width of thirteen (12) feet with two 5-foot travel lanes and 1-foot-wide shoulders in each direction will result in the limit of the pavement being closer to the wetland under proposed conditions.

In addition to the WPA buffers, the Peabody Local Wetlands Bylaw also regulates a “No Disturb Zone” in which the Commission may require that the applicant maintain a strip or buffer of continuous, undisturbed vegetative cover within 200 feet of resource areas defined in Sec. 32-2 Definitions Resource Area (I), and within 100 feet of resource areas defined in Sec. 32-2 Definitions Resource Area (A-H). However, since this project is a public project proposed by the City of Peabody, which also includes replacement of water dependent structures, it falls under the circumstances where limited wetland alteration necessary to accomplish the goals of the project may be permitted under the provisions of Section 32-36 of the local ordinance. Section 2.2.1 of this Application demonstrates that acceptable mitigation has been provided to foster the values and interests protected by this ordinance.

2.2 REGULATORY COMPLIANCE

Pursuant to 310 CMR 10.53(3), the project has been designed to avoid wetland resource area impacts to the maximum extent practicable and will mitigate unavoidable resource area impacts in accordance with state regulations.

2.2.1 Limited Project Status

Since majority of the proposed project qualifies as a limited project, it is required to meet the performance standards for each resource area to the maximum extent practicable. While some portions of the project that are located within BLSF do not fall under limited provisions, as a whole the project is meeting the

performance standards for BVW, LUW, Bank, BLSF and RFA. Mitigation of impacts, replication and restoration of the impacted resource areas are provided under the scope of this project to contribute to the protection of the interests identified in M.G.L. c. 131, § 40. Mitigation areas will be constructed to meet the requirements of permits and certifications including relevant performance standards of the Massachusetts Wetlands Protection Act (MGL C. 131, s40) and U.S. Army Corps of Engineers.

2.2.2 Resource Areas Impacts

There are direct impacts to wetland resource areas associated with the project. These impacts are associated with construction activities necessary to achieve the project purpose of constructing an extension of a shared-use path in the location of the former B&M railroad right-of-way. The activities within the resource areas and their buffer zones include clearing and rough grading of the former railroad right-of-way between Northshore Road and Endicott Street; construction of the proposed shared-use path, replacement of stream crossings, landscape improvements, as well as construction of the wetland and floodplain impact mitigation measures. Replication of the impacted wetland resource areas is discussed in detail below. In an effort to minimize the impact to the wetland area buffer zones, proper erosion and sediment controls will be installed during construction.

In addition to the minimum control measures included in the plan set, a Stormwater Pollution Prevention Plan (SWPPP) for construction activities will be prepared by the Contractor for the site in compliance with the EPA's Construction General Permit. It will include measures to minimize exposed soil areas through sequencing and temporary stabilization and establish a permanent vegetative cover or other forms of stabilization as soon as practicable.

Bordering Vegetated Wetlands (BVWs)

There are BVW areas within and adjacent to the project limits. The project results in permanent and temporary impacts to the following wetland areas along the project corridor, as described in Table 1 below.

Table 1: BVW Impacts

Wetland Area Series (STA. #)	Permanent Impacts (ft^2)	Temporary Impacts (ft^2)
Z (STA. 329+85)	264	245
Y (STA. 329+85)	447	58
V (STA. 340+10)	168	88
V (STA. 342+20)	183	435
V (STA. 346+20)	914	216
E (STA. 346+20)	126	72
E (STA. 346+90)	117	66
X (STA. 352+00)	6	3,461
Total	**2,225**	**4,641**

*see Figure 6A – 6H in Appendix C

The direct impacts to BVWs were minimized to the maximum extent feasible but cannot be avoided in order to achieve the project goals. The majority of permanent BVW impacts are associated with the proposed bank protection and stabilization countermeasures near the proposed culverts; other BVW impacts are associated with the adjacent areas of slope stabilization and regrading. The proposed extension on the

Independence Greenway and stream crossing replacements necessary to achieve the project purpose are expected to result in an overall improvement of the existing wetland resource areas and the area in general, which are currently degraded, overgrown with invasives and brush, and contain a lot of debris and garbage. The project will not impact the capacity of the BVW to prevent or reduce contamination or damage to fish; and to serve as their habitat and nutrient source. There is no land containing shellfish or NHESP Estimated or Priority Habitats of Rate Wildlife located within or in close proximity to the project area, therefore the project will not negatively impact these interests of the WPA.

Temporary disturbance to BVW (4,641 square feet) will be required for installation of Erosion & Sediment Control BMPs. The 3,461 square feet of temporary impact to BVW X is caused by placement of the temporary timber matting in order to protect the BVW X from negative impacts by construction machines during installation of helical piles for the duration of its construction. Under existing conditions, the entire wetland area at the location of the proposed boardwalk area is shaded by the surrounding tree canopy. Since the entire area is completely shaded by the tree canopy, as depicted in the photo log in Appendix B, the proposed boardwalk will not result in any new shade impacts to the BVW area. After the erosion controls have been removed the BVWs will be restored to preexisting conditions in accordance with the MassDOT Specifications for Wetland Restoration. The MassDOT Specification for Item 755.45 Wetland Restoration provides further detail on the restoration of wetland areas upon completion of construction work including placement of sediment barriers if they are required for sediment control during restoration work. Additionally, this includes removal and disposal of the proposed timber matting after construction and restoration of grades to existing pre-construction elevations.

The following section describes how the proposed work within BVW meets the performance standards:

The proposed work will comply with General Performance Standards in accordance with 310 CMR 10.55 (4)(b), (d) and (e). The 310 CMR 10.55 (4)(c) Standard does not apply to this project as the impacts are more than 500 SF.

In compliance with 310 CMR 10.55 (4)(d), the proposed project will not have any "… adverse effect on specified habitat sites of rare vertebrate or invertebrate species, as identified by procedures established under 310 CMR 10.59." The project site is not located within an area designated as Priority or Estimated Habitat of Rare Species by the Natural Heritage & Endangered Species Program (NHESP) 2021 Maps. No Certified or Potential Vernal Pools are located in this area of the City (see Figure 3).

In compliance with 310 CMR 10.55 (4)(e), the proposed project is not located within an Area of Critical Environmental Concern (ACEC), therefore, proposed work will "*not destroy or otherwise impair any portion of a Bordering Vegetated Wetland that is within an Area of Critical Environmental Concern designated by the Secretary of Energy and Environmental Affairs under M.G.L. c. 21A, § 2(7) and 301 CMR 12.00: Areas of Critical Environmental Concern*."

A wetland replication of approximately 2,500 square feet is proposed and designed in accordance with 310 CMR 10.55 (4)(b) provisions and MassDOT Specification 755.35, Inland Wetland Replication Area, as summarized below. The MassDOT Specification for Item 755.35 Inland Wetland Replication Area provides further detail for the construction of the proposed replication area including the proposed sediment control barrier and erosion prevention measures, the wetland soil to be used, planting, seed mix, and other construction methods and site protection methods.

1. *Replacement areas (replication areas) must be equal in total size to lost BVW area;*

As shown on the plans (see Figure 6D and plan sheet 26), the proposed replication area on the northern side of the proposed bikeway around Sta. 327+00 adjacent to BVW Z has an area of approximately 2,500 square feet, which is slightly greater than the 2,225 square feet of permanently impacted area as required by the regulations.

2. *The surface/ground water elevations of the replacement must approximate those that characterized the lost BVW areas;*

The proposed wetland replication area around Sta. 327+00 will be connected to BVW Z and will be at the same elevation as BVW Z.

3. *Replication areas are to be configured and located, with respect to inland bank, in a similar manner as was the case for lost BVW areas;*

The overall horizontal configuration and location of the replacement area with respect to the bank are similar to the lost areas.

4. *Replication areas must have an unrestricted hydraulic connection to the same waterways and/or waterbodies as the lost areas;*

The replication area proposed around Sta. 327+00 adjacent to BVW Z is hydrologically connected to all wetlands being impacted by the proposed project.

5. *Replication areas are to be located within the same reach of waterway or general areas of waterbody, as lost BVW areas;*

The proposed replication area is located along the same waterbody and the same reach of Proctor Brook as the lost areas. Due to site constraints and limited area within the right-of-way, the replication area cannot be closer to any of the lost wetlands than the location in which it is proposed on the plans. Additional site constraints of this area include a concrete pool that is located just north of the proposed wetland replication area. The pool is located approximately 12 feet from the existing wetland edge, preventing a more linear wetland replication in this area.

6. *In the replication areas, indigenous plant species shall be used to reestablish the vegetation cover of the new BVW areas such that a 75% cover of these areas is attained within two (2) growing seasons. During the period of reestablishment, any exposed soil must be stabilized in accordance with U.S. Soil Conservation Service methods;*

Indigenous plant species are proposed to reestablish vegetation, as shown on the plans. Any exposed soil will be stabilized in accordance with U.S. Soil Conservation Service methods.

7. *General Performance Standards for BVW areas must be addressed in a manner consistent with those of other resource areas described in 310 CMR 10.*

The proposed work will comply with General Performance Standards for BVW areas.

Land Under Water Bodies and Waterways (LUW)

The main protected wetland resource area within the project area is Proctor Brook, which is a perennial stream. General Performance Standards for Land Under Water Bodies and Waterways (LUW), as presented in 310 CMR 10.56(4), allows work in LUW that will not impair the water carrying capacity of the existing channel, nor ground water and surface water quality, nor the capacity of the LUW to provide breeding

habitat, escape cover, or food for fisheries. The work also may not impair the capacity of the LUW to provide important wildlife functions. The regulations provide that the capacity of LUW to provide important wildlife functions is deemed to be unimpaired so long as less than ten (10) percent of the area of LUW significant to protection of wildlife habitat, or 5,000 square feet of LUW (whichever is less) is cumulatively altered.

The proposed Independence Greenway extension requires replacement of the existing two (2) cross culverts to allow Proctor Brook to pass beneath the proposed shared-use trail. There is also a portion of the proposed Greenway near the eastern limits where the light duty timber boardwalk structure supported on helical piles is proposed. Replacement of the culverts and construction of the timber boardwalk will result in permanent and temporary impacts to LUW, as described in Table 2 below.

Table 2: LUW Impacts

Proctor Brook (STA. #)	Permanent Impacts (ft^2)	Temporary Impacts (ft^2)
STA. 329+85	8,365	1,009
STA. 340+10	107	32
STA. 342+20	79	64
STA. 345+50	13	72
STA. 346+20	1,474	355
STA. 351+50	305	550
Total	**10,343**	**2,082**

*see Figure 6A – 6H in Appendix C

The proposed improvements under this project will result in 10,343 square feet of permanent impacts within the waterways. Permanent impacts will be caused by the replacement of the existing Proctor Brook crossings beneath the former railroad bed (proposed shared-use path), including placement of riprap at the proposed culvert inlets and outlets for scour protection and associated regrading near proposed culverts.

The extensive work within the LUW at the locations of Culvert No. 1 (Sta. 329+85) and Culvert No.2 (Sta. 346+20) is required to place riprap countermeasures, which were designed in accordance with the guidelines outlined in Hydraulic Engineering Circular No. 14, specifically Chapters 5 and 10. These guidelines were utilized to estimate scour levels at culvert outlets and to develop the design for riprap basins and aprons, respectively. In order to mitigate the impacts of the high volume of riprap at the culvert inlets and outlets of these two culverts at Sta. 329+85 and Sta. 346+20, as well as at the outlets of the smaller culverts within Proctor Brook at Sta. 340+10 and Sta. 342+20, an additional 12-inch layer of natural streambed material will be placed on top of the riprap and stone for pipe ends on each side of the culverts as shown on the plans to restore natural substrate.

Additionally, the temporary impacts of 2,082 square feet are associated with the control of water during construction and installation of erosion and sediment controls to protect the downstream waterway during the replacements of the stream crossings, installation of boardwalk. The proposed replacement of Culverts 1 and 2 at Sta. 329+85 and 346+20, respectively, may require dewatering to take place, and installation of erosion & sediment controls at the boardwalk will result in temporary LUW impacts at these locations. Dewatering for culverts within temporary cofferdams to allow for construction “in the dry” will be required for removal of groundwater from excavations for structural components and from surface water that enters the work area by precipitation or splash-over.

The Contractor will be expected to perform this work in accordance with MassDOT specifications for Control of Water (Items 991.11, 991.12 and 991.13 – Control of Water for Structures - Culvert No. 1, Culvert No.2 and Bridge Structure No. P-03-020 (CAK) respectively). The Contractor must treat dewatering discharges, prior to outletting these flows to local waterways, for removal of sediments. This will be done by use of sediment tanks, fractionalization tanks, sediment basins, or other approved means. Outlets from these treatment measures will discharge onto splash pads or other measures that will prevent concentrated flows that could erode bank soils or streambed materials en route to the receiving watercourse.

There will be no direct discharge of pumped water into any wetland, resource area, or closed drainage system.

Bank

The proposed project activities will permanently impact 618 linear feet of inland bank associated with Proctor Brook and two (2) intermittent streams within the project limits. These activities consist of the proposed replacement of culverts conveying Proctor Brook, intermittent streams and hydrological connection beneath the proposed shared-use path. Temporary disturbance to Bank (201 linear feet) will be required for installation of Erosion & Sediment Control BMPs. The permanent and temporary impacts to the Bank are summarized in Table 3 below.

Table 3: Impacts to Bank

Bank (STA. #)	Permanent Impacts (LF)	Temporary Impacts (LF)
Proctor Brook (West STA. 329+85)	117	9
Proctor Brook (East STA. 329+85)	125	39
Proctor Brook (North STA. 340+10)	10	3
Intermittent Stream (South STA. 340+00)	17	13
Proctor Brook (STA. 342+20)	15	17
Proctor Brook (West STA. 346+20)	94	4
Proctor Brook (East STA. 346+20)	78	5
Proctor Brook (West STA. 351+00)	37	4
Intermittent Stream (358+00)	125	107
Total	**618**	**201**

* see Figure 6A – 6H in Appendix C

General Performance Standards for Inland Bank, as presented in 310 CMR 10.54(4), allow work on a Bank that will not impair its physical stability, the water carrying capacity of the existing channel within the Bank, or ground water and surface water quality. Such work also must not impair the capacity of the Bank to provide breeding habitat, escape cover, or food for fisheries; nor may the work impair the capacity of the Bank to provide important wildlife functions. A Bank's capacity to provide important wildlife functions is deemed to be unimpaired so long as less than ten (10) percent of the length of the Bank, or 50 feet of the Bank (whichever is less) is cumulatively altered.

Additional alterations beyond the above threshold may be permitted if they will have no adverse effects on wildlife habitat, as determined by procedures contained in 310 CMR 10.60.

The WPA regulations require, in part, that wildlife habitat evaluations be conducted when a proposed project will alter Inland Bank, Land Under Water ("LUW"), Riverfront Area ("RFA"), or Land Subject to Flooding ("BLSF" or "ILSF") beyond the thresholds permitted under 310 CMR 10.54(4)(a)5., 10.56(4)(a)4., 10.57(4)(a)3., and 10.58(4)(d)1. The proposed work under this project will cumulatively alter more than 50 linear feet of Bank, which is beyond the threshold referenced in the Regulations thus requiring an Evaluation.

Wildlife Habitat Evaluation was performed on November 2, 2022 by the Certified Wildlife Biologist, at the locations where Bank was impacted due to project improvements in order to assess how project activities may impact the Banks' capacities to provide breeding habitat, escape cover and food for wildlife.

The Wildlife Habitat Evaluation conducted in six locations along the former railroad right-of-way between Northshore Road and Endicott Street concluded that although significant disturbance is proposed in several wetland resource area types, the existing condition in the study area being heavily disturbed with a variety of developments and former railroad infrastructure as well as the area being dominated by the invasive and/or noxious species are expected to result in a net improvement under proposed project, as designed. Not only no adverse impacts to wildlife habitat are anticipated, but the proposed project, as designed, is expected to improve the wildlife habitat and the affected resource areas' overall capacities to provide important wildlife habitat functions listed in 310 CMR 10.60(2), including food, escape cover, migratory and breeding habitat after reconstruction of stream crossings under the scope of this project is completed. While there are open water areas along the brook, which may have Important Habitat Features for winter waterfowl as well as plunge pools significant for fisheries, the disturbance to wildlife habitat required to replace the stream crossings is temporary and the natural streambed will be reestablished and the LUW area will be restored upon completion of construction. Notwithstanding the requirements of 310 CMR 10.56(4)(a)4., the impact on Land under Water Bodies and Waterways caused by the installation of a stream crossing is exempt from the requirement to perform a habitat evaluation in accordance with the procedures established under 310 CMR 10.60 (see Wildlife Habitat Evaluation in Appendix D of this Application).

The "no substantial reduction" standard is met when "important wildlife habitat functions are substantially restored" during project construction, or it is otherwise demonstrated that "the proposed alterations will have no adverse effects on wildlife habitat" because the important features identified in a particular study area are common to the overall area, and potential habitat features lost are minimal and any adverse impacts are avoided or minimized and mitigated. Therefore, the project should not result in a significant adverse effect or impair or reduce the capacity of Bank to provide important wildlife habitat functions.

The following section describes how the proposed work within the Bank meets the performance standards in accordance with 310 CMR 10.54 (4)(a):

310 CMR 10.54(4)(a)(1) Physical Stability of the Bank:

The proposed work will not impair the physical stability of the Bank. The minor impacts associated with construction activities will be mitigated by the implementation of E&S controls to minimize impacts on Bank. After completion of work, the total area of bank disturbed under proposed conditions will be replaced in accordance with the performance standards listed in 310 CMR 10.54(4).

310 CMR 10.54(4)(a)(2) Water Carrying Capacity of the Existing Channel within the Bank:

The proposed work will not impair the water carrying capacity of the existing channel within the bank. The permanent impacts to the inland bank of the streams within the project area result from the proposed water-dependent activities (replacement of culverts conveying Proctor Brook, intermittent streams and

hydrological connection beneath the proposed shared-use path). The impacted banks will be stabilized with riprap at the culvert ends and headwalls, therefore, the water carrying capacity of the existing channel within the bank will not be affected.

310 CMR 10.54(4)(a)(3) Ground Water and Surface Water Quality:

The work within the Bank will not have a negative impact on the ground water and surface water quality due to the nature of disturbance associated with water-dependent activities such as replacement of culverts conveying Proctor Brook, intermittent streams and hydrological connection beneath the proposed shared-use path. In addition, implementation of the proposed erosion and sediment control measures will help maintain water quality (ground and surface) throughout construction.

310 CMR 10.54(4)(a)(4) Capacity of the Bank to provide Breeding Habitat, Escape Cover and Food for Fisheries:

The proposed work will not have an adverse effect on the capacity of the Bank to provide breeding habitat, cover and food for fisheries. In addition, the impacts will be also offset by the proposed mitigation measures, since culvert replacements with larger openings and a natural stream bottom may actually improve animal movement along the abandoned railroad right-of-way, potentially create and/or improve the escape cover and breeding habitat.

The Wildlife Habitat Evaluation in Appendix D of this Application concluded that no important habitat features were observed at these locations, and there will be no significant adverse impacts to wildlife habitat. Therefore, the Banks' capacities to provide breeding habitat, escape cover and food for fisheries will not be impacted by the proposed work.

310 CMR 10.54(4)(a)(5) Capacity of the Bank to provide Important Wildlife Habitat Functions:

The capacity of Bank to provide important wildlife functions will not be impacted by this project since the existing characteristics of the Bank and landscape context within and adjacent to the previously developed paved project area will not be negatively affected as concluded by the Wildlife Habitat Evaluation (see Appendix D). Impacts to wildlife are expected to be negligible and are expected to be offset by the proposed mitigation measures. In addition, the proposed culvert replacements may actually improve animal movement at the locations of larger culvert openings and due to placement of a natural stream bottom at each replacement stream crossing. Furthermore, based on the conclusion of the Wildlife Habitat Evaluation, an Appendix B WHE is not needed for this project because there are no Important Habitat Features found on or even around the areas of Bank proposed for alteration.

Pursuant to 10.54(4)(b), notwithstanding the provisions of 310 CMR 10.54(4)(a), structures may be permitted in or on a Bank when required to prevent flood damage to facilities, buildings and roads constructed prior to the effective date April 1, 1983, including the renovation or reconstruction (but not substantial enlargement) of such facilities, buildings and roads, provided that the following requirements are met:

1. The proposed protective structure, renovation or reconstruction is designed and constructed using best practical measures so as to minimize adverse effects on the characteristics and functions of the resource area;

The impacts to Banks were minimized to the maximum extent practicable.

2. The applicant demonstrates that there is no reasonable method of protecting, renovating or rebuilding the facility in question other than the one proposed.

There are no reasonable alternatives that would achieve the project purpose of extending the existing Independence Greenway bikeway/share-use path network along the former B&M railroad right-of-way, as proposed. The replacement of multiple stream crossings along the project corridor are required due to the project's location near Proctor Brook; therefore, the impacts to the Bank are unavoidable, however, they were minimized to the maximum extent feasible. With the dominance of invasive and/or noxious plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings and adjacent landscape improvements, the proposed work, as deigned, is expected to result in a net improvement to wildlife habitat across the project.

In order to mitigate impacts to bank caused by the placement of riprap for scour protection and bank stabilization near the proposed culvert replacements, vegetated riprap is proposed for bank protection and stabilization. The vegetated rip rap is proposed at the inlets and outlets of Culverts 1 and 2 at Sta. 329+85 and Sta. 346+20, respectively, in the areas where rip rap is proposed within BVW. At Culvert 1 at Sta. 329+85, approximately 694 SF of vegetated rip rap is proposed. At Culvert 2 at Sta. 346+20, approximately 1,520 SF of vegetated rip rap is proposed. The selected method is to plant live vegetated stakes in the voids between the riprap area in order to further aid in slope stabilization and restoring the area to natural conditions. The proposed live stakes will integrate brush layering, pole planting, and live siltation techniques during rock placement to ensure contact with native ground and will be laid horizontally to maximize rooting in accordance with MassDOT specifications for Live Stakes. The MassDOT Special Provision for Item 799.775 Live Stakes specifies that the live stakes be a minimum of four feet in length, a minimum of three-quarter inch (3/4") in diameter, harvested locally, and have side branches removed with the bark intact. Additionally, the stakes will have at least two (2) bud scars near the top to facilitate branch development and shall be planted at 90-degrees to the slope.

Bordering Land Subject to Flooding (BLSF)

Majority of the project corridor is located along Proctor Brook which is generally flowing in the west-to-east direction which has various 100-year flood elevations which drop from 47.1 feet near the western project limit to 39.6 feet at the eastern project limit (NAVD 88).

The proposed project activities will occur within approximately 69,340 square feet of BLSF area, due to proposed shared-use path currently being located within the 100-year floodplain area associated with Proctor Brook. There are areas of cut and fill within BLSF along the project corridor, required for regrading and construction activities to make the area usable for the proposed shared-use path (see Figure 7A-7H for details).

The following section describes how the proposed work within BLSF meets the performance standards in accordance with 310 CMR 10.57 (4)(a):

10.57(4)(a)(1) Compensatory Storage:

The fill within the floodplain is proposed from approximately Sta. 352+50 to Sta. 358+50 and is associated with the proposed timber boardwalk located within a portion of the 100-year floodplain. At other areas along the project corridor between Sta. 345+50 and 352+50 minor fill is proposed due to required regrading of the existing railroad track bed located within the BLSF. The areas where the existing railroad track bed will be regraded and lowered and at the proposed culvert replacement sites, the project will result in either

no impacts or net cut within the BLSF. The project overall will result in a net fill of 2,982 cubic feet. However, compensatory flood storage of 3,472 cubic feet will be provided.

The proposed flood storage compensation area will be located near the eastern end of the project approximately 350 feet west of Endicott Street (approx. Sta. 355+50) and must comply with the General Performance Standards presented in 310 CMR 10.57 (4)(a). These call for the provision of compensatory flood storage volume for existing flood storage that will be made unavailable by the proposed work. These storage areas must be incrementally equal per foot of elevation to storage volume lost. They also must have an unrestricted hydraulic connection to the same waterway segment as the lost storage volumes. Work within BLSF cannot restrict flows in any manner that would increase flood stages or flow velocities. The proposed flood storage area is hydrologically connected to the affected floodplain and will provide flood storage compensation on a foot-by-foot basis where feasible. Due to the close proximity of wetlands at the same elevations as the proposed fill within the 100-year floodplain, the project, though resulting in overall incremental net cut, is not able to compensate fill at elevations 37-41 feet as compensation would result in additional impacts to the surrounding wetland resource areas. However, the project is able to compensate the remaining project's flood storage loss at elevations 34-37 feet. While the project is not compensating at the same incremental elevations that fill is occurring at, all of the flood storage compensation that will be provided is occurring either at or below the elevations of fill. Compensating at a lower overall elevation, and providing more storage overall, is more beneficial for mitigating and reducing flood impacts than simply compensating for lost storage on a foot-by-foot basis. The proposed flood compensation area more than compensates for the existing flood storage that will be made unavailable by the proposed work, compensates at lower overall elevations, is hydraulically connected to the same waterway segments as the lost storage volumes, and will not result in restricted flows. Additionally, although the majority of the project is eligible for limited project status, there are portions of the project within BLSF that are not eligible for limited project status. However, the proposed work within the BLSF area is being compensated at the elevations listed in Table 4 below, and the BLSF performance standards are being met. Table 4 below provides a summary of cut, fill and flood storage compensation provided:

Table 4: Cut/Fill Across the Project & Compensatory Flood Storage

Elevation (FT)	Incremental Net Cut/Fill Volume (CF)	Storage Cut Volume (CF)	Total Net Cut/Fill Volume (CF)
34-35	301	-921	-620
35-36	-159	-1,400	-1,559
36-37	2,197	-1,151	1,046
37-38	2,033	0	2,033
38-39	1,305	0	1,305
39-40	5,246	0	5,246
40-41	2,207	0	2,207
41-42	-726	0	-726
42-43	79	0	79
43-44	-4,458	0	-4,458
44-45	-1,980	0	-1,980
45-46	-1,495	0	-1,495
46-47	-1,490	0	-1,490

47-47.1	-79	0	-79
TOTAL	**2,982**	**-3,472**	**-490**

*see Figure 7A-7H in Appendix C

The project is not increasing the FEMA Base Flood Elevations. A hydraulic study of Proctor Brook was done that included the increase in peak rates due to the increase in impervious area. The proposed reconstruction of culvert No. 1 at Sta. 329+85 and culvert No. 2 at Sta 346+20 with larger box culverts to increase flows through the culverts beneath the proposed shared-use path will not result in increase to the Base Flood Elevation (BFE) or downstream flooding.

10.57(4)(a)(2) Restriction of Flows:

The proposed work will redevelop the existing previously disturbed and degraded area associated with the former B&M railroad track bed, which is currently located within BLSF. The work will include the activities associated with replacements of the cross culverts to promote unrestricted flows under the proposed shared-use path. Therefore, the proposed improvements will not restrict flows so as to cause an increase in flood stages on flow velocities, in compliance with this standard.

10.57(4)(a)(3) Shall Not Impair Wildlife Habitat:

The proposed site alterations within BLSF will not adversely impact portions of the BLSF found to be significant to the protection of wildlife habitat nor its capacity to provide wildlife habitat functions. The proposed alterations are located outside areas depicted as “priority habitat or rare species” and “estimated habitat of rare wildlife” as depicted on the 2021 Massachusetts Natural Heritage Atlas. The project area is comprised of disturbed and degraded areas associated with the former B&M railroad, which is surrounded by Proctor Brook, BVWs and adjacent intermittent streams. However, project activities will not negatively impair wildlife habitat, and, on the contrary, are expected to result in improved wildlife passage beneath the proposed path due to larger culvert openings, as well as improved wildlife habitat functions. The site is currently degraded, overgrown with invasives and brush, and contains a lot of debris and garbage. These are anticipated to be addressed by this project resulting in improved wildlife habitat functions. With the dominance of invasive and/or noxious plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings, the proposed work will only result in a net improvement to wildlife habitat. Additionally, a Wildlife Habitat Evaluation was performed and concluded that an Appendix B WHE is not required for this project because there are no Important Habitat Features found on or even around the areas of Bank proposed for alteration (see Appendix D for Wildlife Habitat Evaluation).

Riverfront Area

Riverfront Area associated with Proctor Brook extends over 294,400 square feet of the project site. The work proposed in the Riverfront Area includes construction of the Independence Greenway Extension along the former B&M railroad right-of-way, the replacement of existing stream crossings, construction of a light duty timber boardwalk structure supported on helical piles and associated work necessary to achieve the project purpose.

The railroad that formerly operated on the subject property was constructed in approximately 1848-1849 and was opened for service in 1850 as the Salem & Lowell Branch of the Lowell & Lawrence Railroad. The Salem & Lowell Branch ran between Peabody and Tewksbury, Massachusetts. Operation of the Lowell &

Lawrence Railroad was taken over by the Boston & Lowell Railroad in 1858, which operated on the subject property until the tracks were leased by the Boston & Maine Railroad in 1887. Trains using the subject property provided both passenger and freight service for several decades until passenger service was discontinued on the Salem & Lowell Branch in 1932. Freight service between Peabody and West Peabody (including the proposed project site) continued until 1962, and freight service from West Peabody to South Middleton (west of the proposed project site) continued until 1980. The entire Salem & Lowell branch was formally abandoned in 1987.

As a result of the project site's history as an abandoned railroad, the ground surface within the former railroad bed is mixed with the remains of the materials typically used for construction of railroads, such as track ballast and railroad ties. Additionally, in the years since the railroad was abandoned, the already degraded site has since been degraded even further with the presence of discarded waste, debris, trash, and overgrown invasives.

This proposed work will occur within previously degraded Riverfront Area, and therefore meets the requirements for review under Redevelopment: 10.58(5). The Riverfront Area associated with Proctor Brook in this area is located with an abandoned railroad bed and has a significant amount of debris and trash that has collected in the area over the years. Additionally, the area has had significant erosion and culverts have failed and washed out. While the area is not impervious or developed, it is significantly disturbed and degraded and therefore meets the requirements as a Redevelopment project.

In addition, a large portion of the project within the existing railroad right-of-way falls under the limited project provisions listed in 310 CMR 10.53(6) and 310 CMR 10.53(3)(i) as well as 310 CMR 10.53(3)(j) and 10.53(3)(f). See Figure 2 in Appendix C for the portions of the project that are within each of the above limited project provisions.

General Performance Standards for Riverfront Area, as set forth in 310 CMR 10.58(4), are addressed as described below:

(a) Protection of other Resource Areas: The affected Riverfront Area includes BVWs, Inland Bank, BLSF and Buffer Zones. The project will comply with the performance standards as described above in previous sections of this narrative.

(b) Protection of Rare Species: As indicated previously in this Narrative, there are no threatened or endangered species, or species of concern, in the project area.

(c) Practicable and Substantially Equivalent Economic Alternative: This project evaluated several Practicable and Substantially Equivalent Economic Alternatives to the proposed design in order to select the design that avoids, minimizes, and mitigates all wetland resource area impacts to the maximum extent practicable. A thorough Alternatives Analysis was conducted and is included in Section 4.0 of this report.

(d) No Significant Adverse Impact: The project will result in an increase in impervious area. Most of the permanent work will occur within a Riverfront Area that is previously degraded by the fill associated with the former railroad track bed and embankments. The work associated with culvert replacements may partially encroach into undeveloped portions of the Riverfront Area; however, those impacts are unavoidable due to the need to replace the existing culverts. No significant adverse impacts are anticipated, since all impacts have been minimized to the maximum extent practicable and the area will be stabilized upon completion of construction.

When work that redevelops previously developed Riverfront Areas is proposed, the following criteria from 310 CMR 10.58(5) need to be complied with:

(a) At a minimum, proposed work shall result in an improvement over existing conditions of the capacity of the Riverfront Area to protect the interests identified in M.G.L. c.131,§40. When a lot is previously developed but no portion of the Riverfront Area is degraded, the requirements of 310 CMR 10.58(4) shall be met.

This project is intended to provide the highest level of service to bikers and pedestrians that can be utilized for recreation or for short-range trips to businesses or other destinations along the Greenway. The project mostly alters previously disturbed and degraded Riverfront Area, and within the limits of the project area, minimal space is present where improvements to the Riverfront Area could be realized. Since most of the Riverfront Area within the project corridor is degraded, and as such there is no need to meet requirements of 310 CMR 10.58(4). The work within small undeveloped portions of the Riverfront Area is unavoidable due to culvert replacements, associated regrading and placement of the erosion and sediments controls to protect nearby BVWs. Where possible, disturbed areas will be loamed and seeded. Portions of the Riverfront Area within the project corridor and near the reconstructed stream crossings which are currently degraded, overgrown with invasives and brush, and contain a lot of debris and garbage will be improved as a result of this project. Mitigation for impacts to Riverfront Areas at a ratio of 1:1 was considered for this project. However, mitigation at a 1:1 ratio was determined to be infeasible due to limited space within the Right of Way and due to the fact that the area surrounding the project is primarily already developed and degraded riverfront. Local options for restoration or replication of disturbed areas outside of the project area are also not available due to the surrounding land uses consisting of mostly residential and paved areas. Herbicide treatment of invasive plants currently existing within the project limits and as directed will occur as part of this project in accordance with MassDOT specifications for Invasive Plants Management (Items 102.3 and 102.33). The MassDOT Special Provisions for Invasive Plants Management specify that all herbicide application shall conform to Massachusetts Pesticide Laws and Regulations per the Massachusetts Department of Agricultural Resources (MDAR) Pesticide Bureau. Mixing, applying and/or disposing of herbicides shall always be in accordance with instructions on their labels and all applicable federal, state, and local regulations. Mixing shall not occur within sensitive areas, wetlands, or buffer zones. Additionally, the contractor shall not spray 2 hours prior to precipitation, during rain, or during windy conditions and shall be responsible for monitoring weather conditions and adjusting the work schedule as appropriate for the herbicide and application method to be used. Item 102.33 also specifies that a written Invasive Plant Management Strategy (IPMS) proposal must be submitted for approval by the Engineer and MassDOT Landscape Architect at least thirty (30) days prior to construction activities and/or any proposed treatment.

(b) Stormwater management is provided according to Massachusetts Stormwater Management Standards, as can be seen in Appendix F to this Application.

This project provides an opportunity to improve the existing drainage system and improve the quality of stormwater runoff discharged to adjacent wetlands. This project will incorporate the installation of practical Best Management Practices (BMPs). Retrofitting of outfall locations with stone for pipe ends to provide splash pads for stormwater discharges will reduce erosion and movement of sediment into the waterbodies. Additionally, new catch basins have been proposed to replace existing catch basins where proposed roadway geometry differs from existing conditions. Sediment filters (silt sacks) will be installed at all existing and proposed drainage structures and maintained and cleaned as required to maintain their effectiveness. Catch basins, drain manholes and storm drain pipes will be cleaned of sediment and debris after the completion of construction. Sediment collected in structures will be disposed of properly and covered, if

stored on-site. A stormwater BMP (infiltration trench) will be installed to help with peak rate attenuation and improve water quality. All proposed drainage improvements will maintain historic drainage patterns, distributing runoff to the existing discharge points, and will be done in a manner that will limit the impacts to adjacent resource areas. These improvements may contribute to improved water quality and drainage characteristics; therefore, contributing to the interests of the WPA (public or private water supply, to ground water supply, to flood control, to storm damage prevention, to the prevention of pollution and to the protection of fisheries and wildlife habitat).

(c) Within 200-foot Riverfront Areas, proposed work shall not be located closer to the river than existing conditions or 100 feet, whichever is less, or not closer than existing conditions within 25 foot Riverfront Areas, except in accordance with 310 CMR 10.58(5)(f) or (g).

Majority of proposed work will occur as close to the river as the present limits of areas degraded by the former railroad track bed and embankments. However, due to the project's purpose to extend the existing Independence Greenway along the former B&M railroad right-of-way, the existing stream crossings beneath it require to be replaced; therefore, small portions of this work associated with stream crossing replacements may be located closer to the river than existing conditions. The limit of work has been minimized to the maximum extent practicable, and the area will be stabilized and restored to the maximum extent feasible upon completion of work.

(d) Proposed work, including expansion of existing structures, shall be located outside the riverfront area or toward the riverfront area boundary and away from the river, except in accordance with 310 CMR 10.58(5)(f) or (g).

Most of the permanent work will be located within the area previously disturbed, due to the present limits of areas degraded by the former railroad track bed. Areas disturbed by culvert reconstruction and regrading within the Riverfront Area will be stabilized upon completion of construction to the maximum extent practicable.

(e) The area of proposed work shall not exceed the amount of degraded area, provided that the proposed work may alter up to 10% if the degraded area is less than 10% of the riverfront area, except in accordance with 310 CMR 10.58(5)(f) or (g).

The amount of work in the Riverfront Area is 103,288 square feet of the 294,400 square feet of the total Riverfront Area within the project area. Approximately 35 percent of the Riverfront Area will be affected by the proposed work. Of the 103,288 square feet of affected Riverfront Area within the project area, most of the resource area is already degraded by the former railroad track bed. Disturbances within the Riverfront Area associated with culvert replacements and regrading have been minimized to the maximum extent practicable and the area will be stabilized upon completion of construction.

(f) When an applicant proposes restoration on-site of degraded riverfront area alteration may be allowed notwithstanding the criteria of 310 CMR 10.58(5)(c), (d), and (e) at a ratio in square feet of at least 1:1 of restored area to area of alteration not conforming to the criteria. Areas immediately along the river shall be selected for restoration. Alteration not conforming to the criteria shall begin at the riverfront area boundary. Restoration shall include:

1. removal of all debris, but retaining any trees or other mature vegetation;
2. grading to a topography which reduces runoff and increases infiltration;
3. coverage by topsoil at a depth consistent with natural conditions at the site; and

4. seeding and planting with an erosion control seed mixture followed by plantings of herbaceous and woody species appropriate to the site;

The project proposes restoration of the degraded Riverfront Area within the former railroad right-of-way. The proposed restoration within the Riverfront Area will include removal of debris and invasives, regrading, wetland restoration and replication, as well as areas of landscape improvements. With the dominance of invasive and/or noxious plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings and adjacent landscape improvements, the proposed work, as designed, is expected to result in a net improvement to wildlife habitat across the project. Existing areas that are currently degraded by the presence of invasive plants, debris, and garbage will be improved by the proposed work which will involve herbicide treatment of invasive plants currently existing within the project limits and as directed will occur as part of this project in accordance with MassDOT specifications for Invasive Plants Management (Items 102.3 and 102.33) as well as the removal of debris and garbage from the project site. All areas will be stabilized upon completion of the work.

(g) When an applicant proposes mitigation either on-site or in the riverfront area within the same general area of the river basin, alteration may be allowed notwithstanding the criteria of 310 CMR 10.58(5)(c), (d), or (e) at a ratio in square feet of at least 2:1 of mitigation area to area of alteration not conforming to the criteria or an equivalent level of environmental protection where square footage is not a relevant measure. Alteration not conforming to the criteria shall begin at the riverfront area boundary. Mitigation may include off-site restoration of riverfront areas, conservation restrictions under M.G.L. c. 184, §§ 31 to 33 to preserve undisturbed riverfront areas that could be otherwise altered under 310 CMR 10.00, the purchase of development rights within the riverfront area, the restoration of bordering vegetated wetland, projects to remedy an existing adverse impact on the interests identified in M.G.L. c. 131, § 40 for which the applicant is not legally responsible, or similar activities undertaken voluntarily by the applicant which will support a determination by the issuing authority of no significant adverse impact. Preference shall be given to potential mitigation projects, if any, identified in a River Basin Plan approved by the Secretary of the Executive Office of Environmental Affairs.

The project proposes restoration of the degraded Riverfront Area within the former railroad right-of-way. With the dominance of invasive and/or noxious plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings and adjacent landscape improvements, the proposed work, as designed, is expected to result in a net improvement to wildlife habitat across the project. Existing areas that are currently degraded by the presence of invasive plants, debris, and garbage will be improved by the proposed work which will involve herbicide treatment of invasive plants currently existing within the project limits and as directed will occur as part of this project in accordance with MassDOT specifications for Invasive Plants Management (Items 102.3 and 102.33) as well as the removal of debris and garbage from the project site. All areas will be stabilized upon completion of the work.

(h) The issuing authority shall include a continuing condition in the Certificate of Compliance for projects under 310 CMR 10.58(5)(f) or (g) prohibiting further alteration within the restoration or mitigation area, except as may be required to maintain the area in its restored or mitigated condition. Prior to requesting the issuance of the Certificate of Compliance, the applicant shall demonstrate the restoration or mitigation has been successfully completed for at least two growing seasons.

The project proposes restoration of the degraded Riverfront Area within the former railroad right-of-way. With the dominance of invasive and/or noxious plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings and adjacent landscape improvements, the proposed work, as designed, is expected to result in a net improvement to wildlife habitat across the project. Existing areas that are currently degraded by the presence of invasive plants, debris, and garbage will be improved by the proposed work which will involve herbicide treatment of invasive plants currently existing within the project limits and as directed will occur as part of this project in accordance with MassDOT specifications for Invasive Plants Management (Items 102.3 and 102.33) as well as the removal of debris and garbage from the project site. All areas will be stabilized upon completion of the work.

Buffer Zone

The majority of the project corridor is located within the 100-foot Buffer Zone to the BVWs and Banks of the intermittent streams. The project will result in approximately 54,594 SF of Buffer Zone impacts. Erosion and sediment control Best Management Practices (BMPs) will be installed during construction to protect adjacent resource areas, which will temporarily impact the buffer zones. These BMPs ensure the land disturbance within the Buffer Zone does not negatively impact resource areas and will secure the protection of the interests of the Act they are supporting.

Local Bylaw Buffer Zones

Portions of the project corridor are located within the Local "No Disturb Zones" subject to local bylaw regulations. Since this project is a public project proposed by the City of Peabody, which also includes replacement of water dependent structures, it falls under the circumstances where limited wetland alteration necessary to accomplish the goals of the project may be permitted under the provisions of Section 32-36 of the local ordinance.

The work within these buffer zones has been designed to minimize impacts to the buffer area to the maximum extent practicable. Erosion and sediment control Best Management Practices (BMPs) will be installed during construction to protect adjacent resource areas, which will temporarily impact the buffer zones. These BMPs ensure the land disturbance within the Buffer Zone does not negatively impact resource areas.

2.2.3 Compliance with Massachusetts River and Stream Crossing Standards

The existing 24-inch diameter CMP culvert at Sta. 342+20 conveys a hydrological connection between Proctor Brook and the BVW V-series beneath the former railroad bed; therefore, the replacement of this culvert is not required to meet the MA Stream Crossing General Standards (SCGS). However, the proposed stone for pipe ends on the outlet side of the culvert in Proctor Brook will be topped with a 12-inch layer of natural streambed in order to reestablish natural substrate upon completion of construction.

The compliance of each stream crossing with the Massachusetts River and Stream Crossing Standards are summarized in Table 5 below.

Table 5: Compliance with Massachusetts River and Stream Crossing Standards

Stream Crossing (STA. #)	SCGS #1	SCGS #2	SCGS #3	SCGS #4	SCGS #5	SCGS #6
Culvert No. 1 Replacement at STA. 329+85	Not met	Partially Met	Not met	Met	Met	Met
Culvert Replacement STA. 340+10	Not met	Met	N/A	Met	Met	Not met
Culvert No. 2 Replacement at STA. 346+20	Not met	Partially Met	Met	Met	Met	Met
Prop. Timber Boardwalk at STA. 351+50	Met	N/A	Met	N/A	Met	Met
Culvert Replacement at STA. 358+51	Not met	Not met	N/A	Not met	Met	Not met

The proposed replacement concrete box culverts at Sta. 329+85 and Sta. 346+20 achieve partial compliance with the Massachusetts River and Stream Crossing Standards (revised March 2011) as discussed below and summarized in Table 5 above. SCGS #1 cannot be complied with for either culvert. An open bottom culvert requires the installation of a footing which will result in significantly more excavation and, as a result, significantly more impacts within the surrounding wetland resource areas.

The proposed timber boardwalk pedestrian bridge at Sta. 351+50 achieves compliance with the Massachusetts River and Stream Crossing Standards by conforming with the SCGS #1, #3, #5, and #6. SCGS #2 and SCGS #4 do not apply.

The proposed embedded 36-inch diameter DIP culvert at Sta. 340+10 and the proposed 16-inch DIP culvert Sta. 358+51 both convey intermittent streams under the former railroad bed. These culverts will achieve partial compliance with the MA SCGSs as discussed below and summarized in Table 5 above.

SCGS #1 posits that "*Spans (bridges, 3-sided box culverts, open-bottom culverts or arches) that preserve the natural stream channel are strongly preferred*." The project proposes the replacement of the existing undersized culverts with larger box culverts. The existing culverts are not open bottom, and replacement of the culverts with open bottom structures is not feasible in order to expeditiously complete the replacement of the culverts, without disturbing substantially more adjacent resource areas and established site hydrology. An open bottom culvert requires the installation of a footing which will result in significantly more excavation and fill within the surrounding wetland resource areas. Therefore, this standard cannot be complied with. The proposed timber boardwalk pedestrian bridge at Sta. 351+50 will preserve Proctor Brook's natural stream channel and therefore complies with SCGS #1.

SCGS #2 provides recommendations for a culverted crossing to be embedded a minimum of 2 feet for box culverts or at least 25% for round pipe culverts. When embedment material includes elements > 15 inches in diameter, embedment depths should be at least twice the D84 (particle width larger than 84 % of particles) of the embedment material.

As shown in the Plans, the proposed concrete box replacement Culverts 1 and 2 will be embedded 12 inches with a natural streambed material proposed in the bottom of Culverts 1 and 2 at the same elevations as the existing surface. Embedding of these box culverts to the depth of 2 feet is not feasible due to the need to maintain the distance between the bottom of the structures and the existing 42-inch sewer lines located below both crossings, as shown on the Culvert 1 and Culvert 2 Plan and Longitudinal Section sheets in Appendix G. Considering that the embedment depth of a minimum of 2 feet for box

culverts is recommended in order to prevent streambed washout, and ensure compliance and long-term success of the proposed replacement stream crossing, the proposed design at both culverts includes concrete baffles in the bottom of box culverts to help hold the 12-inch layer of natural streambed in place and prevent washouts.

The proposed 36-inch culvert at Sta 340+10 will be embedded 12-inches, which exceeds the recommended minimum embedment depth of 25% for the round pipe culverts. This culvert was upsized in order to be embedded to provide a layer of natural streambed to match the existing surface elevations.

The proposed 16-inch DIP conveying an intermittent stream beneath the proposed bikeway at Sta 358+51 is not being embedded due to the small diameter of the culvert under both the existing and proposed conditions; upsizing this culvert significantly to allow for embedment and placement of natural streambed within it is precluded due to the hydraulic requirements. In addition, significantly upsizing this culvert to be embedded to provide enough room for placement of the natural streambed material would result in the need to elevate the profile of the bike path at this location, resulting in more impacts to the existing Bank of the stream as well as fill within the 100-year floodplain.

SCGS #3 calls for a new span to incorporate a width that, at a minimum, equals 1.2 times bankfull width of the stream.

- Proposed Culvert 1 (Sta. 329+85) – The existing bankfull width is approximately 19', however, the existing twin culvert spans approximately 7 feet and therefore does not comply with the SCGS. The proposed span of the culvert replacement is 8 feet. Although the proposed span still does not meet the SCGS of 1.2 times bankfull width, this is an improvement upon the existing conditions and meets the standards to the maximum extent practicable. It is not feasible to replace the culvert with a span greater than 8 feet, without disturbing substantially more adjacent resources areas and the established site hydrology. The culvert was sized using hydrological calculations to ensure no potential flooding of the properties and infrastructure will occur as a result of this replacement. Overall, in order to expeditiously complete the replacement of the culvert, without disturbing substantially more adjacent resource areas and established hydrology, additional widening of the passage is precluded. Therefore, this standard is met to the MEP.

- Proposed Culvert 2 (Sta. 346+20) – The bankfull width of the stream at the location of Culvert 2 is approximately 6 feet. The proposed culvert replacement has a span of 8 feet, which approximately 1.33 times the bankfull width of the stream, and therefore meets SGS #3.

- Proposed Timber Boardwalk Pedestrian Bridge (Sta. 351+50) – The bankfull width of the stream at the location of the proposed timber boardwalk is approximately 35 feet. The span of the proposed timber boardwalk is approximately 437 feet which greatly exceeds the minimum of 1.2 times the bankfull width of the stream in order to avoid greater impacts to surrounding resource area, and therefore meets SCGS #3.

- Proposed embedded 36-inch DIP culvert (Sta. 340+10) – Per ACOE terminology, an intermittent stream has flowing water during certain times of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow. Since this culvert conveys an intermittent stream that does not have a year-round flow, this standard is not applicable. However, the proposed design evaluated all opportunities for improvement recommended by the MA Stream Crossing standard. The approximate width of the intermittent stream during the flow

period both at the culvert inlet and outlet is approximately 9 feet. The existing 30-inch CMP is proposed to be replaced with the 36-inch DIP culvert, that will be embedded 12 inches with a layer of natural streambed material in the bottom of it to meet the existing surface elevations. Therefore, the proposed design results in an improvement upon the existing conditions at this stream crossing by embedding the culvert 12 inches and, therefore, increasing the width of the crossing at this location.

- Proposed 16-inch DIP culvert (Sta. 358+51) – As mentioned above, this standard is not applicable to intermittent streams. However, the proposed design evaluated all opportunities for improvement recommended by the MA Stream Crossing standard. The width of the intermittent stream both at the culvert inlet and outlet is approximately 9 feet. The existing 15-inch RCP is proposed to be replaced with the 16-inch DIP culvert, which is an improvement upon the existing conditions at this stream crossing. Since this culvert is conveying and an intermittent stream beneath the existing railroad bed, significant widening of the crossing is precluded due to the hydraulic requirements and to maintain a shallow for depth of cover required to avoid additional fill within the 100-year floodplain.

SCGS #4 calls for placement of natural substrate within the structure. As shown in the Plans, the proposed replacement Culverts 1 and 2 will utilize concrete box culvert span-type structures of larger dimensions than existing culverts and will accommodate 12 inches of natural streambed material in the bottom. In addition, natural streambed material will be placed on top of the riprap in the areas of scour countermeasures outside of the culverts in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction.

The proposed embedded 36-inch culvert at Sta. 340+10 and the proposed 16-inch culvert Sta. 358+51 both convey intermittent streams under the former railroad bed; placement of the stone at pipe ends is required to prevent scour. As shown on the plans, a 12-inch layer of natural streambed material will be placed on top of the stone for pipe ends at Sta 340+10 within the stream areas in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The proposed measures will result in providing a smooth transition from upstream to downstream of the crossing upon completion of construction.

SCGS #5 calls for "… *bed forms and streambed characteristics so that water depths and velocities are comparable to those found in the natural channel at a variety of flows*." The proposed Culverts 1 and 2 have been designed to provide as much accommodation to the existing channel as possible, and natural stream bed will allow for a smooth transition from upstream to downstream of each crossing upon completion of construction. Natural streambed material will be placed on top of the riprap in the areas of scour countermeasures outside of the culverts in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The proposed timber boardwalk pedestrian bridge will preserve Proctor Brook's existing streambed characteristics. The proposed 36-inch Culvert at Sta. 340+10 will be embedded 12-inches with a layer of natural streambed material in the bottom of the culvert to meet the existing surface elevations. In addition, natural streambed material will be placed on both ends of the culvert on top of the stone for pipe ends in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The proposed 16-inch DIP culvert at Sta. 358+51 will also maintain the existing streambed characteristics. Due to a very small area of riprap at the inlet and outlet at the proposed 16-inch DIP culvert at Sta. 358+51, no natural streambed layer is proposed; however, due to the location and the flow of this intermittent stream in the west-to-east directed, it is expected to be naturally reestablished shortly upon completion of construction.

SCGS #6 provides a desired level of "*openness*" for stream crossings so that wildlife will utilize the crossing for passage beneath a roadway. The desired ratio of cross-sectional area of opening to passage length is a minimum value of 0.82 feet. The embedded portion of a culvert is not included in the calculation of cross-sectional area for determining openness.

- Proposed Culvert 1 (Sta. 329+85) – A cross-sectional area of 24 square feet for the proposed culvert, divided by a passage length of 24 feet, both as shown in the Plans, yields a value of 1 foot.
- Proposed Culvert 2 (Sta. 346+20) – A cross-sectional area of 24 square feet divided by a passage length of 18 feet, both as shown in the Plans, yields a value of 1.33 feet.
- Proposed Timber Boardwalk Pedestrian Bridge (351+50) – A cross-sectional area of approximately 368 feet divided by a passage length of 13 feet, both as shown in the Plans, yields a value of 28.27 feet.
- Proposed embedded 36-inch DIP culvert (Sta. 340+10) – A cross-sectional area of the existing 30-inch CMP is approximately 4.9 square feet, divided by a passage length of 20 feet, both as shown in the Plans, yields a value of 0.24 feet. As mentioned above, upsizing this culvert significantly to allow to increase a level of "openness" is precluded due to the hydraulic requirements. The proposed 36-inch embedded replacement culvert's cross-sectional area is 5 square feet, therefore, though it is an improvement over existing conditions, it is not able to meet Standard #6 by providing a minimum level of openness of 0.82 feet.
- Proposed DIP culvert (Sta. 358+51) - A cross-sectional area of the existing 15-inch culvert is approximately 2.5 square feet. The proposed cross-sectional area of the 16-inch DIP culvert is 2.6 square feet, both divided by a passage length of 25 feet yield a value of approximately 0.1 feet. Therefore, the proposed replacement culvert is not able to meet Standard #6 by providing a minimum level of openness of 0.82 feet due to the. As mentioned above, upsizing this culvert significantly to allow to increase a level of "openness" is precluded due to the hydraulic requirements and to avoid additional impact the BLSF and the Bank of the stream.

As shown above, the proposed replacement of the perennial stream culverts and the proposed timber boardwalk pedestrian bridge are all able to meet Standard #6 by providing a minimum level of openness of 0.82 feet.

2.2.4 Stormwater Management

Stormwater management for this project has been designed in compliance with the Stormwater Management Standards as outlined in 310 CMR 10.05(6)(k) through (q) and defined in detail in the DEP's Stormwater Management Handbook. The project has been designed to minimize the impacts to nearby resource areas from both the construction and operation of the proposed project.

To improve upon existing conditions, stormwater runoff contributing to one of the existing discharge points will have a portion of the catchment area routed to a treatment SCM prior to discharge. The proposed SCM is an infiltration trench located in the median adjacent to the proposed shared use path along North Shore Road, between the shared-use path and Route 128 (Northbound). While the location of this proposed infiltration trench is outside of WPA jurisdiction, the proposed infiltration trench will still help improve the quality of discharged stormwater from the overall project. Due to the close proximity of wetlands to the proposed shared-use path throughout the rest of the project, as well as the seasonal high groundwater elevation and presence of existing utilities, it is not possible to provide additional infiltration SCMs within WPA jurisdiction. Additionally, new catch basins have been proposed to replace existing catch basins at certain locations where proposed roadway geometry differs from existing conditions. New

catch basins are also proposed where the new Independence Greenway Extension proposes a higher ground elevation than existing conditions and existing headwalls/culverts will no longer be utilized along North Shore Road. The proposed catch basins will have deep sumps and hoods to provide additional treatment. This project also includes the replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the former track bed. All proposed drainage systems will maintain the historic drainage patterns, distributing runoff to the existing discharge points. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge.

A full Stormwater Management Report documenting compliance with the DEP's Stormwater Management Standards, including required calculations and description of methodology, is attached as Appendix F to this report.

2.2.5 Rare Species

The project site is not located within an area designated as a Priority Habitat of Rare Species or Estimated Habitat of Rare Wildlife by the Natural Heritage & Endangered Species Program (NHESP) 2021 Maps. No certified vernal pools are located in proximity to the project area. The closest potential vernal pool (PVP18854) is located approximately 300 feet west of the project limit, below the current boundary of the Independence Greenway behind the North Shore Lahey Clinic. The project activities are not expected to negatively affect this vernal pool. A combination of erosion and sediment control measures will be installed as shown on the attached plan set in the vicinity of the resource areas, therefore, the above areas will not be affected during construction.

2.2.6 Water Quality

Per MassGIS online data mapping, there are no stormwater "critical areas" are defined in MassDEP's wetland regulations as Outstanding Resource Waters (ORW), Special Resource Waters, recharge areas for public water supplies or cold-water fisheries either crossing or located adjacent to the project area. (See Figure 3).

2.2.7 Area of Critical Environmental Concern

Per MassGIS online data mapping, the project site is not located within an Area of Critical Environmental Concern (ACEC). (See Figure 3).

2.3 AVOIDANCE, MINIMIZATION AND MITIGATION MEASURES

In addition to the above-described avoidance, minimization and mitigation measures, some project activities will contribute to the interests of the WPA:

- Reconstruction of the culvert crossings conveying Proctor Brook beneath the former railroad track bed with larger openings and a natural stream bottom will contribute to improved animal movement along the abandoned railroad right-of-way, potentially create and/or improve the escape cover and breeding habitat.
- As a result of this project, the presently degraded area will be cleared from the existing debris, remains of former washed out infrastructure, garbage, invasives and brush, thereby contributing to the interests of the Act. Corrective measures shall be taken to remove or treat invasive plant

species. The strategy for chemical and/or manual removal shall be in accordance with MassDOT specifications for Invasive Plants Management (Items 102.3 and 102.33).

- Construction of the proposed stream crossing replacements will contribute to the enhanced flood control and storm damage prevention.

The project will not impact the capacity of the resource areas to prevent or reduce contamination or damage to fish; and to serve as their habitat and nutrient source. There are no land containing shellfish or NHESP Estimated or Priority Habitats of Rare Wildlife habitat located within or in close proximity to the project area, therefore the project will not negatively impact these interests of the WPA.

A summary of all of the project's proposed mitigation measures, including the location and size of each measure, is included in Table 6 below.

Table 6: Summary of Mitigation Measures

Mitigation Measure	Location (STA.)	Total Area (SF)
Wetland Replication	STA. 327+00	2,500 SF
Wetland Restoration	STA. 329+85, 340+10, 342+20, 346+20, 346+90, 352+00	4,271 SF
Compensatory Flood Storage	STA. 355+50	1,690 SF / 3,472 CF
Streambed Restoration	STA. 329+85, 340+10, 342+20, 345+50, 346+20	10,343 SF
Vegetated Riprap	STA. 329+85, 346+20	2,215 SF
Infiltration Trench	STA. 310+50	1,600 SF / 1,414 CF

2.3.1 Alternatives Analysis

Several alternatives were considered and evaluated for this project throughout the design process in order to avoid, minimize, and mitigate all impacts to the maximum extent practicable. Alternatives for the project included the "No-Build Alternative". The "No-Build Alternative" would lead to the bikeway extension not being constructed. Since the intent of this project is to extend the Independence Greenway by constructing a continuous shared-use path for bikers and pedestrians in order to continue the development of the Independence Greenway for Peabody's residents and visitors and as an important community and regional greenway network, therefore, the "No-Build Alternative" will not meet the purpose and need of the project, and it was therefore dismissed from further consideration.

A variety of alternatives were evaluated during the planning stages of the project. Options such as alternative sites, alternative alignments, and typical cross sections were evaluated. The primary purpose of the project was to develop a connection from the existing Peabody Independence Greenway path to the greater Border to Boston Trail, a developing shared use path network that will stretch 70 miles between the

MA-NH state line and Boston. An alternative that involved using Warren Street extension as a segment of the path was also evaluated; however, one of the major design considerations was avoiding placing the shared use path for bicyclists and pedestrians directly adjacent to an existing high-traffic roadway in order to promote safety. Additionally, this alternative location would not keep the shared use path as a linear connection, another one of the primary design goals for the project.

Additionally, options for narrowing sections of the shared use path, when wetland resources would be impacted, were also considered in order to reduce the overall resource area impacts of the project. However, the minimum width for a shared use path is 10 feet per MassDOT PDDG Section 11.4.1.1 and the minimum shoulder width for a shared use path is 2 feet per MassDOT PDDG Section 11.4.1.2 and therefore these options were not feasible and therefore were not developed into substantial alternatives. While the path was not able to be narrowed in order to avoid wetland impacts, the grade of the proposed pathway was lowered to the maximum extent feasible to reduce floodplain impacts, the slide slopes of the path were tightened as much as possible, and a boardwalk with helical piles was proposed in lieu of traditional foundations to avoid large amount of fill within the floodplain and wetlands. The proposed depth of riprap is the minimum amount required to provide scour counter measures at the culverts in order to mitigate greater impacts to the brook while also meeting the project goals of restoring the natural streambed and preventing future scour.

Several different stormwater best management practices were also evaluated in various locations throughout the project, including environmentally sensitive site design, low impact development techniques that minimize land disturbance and impervious surfaces, structural stormwater best management practices, pollution prevention, erosion and sedimentation control, and proper operation and maintenance of stormwater best management practices. Primarily, infiltration SCMs were considered for the project in various locations; however, only one location was found to be feasible for an infiltration SCM due to limited space constraints, the seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. The only location that was found feasible for an infiltration SCM is the location of the proposed infiltration trench located adjacent to the proposed shared use path along North Shore Road, between the shared-use path and Route 128 (Northbound). While the location of this proposed infiltration SCM is outside of WPA jurisdiction, the proposed infiltration trench will still help improve the quality of discharged stormwater from the overall project. Due to the close proximity of wetlands to the proposed shared-use path throughout the rest of the project, as well as the seasonal high groundwater elevation and presence of existing utilities, it is not possible to provide additional infiltration SCMs within WPA jurisdiction. Additionally, drywells were considered for additional stormwater treatment, but these provide very little stormwater treatment volume, require 2 feet of separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points. Another alternative that was evaluated for this project was the use of proprietary devices at each discharge point for the stormwater treatment volume, but due to the majority of the site discharging runoff via overland flow, these systems are not practical for this project.

The following alternatives detailed below reflect the alternatives that were deemed the most feasible in order to meet the objectives of the project while also minimizing the environmental impacts to the maximum extent practicable. Each of the alternatives below more thoroughly detail the proposed alternatives that were carefully evaluated, and each reflect the above-described efforts to avoid, minimize, and mitigate environmental impacts while still meeting the project's purpose.

This section describes the alternatives for the major features, broken down by segment, of the proposed Greenway Extension that were analyzed and considered during the design process.

SCOUR COUNTERMEASURES AND BANK PROTECTION ALTERNATIVES:

In addition to evaluating a variety of different alternatives for the locations and design of the pathway segments, various alternatives for the areas of riprap placed for slope stabilization in BVWs adjacent to the top of the bank associated with Proctor Brook near the proposed Culverts No. 1 (Sta. 329+85) and No. 2 (Sta. 340+10) were evaluated in order to select the alternative with the least impacts to the surrounding resource areas. The alternatives analysis that was conducted for the rip rap areas is listed in Table 6 below.

Table 6 Alternatives for Rip Rap at Culvert Inlets/Outlets

Alternative	Details/Reason for Selection/Dismissal
Riprap for Scour Protection and Bank Stabilization	Dumped riprap was originally proposed in the riverbed at the proposed culvert inlets and outlets for scour protection. These riprap countermeasures extended slightly into the adjacent BVWs affecting the existing limits of the Bank of Proctor Brook. The proposed design minimized the extent of the required riprap countermeasures at culvert ends to the maximum extent feasible to still be able to provide the required protection from future scour. However, these impacts are unavoidable. The riprap countermeasures were designed in accordance with the guidelines outlined in Hydraulic Engineering Circular No. 14, specifically Chapters 5 and 10. These guidelines were utilized to estimate scour levels at culvert outlets and to develop the design for riprap basins and aprons, respectively. This alternative was modified to address MassDEP comments received during the MEPA ENF Review.
Vegetated Bank without Riprap	Nature-based solutions and biotechnical engineering countermeasures, such as are described in FEMA's document entitled "*Engineering With Nature - Alternative Techniques to Riprap Bank Stabilization*" and FHWA "*HEC 23 - Bridge Scour and Stream Instability Countermeasures Experience, Selection, and Design Guidance Third Edition"* were also evaluated in order to minimize adverse impacts to Bank, LUW and other jurisdictional resource areas. Utilizing natural methods of slope stabilization such as coir logs, willow whips, deeply rooted bunch grasses, keyed logs, etc. is not feasible for the banks steeper than 2:1. The proposed bank is 1.5:1 and, the majority of the reviewed natural methods are not suitable for this incline. Therefore, not utilizing riprap does not achieve the goal of protecting and stabilizing the bank of Proctor Brook near the proposed replacement stream crossings beneath the bike path. It is also required to protect against scour during overtopping flow. Therefore, this alternative was dismissed from further consideration.
Vegetated Riprap for Bank Protection (Selected)	Due to the proposed slope being 1.5:1 at both stream crossing locations (Culvert No.1 and Culvert No. 2), there are limited biotechnical engineering countermeasures for bank stabilization. Most vegetative measures for bank stabilization are only recommended for up to 2:1 slopes. We reviewed the FHWA "*HEC 23 - Bridge Scour and Stream Instability Countermeasures Experience, Selection, and Design Guidance Third Edition*" and determined that one method they provide could be modified for the rip rap slope at Culvert No. 1 and Culvert No. 2. The selected method is to plant live stakes in the voids between the rip rap. Because of the size and depth of the rip rap needed to protect the bank, live stakes will need to be 4 feet in length to allow them to be installed into the granular fill and subsoil under the rip rap. A detail including the species, spacing, and quantities of the live stakes is included in the Vegetated Riprap detail on Sheet 41 of the NOI Plan Set included in Appendix G.

Natural Streambed Restoration within Riverbed (selected)	In order to mitigate the impacts to the LUW of Proctor Brook associated with the high volume of riprap required at the culvert inlets and outlets for scour protection, a 12-inch (minimum) layer of natural streambed material will be placed on top of the riprap to reestablish the natural streambed, and it will match existing invert elevations.

SEGMENT 1: ESSEX CENTER DRIVE: INDEPENDENCE GREENWAY TRAILHEAD TO UNDERPASS UNDER ROUTE 128

Alternative 1: 10-foot-wide travel lanes, five-foot striped bicycle lanes

Alternative 1 proposes to restripe Essex Center Drive with 10-foot-wide travel lanes and five-foot striped bicycle lanes. The bicycle lanes will be located on the outside of the motor vehicle lanes. Roadway widening or reconstruction is not anticipated under this alternative.

The westernmost 400 feet, passing the Lahey Medical Center parking lot from the existing trailhead, will be marked with shared lane markings and appropriate signage under this alternative. This is necessary due to the narrower width of the roadway in this area. This Alternative separates bicyclists from pedestrians, increasing the comfort of the latter relative to that of a shared-use path. However, bicyclists would need to share the roadway with motor vehicles. This represents a change in character from that of the existing bicycle route on the Greenway.

Alternative 2: 11-foot-wide travel lanes, 10-foot-wide multiuse path with buffer

Alternative 2 proposes Essex Center Drive to be reconstructed to provide 11-foot-wide vehicle travel lanes and replacing the existing sidewalk along the south side with a 10-foot-wide raised multiuse path with 5 feet of separation from the roadway. This will continue the character of the Greenway and will increase comfort for Greenway users when compared with on-street lanes. The raised multiuse path would be widened into the existing roadway and beyond the existing sidewalk, while maintaining the existing curb along the north side of Essex Center Drive. A catch basin will need to be constructed at the corner of the intersection with the mall driveway and underpass to replace the existing due to the change in curb line.

Coordination with Northshore Mall and MassDOT has occurred and approval was stated in August 2023 to reconstruct the roadway with horizontal and vertical separation from the proposed shared-use path and to have part of the shared-use path occur within state layout with the City of Peabody maintaining the path. Coordination is ongoing regarding changes to access to the existing trailhead parking area that borders the Mall-owned portion of Essex Center Drive and the Lahey Medical Center. Additionally, to accommodate the continuation of the trail, parking would be prohibited on the south side of the shared roadway section before the sidewalk and bicycle lanes begin. This being stated, separating bicycle traffic from motor vehicle traffic is the preferred alternative for comfort and safety reasons.

SEGMENT 2: UNDERPASS UNDER ROUTE 128 BETWEEN ESSEX CENTER DRIVE AND NORTHSHORE ROAD

Alternative 1: Divert trail users onto sidewalk of the underpass

Alternative 1 proposes to have trail users divert from the proposed bicycle lanes on Essex Center Drive and from the proposed separated path on Northshore Road to use the sidewalk to connect through the underpass under Route 128. Bicyclists coming from the underpass sidewalk would be alerted to walk across Essex Center Drive at a proposed mid-block crossing west of the intersection of Essex Center Drive with the mall roadway to access the proposed westbound bicycle lane on Essex Center Drive. Although this would

have minimal cost, this is not an ideal condition given that the existing sidewalk on the south side of the underpass is less than five feet wide.

Alternative 2: Sign and mark the outside lanes of the underpass as shared lanes, accommodate WB traffic with two stage left turn box and enhanced crossing markings through the Essex Center Drive intersection

Alternative 2 would stripe the outside lanes of the underpass with shared lane markings in each direction, and with appropriate signage alerting roadway users to the presence of the shared use lanes. In addition, this alternative would stripe a bicycle travel path through the intersection at the north end of the underpass to connect to Essex Center Drive. This path of travel would include a two-stage left- turn queue box which will provide bicyclists with a better opportunity to wait for a gap in opposing traffic to turn left. This alternative allows bicyclists to avoid the discomfort of dismounting and walking on the narrow sidewalk of the underpass. However, bicyclists would be requested to cross the underpass road on the roadway surface to continue towards the direction of the existing Greenway trail and thus presents bicyclist comfort and safety issues.

Alternative 3: Convert one roadway lane into 10-foot-wide multiuse path with 2 feet of buffer

As approved per discussion with the Northshore Mall and MassDOT in August 2023, the southbound underpass connecting Essex Center Drive and Northshore Road will be reduced from two to one vehicle lanes to provide a 10-foot-wide raised multiuse path with a 2-foot buffer and vertical separation from the curb abutting the roadway traffic. The roadway would be restriped to have one 11-foot travel lanes with 1.5-foot-wide shoulders. The curb along the roadway median will be maintained. This conversion will continue the character of the Greenway and will increase comfort for Greenway users when compared with on-street lanes in an unlit underpass. Review of existing and projected future traffic volumes indicates that it is not anticipated that the southbound lane reduction will result in traffic blocking Essex Center Drive. This alternative would maintain motor vehicle/bicyclist separation and thus provide the greatest level of safety and comfort amongst the underpass alternatives. A catch basin will need to be constructed to replace the existing catch basin location approximately midway along the underpass due to the change in curb line.

Alternative 4: Seasonal closure of underpass lane for use as shared-use path

A variant of Alternative 3 proposes to close the leftmost southbound underpass lane to motor vehicle traffic during warmer months to provide a shared-use path with temporary bollards separating the path from the remaining lane. The temporary bollards would be removed in colder months when the shared-use path would be less frequently used such that the underpass would maintain two motor vehicle lanes in the southbound direction and bicyclists would dismount to use the remaining sidewalk. This alternative is not recommended as dismounting compliancy may be low and that this alternative would not always provide separation from motor vehicle traffic.

The preferred alternative for the Route 128 underpass is Alternative 3. Continuing the character of the existing shared-use path is important, especially in this section where shading from the overhead roadway would reduce visibility of bicyclists. Maintaining physical separation between bicyclists and motor vehicles is important in maintaining the safety and comfort of trail users.

SEGMENT 3: NORTHSHORE ROAD FROM ESSEX CENTER DRIVER TO RAILROAD RIGHT-OF-WAY

The proposed design for the Greenway Extension along Northshore Road comprises a multiuse path along the west side of the road and parallel to Route 128. The cross section is proposed to consist of a 10-foot-

wide paved shared-use path with nine feet of separation from the path and curb along Northshore Road. On the highway side a grass drainage swale is proposed beyond the shoulder.

A road crossing is necessary to connect the path from the north side of Northshore Road to the proposed segment following the former railroad layout to the south.

Alternative 1: Install Standard W11-1 bicycle warning signage at the crossing

Alternative 1 proposes installing a standard crosswalk treatment, with W11-1 signage at the crosswalk and approximately 200' in advance of the crosswalk. This treatment will make the crossing visible to drivers and ensure the safety of trail users crossing to/from North Shore Road and the old railroad ROW.

Alternative 2: Install W11-15 with RRFB and detection

Alternative 2 Proposed at this crossing is enhanced crosswalk treatment consistent with what has been installed on the trail in West Peabody at the Russell Street crossing. This treatment would install W11-15 signage with a Rectangular Rapid-Flash Beacon (RRFB) at the crosswalk, with standard advance warning signage approximately 200' away from the crosswalk.

BRIDGE DESIGN ALTERNATIVES:

The portion of the shared-use trail in the vicinity of the washed away railroad bridge requires construction of a light duty structure in order to make the former railroad right-of-way usable for a bicycle/pedestrian path and to avoid filling protected wetland resources areas and FEMA-designated 100-year floodplain associated with Proctor Brook. This structure would then tie into the proposed timber boardwalk from the east, which was designed at this location in order to avoid filling the wetland resource areas and the FEMA 100-year floodplain.

The various proposed bridge design alternatives are detailed below. Two (2) viable structure types and four (4) viable substructure and foundation types were considered, and the recommended foundation type of helical piles spaced 8'-0" to 14'-0" center-to-center and retaining walls comprised of timber lagging at each end of the boardwalk, was used in developing the following four (4) bridge alternatives:

Alternative A: Timber Boardwalk (Preferred)

The proposed timber boardwalk alternative consists of a timber deck with a 60'-0" structure length with multiple 8'-0" equal spans for the length of the structure. The boardwalk will have an out-to-out width of 13'-0" to provide a clear width that accommodates a 10'-0" wide pedestrian/bike path with two (2) 1'-0" shoulders. The proposed timber railing is 3'-6" high with vertical timber pickets spaced less than 4" apart with a continuous top handrail and bottom rub rail. All these railing components are required to meet state and federal (OSHA) safety standards for this type of path. The proposed timber decking is comprised of 2x6 timber boards placed transverse to the centerline of the path. The deck boards have a ¼" between their edges to provide a safe continuous riding surface that also allows for minor thermal expansion and contraction. There is an average of ~4-feet between the ground and the bottom of the 2x8 stringers which are spaced ~1-ft on center and support the deck planks for the full length of the boardwalk. Below the stringers there are timber bents comprised of three (3) 2x12s spaced every ~8-feet perpendicular to the center line of the path. This alternative has simple constructure methods, minimal environmental impacts, and requires minimal maintenance, resulting in lower lifecycle costs. In addition, it would be an extension of the timber boardwalk proposed east of this crossing, eliminating the need for additional substructure components on the east side, therefore, minimizing impacts to wetland resource areas and FEMA 100-year floodplain. The proposed substructure type would provide ease of constructability, lower material cost, and

lessen the environmental impacts to adjacent sensitive areas. Timber Boardwalk on Helical Piles is the recommended alternative because it provides the most cost-effective structure with the fewest impacts to the surrounding environmentally sensitive areas. This design also has the shallowest superstructure for meeting hydraulic criteria and the simplest construction method, which uses smaller equipment that can access the site from the trail.

Alternative B: Prefabricated Steel Truss with a Concrete Deck

This proposed bridge design is 60'-0" long with an out-to-out width of 12'-0". The truss will be constructed offsite and delivered to the construction site. The installation will be quicker than traditional bridge construction and have the option for technical guidance and oversight provided by the prefabricator. The installation has minimal impact to the environment when compared to more traditional construction materials and methods, though, would result in more impacts to wetland resource areas and FEMA 100-year floodplain than the preferred alternative A due to installation to the substructure components to support the fabricated steel truss superstructure. The installation might be difficult due to site accessibility for construction equipment and vehicles.

Alternative C: Prestressed Concrete Spread Box Beams with a Composite Concrete Deck

In this proposed bridge design, four (4) S36-12 prestressed concrete spread box beams will be used. The beams will be composite with a 5" cast-in-place deck and have a 3" paved wearing surface. The beams may not be able to support a span length of 60'-0" without a pier. These prestressed concrete beams are manufactured under controlled conditions and are more resistant to corrosion and deterioration than their steel counterparts. This option is a better choice for bridges over water with high constant humidity and for areas where it is difficult to access the superstructure for maintenance work. This alternative requires minimal maintenance, resulting in lower life cycle costs; however, the constructability and component delivery may be difficult due to site accessibility. This design is also significantly heavier than the timber boardwalk or timber beam alternatives and requires large equipment to ship and erect. This alternative would result in more impacts to wetland resource areas and FEMA 100-year floodplain than both Alternatives A and B due to installation to the substructure components, including potential need for an additional pier, to support the proposed superstructure with a span length of 60'-00".

Alternative D: Timber Bridge Structure with Timber Deck

This proposed design consists of three (3) 60'-0" glulam stringers spaced 5'-0" apart. Due to the loading requirements, the minimum depth of each beam would be 36". This depth exceeds the permissible depth requirements for wetland protection and hydraulic opening requirements and would result in even more extensive wetland resource area and FEMA 100-year floodplain impacts. The constructability and delivery of beams would prove to be difficult due to site constraints. However, the timber aesthetic would match the timber of the timber boardwalk and the design would require less maintenance than a steel structure over water.

2.3.2 Construction Mitigation Measures

Erosion and Sediment Control

To protect the resource areas and interests of the WPA during construction, a combination of erosion and sediment control BMPs will be installed as shown on the attached plan set. Primary erosion control techniques proposed include compost filter tubes, sedimentation fence barriers and floating silt fence. The Contractor will have a stockpile of materials required to control erosion on-site to be used to supplement or repair erosion control devices. These materials will include, but are not limited to, compost

filter tubes, sedimentation fence, site bags for catch basins, erosion control matting and crushed stone. The erosion controls will be maintained in good condition until on-site soils are stabilized. All areas will be permanently stabilized following the completion of construction work. For additional information on erosion and sediment controls, please see the attached Stormwater Management Report in Appendix F of this report.

Trench Dewatering

It is anticipated that a NPDES Construction General Permit (CGP) will be required for the project; therefore, if trench dewatering is needed, all pumped effluent will be done in compliance with the dewatering requirements within the CGP. There will be no direct discharge of pumped water into any wetland, resource area, or closed drainage system.

2.3.3 Wetland Mitigation

Wetland mitigation is required, and the wetland impact mitigation measures are discussed in detail above under item 2.2.1 Resource Areas Impacts/Bordering Vegetated Wetland.

2.3.4 Flood Storage Compensation

Flood storage compensation is required, and the required measures are discussed in detail above under item 2.2.1 Resource Areas Impacts/Bordering Land Subject to Flooding.

APPENDICES

APPENDIX A - WETLANDS DELINEATION MEMO WITH DATA FORMS

From:	Brandon Faneuf, PWS
Date:	October 12, 2022
Project Name:	Peabody Bikeway Extension, Peabody, MA
Project Number:	Green No. 17118.0228
Subject:	Wetland Description

Introduction

This memo is to describe the types and extents of wetlands and wetland jurisdictional areas at the above-referenced site (Site). Wetland delineation work was originally performed on February 15, 2018 in conformance with the Massachusetts Wetlands Protection Act (MGL c. 131, §40)(WPA) and its Regulations (310 CMR 10.00). The site was reflagged, and the wetland boundaries were reconfirmed in 2022. Peabody has promulgated a local Wetlands & Rivers Protection Ordinance (The Ordinance) and Wetlands and Rivers Protection Regulations (Chapter 32) that exceed jurisdictional areas and performance standards of the WPA and 310 CMR 10.00. The project site is between Yankee Division Highway and Endicott Street, following the unfinished portion of the Independence Greenway bike trail and parallel to Proctor Brook.

Area of Interest (AOI)

The area between Yankee Division Highway and Endicott St., along Proctor Brook as referenced above, was investigated for wetland resource areas. To ensure that all potential jurisdictional areas that may extend onto the Area of Interest (AOI) were located and defined, all land within 200 feet of the AOI was investigated to the best possible extent while respecting private property rights.

The area of the AOI is heavily disturbed with a variety of developments and infrastructure. Along Proctor Brook, there is a historic railroad that is now decommissioned (i.e. the proposed Independence Greenway bike path). Left in its place is fill and grading that has affected the flow of the river and its floodplain. On either side of Proctor Brook there are housing developments including condominiums and single-family dwellings. Yankee Division Highway runs directly through the AOI in the western part. As a result of the historic disturbance, there is very little natural area left in the AOI and invasive, non-native plant species dominate much of the area.

Wetland Resource Areas

Wetland Resource Areas exist on either side of Yankee Division Highway adjacent to both Essex Center Drive and Northshore Road as well on either side of the abandoned railway between Northshore Road and Endicott Street. Wetlands revolve around a perennial stream, Proctor Brook, that flows west-to-east through the AOI and into a pond that exists to the southeast. Per 310 CMR 10.00 and the Ordinance, Proctor Brook is a perennial river and receives a two-hundred foot (200') Riverfront Area (RFA).

Multiple Bordering Vegetated Wetlands (BVW/BVW's) exist along the southern and western banks of Proctor Brook. These BVW's are delineated separately but are all hydrologically connected, mainly through Proctor Brook. Each alpha-numerically delineated section of BVW retains a one-hundred foot (100') buffer zone per 310 CMR 10.00 and the Ordinance.

The wetland types on site:

- Inland Bank- same as the mean annual high-water (aka bankfull conditions) mark, as delineated in the field with the 'MAHW' flags. This represents the first observable break-in-slope along the bank of the Brook.

- Land Under Waterbodies & Waterways- land between the two (2) mean low water marks (currently underwater and not flagged in the field).

- 200' Riverfront Area ("RFA") of the River. The inner boundary of the RFA is represented by the 'MAHW' flags along the Inland Bank. The RFA extends perpendicularly from the 'MAHW' flags without regard for topography.

- Bordering Vegetated Wetland ("BVW"), as delineated in the field with 'A', 'B', 'C', 'E', 'V', 'Y', and 'Z' series flags. These flags represent the edge of the BVW where it changes to from vegetated wetland to upland. Per 310 CMR 10.00 and The Ordinance, these receive 100' buffer zones.

- Bordering Land Subject to Flooding ("BLSF") associated with the River. This is the 100 year floodplain as delineated by FEMA (see attached FEMA Firmette). This follows Proctor Brook in the AOI.

Soils in the area consist of fine sandy loams and loamy sands on 0-8% slopes. The topography in the area is generally flat with land rising as it gets farther from Proctor Brook.

Table 1. Wetland Resource Areas

Flag Series	Wetland Type	Approx. Location
A1-A14 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Northwest of Independence Greenway and southwest of the parking area associated with Lahey Medical Center.
B1-B10 (pink flags)	N/A	Drainage ditch to between Independence Greenway and Yankee Division Highway.
C1-C7 (pink flags)	N/A	Drainage ditch between Northshore Road and Garden Road.
E1-E12 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Travels east-to-west along the northern bank of Proctor Brook south of the Peabody Municipal Light Plant.
V1-V17 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off of the southern bank of Proctor Brook and travels west. Located northeast of Jennifer Lane.
W1-W4 (blue flags)	Bank of Intermittent Stream w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Makes a semicircle adjacent to Endicott Street and south of Proctor Brook.
X1-X11 (blue flags)	Bank of Intermittent Stream w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off MAHW-11 and travels east along the southern portion of the AOI to Endicott Street.
Y1-Y7 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off of the southern bank of Proctor Brook and travels east. It is located north of Castle Circle. Starts at the end of the MAHW1-MAHW87 series.
Z1-Z8 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	Extends off of the northern bank of Proctor Brook and travels west. Located southwest of the condominium development, "Terrace Estates."

MAHW1-MAHW87 (blue flags)	Inland Bank of Perennial Stream w/ 200' RFA per 310 CMR 10.00 and the Ordinance.	Begins at Endicott Street and travels northwest. It delineates the southern Bank of Proctor Brook in the eastern portion of the AOI.
MAHW101-MAHW138 (blue flags)	Inland Bank of Perennial Stream w/ 200' RFA per 310 CMR 10.00 and the Ordinance.	Begins off of Warren Street Extension directly south of the Peabody Municipal Light Plant and travels northwest. It delineates the northern Bank of Proctor Brook.
MAHW201-MAHW230 (blue flags)	Inland Bank of Perennial Stream w/ 200' RFA per 310 CMR 10.00 and the Ordinance.	Begins off of Northshore Road and travels southeast. It delineates the northern Bank of Proctor Brook.

Other Resources

A search of other critical resources within the project area was conducted using GIS software and data available through various governmental agencies (FEMA, DEP, and others). The results of our search are listed in the table below.

Table 2. Selected MASSGIS Environmental Data Layers

Mapped Resource On or Within Proximity to Site	Yes	No
Area of Critical Environmental Concern		✓
NHESP Certified Vernal Pool		✓[1]
NHESP Potential Vernal Pool		✓
NHESP Estimated Habitat of Rare Wildlife		✓
NHESP Priority Habitat of Rare species		✓
Outstanding Resource Waters		✓
FEMA Flood Zones (BLSF)	✓[2]	
Surface Water Protection Area		✓
Interim Wellhead Protection Area		✓
Zone I Wellhead Protection Area		✓
Zone II Wellhead Protection Area		✓
Mass DCR Designated Coldwater Fisheries		✓

1. A NHESP Certified Vernal Pool exists just outside of the AOI to the southeast. It is located to the southwest of the intersection of the railroad right-of-way and Yankee Division Highway.
2. BLSF closely follows Proctor Brook in the area of the AOI (see attached Figures 5, 6, & 7).

Regulatory Jurisdiction

The wetland resource areas described above are regulated by the Massachusetts Department of Environmental Protection (DEP), through the Peabody Conservation Commission. The City of Peabody has its own City of Peabody Wetlands & Rivers Protection The Ordinance (The Ordinance) and Peabody Conservation Commission Bylaw (Bylaw).

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 10/4/2022 at 4:07 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

MassDEP Bordering Vegetated Wetland (310 CMR 10.55) Delineation Field Data Form

Applicant:_____ Prepared by: **Green International** Project location: **Peabody Bike Trail** DEP File #:_____

Check all that apply:

- ❑ Vegetation alone presumed adequate to delineate BVW boundary: fill out Section I only
- ❑ **Vegetation and other indicators of hydrology used to delineate BVW boundary: fill out Sections I and II**
- ❑ Method other than dominance test used (attach additional information)

Section I.

Vegetation	Observation Plot Number: **A-8**		Transect Number: **Upland**	Date of Delineation: **10/5/2022**
A. Sample Layer & Plant Species (by common/scientific name)	B. Percent Cover (or basal Area)	C. Percent Dominance	D. Dominant Plant (yes or no)	E. Wetland Indicator Category*
Tree Layer:				
Crabapple/*Pyrus malus*	38.0%	100.0%	YES	UPL
Shrub Layer:				
Staghorn Sumac/*Rhus typhina*	63.0%	75.0%	YES	UPL
Red-Osier Dogwood/*Cornus stolonifera*	20.5%	25.0%	YES	FACW+*
Groundcover:				
Canada Goldenrod/*Solidago canadensis*	10.5%	100.0%	YES	FACU

* *Use an asterisk to mark wetland indicator plants: plant species listed in the Wetlands Protection Act (MGL c.131, s.40); plants in the genus Sphagnum; plants listed as FAC, FAC+, FACW-, FACW, FACW+, or OBL; or plants with physiological or morphological adaptations. If any plants are identified as wetland indicator plants due to physiological or morphological adaptations, describe the adaptation next to the asterisk.*

Vegetation conclusion:

Number of dominant wetland indicator plants: **1** Number of dominant non-wetland indicator plants: **3**

Is the number of dominant wetland plants equal to or greater than the number of dominant non-wetland plants? yes **no**

If vegetation alone is presumed adequate to delineate the BVW boundary, submit this form with the Request for Determination of Applicability or Notice of Intent

Proposal No. 609211-132091

MassDEP Bordering Vegetated Wetland (310 CMR 10.55) Delineation Field Data Form

Applicant:_____ Prepared by: **Green International** Project location: **Peabody Bike Trail** DEP File #:_____
Check all that apply:

- ❑ Vegetation alone presumed adequate to delineate BVW boundary: fill out Section I only
- ❑ **Vegetation and other indicators of hydrology used to delineate BVW boundary: fill out Sections I and II**
- ❑ Method other than dominance test used (attach additional information)

Section I.

Vegetation	Observation Plot Number: **B-6**		Transect Number: **Wetland**	Date of Delineation: **2/15/2018**
A. Sample Layer & Plant Species (by common/scientific name)	B. Percent Cover (or basal Area)	C. Percent Dominance	D. Dominant Plant (yes or no)	E. Wetland Indicator Category*
Shrub Layer:				
Red-Osier Dogwood/*Cornus stolonifera*	38.0%	100.0%	YES	FACW+*
Groundcover:				
Cinnamon Fern/*Osmunda cinnamomea*	10.5%	34.0%	YES	FACW*
Sensitive Fern/*Onoclea sensibilis*	20.5%	66.0%	YES	FACW*

* *Use an asterisk to mark wetland indicator plants: plant species listed in the Wetlands Protection Act (MGL c.131, s.40); plants in the genus Sphagnum; plants listed as FAC, FAC+, FACW-, FACW, FACW+, or OBL; or plants with physiological or morphological adaptations. If any plants are identified as wetland indicator plants due to physiological or morphological adaptations, describe the adaptation next to the asterisk.*

Vegetation conclusion:

Number of dominant wetland indicator plants: **3** Number of dominant non-wetland indicator plants: **0**

Is the number of dominant wetland plants equal to or greater than the number of dominant non-wetland plants? **yes** no

If vegetation alone is presumed adequate to delineate the BVW boundary, submit this form with the Request for Determination of Applicability or Notice of Intent

Section II. Indicators of Hydrology

Hydric Soil Interpretation

1. Soil Survey

Is there a published soil survey for this site? Yes
Title/date: Essex County, Southern Part
Map number: Accessed via Web Soil Survey
Soil type mapped: 626B- Merrimac-Urban land complex, 0-8%
Hydric soil inclusions: none

Are field observations consistent with soil survey? Yes

Remarks:

2. Soil Description

Horizon	Depth	Color	Redox
A	**0-7**	**10YR 2/2**	**-**
Bg	**7-20**	**10YR 6/3**	**5YR 4/6**

Remarks:

3. Other:

Conclusion: Is soil hydric? **No**

Other Indicators of Hydrology: (check all that apply & describe)

- ☐ Site Inundated:
- ☐ Depth to free water in observation hole:
- ☐ Depth to soil saturation in observation hole:
- ☐ Water marks:
- ☐ Drift lines:
- ☐ Sediment Deposits:
- ☐ Drainage patterns in BVW:

APPENDIX D – WILDLIFE HABITAT EVALUATION

January 30, 2023

To:	Danielle Spicer, P.E.
Cc:	Oxana Fartushnaya
From:	Brandon Faneuf, PWS
Date:	January 30, 2023
Project Name:	Independence Greenway Extension, Peabody, MA
Project Number:	Green No. 17118.0234
Subject:	Wildlife Habitat Evaluation

Introduction

This memo analyzes areas where physical impacts to wetland resource areas under the Wetlands Protection Act (M.G.L. c.131, §40) and Regulations (310 CMR 10.00) for the above-referenced project (Project).

Area of Interest (AOI)

The area between Yankee Division Highway and Endicott St., along Proctor Brook as referenced above, was analyzed for potential adverse impacts to wildlife habitat on November 2, 2022.

The area of the AOI is heavily disturbed with a variety of developments and infrastructure. Along Proctor Brook, there is a historic railroad that is now decommissioned (i.e. the proposed Independence Greenway bike path). Left in its place is fill and grading that has affected the flow of the river and its floodplain. On either side of Proctor Brook there are housing developments including condominiums and single-family dwellings. Yankee Division Highway runs directly through the AOI in the western part. As a result of the historic disturbance, there is very little natural area left in the AOI and invasive, non-native plant species dominate much of the area.

Appendix A Wildlife Habitat Evaluation

Attached to this memo is a wildlife habitat evaluation (WHE) that outlines potential “Important Habitat Features” within the AOI.

Impacts

Table 1. Impacts to Wetland Resource Areas

Resource Area	Cumulative Impact	Regulatory Threshold to require WHE	Regulatory Citation (310 CMR 10.00)
Bordering Vegetated Wetland (BVW) (all BVW is presumed significant for wildlife habitat)	Perm: 2,225 SF Temp: 4,641 SF	No threshold	10.55(4)(b) (preface to Wetlands Regulations relative to protection of wildlife habitat- 1987 Regulatory Revisions- Section IV)
Land Under Waterbodies and Waterways (LUW) (all land under water is presumed significant for wildlife habitat)	Perm: 10,343 SF Temp: 2,082 SF	10% of the land in this resource area on a single lot or **5,000sf (whichever is less)**[1]	10.56(4)(a)(4)
Bank (all banks are presumed significant for wildlife habitat)	Perm: 618 SF Temp: 201 SF	10% of the length of bank on a single lot or **50 linear feet (whichever is less)**[1]	10.54(4)(a)(5)
Riverfront Area (RFA)	103,288 SF	No threshold, however, different review requirements apply depending on whether the Riverfront is undisturbed (310 CMR 10.58(4)) (and the size of impact), **previously developed (310 CMR 10.58(5))**[1] or if the activity is grandfathered or exempted from requirements for the Riverfront Area (310 CMR 10.58(6)).	10.58(4)(b), (4)(d)1.c, (4)(d)2.c, (4)(d)3.b
Bordering Land Subject to Flooding (BLSF)	69,340 SF	10% of the land in this resource area on a single lot or **5,000sf (whichever is less)**[1]	10.57(4)(a)(3)

[1] Bold wording indicates the applicable standard for this project/AOI.

Analysis

Resource Area impacts are spread throughout the AOI. However, the nature of the habitat within the AOI is fairly uniform (heavily disturbed and dominated by invasive species). Therefore, individual impact areas are not treated separately for this exercise.

BVW – Approximately 2,225 square feet of permanent impacts and 4,641 square feet of temporary disturbance to BVW are proposed. All BVW in the AOI is impacted by invasive and/or noxious species including, but not limited to Phragmites (*Phragmites australis*), invasive honeysuckles (*Lonicera spp.*), glossy buckthorn (*Frangula alnus*), poison ivy (*Toxicodendron radicans*), Japanese knotweed (*Polygonum cuspidatum*), and Asian bittersweet (*Celastrus orbiculatus*). There are also no *Important Habitat Features* within or around the portions of BVW to be impacted.

LUW – Approximately 10,343 square feet of permanent impacts and 2,082 square feet of temporary disturbance to Land Under Waterbodies and Waterways are proposed. This is above the 5,000 SF threshold found in 10.56(4)(a)(4). Regardless, LUW occurs below the mean annual high-water mark (MAHW flags) along Proctor Brook. As such, we have determined that open water areas along the brook *may* be important habitat for winter waterfowl. Further, there may be plunge pools significant to fisheries. However, any plunge pools within the AOI are caused by the gross neglect of culvert pipes. That is, the pipes are no longer functional and water discharging from them tend to be at incorrect heights relative to the stream below, causing erosion and (therefore) plunge pools. However, we do not believe that an Appendix B WHE is required for this project since the proposed work is not expected to reduce the capacity of the resource areas to provide food, shelter, or overwintering habitat to wildlife per 310 CMR 10.60(2)(b).

Notwithstanding the requirements of 310 CMR 10.56(4)(a)4., the impact on Land under Water Bodies and Waterways caused by the installation of a stream crossing is exempt from the requirement to perform a habitat evaluation in accordance with the procedures established under 310 CMR 10.60.

Bank – Approximately 618 linear feet of permanent impacts and 201 linear feet of temporary of disturbance to Bank are proposed. This is greater than the 50 LF threshold for non-single lot projects requiring a WHE. We do not believe, however, that an Appendix B WHE is required for this project because there are no Important Habitat Features found on or even around the areas of Bank proposed for alteration. Further, the proposed work is not expected to reduce the capacity of the resource areas to provide food, shelter, or overwintering habitat to wildlife per 310 CMR 10.60(2)(b).

Notwithstanding the requirement of 310 CMR 10.54(4)(a)5., the impact on bank caused by the installation of a stream crossing is exempt from the requirement to perform a habitat evaluation in accordance with the procedures contained in 310 CMR 10.60.

Riverfront Area – Approximately 103,288 square feet of disturbance to degraded Riverfront Area is proposed, per 310 CMR 10.58(5). No Important Habitat Features are located within the RFA, which includes the vast majority of the project area/AOI. With the dominance of invasive and/or noxious

plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings, the proposed work will only result in a net improvement to wildlife habitat.

BLSF – Approximately 69,340 square feet of disturbance to BLSF is proposed. This is above the 5,000 SF threshold found in 10.56(4)(a)(3). However, no Important Habitat Features are located within the BLSF area, which includes a large portion of the project area. With the dominance of invasive and/or noxious plant species within the project area, the fact that the site is an abandoned railroad bed that has been in disrepair for decades, with substandard stream crossings, the proposed work will only result in a net improvement to wildlife habitat across the project.

Work in those portions of bordering land subject to flooding found to be significant to the protection of wildlife habitat shall not impair its capacity to provide important wildlife habitat functions. Except for work which would adversely affect vernal pool habitat, a project or projects on a single lot, for which Notice(s) of Intent is filed on or after November 1, 1987, that (cumulatively) alter(s) up to 10% or 5,000 square feet (whichever is less) of land in this resource area found to be significant to the protection of wildlife habitat, shall not be deemed to impair its capacity to provide important wildlife habitat functions. Alterations beyond the above threshold, or altering vernal pool habitat, may be permitted if they will have no adverse effects on wildlife habitat, as determined by procedures contained in 310 CMR 10.60. As discussed previously, the proposed work is not anticipated to have any adverse effects on wildlife habitat.

Conclusion

Although significant disturbance is proposed in several wetland resource area types, we do not believe that an Appendix B WHE is required for this project because there are no Important Habitat Features found on or even around the Bank, BLSF, and Riverfront areas proposed for alteration. The areas that are currently dominated by invasive and/or noxious species are expected to result in a net improvement to wildlife habitat and their overall capacities to provide food, shelter, or overwintering habitat to wildlife per 310 CMR 10.60(2)(b). While there are open water areas along the brook, which may have Important Habitat Features for winter waterfowl as well as plunge pools significant for fisheries, the disturbance to wildlife habitat required to replace the stream crossings is temporary and the natural streambed will be reestablished and the LUW area will be restored upon completion of construction.

In compliance with 310 CMR 10.60(1), we do not anticipate any long-term adverse effects on wildlife habitat following two growing seasons of project completion and thereafter. In accordance with 310 CMR 10.60(3)(e), the project does not alter ten or more acres of Land Subject to Flooding or Land under Water found to be significant to the protection of wildlife habitat, or 2,000 feet or more of Bank found to be significant to the protection of wildlife habitat.

Overall, although significant disturbance is proposed as a result of this project, the existing condition of the project area is such that we believe that not only will there be no adverse impacts to wildlife habitat, but that the proposed project, as designed, will result in a net improvement to wildlife habitat.

Important Habitat Features

Direct alterations to the following important habitat features in resource areas may be permitted only if they will have no adverse effect (refer to Section V).

- ☐ Habitat for state-listed animal species (receipt of a positive opinion or permit from MNHESP shall be presumed to be correct. Do not refer to Section V).
- ☐ Sphagnum hummocks and pools suitable to serve as nesting habitat for four-toed salamanders
- ☐ Trees with large cavities (≥18" tree diameter at cavity entrance)
- ☐ Existing beaver, mink or otter dens
- ☐ Areas within 100 feet of existing beaver, mink or otter dens (if significant disturbance)
- ☐ Existing nest trees for birds that traditionally reuse nests (bald eagle, osprey, great blue heron)
- ☐ Land containing freshwater mussel beds
- ☒ Wetlands and waterbodies known to contain open water in winter with the capacity to serve as waterfowl winter habitat
- ☐ Turtle nesting areas
- ☐ Vertical sandy banks (bank swallows, rough-winged swallows or kingfishers)

The following habitat characteristics when not commonly encountered in the surrounding area:

- ☐ Stream bed riffle zones (e.g. in eastern MA)
- ☐ Springs
- ☐ Gravel stream bottoms (trout and salmon nesting substrate)
- ☒ Plunge pools (deep holes) in rivers or streams
- ☐ Medium to large, flat rock substrates in streams

Massachusetts Department of Environmental Protection
Bureau of Resource Protection – Wetlands program

Wildlife Habitat Protection Guidance

Appendix A: Simplified Wildlife Habitat Evaluation

Activities

When any one of the following activities is proposed within resource areas, applicants should complete a Detailed Wildlife Habitat Evaluation (refer to Appendix B).

- ☐ Activities located in mapped "Habitat of Potential Regional or Statewide Importance"
- ☐ Activities affecting certified or documented vernal pool habitat, including habitat within 100' of a certified or documented vernal pool when within a resource area
- ☐ Activities in bank, land under water, bordering land subject to flooding (presumed significant) where alterations are more than twice the size of thresholds
- ☐ Activities affecting vegetated wetlands >5000 sq. ft. occurring in resource areas other than Bordering Vegetated Wetland
- ☐ Activities affecting the sole connector between habitats >50 acres in size
- ☐ Installation of structures that prevent animal movement
- ☐ Activities for the purpose of bank stabilization using hard structure solutions that significantly affect ability of stream channel to shift and meander, or disrupt continuity in cover that would inhibit animal passage
- ☐ Dredging (greater than 5,000 sf)

COMMENTS:

1. Proctor Brook is a perennial river. Unless it freezes in the winter, it will contain open water for waterfowl.
2. Natural plunge pools do not exist. Any plunge pool present is the result of gross neglect of existing culvert pipes over a period of decades.

APPENDIX E – ABUTTER INFORMATION

- Certified Abutters List
- Abutter Notification
- Affidavit of Service

NOTIFICATION TO ABUTTERS UNDER THE MASSACHUSETTS WETLANDS PROTECTION ACT AND/OR CHAPTER 32 THE CITY OF PEABODY'S LOCAL WETLANDS AND RIVERS PROTECTION ACT

In accordance with the second paragraph of Massachusetts General Laws, Chapter 131, Section 40 and/or Chapter 32 the City of Peabody's Local Wetlands and Rivers Protection Act, you are hereby notified of the following:

1. The name of the applicant is: The City of Peabody
2. The applicant has filed a Notice of Intent with the Conservation Commission.
3. The address of the proposed activity is: Former B & M Railroad Easement, Northshore Road, Essex Center Drive, Endicott Street
4. The proposed activity is: The project proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, MA for a total project length of approximately 1.3 miles.
5. Copies of the (CIRCLE ONE) **Notice of Intent/Request for Determination of Applicability/Abbreviated Notice of Intent/Abbreviated Notice Resource Area Delineation** may be **examined only** in the Community Development Department, Conservation Commission Office, City Hall, 24 Lowell St., Peabody, MA between the hours of 8:30 am to 4 p.m., Monday, Tuesday, Wednesday; 8:30 to 7 p.m. Thursday and 8:30 to 12:30 on Friday (with the exception of lunch). Email is also available and is the preferred form of request. Please make request to: lucia.delnegro@peabody-ma.gov
6. Copies of the **NOI/RDA/ANRAD/ANOI** may be obtained from the applicant by calling: 978-538-5780 or by emailing brendan.callahan@peabody-ma.gov
7. Information regarding the date and time of the public hearing may be obtained from the Commission Office at 978-538-5782.

NOTE: Notice of the public hearing including the date, time and place, will be published in the local paper, ex. (Weekly News, Lynn Item or Salem News) at least five (5) days in advance of the hearing.

NOTE: Notice of public hearing, including the date, time and place will be posted in City Hall by the Clerk's Office not less than forty-eight (48) hours in advance.

NOTE: You may contact your local Conservation Commission or the Department of Environmental Protection (DEP) for more information about this application of the Wetlands Protection Act. To contact DEP, call:

DEP Northeast Region: 978-694-3200

PROPOSED MEETING DATE: May 8, 2024
Location of meeting TBD: Via Zoom and start time is 7PM unless otherwise noted.

Introduction

This Stormwater Management Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00). Appendix A includes a completed Massachusetts Department of Environmental Protection (MassDEP) Checklist for Stormwater Report, stamped by a professional engineer.

The project follows the guidance presented in the MassDOT Stormwater Handbook (the Handbook), and stormwater management systems are designed in accordance with MassDEP Standards.

Project Summary

Project Description

The Applicant, MassDOT, is proposing Project 609211 to construct the Independence Greenway extension in Peabody, MA. The project consists of an approximately 1.3-mile extension of the Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street. The Independence Greenway currently consists of two discontinuous segments separated by Interstate 95 and Route 1. The west section of the existing Independence Greenway runs 2.9 miles between Russell Street near the Ipswich River and Lt. Ross Park. It opened in 2008. The east section is 1.7 miles long and runs from Peabody Road at Proctor Brook and ends at the Northshore Mall near Lahey Medical Center. The trail was built on the route of the former Boston and Maine (B&M) Railroad right-of-way (ROW) north of Lowell Street. The existing Greenway is owned and maintained by the City of Peabody.

This project transforms the former railroad bed into a shared use pedestrian pathway. As the proposed project is a pathway for pedestrian and/or nonmotorized vehicle access, it is therefore categorized as a “Redevelopment Project” under the Massachusetts Stormwater Management Standards. The project is required to meet only Standards 2 & 3 and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5 & 6 to the maximum extent practicable.

This project provides an opportunity to improve the existing drainage system and improve the quality of stormwater runoff discharged to adjacent wetlands. This project will incorporate the installation of practical Stormwater Control Measures (SCMs). The goal of the proposed stormwater improvements is to improve the quality of discharged stormwater to the maximum extent that it is practical.

The following report was created in accordance with the “Massachusetts Stormwater Handbook” last revised in January 2008. The report is organized into sections that correspond to the categories listed in the “Massachusetts Stormwater Report Checklist”. The checklist is included in Appendix A of this report along with a “Redevelopment Checklist”. The following is a more detailed description of the existing and proposed drainage areas and the design methodology for this project.

See Figure 1 for the Project Locus Map and Figure 2 for the Aerial Map.

Existing Conditions

The existing site can be analyzed as ten (10) watershed areas that contribute runoff to ten (10) discharge points. The existing drainage areas are delineated in Figure 6 - Existing Watershed Plan. For the purpose of this hydrologic analysis, the following assumptions were made:
When the watershed boundary fell outside of the limit of work an arbitrary line was delineated as the watershed boundary.

The total watershed area for the existing conditions is used as the comparison base for the watershed area in the proposed conditions.

There are protected wetland resource areas that exist surrounding Proctor Brook which runs adjacent to North Shore Road. The Riverfront Area associated with Proctor Brook, Buffer Zones, as well as 100-year floodplain extend into the project limits along the Independence Greenway Extension. The upstream and downstream side of Proctor brook are hydraulically connected by existing culverts which cross North Shore Road and Endicott Street. Wetland “A” is also in close proximity to the project limits north of Essex Center Drive.

Some areas of the existing drainage system on the roadways within the project limits and the entirety of the Independence Greenway Extension includes “country drainage” (i.e. no curb), where the runoff sheet flows into the pervious shoulder, roadside ditches, wetlands, or private front yards. These watershed areas include EDA-1, -3, and -6 through -10.

There are separate closed drainage systems spread throughout the project, servicing existing watershed areas via catch basin curb inlets and at low points. Where stormwater does not sheet flow off the roadway via country drainage, it travels via curb along the roadway into these closed drainage systems.

There are ten discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. These locations were analyzed as Discharge Points during the hydrologic analysis, as indicated on the attached Existing Watershed Plan. Brief descriptions of each contributing area are below.

DRAINAGE AREA EDA-1
This area consists mostly of a pervious median adjacent to Essex Center Drive and the start of the Independence Greenway. This area also includes approximately 400’ of the impervious path. Stormwater runoff travels via overland flow into a ditch on the south side of Essex Center Drive and discharges to the north through a culvert beyond the project limits to Wetland “A” at DP-1.

DRAINAGE AREA EDA-2
This area consists mostly of impervious roadway and sidewalk along Essex Center Drive, as well as portions of several parking lots and driveways abutting the roadway to the north. This area also includes one half of the bridge that connects Essex Center Drive with North Shore Road at the eastern project limit. Portions of grass medians and a gravel shoulder are also included in this area. Stormwater runoff travels via gutter flow along the curb into a closed drainage system. The closed drainage system discharges beyond the project limits to the north through a culvert to Wetland “A” at DP-2.

DRAINAGE AREA EDA-3
This area consists of the impervious westbound lane of North Shore Road, as well as one half of the bridge that connects North Shore Road with Essex Center Drive (STA. 303+20 to 306+57). This area also includes pervious grass area within the median on the bridge and the area between North Shore Road and Route 128 to the north. Stormwater runoff from the roadway travels via country drainage and discharges into a ditch on the south side of the roadway at DP-3. Stormwater runoff from the grass area adjacent to the roadway travels via overland flow into a culvert, which discharges to the ditch at DP-3.

DRAINAGE AREA EDA-4
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 306+57 to 314+97). Stormwater runoff from the road travels via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a culvert at DP-4.

DRAINAGE AREA EDA-5
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 314+97 to the project limit approximately 500 feet west). Stormwater runoff from the road travels via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a culvert at DP-5.

DRAINAGE AREA EDA-6
This area consists entirely of woods starting perpendicular to the eastbound lane of North Shore Road that extends southwest (STA. 318+45 to 329+88). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north through a culvert at DP-6.

DRAINAGE AREA EDA-7
This area consists entirely of woods that extends southwest (STA. 329+88 to 340+31). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-7.

DRAINAGE AREA EDA-8
This area consists entirely of woods that extends southwest (STA. 340+31 to 346+35). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-8.

DRAINAGE AREA EDA-9
This area consists mostly of woods and a portion of Proctor Brook that extends southwest (STA. 346+35 to 351+77). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs

parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north at DP-9.

DRAINAGE AREA EDA-10
This area consists of woods and a portion of Proctor Brook that extends southwest (STA. 351+77 to 359+02). This section of woods is approximately 15 to 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges southwest through a culvert that crosses under Endicott Street at DP-10.

Table 1 presents the existing drainage areas and their characteristics. Figure shows existing drainage patterns and delineations by design point.

Table 1: Existing Drainage Areas

Drainage Area	*Design Point*	*Area (acres)*	*Curve Number*
EDA-1	*DP-1*	*2.14*	*50*

Proctor Brook and its adjacent Bordering Vegetated Wetland is located within the Project area and listed in Table 3.

Table 3: Wetland Resource Areas

Wetland Resource Area	*Wetland Type*	*Description*
Proctor Brook	*Brook*	*Headwaters, outlet small pond in wetland north of Downing Road, Peabody to Grove/Goodhue Street bridge, Salem (formerly part of MA93-06) (interrupted urban).*
Wetland "A"	*Wetland*	*North of Essex Center Drive.*

The Project is located within the 100-year floodplain as shown on the FIRM community panel 25009C0412F, dated 07/03/2012 included in Appendix B.

Review of the NRCS Soil Survey map of the Project area identified the following soils within the project limits:

- 38A - “Pipestone loamy fine sand, 0 to 3 percent slopes” (HSG A/D)
- 43A - “Scarboro mucky fine sandy loam, 0 to 3” (HSG A/D)
- 51A - “Swansea muck, 0 to 1 percent slopes” (HSG B/D)
- 52A - “Freetown muck, 0 to 1 percent slopes” (HSG B/D)
- 71B - “Ridgebury fine sandy loam, 3 to 8 percent slopes, extremely stony” (HSG D)
- 73A - “Whitman fine sandy loam 0 to 3 percent slopes, extremely stony” (HSG D)
- 102E - “Chatfield-Hollis-Rock outcrop complex, 15 to 35 percent slopes” (HSG D)
- 254A - “Merrimac fine sandy loam, 0 to 3 percent slopes” (HSG A)
- 301B - “Montauk fine sandy loam, 0 to 8 percent slopes, very stony” (HSG C)
- 301C - “Montauk fine sandy loam, 8 to 15 percent slopes, very stony” (HSG C)
- 305B - “Paxton fine sandy loam, 3 to 8 percent slopes” (HSG C)
- 305C - “Paxton fine sandy loam 8 to 15 percent slopes” (HSG C)
- 305D - “Paxton fine sandy loam, 15 to 25 percent slopes” (HSG C)
- 311B - “Woodbridge fine sandy loam, 0 to 8 percent slopes, very stony” (HSG C/D)
- 616A - “Fluvaquents, frequently flooded, 0 to 3 percent slopes” (HSG B/D)
- 622C - “Paxton-Urban land complex, 3 to 15 percent slopes” (HSG C)
- 626B - “Merrimac-Urban land complex, 0 to 8 percent slopes” (HSG A)
- 628C – “Canton-Urban land complex, sloping” (No Designation)
- 651 – “Udorthents, smoothed” (No Designation)
- 724C – “Hollis-Urban land-Rock outcrop complex, sloping” (No Designation)

On-site subsurface investigations were performed within the Project area by GZA in 2019. Appendix B provides detailed soils information, including the NRCS soil survey data for the Project area and results of on-site subsurface investigations.

See Figure 5 for the Soils Figure and Figure 6 for the Existing Watershed Plans.

Proposed Conditions

The proposed stormwater management analysis can be summarized as ten (10) watershed areas that contribute runoff to ten (10) discharge points. The overall watershed area and discharge points of analysis are the same in the proposed condition as in the existing condition. The proposed drainage areas are delineated in Figure 7 - Proposed Watershed Plan.

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is 1.3 miles.

The proposed project is located along the abandoned railroad right-of-way that has not seen any improvements since the rails were removed. Existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed will be replaced with new culverts designed to address, to the maximum extent possible, the Massachusetts State Stream Crossings Standards.

In place of the former railroad bridge over Proctor Brook that has been washed away, a new light duty timber boardwalk on helical piles structure is proposed in order to make the abandoned railroad right-of-way usable for a bicycle/pedestrian path. The proposed 56-span light duty timber boardwalk structure will be approximately 437’- 9” long with an out-to-out width of 13’-0” and will provide a clear width of 12’- 1” to accommodate two 5’- 0” wide travel lanes, one in each direction, and two 1’-0” shoulders on each side.

The proposed bituminous shared-use trail pavement will match the dimensions of the existing discontinued railroad structure. This will include 10’-0” wide hot mix asphalt pavement carrying two 5’-0” wide travel lanes, one in each direction, and two 2’-0” wide crushed stone shoulders on both sides. Bike traffic on the existing Independence Greenway has not been formally quantified, but users report that the facility is heavily utilized by bicyclists and pedestrians.

The proposed shared-use trail will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Guide for the Development of Bicycle Facilities (Fourth Edition, 2012) and the MassDOT Separated Bike Lane Planning & Design Guide 2015. The proposed bridge will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Standard Specifications for Highway Bridges and the most recent supplemental Specifications, Standard Nomenclature and Engineering Directives.

New catch basins have been proposed to replace existing catch basins at certain locations where proposed roadway geometry differs from existing conditions. New catch basins are also proposed where the new Independence Greenway Extension proposes a higher ground elevation than existing conditions and existing headwalls/culverts will no longer be utilized along North Shore Road. A stormwater SCM (infiltration trench) will be installed to help with peak rate attenuation at PDA-4. This project also includes the replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the former track bed. All proposed

drainage systems will maintain the historic drainage patterns, distributing runoff to the existing discharge points.

There are ten discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. These locations are the same in both Existing & Proposed Conditions and were analyzed as Discharge Points during the hydrologic analysis, as indicated on the attached Proposed Watershed Plan. Brief descriptions of each contributing area are below.

DRAINAGE AREA PDA-1
This area consists mostly of a pervious median adjacent to Essex Center Drive and the start of the Independence Greenway. This area also includes approximately 400' of the impervious path. Stormwater runoff travels the same as existing conditions via overland flow into a ditch on the south side of Essex Center Drive and discharges to the north through a culvert beyond the project limits to Wetland "A" at DP-1.

DRAINAGE AREA PDA-2
This area consists mostly of impervious roadway and sidewalk along Essex Center Drive, as well as portions of several parking lots and driveways abutting the roadway to the north. This area also includes one half of the bridge that connects Essex Center Drive with North Shore Road at the eastern project limit. Portions of grass medians and a gravel shoulder are also included in this area. Stormwater runoff travels the same as existing conditions via gutter flow along the curb into a closed drainage system. The closed drainage system discharges beyond the project limits to the north through a culvert to Wetland "A" at DP-2.

DRAINAGE AREA PDA-3
This area consists of the impervious westbound lane of North Shore Road, as well one half of the bridge that connects North Shore Road with Essex Center Drive (STA. 303+20 to 306+57). This area also includes pervious grass area within the median on the bridge and the area between North Shore Road and Route 128 to the north. The Independence Greenway extension is also proposed through this PDA. Stormwater runoff from the roadway travels the same as existing conditions via country drainage and discharges into a ditch on the south side of the roadway at DP-3. Stormwater runoff from the grass area adjacent to the roadway travels via overland flow into a proposed catch basin, which discharges to the ditch at DP-3.

DRAINAGE AREA PDA-4
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 306+57 to 314+97). The Independence Greenway extension is also proposed through this PDA. Stormwater runoff from the road travels the same as existing conditions via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a proposed infiltration trench SCM that discharges to a catch basin connected to the existing culvert at DP-4.

DRAINAGE AREA PDA-5
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 314+97 to the project limit approximately 500 feet west). The Independence Greenway extension is also proposed through

this PDA. Stormwater runoff from the road travels the same as existing conditions via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a culvert at DP-5.

DRAINAGE AREA PDA-6
This area consists of the Independence Greenway extension starting perpendicular to the eastbound lane of North Shore Road that extends southwest (STA. 318+45 to 329+88). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. The area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north through a culvert at DP-6.

DRAINAGE AREA PDA-7
This area consists of the Independence Greenway extension that extends southwest (STA. 329+88 to 340+31). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. This area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-7.

DRAINAGE AREA PDA-8
This area consists of the Independence Greenway extension that extends southwest (STA. 340+31 to 346+35). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. The area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-8.

DRAINAGE AREA PDA-9
This area consists of the Independence Greenway extension that extends southwest (STA. 346+35 to 351+77). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. The area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north at DP-9.

DRAINAGE AREA PDA-10
This area consists of the Independence Greenway extension that extends southwest (STA. 351+77 to 359+02). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, loam & seed grass area, and a boardwalk over Proctor Brook that is approximately 440 feet in length. The area is approximately 15 to 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges southwest through a culvert that crosses under Endicott Street at DP-10.

Table 4 presents the proposed drainage areas and their characteristics under proposed conditions. Figure 7 shows proposed drainage patterns and drainage area delineations by design point.

Impaired Waters and TMDLs

As described under the Proposed Conditions section, the Project will discharge to Proctor Brook (Segment ID MA93-39). Proctor Brook is impaired based on the MassDEP Year 2016 Integrated List of Waters, also known as the 303(d) list. The WQDF assists in the identification of impaired waters and TMDL requirements and quantifies the pollutant reduction provided by the Project's SCMs.

Table 6 lists the receiving water bodies that are impaired, if the water body is covered by a TMDL, and the TMDL's Waste Load Allocation (WLA) for MassDOT property.

Table 6: Impaired Waters and TMDL Information

Water Body	*MassDEP Category*	*303(d) list Impairments*	*TMDL*	*TMDL Pollutant*	*TMDL Name*	*Waste Load Allocation for MassDOT (lbs/yr)*
Proctor Brook	*5*	*E.coli, Fecal Coliform*	*Yes*	*227*	*E. Coli and Trash/Debris*	*N/A*

The proposed infiltration trench has been designed to meet the required water quality volume and TSS removal rates; however, it does not discharge to Proctor Brook. E. Coli is not a stormwater caused pollutant; therefore, TMDL removal calculations were not performed. See Standard 4 for more detailed water quality calculations and discussions.

Stormwater Management Standards

As demonstrated below, the proposed Project complies with the MassDEP Stormwater Management Standards (the Standards). The Project is considered a redevelopment project and only meets standards 2, 3, and 4 to the maximum extent practicable.

Standard 1: No New Untreated Discharges

No new stormwater conveyances may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

The Massachusetts Stormwater Handbook, Standard 1, requires that the project demonstrates that there are no new untreated discharges and that new discharges will not cause erosion or scour to downstream wetlands.

Existing runoff discharges to adjacent wetlands and properties via overland flow or by an existing outfall that can be approximated as ten (10) discharge points, as shown on Figure 6 - Existing Watershed Plan. The runoff is conveyed by a combination of overland flow (country drainage), piped networks to outfalls, and culverts that cross the roadway and track bed. The proposed design adds catch basins in some areas to collect runoff, designed based on MassDOT standards, to increase drainage efficiency. Under proposed conditions, runoff will be conveyed through a combination of overland flow, a closed drainage system, and one infiltration trench.

To improve upon existing conditions, stormwater runoff contributing to one of the existing discharge points (DP-4) will have a portion of the catchment area routed to a treatment SCM prior to discharge. The SCM that discharges to DP-4 is an infiltration trench. The proposed catch basins will have deep sumps and hoods to provide additional treatment. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge.

All new culverts are designed with rip rap protection to prevent erosion to Proctor Brook. Appendix C provides supporting calculations for the outlet protection design.

Stormwater runoff will be treated by deep sump catch basins with hoods at DP-2, -3, and -4, as well as an infiltration trench at DP-4 before discharging. See Standard 4 for the water quality treatment provided by the Project.

There are no new untreated point source discharges created as a result of this project. This standard is fully met.

Standard 2: Peak Rate/Flood Control

Stormwater management systems shall be designed so that post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for discharges to land subject to coastal storm flowage as defined in 310 CMR 10.04.

Standard 2 requires that the rates of flow be attenuated for the proposed development condition. This project is a redevelopment project and is required to meet Standard 2 to the maximum extent practicable. The Independence Greenway Extension will result in a net increase in impervious area.

The peak flow rates were calculated for the 2-, 10-, 25- and 100-year storm events under proposed conditions and compared to the existing peak flow rates. The proposed Independence Greenway Extension and minor geometry improvements result in an overall increase of 44,910 square feet in impervious area within the project limits. The increase in impervious area correlates to a minor overall increase in peak flow rates for the 2-, 10-, 25-, and 100-year storms.

There is an increase in peak flow rates for DP-2, DP-6, DP-7, DP-8, and DP-9 for all storm events due to the proposed increase in impervious area. The increase in peak rates for DP-2, which is the start of the Independence Greenway extension, ranges from 0.17 to 1.38 cfs (cubic feet per second), is minor and considered negligible. The other increases (DP-6,-7,-8, and -9) all occur due to the replacement of track bed with a paved shared use path. The increase of peak rates for DP-6 ranges from 0.96 to 3.21 cfs. The increase of peak rates for DP-7 ranges from 0.84 to 3.07 cfs. The increase of peak rates for DP-8 ranges from 0.41 to 1.77 cfs. The increase of peak rates for DP-9 ranges from 0.42 to 0.63 cfs. These four discharge points correspond to the four cross culverts under the track bed. DP-6 is where two twin 42” culverts that are obstructed are located. DP-7 is where the existing 6.4’ x 4’ box culvert has been washed away. Both areas have resulted in degraded track bed and overtopping of Proctor Brook. The proposed improvements will not only restore what was previously installed but also will enlarge the culverts to allow additional flow through the culverts rather than over the shared use pathway. DP-8 and DP-9 represent existing failed smaller culverts that will be replaced in kind that convey intermittent streams.

When the drainage areas (DP-6, -7, -8, and -9) that discharge to Proctor Brook are combined and compared to the overall peak rates of the Proctor Brook watershed, the increases are negligible. The project drainage area that directly discharges to Proctor Brook is 1.08 acres, with a net increase discharge rate of 8.71 cfs for the 100-year storm event under proposed conditions. Because the project site is located on the lower end of the watershed, the stormwater runoff from the path will reach its peak, prior to Proctor Brook (the combination of DP-6, 7, 8, 9, and 10) reaching its peak at DP-10, resulting in no increase in flood elevations for any storm event. This is demonstrated by adding the net increase in peak rates for the 100-year storm event from the HydroCAD model for DP-6,-7,-8,-9, and -10 (8.71 cfs), to the effective FEMA FIS 100-year peak discharge of 420 cfs for Proctor Brook for a total of 428.71 cfs. The hydraulic model resulted in no increase to the base flood elevation; thereby, demonstrating that the minor increase in peak rates from the project will not result in downstream flooding. A copy of the hydraulic study is included in Appendix D.

Therefore, no adverse impacts are anticipated by the increase in peak rates as a result of the project. The results of this analysis are presented in Appendix D of this report.

Per MassDOT Requirements, a proposed stormwater SCM must hold peak volumes up to the 10-year storm event. The proposed infiltration trench stormwater SCM fully meets this requirement.

Table 7 provides a summary of peak rates for each design point under existing and proposed conditions. Appendix D provides computations and supporting information regarding the hydraulic and hydrologic modeling.

Table 7: Peak Discharge Rates (cfs)

Standard 3: Recharge

Loss of annual recharge to ground water shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the MassDEP Massachusetts Stormwater Handbook.

Standard 3 requires that three computations or demonstrations be fulfilled in order to satisfy the stormwater recharge requirements. They are as follows:

- Impervious Area
- Required Recharge Volume
- Bottom Area Sizing for Subsurface Infiltration Systems and Porous Pavement

As stated previously, this project is a redevelopment project and is required to meet Standard 3 to the maximum extent practicable. This project has 119,834 square feet of total existing impervious area within the limit of work and results in an increase in impervious area by approximately 46,907 square feet due to the Independence Greenway extension and minor roadway geometry improvements. The required recharge volume for the total impervious area within the limit of work is 8,000 CF. The required recharge volume for the net increase in impervious area within the limit of work is 2,348 CF. The required recharge volume for the proposed SCM is 926 CF.

The project considered implementation of SCM's that would provide recharge throughout the project limits; however, there was only one feasible location within the project, which is close to DP-4. Given the limited space within the ROW, existing utilities, the crisscrossing of Proctor Brook under the track bed, close proximity to waterbodies and high groundwater throughout the majority of the project, it was not feasible to propose additional SCMs in all the drainage areas in the project.

The Soil Survey Analysis is included in Section 1.1 of this report, Figure 3 Soils Map, and Appendix B Soil Information. The infiltration trench is located near borings B-3 and B-4 taken by GZA. Boring B-3 did not encounter groundwater and boring B-4 encountered groundwater at 9.5' below the existing surface. The bottom of the proposed infiltration trench will have more than 2-feet of separation to ledge and/or seasonal high groundwater. The NRCS soil report for this area demonstrates that the soil type is 602, Urban Land, within the infiltration trench, which does not have a hydrologic soil group associated with it. The closest NRCS identified soil group to this area is 626, Merrimac urban land with HSG A. In addition, the Geotechnical Report developed by GZA in Appendix B describes the soils closest to the infiltration trench (borings B-3 and B-4) as fine to coarse sand, some silt, trace gravel, and trace ash, which is consistent with HSG A. Therefore, the SCM is determined to be comprised of HSG A soils and the required recharge calculations were made using HSG A soils. See Appendix C of this report for required recharge calculations.

For the infiltration trench SCM, the contributing impervious areas and its underlying Hydrologic Soil Group were used to estimate the recharge volume lost by the addition of impervious area, which was used as its required recharge volume. The combined storage provided by the proposed

infiltration trench is 1,415 CF. While the infiltration trench does not provide storage for the total proposed impervious area within the project limits, the storage volume meets the required volume determined by the impervious area that is routed to the SCM. Therefore, Standard 3 is met to the maximum extent practicable.

The SCM was designed using the static method, so that the storage available below the first overflow is equivalent or larger than the required recharge volume. Drawdown calculations were performed to show that the infiltration trench will drain within 72 hours. For this calculation, the RAWLs infiltration rates were used to estimate the recharge potential of each of the SCMs.

Table 8 provides the required recharge volume for the project, and Table 9 provides the provided recharge volumes for each design point.

Table 8: Required Recharge Volume for Project

	HSG A	*HSG B*	*HSG C*	*HSG D*	*Total*

Provided Recharge Volume (cf)	1,415	-	-	-	1,415

Appendix B provides soil evaluation information (including the geotechnical report), and Appendix C provides computations, drawdown calculations, and supporting information regarding recharge.

Infiltration SCMs were considered for the project, but only one location was feasible due to limited space in the ROW, seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. Drywells were considered but provide very little stormwater treatment volume, require 2' separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points.

Standard 4: Water Quality Treatment

Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This Standard is met when:

- *Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained;*
- *Structural stormwater best management practices are sized to capture the required water quality volume determined in accordance with the MassDEP Massachusetts Stormwater Handbook; and*
- *Pretreatment is provided in accordance with the MassDEP Massachusetts Stormwater Handbook.*

Standard 4 requires that all stormwater management systems be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). The Massachusetts Stormwater Handbook states that this standard is met when:

- Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained;
- Structural stormwater best management practices are sized to capture the required water quality volume as determined in accordance with the Massachusetts Stormwater Handbook; and
- Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.

As stated previously, this project is a redevelopment project and is required to meet Standard 3 to the maximum extent practicable. As mentioned in Section 5, there is an increase in impervious area and one (1) SCM is proposed as part of this project. It has been designed to provide water quality treatment for the area of impervious surface that it captures. The treatment practice is:

- (1) Infiltration Trench

The combination of an infiltration trench and deep sump catch basins with hoods provides 85% TSS removal for DP-4 only. This standard is met to the maximum extent practicable.

The project is not located within a stormwater critical area; therefore, Massachusetts Stormwater Regulations require a “Water Quality Depth” of half (1/2) inch. This project is considered a redevelopment project; one of the objectives of the proposed stormwater improvements is to improve upon the quality of discharged stormwater.

The proposed design aims to improve the water quality by installing a new infiltration SCM and catch basins with deep sumps and hoods where feasible. The required water quality volume for the total impervious area within the limit of work is 6,864 CF. The required water quality volume for the net increase in impervious area within the limit of work is 1,954 CF. The required water quality volume for the impervious area that the SCM receives is 772 CF. Though the proposed infiltration trench does not provide enough volume for the total or net increase of impervious area, it exceeds the water quality volume requirement for the area it was designed to hold, by providing 1,415 CF of storage. As a result, this standard will be met to the maximum extent practicable. See Appendix C for required water quality volume calculations.

The Project has been designed to comply with Standard 4. Stormwater control measures have been sized to treat the required water quality volume and remove required pollutant load to the maximum extent practicable.

The Project used the SCM WQ Curves, as provided by the WQDF, to determine the treatment depth based on the required TSS and/or TP removal percentage for each SCM. Table 10 shows the SCMs organized by design point with each SCM's corresponding treatment depth and TSS and/or TP treatment removal.

Appendix C provides the MassDEP TSS Removal Calculation Worksheets.
The City of Peabody has an active MS4 permit which includes long term operation and maintenance. The project will be maintained by the City's current O&M plan. Appendix E includes the LTPPP for this project.

Infiltration SCMs were considered for the project, but only one location was feasible due to limited space in the ROW, seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. Drywells were considered but provide very little stormwater treatment volume, require 2' separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points. Another option was to use proprietary devices at each discharge point for stormwater treatment volume, but due to the majority of the site discharging runoff via overland flow, these systems are not practical for this project.

The project's water quality treatment provides a minimum of 25% removal where closed drainage only was provided, and up to 85% of removal where the infiltration trench is proposed. The shared-use pathway that will replace the former railroad bed will sheet flow runoff to vegetated/wooded areas. Standard 4 is met to the maximum extent practicable.

Standard 5: Land Uses with Higher Potential Pollutant Loads

For Land Uses with Higher Potential Pollutant Loads (LUHPPLs), source control and pollution prevention shall be implemented in accordance with the MassDEP Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If through source control and/or pollution prevention all LHPPLs cannot be completely protected from exposure to rain, snow, snow melt, and stormwater runoff, the proponent shall use the specific structural stormwater BMPs determined by the Department to be suitable for such uses as provided in the MassDEP Massachusetts Stormwater Handbook. Stormwater discharges from LUHPPLs shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26-53 and the regulations promulgated thereunder at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.

Standard 5 does not apply to the Project. There are no land uses with higher potential pollutant loads within the Project area.

Standard 6: Critical Areas

Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of the specific source control and pollution prevention measures and the specific structural stormwater best management practices determined by the Department to be suitable for managing discharges to such areas as provided in the MassDEP Massachusetts Stormwater Handbook. A discharge is near a critical area, if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters and Special Resource Waters shall be removed and set back from the receiving water or wetland and receive the highest and best practical method of treatment. A "storm water discharge" as defined in 314 CMR 3.04(2)(a)1 or (b) to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00. Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of a public water supply.

Standard 6 does not apply to this Project. There are no critical areas within the Project limits.

Standard 7: Redevelopment

A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

The Independence Greenway extension is considered Redevelopment; therefore, Standard 7 is applicable to this project. Standard 7 requires a redevelopment project to meet Standards 2, 3 and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5 and 6 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

This project provides an opportunity to improve the quality of stormwater runoff discharged to adjacent wetlands. The proposed stormwater enhancements are summarized below:

There is one SCM proposed as part of this project. A portion of the proposed drainage system has been designed to convey runoff to this SCM for water quality treatment, and attenuation prior to discharge to the surrounding environment. The proposed SCM is an infiltration trench.

Cath basins with sumps and hoods are also installed within the project where feasible, which provide additional treatment.

The reconstructed drainage system will utilize existing outfall locations and invert elevations where feasible.

A Redevelopment Stormwater Checklist is provided in Appendix A of this report which illustrates which standards have been met to the maximum extent practicable. The standards are listed below:

Standard 1: Fully Met

Standard 2: Maximum Extent Practicable

Standard 3: Maximum Extent Practicable

Standard 4: Maximum Extent Practicable

Standard 5: Fully Met

Standard 6: Not Applicable

Standard 7: Fully Met

Standard 8: Fully Met

Standard 9: Fully Met

Standard 10: Fully Met

Standard 8: Erosion and Sediment Control

A plan to control construction related impacts, including erosion, sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan) shall be developed and implemented.

The implementation of erosion and sediment controls (ESC) during construction is considered a standard practice for all MassDOT projects. ESC will be installed before any land disturbance begins for the Project and will remain in place for the duration of the project. Construction period pollution prevention and erosion and sedimentation control measures will be implemented at the project site to control construction related impacts during construction and land disturbance activities. The General Contractor for the project will be responsible for implementation of the construction period controls.

The project will disturb more than one acre of land during the construction process and will require a NPDES Construction General Permit issued by the Environmental Protection Agency. As a result, the General Contractor will be required to prepare a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP document will satisfy the requirements of the Construction General Permit and the construction period erosion, sedimentation and pollution prevention plan requirements outlined in Standard 8 of the Massachusetts Stormwater Handbook. A SWPPP has not been prepared for inclusion with this stormwater report; however, one will be prepared prior to any construction activities at the site by the General Contractor.

Without proper erosion and sediment control measures, grading, filling and installing new structures may cause erosion and sedimentation, resulting in temporarily increased turbidity and suspended solid loads. Runoff from construction sites may also transport sediment to downstream watercourses, where sediment deposition and accumulation will occur as flow velocities decrease.

Erosion and sedimentation controls will be employed to prevent the erosion and transport of sediment into resource areas during the earthwork and construction phases of the project. Erosion and sedimentation control measures will be installed prior to site excavation or disturbance and will be maintained throughout the construction period.

Below is a description of some of the erosion and sediment control measures that will be employed at the project and that will be included in the SWPPP.

Minimize Disturbed Area and Protect Natural Features and Soil

The most important aspects of controlling erosion and sedimentation are limiting the extent of disturbance and limiting the size and length of the tributary drainage areas to the worksite and drainage structures. These fundamental principles will be the key factors in the Contractor's control of erosion on the project site. If appropriate, the Contractor will construct temporary diversion swales and settling basins or use a settling tank. If additional drainage or erosion control measures are needed, they will be located up-gradient from the compost filter tubes and sedimentation fences when possible.

The Contractor is responsible for the maintenance and repair of all on-site erosion control devices. All erosion control devices will be regularly inspected. At no time will silt-laden water be allowed to enter sensitive areas (wetlands, streams, and drainage systems). Any runoff from disturbed surfaces

will be directed through a sedimentation process prior to being discharged to the existing on-site drainage system.

The contractor will establish a staging area(s) on areas to be disturbed for the overnight storage of equipment and stockpiling of materials.

In the staging area, the Contractor will have a stockpile of materials required to control erosion on-site to be used to supplement or repair erosion control devices. These materials will include, but are not limited to, compost filter tubes, sedimentation fence, erosion control matting and crushed stone. As mentioned previously, erosion and sedimentation controls will be employed to minimize the erosion and transport of sediment into resource areas during the earthwork and construction phases of the project. Erosion and sedimentation control measures will be installed prior to site excavation or disturbance and will be maintained throughout the construction period.

The Contractor is responsible for erosion control on the site and will utilize erosion control measures where needed, regardless of whether the measures are specified on the construction plans or in supplemental plans prepared for the Stormwater Pollution Prevention Plan (SWPPP).

Primary erosion control techniques proposed include compost filter tubes, sedimentation fence barriers, and a stabilized construction entrance. A detailed description of each technique is discussed below.

Best Management Practices (BMPs)

COMPOST FILTER TUBES AND SEDIMENTATION FENCE

Erosion control barriers such as compost filter tubes and/or sedimentation fence or similar will be installed where required prior to the start of construction. These barriers will remain in place until all tributary surfaces have been fully stabilized.

DRAINAGE SYSTEM PROTECTION

Sediment filters (silt sacks) will be installed at all existing and proposed drainage structures and maintained and cleaned as required to maintain their effectiveness. Catch basins, drainage manholes and storm drain pipes will be cleaned of sediment and debris after the completion of construction. Sediment collected in structures will be disposed of properly and covered, if stored on-site. The following construction measures will be implemented to prevent the transport of sediment through the drainage system.

The Project disturbs one or more acres of land; therefore, the project contractor will request coverage under the NPDES Construction General Permit (CGP) and develop a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP follows the requirements of this standard and will be in compliance with the latest NPDES CGP.

Standard 9: O&M Plan

A long-term operation and maintenance plan shall be developed and implemented to ensure that stormwater management systems function as designed.

The City of Peabody is responsible for implementing the O&M Plan within their jurisdiction. Appendix E includes the O&M Plan for this project.

Standard 10: Illicit Discharges

All illicit discharges to the stormwater management system are prohibited.

Standard 10 of the Massachusetts Stormwater Handbook prohibits illicit discharges to stormwater management systems. As stated in the handbook, "The stormwater management system is the system for conveying, treating, and infiltrating stormwater on-site, including stormwater best management practices and any pipes intended to transport stormwater to the groundwater, a surface water, or municipal separate storm sewer system. Illicit discharges to the stormwater management system are discharges that are not entirely comprised of stormwater."

Proponents of projects within Wetlands jurisdiction must demonstrate compliance with this requirement by submitting to the issuing authority an Illicit Discharge Compliance Statement verifying that no illicit discharges exist on the site and by including in the pollution prevention plan measures to prevent illicit discharges to the stormwater management system.

Standard 10 also states that "The Illicit Discharge Compliance Statement must be accompanied by a site map that is drawn to scale and that identifies the location of any systems for conveying stormwater on the site and shows that these systems do not allow the entry of any illicit discharges into the stormwater management system. The site map shall identify the location of any systems for conveying wastewater and/or groundwater on the site and show that there are no connections between the stormwater and wastewater management systems and the location of any measures taken to prevent the entry of illicit discharges into the stormwater management system." Included with the Notice of Intent Submission are construction plans that displays the location of all of the stormwater management components as well as other utilities (existing and proposed) on the project site and conforms to requirements of a "site map" to accompany the Illicit Discharge Compliance Statement.

An Illicit Discharge Compliance Statement is included in Appendix E – Illicit Discharge Compliance Statement of this Report.

Where a new, closed drainage system will be constructed, there will be no connections to sanitary sewer. In other areas, stormwater runoff discharges via overland flow.

The design plans submitted with this report have been designed in full compliance with Standard 10. The project area does not have any known illicit connections.

Appendix A: MassDEP Checklist for Stormwater Report

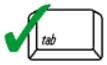
- Massachusetts Stormwater Report Checklist
- Redevelopment Checklist

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☒ Redevelopment

☐ Mix of New Development and Redevelopment

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- ☐ No disturbance to any Wetland Resource Areas
- ☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- ☐ Reduced Impervious Area (Redevelopment Only)
- ☒ Minimizing disturbance to existing trees and shrubs
- ☐ LID Site Design Credit Requested:
  - ☐ Credit 1
  - ☐ Credit 2
  - ☐ Credit 3
- ☒ Use of "country drainage" versus curb and gutter conveyance and pipe
- ☐ Bioretention Cells (includes Rain Gardens)
- ☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- ☐ Treebox Filter
- ☐ Water Quality Swale
- ☐ Grass Channel
- ☐ Green Roof
- ☒ Other (describe): Infiltration Trench

Standard 1: No New Untreated Discharges

- ☒ No new untreated discharges
- ☒ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- ☒ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☒ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☐ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☒ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☐ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☒ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☒ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☒ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☐ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☐ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☒ Bike Path and/or Foot Path
- ☒ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☒ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☒ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☒ Name of the stormwater management system owners;
- ☒ Party responsible for operation and maintenance;
- ☒ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☒ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Checklist for Redevelopment Projects

Redevelopment Location:
The entire work within the limit of disturbance is considered redevelopment.

Standard 7: A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions. Standards that are fully met are checked and do not require additional explanation.

☒ Standard 1: (Untreated discharges)
No new stormwater conveyances (e.g., outfalls) may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

☐ Standard 2: (Peak rate control and flood prevention)
Stormwater management systems must be designed so that post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for land subject to coastal storm flowage.

The peak flow rates were calculated for the 2-, 10-, 25- and 100-year storm events under proposed conditions and compared to the existing peak flow rates. The proposed Independence Greenway extension and minor geometry improvements result in an overall increase in square feet of impervious area within the project limits.

Though there is an increase in peak flow rates for DP -2, -6, -7, -8, and -9 for all storm events, additional studies were done to demonstrate there will be no adverse impacts. See page 16 in the Stormwater Report for additional information.

Implementations of Stormwater Control Measures (SCMs) for peak rate attenuation were used for one discharge point, but are not feasible for all discharge points due to the limited space within the existing Right-Of-Way (ROW), high groundwater, close proximity to resource areas and existing utilities.

☐ Standard 3: (Recharge to Ground water)
Loss of annual recharge to ground water shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from the pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The project considered implementation of SCM's that would provide recharge throughout the project limits; however, there was only one feasible location in the project close to DP-4. Given the limited space within the ROW, existing utilities, the crisscrossing of Proctor Brook under the track

bed, close proximity to waterbodies and high groundwater throughout the majority of the project, it was not feasible to propose SCMs in all the drainage areas in the project.

For the SCM, the contributing impervious areas and their underlying Hydrologic Soil Groups were used to estimate the recharge volume lost by the paved shared use path, which was used as the required recharge volume for the given SCM. The recharge volume provided by the SCM is 1,415 CF. While the infiltration trench does not provide storage for the total proposed impervious area within the project limits, the storage volume meets the required volume determined by the impervious area that is routed to the SCM. Therefore, Standard 3 is met to the maximum extent practicable.

☐ Standard 4: (80% TSS Removal)

Stormwater management systems must be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This standard is met when:

a. *Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan and thereafter are implemented and maintained;*
b. *Stormwater BMPs are sized to capture the required water quality volume determined in accordance with the Massachusetts Stormwater Handbook; and*
c. *Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.*

Infiltration SCMs were considered for the project, but only one location was feasible due to limited space in the ROW, seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. Drywells were considered but provide very little stormwater treatment volume, require 2' separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points. Another option was to use proprietary devices at each discharge point for stormwater treatment volume, but due to the majority of the site discharging runoff via overland flow, these systems are not practical for this project.

The infiltration trench at DP-4 will be able to achieve 85% TSS removal with the crushed stone shoulder forebay and the catch basins with deep sump and hood providing pretreatment.

The project's water quality treatment provides a minimum of 25% removal where closed drainage only was provided, and up to 85% of removal where the infiltration trench is proposed. The shared-use pathway that will replace the former railroad bed will sheet flow runoff to vegetated/wooded areas. Standard 4 is met to the maximum extent practicable.

☒ Standard 5 (Higher Potential Pollutant Loads (HPPL)

For land uses with higher potential pollutant loads, source control and pollution prevention shall be implemented in accordance with the Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If through source control and/or pollution prevention, all land uses with higher potential pollutant loads cannot be completely protected from exposure to rain, snow, snow melt and stormwater runoff, the proponent shall use the specific stormwater BMPs determined by the Department to be suitable for such use as provided in the Massachusetts Stormwater Handbook. Stormwater discharges from land uses with higher potential pollutant loads shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26-53, and the regulations promulgated thereunder at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.

Not Applicable.

☒ Standard 6 (Critical Areas)
Stormwater discharges to a Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or any other critical area require the use of the specific source control and pollution prevention measures and the specific stormwater best management practices determined by the Department to be suitable for managing discharges to such area, as provided in the Massachusetts Stormwater Handbook. A discharge is near a critical area if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters or Special Resource Waters shall be set back from the receiving water and receive the highest and best practical method of treatment. A "stormwater discharge," as defined in 314 CMR 3.04(2)(a)1. or (b), to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00. Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of the public water supply.

Not Applicable.

☒ Standard 8: (Erosion, Sediment Control)
A plan to control construction-related impacts, including erosion sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan), must be developed and implemented.

☒ Standard 9: (Operation and Maintenance)
A long-term operation and maintenance plan must be developed and implemented to ensure that stormwater management systems function as designed.

☒ Standard 10 (Illicit Discharges)
All illicit discharges to the stormwater management system are prohibited.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Essex County, Massachusetts, Southern Part
Survey Area Data: Version 19, Sep 9, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 22, 2022—Jun 5, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Re: Geotechnical Engineering Report
Proposed Peabody Bikeway – Phase II
Peabody, Massachusetts

Dear Adel:

In accordance with our Agreement dated December 20, 2018, GZA GeoEnvironmental, Inc. (GZA) is pleased to submit this geotechnical engineering report for the proposed Peabody Bikeway project located in Peabody, Massachusetts. The objectives of our services were to evaluate subsurface conditions and develop geotechnical design and construction recommendations to support the 25% design of proposed structural features of the project.

The proposed Peabody Bikeway Phase II project is part of the overall 5.3-mile Independence Greenway that extends from the Ipswich River Trailhead in Middleton, MA to the North Shore Mall Trailhead in Peabody, MA. The Peabody Bikeway Phase II Segment is an approximately 1.3-mile-long segment of trail that extends from the North Shore Mall Trailhead (STA 290+00) to Endicott Street in Peabody (STA 359+43).

This report supersedes our Preliminary Geotechnical Engineering Report dated April 22, 2019. The report was updated to reflect changes to the structural design and structural elements to the project. Specifically, the two retaining walls previously proposed between the Route 128 northbound highway embankment and the existing sidewalk of North Shore Road have been eliminated from the project. In addition, we understand that the proposed stream crossing structure located off Warren Street extension crossing Proctor Brook will consist of an approximately 438-foot-long elevated boardwalk rather than an 80-foot-long prefabricated steel truss bridge.

Elevations herein are in feet and referenced to the National American Vertical Datum of 1988 (NAVD 88). This report is subject to the Limitations set forth in **Appendix A** and the Terms and Conditions of our Agreement.

BACKGROUND

Our understanding of the project is based on:

- Discussions and email correspondence with Green International Affiliates Inc. (Green);
- Aerial photograph with proposed boring locations selected by Green at each structural feature;

- Construction Plans and Profiles along the Bikeway, Sheets 32 through 39, prepared by Green dated "fiscal year 2005";
- Site visits and observations of subsurface explorations at the site;
- CAD file of project base map provided by Green on January 15, 2019;
- MassDOT 25% Submittal Plan and Profile of Independence Greenway Extension, provided by Green on January 23, 2019;
- In-progress Sketch Plans entitled "Proposed Bridge Peabody Independence Greenway Extension over Proctor Brook", prepared by Green, with print date April 9, 2021.
- In-progress Construction Plans and Profiles, with print date April 5, 2021 and Bikeway Cross Sections, with print date April 7, 2021, prepared by Green.
- Readily available on-line surficial geology information, as well as on-line aerial photographs and topographic maps.

Existing Conditions

The Peabody Bikeway Phase II site starts from a previously completed portion of the Independence Greenway located near the southbound Route128 roadway and the North Shore Shopping Mall in Peabody, MA (Begin Bikeway STA 289+66). The bikeway extends east about 1,200 feet roughly parallel to the Route 128 roadway, then crosses under the southbound and northbound Route 128 roadways (at the existing Route 128 bridge over the entrance to the shopping mall), extends west about 1,400 feet along North Shore Road, crosses North Shore Road, and then follows an existing abandoned railroad right-of-way in an easterly direction roughly following Proctor Brook and terminating at about Endicott Street (End Bikeway STA 369+30) for about 4,100 feet. A site Locus is presented as **Figure 1**.

Route 128 Southbound Roadway Embankment Segment

The segment of the bikeway along the southbound Route 128 roadway (shopping mall side of the bikeway) will consist of an approximately 4-foot-wide trail. There are no structural features required to support the bikeway along this portion of the alignment.

North Shore Road Segment

The North Shore Road segment of the bikeway alignment is the existing highway embankment along the northbound side of Route 128. The embankment is grass covered with vegetation, overgrown bushes and small-diameter trees. There are several drainage basins and culverts within the embankment.

Photograph A: Embankment Slope looking Southwest at Route 128 Northbound Roadway adjacent to North Shore Road.

The embankment slope is approximately 1.5 horizontal to 1 vertical (1.5H:1V) at the northern end underpass and becomes flatter towards the west (**Photograph A**). The existing grade ranges from approximately elevation (El.) 53 to El. 68 feet along North Shore Road to about El. 52 to El. 75 at Route 128 - Northbound. The segment of the bikeway along the North Shore Road will consist of an approximately 10-foot-wide trail. There are no structural features required to support the bikeway along this portion of the alignment. However, earthwork with cuts up to about 5 feet at a maximum 2H:1V side slope and fills up to about 5 feet at a maximum 4H:1V side slope will be required to construct the bikeway along the existing embankment.

Existing Abandoned Railroad Right-of-Way Segment

The proposed bikeway alignment extends east from North Shore Road along an existing railroad right-of-way through a wooded area located between and roughly parallel to Lowell Street to the south and Warren Street Extension to the north. The railroad alignment approximately follows Proctor Brook. This portion of the site is heavily wooded with wetland vegetation. Existing site grades range from approximately El. 50 to El. 38.

There are four existing culvert crossings along the existing rail bed:

- a 36-inch and a 42-inch-diameter culvert at about STA 329+85
- a 30-inch-diameter culvert at about STA 340+10
- a 24-inch-diameter culvert at about STA 342+25
- a stone culvert of unknown size at about STA. 346+20.

There is also a former stream crossing over Proctor Brook at about STA. 351+60 (**Photograph B**).

Photograph B: Former Stream Crossing at Proctor Brook. Also, location of proposed pedestrian boardwalk.

An existing 42-inch-diameter sewer main also crosses through the right-of-way between Warren Street Extension and Endicott Street. The sewer main is reported to be about 12 feet below grade.

Proposed Construction

Proposed structural features for the bikeway include two box culverts and a stream crossing structure consisting of an elevated boardwalk.

Culverts

Two precast concrete, single-cell box culverts will be constructed to replace two of the existing culverts along Proctor Brook. One culvert is located at about STA 329+85 and is proposed to be 2.5-feet high by 6-feet wide by 24-feet long and the other culvert is located at about STA. 346+20 and is proposed to be 3-feet high by 7-feet wide and 18-feet long. Each culvert will include precast wing walls set at 45 degrees at both ends of the box culvert.

Stream Crossing Structure

The proposed stream crossing structure will consist of an elevated boardwalk located off the west end of Warren Street Extension that crosses over Proctor Brook and extends through wetland areas adjacent to the brook between approximately STA. 351+09 and STA. 355+47, terminating about 300 feet west of Endicott Street. The boardwalk will consist of composite wood decking with a clear width of 12 feet and piers (bents) generally spaced at 8-feet on-center. Helical piles are proposed for support of the boardwalk. The Sketch Plans show a timber wingwall at the abutments at the west and east ends of the boardwalk. The height of the boardwalk is generally within about 3 feet above existing

grade and extends locally up to about 3.75 feet above existing grade. The stream crossing structure will be designed to accommodate light-duty H-5 truck loading conditions.

SUBSURFACE EXPLORATIONS

Subsurface explorations included geotechnical test borings at each of the proposed structural features along the proposed bikeway alignment and sediment sampling for laboratory testing to provide data for scour analyses and completion of a 401 Water Quality Certification by others for the stream crossing structure.

Geotechnical Test Borings

GZA engaged New England Boring Contractors, Inc. (NEBC) of Derry, New Hampshire to perform eight test borings, including four borings (B-1 through B-4) along the highway embankment adjacent to North Shore Road for the previously proposed retaining walls (which are now planned to be a cut/fill slopes); two borings (B-5 and B-6) at the proposed culvert replacement locations, and two borings (B-7 and B-8) at the proposed pedestrian crossing as planned in 2018. It is noted that test boring B-5 was not performed due to accessibility issues but may be drilled at a later date as a confirmation boring during construction. The locations of several of the other borings had to be relocated from the originally proposed locations due to lack of access or the presence of overhead electrical wires. Approximate locations of the completed borings are shown on **Figure 2**. The original proposed boring locations were located in the field with a Trimble GPS unit and relocated borings using tape measurements from existing topographic features. Exploration locations should be considered accurate to the degree implied by the method used.

The test borings were performed between January 2 and 15, 2019 with an ATV-mounted drill rig using either 2-¾-inch inner diameter (I.D.) hollow stem augers or drive-and-wash drilling techniques to depths ranging from about 10 to 36 feet below ground surface (bgs). Split-spoon samples were collected and Standard Penetration Tests (SPTs) were generally taken continuously through the fill, and then at approximate 5-foot intervals thereafter. The samples were obtained in general accordance with ASTM D1586. The SPT method consists of driving a 1-⅜ I.D. split-spoon sampler 24 inches with a 140-pound hammer falling 30 inches. The number of blows required to drive the sampler from 6 to 18 inches is the SPT blow count (N-value), which is a commonly used indicator of soil density and consistency. An NX-sized, 10-foot-long rock core was obtained at borings B-7 and B-8 to confirm the type and quality of bedrock. Water levels were recorded at the completion of drilling, however, may not represent stabilized groundwater levels due to the introduction of drilling fluids. Upon completion of drilling, all borings were backfilled with drill cuttings and surficial soils.

A GZA representative was present during drilling to observe the borings and visually classify the soil samples using the Modified Burmister Soil Classification System and rock cores using the International Society of Rock Mechanics (ISRM) System. Boring logs prepared by GZA are attached in **Appendix B**. Photographs of the rock cores obtained from the borings are presented in **Appendix C**.

Sediment Sampling

GZA collected ten (10) shallow soil samples to a depth of up to 2 feet below the bottom of the brook for laboratory gradation testing for use in scour analysis by others and the 401 Water Quality Certification.

Six shallow soil/sediment samples were collected at the pedestrian bridge (as previously proposed in 2018) at locations specified by Green including, three samples approximately 72 feet upstream of the bridge (distance from the bridge equal to the length of the bridge crossing over the brook): one sample from the left bank on land, one sample from the right bank

on land, and one in the channel; and three samples at the bridge: one sample at the left abutment on land in front of the abutment, one sample at the right abutment on land in front of the abutment, and one in the channel.

Two (2) shallow sediment samples were also collected at each of the two proposed box culverts (total of 4 samples). The samples were obtained at the upstream opening of the existing culvert and at a distance upstream from the culvert equal to the length of the box culvert spanning over the brook; in this case one culvert is 24 feet wide and the other 18 feet wide.

The samples were collected using a hand shovel and a hand auger. The sediment material submitted for laboratory testing was a composite of material collected over the depth of sampling. Locations of the samples were made using tape measurements to existing topographical features.

LABORATORY TESTING

Geotechnical Laboratory Testing

Four soil samples from the geotechnical borings were submitted to Thielsch Laboratories in Cranston, Rhode Island for sieve analyses (ASTM D 422) to confirm field classifications, evaluate soil properties across the site, and evaluate the potential for soil re-use. Geotechnical laboratory test results are attached as **Appendix D**.

The ten (10) sediment samples obtained from the pedestrian bridge and replacement culvert locations were submitted to Thielsch Laboratories for sieve analyses for use in scour analyses by others and for 401 Water Quality Certification. Geotechnical laboratory test results of the sediment are attached as **Appendix D**.

Environmental 401 Water Quality Certification Testing

Four sediment samples were submitted to ESS Laboratory in Cranston, Rhode Island for environmental laboratory testing to evaluate parameters specified in the MassDEP BRP WW 08 Dredging Application and in accordance with MassDEP Policy No. Comm 97-001 Reuse and Disposal of Contaminated Soil at Massachusetts Landfills. Soil that is generated during the removal of sediment form the bottom of the brook and during excavation for the bridge abutments which is considered to be excess to the project must be managed in accordance with the MassDEP Massachusetts Contingency Plan (MCP) regulations and to evaluate whether the excavated material can meet the criteria for disposal at a Massachusetts landfill, if required. The testing also included analytes to satisfy criteria listed in 314 CMR 9.07 Criteria for Evaluation of Applications for Dredging and Dredged Materials Management. Analyses included:

<u>BRP WW 08 (assuming minor dredging):</u>

- Metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, zinc)
- EPA Method 8100 Polycyclic Aromatic Hydrocarbons (PAHs)
- EPA Method 8080 Polychlorinated Biphenyls (PCBs)
- MassDEP Extractable Petroleum Hydrocarbons (EPH) ranges
- Total Petroleum Hydrocarbons (TPH)
- Volatile Solids (percent)
- Water (percent)
- Grain Size (performed as part of geotechnical laboratory testing above)

Additional testing performed not covered by BRP WW 08, but needed for MassDEP and Massachusetts dredging, included:

MassDEP Policy No. Comm 97-001:

- EPA Method 8270 Semi-Volatile Organic Compounds (SVOCs)
- EPA Method 8260 Conductivity

314 CMR 9.07(2):

- EPA Method 8240 Volatile Organic Compound (VOCs)
- Total Organic Carbon

In addition, testing was performed for pesticides and herbicides, reactive sulfide and cyanide, pH, and flashpoint, since these tests are often required for certain disposal facilities.

Results of the environmental laboratory testing are summarized on **Table 1** and contained in **Appendix E**. As indicated on **Table 1**, the laboratory test results indicate levels for chromium in two samples (one at the bridge from boring B-7 and one at a culvert from boring B-6 exceeds the MassDEP MCP CMR 40.1600 Reportable Concentration (RC) S-1 standards. Reporting Category RC S-1 means "the category of criteria listed in CMR 40.1600 applicable to soil samples obtained at or within 500 feet of a residential dwelling, a residentially-zoned property, school, playground, recreational area or park; or within the geographic boundaries of a groundwater resource area categorized as RC GW-1". Excess soils generated during construction may be disposed at a Massachusetts landfill, but additional sampling and testing may be required by the disposal facility at the time of construction.

SUBSURFACE CONDITIONS

Subsurface conditions encountered in the borings generally consisted of fill underlain by natural granular soil deposits and bedrock. The strata encountered in the borings are described below in order of increasing depth and are summarized on **Table 2**. The depths, thicknesses, and elevations referenced herein should be considered approximate. Refer to the borings logs for more detailed subsurface conditions at specific exploration locations. A general description of the subsurface conditions encountered in the borings from the ground surface down follows:

North Shore Road Embankment Segment (B-1 through B-4)

This section provides a general description of the primary stratigraphic units encountered in the borings along the North Shore Road embankment segment.

Fill – Underlying approximately 6 to 12 inches of topsoil, granular fill was encountered to depths ranging from about 3 to 8 feet bgs. The fill generally consisted of dark brown to brown, fine to coarse sand with up to 30 percent silt and up to 15 percent gravel, root fibers, and ash particles. SPT N-values within the fill varied between 4 and greater than 100 blows per foot (bpf). The higher SPT N-values are likely due to the presence of gravel.

Natural Granular Soil Deposits – Natural granular soil/glacial deposits were encountered below the fill in borings B-1 through B-4 and ranged from about 6.5 to 13.5 feet in thickness before the split-spoon sampling was terminated on refusal within this deposit. The glacial deposits generally consisted of medium dense to very dense, brown to gray, fine to coarse sand with up to 50 percent gravel and up to 30 percent silt. The SPT N-values within the glacial deposits layer ranged from 15 to greater than 100 bpf. The higher SPT N-values are likely due to the presence of gravel or possibly, refusal on the top of bedrock.

Bedrock – Borings B-1 through B-4 were terminated upon reaching refusal to either or both advancement of the split-spoon and/or auger on possible top of bedrock at depths ranging from about 10.5 to 17 feet bgs. The refusal on bedrock was not confirmed by coring.

Existing Abandoned Railroad Right-of-Way Segment (B-6 through B-8)

This section provides a general description of the primary stratigraphic units encountered in the borings along the existing abandoned railroad right-of-way and elevated boardwalk segment. A generalized subsurface profile along the alignment of the proposed is presented on **Figure 3**. It should be noted that the borings along the Proctor Brook stream crossing were located based on the previous 80-foot-long prefabricated steel truss bridge crossing rather than the 438-foot-long elevated boardwalk, which is why there were no borings taken at the east end of the boardwalk.

Fill – Underlying topsoil, fill was encountered to depths ranging from about 2 to 4 feet bgs. The fill generally consisted of dark brown to brown, fine to medium sand with up to 35 percent silt and up to 20 percent gravel, root fibers, and wood fragments. The fill in boring B-8 was predominantly dark brown, organic Clay & Silt with up to 35 percent sand and up to 20 percent gravel. SPT N-values within the fill varied between 5 and 32 bpf.

Natural Granular Soil Deposits – The natural granular soil deposit in boring B-6 was predominantly fine to coarse sand with SPT N-values ranging from 11 to 36 bpf. The natural granular soil deposit in boring B-6 was encountered at a depth of about 2 feet bgs and extended to a depth of about 26 feet where the split-spoon sampling was terminated on possible bedrock. “Blow-in” was observed while drilling boring B-6 at around 10 to 12 feet bgs.

The natural granular soil deposits in borings B-7 and B-8 performed for the proposed pedestrian crossing differed from the other borings drilled for the bikeway. The natural granular soil deposits were further classified into sand and gravel, silt & clay, and a glacial deposit, each layer generally described as follows:

Sand and Gravel: encountered underlying the fill at approximately 4 feet bgs. The Sand and Gravel layer ranged from about 13.5 feet thick (B-7) to 15 feet thick (B-8) and generally consisted of medium dense to dense, brown to light brown fine to medium sand with up to 35 percent gravel and up to 15 percent silt. The SPT N-values within the Sand and Gravel layer ranged from 6 to 33 bpf. The SPT N-values in boring B-7 appeared to generally be lower than in boring B-8.

Silt & Clay – A relatively thin (approximately 2 to 3 feet thick) layer of Silt & Clay was observed in borings B-7 and B-8 at depths ranging from 17 to 22 feet bgs and generally consisted of brown to gray, Silt & Clay with up to 10 percent sand and gravel. One SPT N-value obtained in this layer indicated 12 bpf indicating stiff consistency.

Glacial Deposits – Glacial deposits were encountered underlying the Silt & Clay in borings B-7 and B-8 ranging from about 19 to 22 feet bgs. The glacial deposits generally consisted of dense to very dense, brown to gray, fine to coarse sand with up to 30 percent silt and up to 30 percent gravel. The SPT N-values based on two samples obtained from this layer were 40 bpf (B-8) and 44 bpf B-7).

Bedrock – It appears that the top of bedrock may include a relatively thin layer of weathered bedrock overlying more competent rock. In each boring, a layer of gravel and refusal to the split-spoon was encountered. The weathered rock appears to range from about 6 to 12 inches thick. Bedrock was not confirmed by coring in boring B-6, however, bedrock was confirmed with rock coring in borings B-7 and B-8 starting at 26 feet and 31 feet bgs, respectively. These depths correspond to approximately El. 13 and El. 8, respectively. Less than 100 feet north of Proctor Brook on the opposite side of Warren Street Extension bedrock outcrops are present.

The bedrock, based on the cores obtained from borings B-7 and B-8, generally consists of gray, hard, slightly weathered, medium to coarse grained GRANITE. **Table A** summarizes the rock recovery percentages and the Rock Quality Designation (RQD) values (the sum of the lengths of NX-sized core pieces that are greater than 4 inches in length divided by the length of the core run) for each core run. As noted in the table, the RQD values in boring B-8 were very poor. The rock core barrel jammed during coring the rock in boring B-8.

Table A: Summary of Rock Core Data

Boring Number	Core Run	Core Depth Below Ground Surface (ft)	Approximate Elevation (ft)	Recovery (%)	RQD (%)
B-7	C-1	26 – 31	13.5 – 8.5	93	20
	C-2	31 – 36	8.5 – 2.5	100	35
B-8	C-1	31 – 36	7.8 – 2.8	70	0
	C-2	36 – 41	2.8 – -3.2	100	0

GROUNDWATER

Groundwater levels were measured in the borings after completion of drilling, prior to backfilling and therefore, are not considered to be representative of stabilized groundwater levels. Measured levels are indicated on **Table 2** and summarized below:

- The groundwater levels along the Northshore Road segment ranged from approximately 6 to 10 feet bgs, corresponding to elevations ranging from 42 to 62.
- The groundwater level at the culvert at STA 346+20 (boring B-6) was encountered at about 3.5 feet bgs, corresponding to about El. 37.
- The groundwater levels at the elevated boardwalk ranged from 3 to 6 feet bgs, corresponding to about El. 32 to El. 36.

Note that fluctuations in groundwater levels are expected to occur due to variations in season, rainfall, site features and other factors different from those existing at the time of the explorations and measurements.

The bikeway is located within the 100-year flood zone based on FEMA FIRM 25009C0412F dated July 3, 2012. The 100-year base flood ranges from about El. 47 at North Shore Road to El. 39.5 feet at Endicott Street. We understand that the stream level within Proctor Brook is relatively shallow and runs west to east. A summary of stream levels based on the hydraulic study performed by others for the project site is provided in **Table B**.

Table B: Summary of Stream Levels at the Proctor Brook Stream Crossing Structure

Return Period	Elevation (ft)
Ordinary High Water	37.88
10-year Design Flood	39.33
25-year Scour Design Flood	39.53
50-year Scour Check Flood	39.82
100-year Base Flood	40.19

KEY GEOTECHNICAL ISSUES

The primary geotechnical issues associated with the design and construction of the proposed culverts and elevated boardwalk include:

- Relatively Shallow Groundwater Within the Existing Abandoned Railroad Segment. Being that the Proctor Brook is a wetland area, groundwater is shallow, and significant portions of the proposed bikeway are prone to flooding. Construction dewatering and possibly temporary cofferdams will likely be required during excavations for the culvert and approach embankments for the elevated boardwalk.

- Working within the Wetland to Construct the Culverts and Stream Crossing Structure. Limiting disturbance to the wetland areas surrounding the rail alignment associated with excavation in the wetlands needs to be considered when selecting foundation types to limit excavation quantities and access for construction equipment. In addition, construction equipment will only be able to access the bikeway from limited locations. Therefore, tracked and/or small- to medium-sized construction equipment would allow for installation of foundations that limit disturbance. Also, contractors will need to be aware of restrictions from the Conservation Commission with regard to removal of brush.

- Existing Granular Soils at the Elevated Boardwalk. The soils at the elevated boardwalk structure are relatively "clean" and are susceptible to scour during the design scour flood event and the check scour flood event due to water velocity. Based on hydraulic analyses by others, the scour depth at the abutments is 1.95 feet and at the piers is 1.17 feet during the Design Scour (25-year flood) event and scour depth at the abutments is 2.28 feet and at the piers is 1.22 feet during the Check Scour (50-year flood) event.

- Existing Cobbles/Boulders at Ground Surface. Clearing of the existing surficial cobbles/boulders will be required prior to installation of foundations for the elevated boardwalk structure.

- Existing Sewer Line. The existing sewer line extends between Warren Street Extension and Endicott Street and is close to the elevated boardwalk. The closest point occurs at the west side of the boardwalk, where the sewer line is located within less than 5 feet laterally of the proposed foundations. In order to avoid imposing load on the existing sewer, foundations for the stream crossing will need to extend into the natural soils below the bottom elevation of the sewer. Construction methods used to install foundations for the stream crossing will need to consider and mitigate potential construction impacts (i.e., ground movement and vibrations) to the existing sewer line.

GEOTECHNICAL RECOMMENDATIONS

This section presents the geotechnical recommendations for the proposed culverts and elevated boardwalk structure. These recommendations are subject to the limitations contained in **Appendix A**. Recommendations for the culverts and wing walls for the elevated boardwalk are based on foundation design provisions of the AASHTO LRFD Bridge Design Specifications, 8th Edition (2017 AASHTO LRFD), 2011 AASHTO Guide Specifications for LRFD Seismic Bridge Design, 2nd Edition, with 2015 Interim Revisions (2015 AASHTO LRFD Seismic), and the MassDOT LRFD Bridge Manual, 2020. Recommendations for the foundations for the elevated boardwalk are based on helical piles and allowable stress design and the International Code Council Evaluation Services (ICC-ES) Acceptance Criteria AC358 for Helical Systems and Devices.

1. CULVERTS AND CULVERT WING WALLS

Type of Culvert

The proposed box culverts specified by Green for this project are single-cell, precast box sections and the wing walls at the ends of the culverts will also be precast sections. Criteria for loads and live load distributions should be in accordance with Section 3.3.4.4 of the MassDOT LRFD Bridge Manual. As specified in that section of the Manual, earth pressure should be based on a minimum and maximum equivalent fluid pressure of 30 pcf and 60 pcf, respectively. Lateral earth pressure from weight of earth above and adjacent to a box section should be taken as 0.5 times the vertical pressure. Load factors on the lateral earth pressures should follow the recommendations in Section 3.3.4.4.

We anticipate that the box culverts and wing walls can be installed by cut and cover methods in excavated trenches. The length of the trenches may need to be limited to help control in-flow of groundwater but will need to be long enough to accommodate the lengths of the precast box sections.

Based on the subsurface conditions indicated in boring B-6 (boring B-5 is pending), the box culvert will bear on relatively clean granular soil consisting of medium dense to dense fine to medium or fine to coarse sand with up to 10 percent silt and up to 10 percent gravel. These natural granular soil deposits are considered suitable for support of the box culverts provided the subgrade can be adequately dewatered to allow the subgrade to be recompacted and remain firm and stable when proof compacted.

If organic soils, loose or otherwise unstable or disturbed soils are encountered at subgrade level, those soils should be excavated and replaced with Gravel Borrow or ¾" crushed stone wrapped in non-woven filter fabric to the top of the naturally deposited inorganic soils below, or to a maximum depth of 3 ft below the bottom of culvert. Where compacted Gravel Borrow or ¾" crushed stone is placed for support of the box culvert, the lateral limits of the fill should be defined as a line extending horizontally outward and downward at a 1H:1V slope from the bottom of the culvert. Controlled density fill may be used in lieu of Gravel Borrow or crushed stone.

Culvert Bedding

The box culvert sections should be placed on a bedding of at least 12 inches of Gravel Borrow or ¾" crushed stone wrapped in Mirafi 180N, or equivalent, non-woven filter fabric.

Trench Backfill

Material placed against the culverts should consist of Gravel Borrow, Type C. Sidesway of the structure may be ignored in the design of the culverts provided that the fill placed around the structure is placed on both sides to approximately the same elevations at the same time.

2. ELEVATED BOARDWALK STRUCTURE

Boardwalk – Helical Pile Foundations

We recommend the boardwalk be supported on helical piles deriving their support in the natural granular soil deposits below the existing fill. Helical piles are a steel foundation system consisting of a central shaft with one or more helix-shaped bearing plates, welded to a lead section. Extension shafts are used to extend the pile into competent load-bearing soils. Helical piles will derive their support primarily in bearing of the helices within the

natural granular soil deposits. Helical piles are advanced by rotating the pile into the ground with the application of torque.

Helical piles are available as both round and square shafts with a range of shaft diameters and helix configurations (number of helices, helix diameters and helix spacing), depending on the design loads and installation considerations and vary by the manufacturer

Due to special requirements for installation of helical piles and the requirements for proper performance of the structural system, helical piles, including bracket assemblies should be designed and installed by a specialized helical pile Contractor. In addition, each Contractor typically works with a specific manufacturer and engineer. Thus, the size of the helical pile shaft, the number and diameter of the helices, and the overall design will vary depending on the manufacturer selected by the Contractor. Therefore, performance design criteria need to be specified on the Contract Bid Drawings and Specifications in sufficient detail to enable a Contractor to design and install piles for support of the proposed boardwalk.

To evaluate the feasibility of using helical piles to support the elevated boardwalk, a preliminary helical pile design was performed using geometry and the design loads provided by Green on April 6, 2021, which are summarized in **Table C**. Based on our evaluation, Chance™ RS2875.276 helical piles with a 10-, 12-, and 14-inch diameter helix lead section is considered a feasible helical pile option. The estimated pile embedment of the top helix is 11 feet below existing ground surface, or about 9 feet below the scoured ground surface. The preliminary helical pile calculations are provided in **Appendix F**.

Table C: Helical Pile Loads for Proposed Elevated Boardwalk

Load Type	Design Load (kips)
Vertical – Compression	25.0
Vertical – Tension	10.0
Lateral – Transverse (every bent)	7.5
Lateral – Longitudinal (every third bent)	5.0 (each way)

Note: The design compression, tension and lateral design loads are the ultimate load divided by a factor or safety of 2.0.

The following design criteria are presented for the helical pile foundation system:

- The structural design of the decking is based on 8-foot bent (longitudinal) spacing.
- Two vertical helical piles and one inclined (battered) pile are specified at each bent to resist axial compression/tension and horizontal (transverse direction) loads in compression/tension. The inclined helical anchor at each bent should alternate lateral directions from bent to bent.
- Two inclined piles are specified at every third bent of the boardwalk to resist longitudinal loading.
- The Contractor should determine the required angle of inclination for inclined piles so that the angle is no greater than 45 degrees and no less than 25 degrees from vertical.
- Design of the helical piles should be based on Allowable Stress Design (ASD) and should use a factor of safety of 2.0.

- Helical piles should be designed to provide allowable geotechnical capacity greater than the design loads presented in **Table C**.
- Static load testing should be performed in accordance with ASTM D1143 for compression and ASTM D3689 for tension.
- Helical piles should be designed so that the helices derive support entirely in the natural sand and gravel deposits underlying the existing fill stratum.
- The helical piles should be designed for tension during the design scour (25-year) flood. The maximum scour occurs at the abutments, therefore the piles should be designed for 1.95 feet of scour.
- The top helix should extend at least 11 feet below ground surface to provide sufficient overburden weight for the tension load (note that this will also provide more than the 4 feet of embedment required for frost protection).
- Helical piles in close proximity to the existing sewer line will need to be installed such that the top helix is located below the zone of influence on the pipe. The zone influence for the purpose of loading is defined as a 1H:1V plane from the springline of the pipe. The utility plans should be reviewed to confirm the sewer location and minimum depth to the top helix during final design.
- Design and installation of helical piles should conform to the manufacturer's recommendations.

These design criteria, as well as further specifics for design and installation of the helical piles should be provided in the Helical Pile performance specification. Further requirements regarding connection details will be presented on the structural drawings to be prepared by Green. Also, refer to the Construction Recommendations presented herein for additional requirements.

Abutments and Wingwalls

The Sketch Plans show timber abutments and wingwalls. In order to protect the existing sewer line, we have assumed the abutment and wingwalls will consist of crib walls constructed using pressured treated timber. Additional types of retaining walls should be considered for design and construction of the abutment and wing walls including mechanically stabilized earth, cast-in-place concrete, precast concrete, and other proprietary walls types such as Redi-Rock or similar. Selection of the final wall type should consider type of equipment that can readily access the wall locations and using construction methods that result in the least amount of disturbance to the wetland.

Bearing Resistance & Settlement

The factored geotechnical bearing resistance for the new abutment and wingwalls were evaluated using the following parameters and assumptions based on the methodology of 2017 AASHTO LRFD Section 10.6.3.1.2a:

- Effective footing widths (B') ranging from 2 to 6 feet
- Eccentricity (e) is less than or equal to 1/3 of the footing width
- Estimated footing lengths (L) of 10, 15, and 20 feet

- Minimum footing embedment depth (Df) of 4 feet below check scoured ground surface which will provide a minimum of 4 feet of embedment for frost protection even after the scour check event.
- Design groundwater elevation at proposed scoured streambed
- Footings are assumed to bear in the existing fill or natural granular soils. The presence of the Crushed Stone stabilization layer is neglected.
- Estimated friction angle (ϕ) of the footing bearing soils of 32 degrees
- Unit weight of the bearing soils of 120 pounds per cubic foot (pcf)
- Resistance factor for bearing resistance (ϕb) of 0.45 in accordance with 2017 AASHTO LRFD Table 10.5.5.2.2-1.

As required by MassDOT LRFD Section 3.2.10, the stability and bearing resistance of the footings under scour conditions is required to be considered.

Bearing resistance design charts to facilitate the selection of a footing size for the abutment and wingwalls based on factored bearing pressures (strength limit state) and tolerable settlement (service limit state) are provided in **Appendix F**. The charts are based on the effective footing width, B', where B'=B-2e (B is the footing width and e is the eccentricity of the loading on the footing). The factored bearing pressures shown in the charts in **Appendix F** are based on a resistance factor of 0.45, which is conservative for the wingwalls. The net bearing pressure for service limit state should be used to estimate footing settlement on the chart. Settlement is anticipated to be elastic and the majority of settlement will occur during construction (i.e., from the bridge dead loads).

Sliding and Overturning

The abutments and wingwalls need to be designed for sliding and overturning. The overturning analyses should be based on limiting the eccentricity to no more than one-third the footing dimension, B/3 (2017 AASHTO LRFD Section 10.6.3.3). Sliding analyses should be performed in accordance with Section 10.6.3.4 of 2017 AASHTO LRFD utilizing a resistance factor of 0.9 (Table 10.5.5.2.2-1) and a friction factor (tan δ) of 0.625 for soil-to-soil contact assuming the crib walls are filled with granular material.

We recommend that the passive soil resistance on the front side of the wingwalls and abutments be ignored when evaluating sliding.

Lateral Earth Pressure

The following backfill parameters/assumptions are recommended for the design of the abutment and wingwalls backfilled using compacted Gravel Borrow:

- Estimated soil friction angle (ϕ) of 34 degrees.
- A moist soil unit weight of 125 pounds per cubic foot (pcf) above the groundwater level and a saturated unit weight of 130 pcf below the groundwater level.
- Horizontal backfill slope behind the wall (walkway grade).
- Design groundwater at the top of the abutment assuming the area is prone to flooding.

- Based on Section 3.1.6 of the 2013 MassDOT LRFD Bridge Manual, for walls greater than 5 feet, the lateral earth pressure should be based on active earth pressure (K_a) conditions. Walls should be designed an active earth pressure coefficient of 0.26 for Gravel Borrow.

Additional lateral pressures due to traffic surcharge loads should be applied as required by 2017 AASHTO LRFD. However, based on Section 3.3.1.3 of the 2013 MassDOT LRFD Bridge Manual, if approach slabs are used, the AASHTO live load surcharge load on the abutment can be ignored.

The ends of the elevated boardwalk will be relatively hard points in comparison to the adjacent at-grade trail. We recommend an approach slab similar to that used for a bridge abutment or a cantilever end segment of boardwalk be used. The approach slab or cantilever segment should be structurally tied to the abutment or last pier and be free to rotate. The intent is to avoid any abrupt differential settlement between the boardwalk and approach embankment, which could cause a tripping hazard.

When considering fill in front of the wall, passive resistance should be neglected in determining wall stability in accordance with the 2013 MassDOT LRFD Bridge Manual.

3. ELEVATED BOARDWALK APPROACH EMBANKMENTS

Approach embankments up to about 5 feet above the current grade will be required at the ends of the elevated boardwalk. The approach embankments will be graded to a 3.1% slope or less. The approach embankments will be 14-feet wide with 2H:1V side slopes down to existing grade. The approach embankment fill should consist of Gravel Borrow (M.1.03.0, Type B) compacted to 95% of the maximum dry density. If project hydraulic studies indicate that erosion of the side slopes of the approach embankment is a concern, protection of the slope surface by armoring with stones (such as a modified rock fill underlain by non-woven filter fabric), a permanent turf reinforcement mat (TRM), or other material acceptable to the conservation agency will need to be constructed.

The approach embankment, including base course should be constructed as soon as practical and at least 2 months prior to binder course construction. Placement of the final wearing course of pavement should be held off to the degree practical to allow for any settlement of the new embankment to occur during construction.

Prior to placement of embankment fill, the subgrade embankment areas should be prepared and proof-compacted as recommended herein.

4. GEOTECHNICAL SEISMIC DESIGN PARAMETERS

Seismic Site Class

A Seismic Site Class analysis was performed using SPT N-values from the borings in accordance with Section 3.10.3.1 of 2017 AASHTO. Based on the results of our analysis we recommend Site Class D be used for design.

The design response spectrum parameters are based on the 1,000-year return period, corresponding to a non-critical, non-essential structure. In accordance with 2011 AASHTO Guide Specifications for LRFD Seismic Bridge Design, 2nd Edition, with 2015 Interim Revisions (AASHTO 2015 Seismic), for Site Class D, we recommend the following design response spectra parameters:

A_s = 0.133g S_{DS} = 0.263g S_{D1} = 0.096g

where:

A_s is the short period acceleration based on Site Class D
S_{DS} is the design spectral acceleration coefficient at 0.2-second period
S_{D1} is the design spectral acceleration coefficient at 1.0-second period

Seismic Design Category

Based on the 1-second period design spectral acceleration for this site and in accordance with Table 3.5-1 of AASHTO Guide Specifications for LRFD Seismic Bridge Design, the elevated boardwalk structure may be assigned to Seismic Design Category (SDC) A.

Liquefaction

In accordance with Section 3.5 of the 2011 AASHTO Guide Specifications for LRFD Seismic Bridge Design, no liquefaction evaluation is required for bridges assigned to SDC A. Furthermore, based on the SPT N-values obtained from the borings, the soils are judged to be not considered susceptible to liquefaction.

5. ADDITIONAL SUBSURFACE EXPLORATIONS

During design development, the length of the stream crossing structure presented in the Bridge Type Selection Worksheet was increased from about 70 feet to about 438 feet. Thus, we recommend that additional explorations be performed prior to final design for the elevated boardwalk. Four borings should be performed between boring B-8 and the east abutment/transition ramp. The borings should be advanced to a depth of 25 feet bgs, or refusal, whichever is shallower. Split-spoon samples and SPTs are recommended to be taken continuously from 10 to 20 feet bgs and at standard 5-foot intervals to complete the boring to the specified depth. The borings will provide confirmatory information for the east end of the alignment where there is currently no subsurface information available.

CONSTRUCTION CONSIDERATIONS

1. HELICAL PILES

Contractor Qualifications

A specialty contractor should be engaged by the Contractor to install the helical piles who is capable of demonstrating successful completion of design, installation, and testing of helical piles with similar load capacity and similar subsurface conditions. The design of the helical piles and load tests should be prepared and stamped by a Professional Engineer Registered in the Commonwealth of Massachusetts. In addition to the design calculations, the Contractor's submittal should include a description of the load test set-up, equipment, and procedures.

Helical Pile Load Testing

The helical pile geotechnical capacity should be confirmed with load tests. We recommend performing a compression and tension load test on at least two piles. Load testing should be in accordance with ASTM D1143 for compression testing, and ASTM D3689 for tension testing. Locations of the load test piles should be agreed upon by the Contractor and geotechnical engineer. Tension load testing may be performed on the same pile that compression testing is performed.

QA/QC During Installation of Helical Piles

Observation of helical pile testing and production helical pile installation should be made by experienced geotechnical personnel. The depth, final installation torque, advancement rate, number and diameter of helices, diameter of extension shafts, and alignment should be verified and documented for each helical pile.

Obstructions

Removal of surficial cobble/boulders along the will be required prior to helical pile installation. Pre-drilling may be required to penetrate the cobbles and boulders. If, after pre-drilling, foundations are not able to be installed at anticipated locations, the structural engineer should be prepared to relocate and/or add additional helical piles to provide the required geotechnical resistance to support the proposed structures.

2. SUBGRADE PREPARATION FOR EMBANKMENTS

Remove all existing topsoil/subsoil within proposed fill areas to construct embankments (e.g., along North Shore Road and for the approaches to the elevated boardwalk). Perform final excavation using a smooth-edged bucket to limit disturbance to the exposed final subgrade. Proof-roll final subgrade areas prior to placement fill with at least ten (10) passes of a large vibratory plate compactor or walk-behind vibratory drum roller. If work is performed during periods of wet weather and groundwater is near the subgrade proof-rolling should be performed at the discretion of the Geotechnical Engineer and should be performed using static (non-vibratory) equipment. Weak, unstable or saturated areas that are observed during proof-rolling should be overexcavated and replaced with compacted Gravel Borrow (or crushed stone wrapped in non-woven geotextile fabric if greater than 4 inches in thickness).

Subgrade preparation for the culverts and culvert wing walls was described in Design Section 2 above.

Fill for embankments, footings for the culvert wingwalls as well as bedding for the culverts and culvert wingwalls should not be placed in water or on frozen ground.

3. GROUNDWATER AND SURFACE WATER CONTROL

Proctor Brook is a wetland and it is prone to flooding. The Contractor should be prepared to divert, manage, and control infiltrating groundwater during excavations for foundations and culverts, as well as control surface water from entering excavations to provide a dry and stable subgrade. The method of diverting water and dewatering excavations will depend on several factors, including localized soil conditions encountered, time of year performed, size of the open excavation and the length of time the excavation is left open. The Contractor should be responsible for selecting diversion, management and dewatering methods based on his proposed methods and equipment used for excavation in order to achieve the desired objectives (that is, maintaining a dry condition at the bottom of the excavation during installation of structures, preparation of stable subgrades, etc.). Temporary portable cofferdams, sandbags, supersacks or berms with bypass culverts or pumps may be required to mitigate surface water inflow. If utilized, local sump pumps should be surrounded by ¾-inch Crushed Stone wrapped in non-woven

filter fabric and well points should utilize properly graded filter material to limit migration of fines. Dewatering discharge must satisfy requirements of local, state and federal environmental and conservation authorities.

4. EXCAVATIONS / PROTECTION OF EXISTING UTILITIES

We anticipate that the excavations can be made using conventional earthmoving equipment. Most excavations are expected to be less than about 5 feet deep and should not require excavation support systems but will likely require dewatering to maintain stable side slopes and bottom subgrade. Where open excavations are constructed, the side slopes should be designed and sloped in accordance with OSHA regulations. Where excavation support is used, the Contractor's engineer should design the excavation support system.

Excavations should not extend into the zone of influence of any utility or structure. The zone of influence is defined as a line extending 2 feet beyond the bottom exterior edge of the foundation or springline of the utility then down and away at a one horizontal to one vertical (1H:1V) slope. Undermining of existing foundations or utilities must not occur.

5. BACKFILL AND COMPACTION

Embankment fill and fill placed behind the abutments should be in accordance with Sections 150 and M of MassDOT Standard Specifications for Highways and Bridges. Reference is also made to **Table F**.

Table F: Backfill Material Specification & Recommended Use

Borrow Material	MassDOT Spec. No.	Use
Ordinary Borrow	M1.01.0	General Fill
Special Borrow	M1.02.0	Drainage, Stabilization Fill
Gravel Borrow	M1.03.0, Type B	Behind abutments and wingwalls and as embankment fill
Crushed Stone	M2.01.4	Drainage

Fill should be placed in loose layers not more than 12 inches thick and compacted to at least 95 percent of the maximum dry density as determined by the Modified Proctor Test (ASTM D-1557). In confined areas, place only 6-inch layers and compact with manually operated, powered vibratory compactor acceptable to the geotechnical engineer. Crushed Stone should be placed in lifts no greater than 12-inches-thick with each lift compacted to an unyielding surface. Crushed Stone placed in layers greater than 4 inches should be wrapped all-around in non-woven geotextile fabric. Fill should be free of frost and not be placed over frozen soil. Subgrades should be protected against frost during and after construction.

6. REUSE OF EXCAVATED MATERIALS

Based on the soil descriptions on the boring logs, it is not expected that the existing on-site soils will meet the gradation requirements for the borrow materials presented in **Table F**, except ordinary borrow. Excavated soil that cannot be reused on-site or on other portions of the project should be removed from the site in accordance with applicable local, state and federal regulations.

FINAL DESIGN, CONTRACT DOCUMENTS AND CONSTRUCTION MONITORING

GZA will continue to support you with preparation of specifications and review of near final plans for conformance with our geotechnical recommendations. We also recommend that during construction GZA provide review of contractor submittals related to foundations and earthwork, and construction QA/QC observation and testing services during the earthwork and helical pile installation phases of the project. Construction services may include verification of subgrade soils, observation of proof-rolling operations and placement of fill, performance of field density tests, observation of helical pile testing and production installation, and in general, observe compliance with recommendations in this report and the Contract Documents. This construction oversight is considered an important part of obtaining quality site improvements.

CLOSING

We trust the information presented herein is sufficient for your use in preliminary design of the proposed Peabody Bikeway structures. We look forward to working with you as you advance the project through Final Design. Please contact the undersigned with any questions.

Very truly yours,

GZA GEOENVIRONMENTAL, INC.

B-6		40.5	2.0	2.0	38.5	25.9	14.6	26	15	3.5	37.0
B-7	Pedestrian Bridge	38.5	4.0	4.0	34.5	23.8	14.7	36	3	2.8	35.7
B-8		37.8	4.0	4.0	33.8	31.0	6.8	41	-3	5.8	32.0

Notes:

1. Ground surface elevation estimated from electronic plan entitled Peabody Bike Path 2018 Merge Basempap-Final.DWG", provided by Green on 1/16/2019.
2. Elevations are referenced to the North American Vertical Datum of 1988 (NAVD 88).
3. Depth to top of bedrock for borings B-1 through B-6 is based on refusal to the split-spoon or auger. Rock coring not performed in these borings. Depth to bedrock for borings B-7 and B-8 was confirmed by rock coring. Top of rock noted in boring B-7 is top of competent rock. An approximate 1.2 feet of weathered rock was encountered prior to the start of rock coring.
4. NE = Not Encountered.
5. Refer to the boring logs for additional notes and stabilization times at the time of the measurement.

NOTES:

1. THE BASEMAP WAS DEVELOPED FROM ELECTRONIC CAD FILE PLANS "Peabody Bike Path 2018 Merge Basemap-Final.DWG" PROVIDED BY GREEN INTERNATIONAL INC., ON 01/16/2019.
2. BORINGS WERE PERFORMED BY NEW ENGLAND BORING COMPANY OF DERRY, NEW HAMPSHIRE BETWEEN JANUARY 2 AND 15, 2019.
3. LOCATIONS OF BORINGS WERE LOCATED IN THE FIELD USING A TRIMBLE GPS UNIT. SEVERAL BORING LOCATIONS WERE MOVED IN THE FIELD DURING THE DRILLING PROGRAM BASED ON SITE ACCESS. REVISED LOCATIONS WERE BASED ON TAPED MEASUREMENTS FROM MARKED LOCATIONS. EXPLORATION LOCATIONS SHOULD BE CONSIDERED ACCURATE TO THE DEGREE IMPLIED BY THE METHOD USED.
4. TEST BORING B-5 WAS NOT PERFORMED DUE TO ACCESSIBILITY ISSUES BUT MAY BE DRILLED AT A LATER DATE AS A CONFIRMATION BORING DURING CONSTRUCTION.

Appendix A – Limitations

USE OF REPORT

1. GZA GeoEnvironmental, Inc. (GZA) prepared this report on behalf of, and for the exclusive use of Green International Affiliates, Inc. (Green) for the stated purpose(s) and location(s) identified in the Proposal for Services and/or Report. Use of this report, in whole or in part, at other locations, or for other purposes, may lead to inappropriate conclusions; and we do not accept any responsibility for the consequences of such use(s). Further, reliance by any party not expressly identified in the agreement, for any use, without our prior written permission, shall be at that party's sole risk, and without any liability to GZA.

STANDARD OF CARE

2. GZA's findings and conclusions are based on the work conducted as part of the Scope of Services set forth in Proposal for Services and/or Report, and reflect our professional judgment. These findings and conclusions must be considered not as scientific or engineering certainties, but rather as our professional opinions concerning the limited data gathered during the course of our work. If conditions other than those described in this report are found at the subject location(s), or the design has been altered in any way, GZA shall be so notified and afforded the opportunity to revise the report,as appropriate, to reflect the unanticipated changed conditions.

3. GZA's services were performed using the degree of skill and care ordinarily exercised by qualified professionals performing the same type of services, at the same time, under similar conditions, at the same or a similar property. No warranty, expressed or implied, is made.

4. In conducting our work, GZA relied upon certain information made available by public agencies, Client and/or others. GZA did not attempt to independently verify the accuracy or completeness of that information. Inconsistencies in this information which we have noted, if any, are discussed in the Report

SUBSURFACE CONDITIONS

5. The generalized soil profile(s) provided in our Report are based on widely-spaced subsurface explorations and are intended only to convey trends in subsurface conditions. The boundaries between strata are approximate and idealized, and were based on our assessment of subsurface conditions. The composition of strata, and the transitions between strata, may be more variable and more complex than indicated. For more specific information on soil conditions at a specific location refer to the exploration logs. The nature and extent of variations between these explorations may not become evident until further exploration or construction. If variations or other latent conditions then become evident, it will be necessary to reevaluate the conclusions and recommendations of this report.

6. In preparing this report, GZA relied on certain information provided by the Client, state and local officials, and other parties referenced therein which were made available to GZA at the time of our evaluation. GZA did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this evaluation.

7. Water level readings have been made in test holes (as described in the Report) at the specified times and under the stated conditions. These data have been reviewed and interpretations have been made in this Report. Fluctuations in the level of the groundwater however occur due to temporal or spatial variations in areal recharge rates, soil heterogeneities, the presence of subsurface utilities, and/or natural or artificially induced perturbations. The water table encountered in the course of the work may differ from that indicated in the Report.

8. GZA's services did not include an assessment of the presence of oil or hazardous materials at the property. Consequently, we did not consider the potential impacts (if any) that contaminants in soil or groundwater may have on construction activities, or the use of structures on the property.

COMPLIANCE WITH CODES AND REGULATIONS

9. We used reasonable care in identifying and interpreting applicable codes and regulations. These codes and regulations are subject to various, and possibly contradictory, interpretations. Compliance with codes and regulations by other parties is beyond our control.

ADDITIONAL SERVICES

10. GZA recommends that we be retained to provide services during any future: site observations, design, implementation activities, construction and/or property development/redevelopment. This will allow us the opportunity to: i) observe conditions and compliance with our design concepts and opinions; ii) allow for changes in the event that conditions are other than anticipated; iii) provide modifications to our design; and iv) assess the consequences of changes in technologies and/or regulations.

Appendix B – GZA Boring Logs

Modified Burmister Soil Classification

Soil samples are visually classified by the Modified Burmister System using the following format and order:

1. Density or Consistency
2. Color
3. MAJOR SOIL TYPE
4. Minor Components
5. Special Components

Density or Consistency – Density or consistency estimates are based on the measured N-Values obtained from the Standard Penetration Test (SPT). For granular soils (sand, gravel, silt), density is reported. For plastic soils, consistency is reported. Broken gravel, if encountered at the tip of the spoon, is indicated on the log and will affect the measured SPT N-Value.

Table A-1: Density and Consistency of Soils

Granular Soils		Plastic Soils	
SPT N-Value	Relative Density	SPT N-Value	Consistency
0-4	Very Loose	<2	Very Soft
4-10	Loose	2-4	Soft
10-30	Medium Dense	4-8	Medium Stiff
30-50	Dense	8-15	Stiff
>50	Very Dense	15-30	Very Stiff
		>30	Hard

Color - The color of the soil matrix is estimated in the field by the engineer or geologist observing the borehole.

Major Soil Type - The soil type is determined by the major component of the soil that comprises 50% or more of the sample by weight. The major component in the description is capitalized (e.g. SAND, GRAVEL, SILT).

Table A-2: Soil Types/Components

Sieve Size	Description	Visual Description
Passing No. 200	SILT	No grains, cannot roll into thread
	Clayey SILT	Can roll into 1/4" thread*
	SILT & CLAY	Can roll into 1/8" thread*
	CLAY & SILT	Can roll into 1/16" thread*
	Silty CLAY	Can roll into 1/32" thread*
	CLAY	Can roll into 1/64" thread*
No. 200 – No. 40	Fine SAND	Finest Visible Particles
No. 40 – No. 10	Medium SAND	1/64 to 1/16"
No. 10 – No. 4	Coarse SAND	1/16 to 1/4"
No. 4 – 3/4 Inch	Fine GRAVEL	1/4 to 3/4"
3/4 Inch – 3 Inch	Coarse GRAVEL	
3 Inch – 6 Inch	Cobbles	
>6 Inch	Boulders	

* May need to moisten sample to determine thread diameter

Table A-3: Expanded Sand/Gravel Soil Descriptions

Granular Description	Proportions of Component
Fine	Less than 10% coarse and medium
Medium	Less than 10% coarse and fine
Fine to Medium	Less than 10% coarse
Medium to Coarse	Less than 10% fine
Fine to Coarse	All greater than 10%

Minor Components – Minor components are described after the major component in order of decreasing percentages. Only the first letter of the minor component is capitalized, except if "and" is used (e.g. trace Silt).

Table A-4: Definition of Proportional Terms

Proportional Term	Percent by Weight of Total Sample
and	35-50
some	20-35
little	10-20
trace	<10

Special Components – anthropogenic materials encountered in the fill such as Glass, Brick fragments, etc. Proportional terms used are occasional (<15% by weight) and frequent (15% or more by weight).

Modified ISRM Rock Classification

Rock cores are visually classified by the Modified ISRM System using the following format and order: Field hardness, weathering, grain size, color, ROCK TYPE, foliation thickness, foliation dip angle, foliation joint/fracture shape and roughness, foliation joint/fracture spacing, dip angle of other joints and fractures, condition of joint surfaces, other features such as minerals.

FIELD HARDNESS:
Very Hard – Cannot be scratched with knife or sharp pick. Breaking of hand specimens requires several hard blows of geologists pick.
Hard – Can be scratched with knife or pick only with difficulty. Hard blow of hammer required to detach hand specimen.
Medium – Can be grooved or gouged 1/16 in. deep by firm pressure on knife or pick point. Can be excavated in small chips to pieces about 1 in. maximum size by hard blows from the point of a geologist's pick.
Soft – Can be gouged or grooved readily with knife or pick point. Can be excavated in chips to pieces several inches in size by moderate blows of a pick point. Small thin pieces can be broken by finger pressure.
Very Soft – Can be carved with knife. Can be excavated readily with point of pick. Pieces 1 in. or more in thickness can be broken with finger pressure. Can be scratched readily by fingernail.

WEATHERING:
Fresh – Rock fresh, crystals bright, few joints may show slight staining. Rock rings under hammer if crystalline.
Slight – Rock generally fresh, joints stained, and discoloration and weathering effects. In granitoid rocks some occasional feldspar crystals are dull and discolored. Crystalline rocks ring under hammer.
Moderate – Significant portions of rock show discoloration and weathering effects. In granitoid rock, most feldspars are dull and discolored; some show clayey. Rock has dull sound under hammer and shows significant loss of strength as compared with fresh rock.
Severe – All rock except quartz discolored or stained. Rock "fabric" clear and evident, but reduced in strength to strong soil. In granitoid rocks, all feldspars kaolinized to some extent. Some fragments of strong rock usually left.
Complete – Rock reduced to "soil". Rock "fabric" not discernible or discernible only in small scattered locations. Quartz may be present as dikes or Stringers.

GRAIN SIZE:
Fine Grained – Barely seen with naked eye.
Coarse Grained: 1/8 in. to 1/4 in.
Amorphous: Too small to be seen with naked eye.
Medium Grained: Barely seen with naked eye to 1/8 in.
Very Coarse Grained: >1/4 in.

DISCONTINUITIES:
Healed Joint – A partial or incomplete fracture.
Joint/Fracture – A simple fracture along which no shear displacement has occurred. May form sets.
Shear – A zone of fractures along which differential movement has taken place parallel to the surface sufficient to produce slickensides, striations, or polishing. May be accompanied by a zone of fractured rock up to a few inches wide.
Fault – A fracture along which there has been displacement and accompanying slickensides, striations, or polishing by gouge and/or severely fractured adjacent zone.
Shear or Fault Zone – A band or zone of parallel, closely spaced shears or faults accompanied by gouge, maylonite, and breccia.

Table A-5: Fractures and Foliation Spacing and Attitude

Fractures	Foliation	Spacing	Attitude	Angle
Very close	Very thin	Less than 2 in.	Horizontal	0° - 5°
Close	Thin	2 in. - 1 ft.	Subhorizontal	5° - 35°
Moderately close	Medium	1 ft. - 3 ft.	Moderately dipping	35° - 55°
Wide	Thick	3 ft. - 10 ft.	Subvertical	55° - 85°
Very Wide	Very thick	More than 10 ft.	Vertical	85° - 90°

Table A-6: Condition of Joint/Fracture Surfaces

Descriptive Term	Conditions
Planar	A flat surface
Curved	A curved surface
Irregular	Multi-curved surface
Slick	A polished and striated surface indicating sliding along a plane; also referred to as slickensided.
Smooth	Few irregularities, but no obvious indication of sliding; adjacent pieces of core can be slid past on another with relative ease.
Rough	Many irregularities; difficult to slide adjacent pieces of core by each other.

GZA reports the total core recovery and rock quality designation for each core run* on the boring logs. The definitions of these terms are as follows:

TOTAL CORE RECOVERY (REC)

$$\textbf{REC (\%)} = \frac{\text{Sum of Recovered Core}}{\text{Length of Core Run}} \times 100$$

ROCK QUALITY DESIGNATION (RQD)

$$\textbf{RQD (\%)} = \frac{\text{Sum of Lengths of intact Core with Full Diameter in Pieces 4 in. and Longer}}{\text{Length of Core Run}} \times 100$$

The RQD is in general accordance with methodology described by Deere and Deere (1988). In addition, significant vertical to sub-vertical foliation/cross-foliation joints/fractures occur within the rock mass and influence ground behavior. The length of core exhibiting the vertical to sub-vertical joints/fractures has been deducted from the RQD, which is consistent with the "pieces of intact rock core" criteria. The vertical to sub-vertical joints/fractures have been identified on the rock core or the upside divider in the core box with permanent "dots" spaced every 0.1 feet apart. These dots have been counted and entered in the fractures per foot column on the boring log.

* - RQD not reported for severely and/or completely weathered rock or core runs with length of 2.0 feet or less.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Borehole relocated approximately 25 feet from staked location due to access.
3. Driller noted increased drilling resistance at 6.5 feet below ground surface (bgs).
4. Gravel and Cobbles (less than 6 inches) observed in drill spoils at approximately 11 feet bgs.
5. Auger refusal at 15.3 feet bgs on possible bedrock. Borehole terminated.
6. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Auger refusal at 14.5 feet below ground surface (bgs) on possible bedrock. Advanced split spoon. Split spoon refusal at 14.7 feet bgs. Borehole terminated.
3. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Hole appears to have blown in prior to sampling S-5. Blow counts at S-5 may be inaccurate. Driller removed augers and offset 4 feet southeast of staked location and continued hole with 4-inch casing. Samples S-6 through S-8 obtained using drive and wash drilling methods.
3. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 5.5 feet south of staked location due to restricted access and overhead wires.
3. Continuous sampling performed from sampling depths 0 to 10 feet below ground surface (bgs). Driller advanced 4-inch casing down as sampling advanced. The casing was advanced to 14 feet bgs following sampling of S-5.
4. Standard sampling performed from sample depths 14 to 24.2 feet bgs.
5. Driller advanced 4-inch casing from 14 to 24 feet bgs.
6. Clayey Silt observed in drill cuttings from 17.5 to 19 feet bgs.
7. Weathered Bedrock fragments and increased drill effort observed at 23.8 feet bgs.
8. Cored bedrock with a downward pressure of 500 psi at 1,350 rpm in 3rd gear using an NX core barrel.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) Report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS Report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study Report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study Report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study Report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Massachusetts State Plane Mainland Zone (FIPS zone 2001). The **horizontal datum** was NAD 83, GRS 1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713- 3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was derived from digital orthophotography provided by the Massachusetts Geographic Information System. This information was created from photography dated 2005.

The **profile baselines** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the **profile baseline**, in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Based on updated topographic information, this map reflects more detailed and up-to-date **stream channel configurations and floodplain delineations** than those shown on the previous FIRM for this jurisdiction. As a result, the Flood Profiles and Floodway Data tables for multiple streams in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on the map. Also, the road to floodplain relationships for unrevised streams may differ from what is shown on previous maps.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products, or the National Flood Insurance Program in general, please call the **FEMA Map Information eXchange (FMIX)** at **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% Annual Chance Floodplain Boundary
- 0.2% Annual Chance Floodplain Boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths, or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

- A — A: Cross section line
- 23 — 23: Transect line
- Culvert
- Bridge
- 45° 02' 08", 93° 02' 12" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83) Western Hemisphere
- 4989000 M — 1000-meter ticks: Massachusetts State Plane Mainland Zone (FIPS Zone 2001), Lambert Conformal Conic projection
- 4689000mN — 1000-meter Universal Transverse Mercator grid values, zone 19N
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

RECHARGE VOLUME CALCULATIONS

Date: October 11, 2023
Revised:
Project: Peabody - Independence Greenway Extension
Project No: 17118
Location: Peabody, MA

Prepared By: BV
Checked By: DHS

Recharge Volume Design

Objective: Size infiltration BMPs that will approximate the annual recharge from the existing conditions.

Methodology: MA Department of Environmental Protection (DEP) Massachusetts Stormwater Handbook (Vol.3, Ch.1)

Design Criteria: Required recharge volume equals a depth of runoff corresponding to the soil type times the increase in impervious areas covering that soil type at the post-development site.

Based on the Site Hydrologic Soil Group:

Hydrologic Soil Grou	Soil Texture	Target Depth Factor (F)
A	Sand	0.60 inches
B	Loam	0.35 inches
C	Silty Loam	0.25 inches
D	Clay	0.10 inches

The soils are defined by the Soil Conservation Services (SCS) Soil Survey of Essex County of Massachusetts. The site is comprised of 'A' and 'B' soils.

Required Drawdown Time: Maximum of 72 Hours using the following equation:

$$\text{Drawdown Time} = \frac{R_v}{(K x A_{Bot})}$$

R_v = Required Recharge Volume
K = Permeability
A_{Bot} = Bottom area of trench

Calculation Results:

Designation	Total Volume Required (cf)	Net Increase Volume Required (cf)	Receiving Volume Required (cf)	Volume Provided (cf)
Infiltration Trench 1	**8,000**	**2,348**	**926**	**1,415**

WATER QUALITY CALCULATIONS

Date: October 11, 2023
Revised:
Project: Peabody - Independence Greenway Extension
Project No: 17118
Location: Peabody, MA

Prepared By: BV
Checked By: DHS

Objective: To determine the required Water Quality Volume (WQV) for adequate stormwater treatment

Methodology: MA Department of Environmental Protection (DEP) Stormwater Management (Vol. 3, Ch. 1)

Design Criteria: Volume to be treated =0.5" x Post Development Impervious Area

Critical Areas (include ORW, ACEC, recharge areas for public water supplies (Zone Is, Zone IIs and Interim Wellhead Protection Areas for ground water sources and Zone As for surface water sources), bathing beaches, cold water fisheries, shellfish growing areas and LUHPPL's

The project is not within a critical area; therefore,

Volume to be treated = 0.5" x Receiving Impervious Area

Calculation results:

Designation	Volume Required (cf)	Volume Provided (cf)
Infiltration Trench 1	**6,864**	**1,415**

Volume to be Treated:

Total proposed receiving impervious area including outside of LOW: **164,744** sf
Total Treatment volume required: **6,864 cf**

WQv = storage provided below lowest outlet = **1,415 cf**

PRETREATMENT CALCULATION

Date: February 2, 2023
Revised:
Project: Peabody - Independence Greenway Extension
Project No: 17118
Location: Peabody, MA

Prepared By: BV
Checked By: DHS

Objective: To determine the required pretreatment Volume for adaqute stormwater treatment. This project is a redevelopment and is required to meet this Standard (4) to the maximum extent practicable.

Methodology: MA Department of Environmental Protection (DEP) Stormwater Management (Vol. 2, Ch. 2)

Design Criteria: Volume to be treated = (0.1" x Required Water Quality Volume)

Calculation results:

Designation	Volume Required (cf)	Volume Provided (cf)
Impervious Area to Infiltration Trench 1	**154**	**251**

Volume to be Treated:

Impervious Area to Infiltration Trench 1

Total Proposed Impervious Area: 18,524 sf
Total Treatment Volume: **154 cf**

Volume Provided:

Pretreatment volume of Crushed Stone Shoulder

Top Elevation = 51.52 Area of contour = 1,670 sf
Bottom Elev = 51.02 Area of contour = 1,670 sf Storage Volume*: **251**

Dewatering check:

Volume cf	K in/hr	A_{Bot} sf	Time Hours		
251	2.41	1,670	**0.75**	<	**72 Hours**

*Assumes 30% voids within crushed stone shoulder for pretreatment

JOB	17118		
SHEET NO.	1	OF	1
CALCULATED BY	JRM	DATE	1/27/2023
CHECKED BY	AF	DATE	1/27/2023
DESCRIPTION	Culvert @ Station 329+85		
SCALE			

Hydraulic Engineering Circular No. 14, Third Edition

Several relationships have been proposed for riprap sizing for culvert aprons and several of these are discussed in greater detail in Appendix D. The independent variables in these relationships include one or more of the following variables: outlet velocity, rock specific gravity, pipe dimension (e.g. diameter), outlet Froude number, and tailwater. The following equation (Fletcher and Grace, 1972) is recommended for circular culverts:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right) \qquad (10.4)$$

where,

- D_{50} = riprap size, m (ft)
- Q = design discharge, m^3/s (ft^3/s)
- D = culvert diameter (circular), m (ft)
- TW = tailwater depth, m (ft)
- g = acceleration due to gravity, 9.81 m/s^2 (32.2 ft/s^2)

Tailwater depth for Equation 10.4 should be limited to between 0.4D and 1.0D. If tailwater is unknown, use 0.4D.

D=	5.97	ft
g=	32.2	ft/s^2
Q=	277	cfs
TW=	0.9	ft
D_{50}=	0.61	ft
	7.36	in
	186.90	mm

Use Class 2 Dumped RipRap

Table 10.1. Example Riprap Classes and Apron Dimensions

Class	D_{50} (mm)	D_{50} (in)	Apron Length[1]	Apron Depth
1	125	5	4D	$3.5D_{50}$
2	150	6	4D	$3.3D_{50}$
3	250	10	5D	$2.4D_{50}$
4	350	14	6D	$2.2D_{50}$
5	500	20	7D	$2.0D_{50}$
6	550	22	8D	$2.0D_{50}$

[1]D is the culvert rise.

Apron Length= 4.00 x 5.97 = 24 ft

Apron Depth= 3.30 x 0.61 = 2.0 ft

Apron Width= 34 ft

Hydraulic Engineering Circular No. 14, Third Edition

Several relationships have been proposed for riprap sizing for culvert aprons and several of these are discussed in greater detail in Appendix D. The independent variables in these relationships include one or more of the following variables: outlet velocity, rock specific gravity, pipe dimension (e.g. diameter), outlet Froude number, and tailwater. The following equation (Fletcher and Grace, 1972) is recommended for circular culverts:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right) \qquad (10.4)$$

where,

- D_{50} = riprap size, m (ft)
- Q = design discharge, m^3/s (ft^3/s)
- D = culvert diameter (circular), m (ft)
- TW = tailwater depth, m (ft)
- g = acceleration due to gravity, 9.81 m/s^2 (32.2 ft/s^2)

Tailwater depth for Equation 10.4 should be limited to between 0.4D and 1.0D. If tailwater is unknown, use 0.4D.

D=	2.50	ft
g=	32.2	ft/s^2
Q=	55	cfs
TW=	1	ft
D_{50}=	0.49	ft
	5.85	in
	148.51	mm

Use Class 1 Stone for Pipe Ends

Table 10.1. Example Riprap Classes and Apron Dimensions

Class	D_{50} (mm)	D_{50} (in)	Apron Length[1]	Apron Depth
1	125	5	4D	$3.5D_{50}$

HYDRAULIC AND SCOUR ANALYSIS SUMMARY REPORT

Independence Greenway Extension
Over Proctor Brook
Peabody, Massachusetts

Prepared for

Massachusetts Department of Transportation

February 2023

Prepared by

GREEN INTERNATIONAL AFFILIATES, INC.
Civil and Structural Engineers

Building Strong Client Relationships Through Engineering Excellence

1.0 EXECUTIVE SUMMARY

1.1 Purpose

The purpose of this report is to present the results of a Hydraulic and Scour Study performed by Green International Affiliates, Inc. (Green) for MassDOT for Proctor Brook along the Independence Greenway Extension. The proposed bikeway crosses Proctor Brook at three (3) locations. The Hydraulic Report submitted to MassDOT in February 2021 described the proposed bridge located approximated 800' west of Endicott Street. This study evaluates the hydraulic performance of the existing and proposed conditions for the remaining project area upstream of this proposed bridge, including the two (2) crossing locations that weren't discussed in the previous report.

This study was conducted in a manner consistent with the American Association of State Highway Officials (AASHTO), Federal Highway Administration (FHWA), and Massachusetts Highway Department of Transportation (MassDOT) guidelines for preparation of hydraulic studies at brook crossing sites.

1.2 Scope of Work

The Scope of Work for this study included a review of available hydrologic and hydraulic data for Proctor Brook from the City of Peabody Flood Insurance Study (FIS) dated November 1978, a detailed hydraulic analysis for the brook; and a scour/stability analysis. Pertinent data and the hydraulic computer modeling output are contained in the attachments of this report.

Section 2 of this report contains a project description. Section 3 outlines the data collected and applications used in the study. Section 4 describes the Engineering methods used in the hydrologic and hydraulic analyses, as well as the scour/stability analysis. Section 5 contains conclusions and recommendations.

This project involves the construction of two (2) new culverts that will cross over Proctor Brook in the City of Peabody, Massachusetts. There were previous culvert structures that used to carry railroad over Proctor Brook, the railroad was abandoned, along with the culverts, and the culvert structures have been washed away over time. The purpose of this report is to present the results of a study conducted for the subject culvert sites to evaluate the hydraulic performance of the proposed structures for these crossings.

The scope of this investigation consists of a review of pertinent hydrologic analysis data for the Proctor Brook at the project site and a detailed hydraulic analysis. Data collected, hydraulic model input/output and scour calculations are presented in the appendices of this report. A project description, engineering methods, as well as conclusions of the hydraulic study follows.

2.0 PROJECT DESCRIPTION

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is 1.45 miles.

The proposed project is located along the abandoned railroad right-of-way that has not seen any

improvements since the rails were removed. Existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed will be replaced with new culverts designed to address, to the maximum extent possible, the Massachusetts State Stream Crossings Standards.

In place of the former railroad bridge over Proctor Brook that has been washed away, a new light duty timber boardwalk on helical piles structure is proposed in order to make the abandoned railroad right-of-way usable for a bicycle/pedestrian path. The proposed 8-span structure will be approximately 60'-0" long with an out-to-out width of 12'-0" and will provide a clear width of 11'-0" to accommodate two 5-0" wide travel lanes, one in each direction.

2.1 Existing Conditions

Proctor Brook originates in western Peabody, Massachusetts and flows southeast until it joins Goldthwait Brook to form the North River. Historical flood data is not available for this waterway. The subject locations are within NFIP SFHA Zone AE and spans a section of the river's NFIP regulatory floodway.

Refer to Figure 1 for a locus map of the project area.

The remnants of two (2) culverts remain in the channel. There are no existing trail, roadway, or railroad tracks at the crossing location. The area surrounding the remains of the culverts are currently wooded and includes Bordering Vegetated Wetlands.

The existing culverts were studied during FEMA's 1978 FIS study. At the time of the study the culverts had not been washed out and were functioning as hydraulic connections to convey Proctor Brook under the railroad bed. More detailed description of the culverts are as follows:

Culvert at Station 329+85

This culvert is located at cross section H of the FEMA FIS study. The existing culvert is a 25' long double 42" barrel RCP culvert. The culvert hasn't been maintained and the railbed above the culvert has been washed away. The culvert piping has remained in place. Remnants of granite guidebanks remain at the upstream entrance to the culvert and remnants of a granite headwall remain on the downstream end of the culvert

Culvert at Station 346+20

This culvert is located at cross section F of the FEMA FIS study. Review of the FEMA's HEC-2 hydraulic model indicates that the culvert was originally a 6'-5" box culvert. Due to a lack of maintenance along the abandoned railroad bed, the culvert has collapsed, and the remnants remain in the channel.

2.2 Proposed Conditions

Although the culvert crossings have failed to varying degrees, the horizontal alignment of Proctor Brook has remained. The culverts are being replaced at the same locations as the original structures in order to maintain the alignment of Proctor Brook at these crossings. The channel elevation will remain although some sediment will be removed to facilitate construction.

Both of the culverts will be replaced with 8'x4' concrete box culverts. The bottom 1' of each culvert will be filled with streambed material to provide a more natural wildlife habitat. This hydraulic study examines the impact of providing an 8'x3' hydraulic opening at both of these crossings.

3.0 DATA COLLECTION

The following data and reports on the study area were available and were used as guidance during the hydraulic and hydrologic model development and Analysis:

4.0 ENGINEERING METHODS

Proctor Brook was studied for its entire length within the City of Peabody, MA by FEMA using detailed methods as part of the FIS for the City of Peabody. To ensure compliance with FEMA requirements (44 CFR 60.3) and the requirements of the Massachusetts Wetlands Protection Act (310 CMR 10.0), the proposed conditions of the culverts have been analyzed to ensure that existing flood elevations will not increase under proposed conditions. In addition, a hydraulic analysis was also performed to calculate the potential for scour.

Figure 2 shows the project location in the flood insurance rate map.

In this hydraulic and scour summary report, peak flow rates from the effective FEMA FIS were used in the analysis.

4.1 Hydrologic Analysis

Peak 10-, 50-, 100- and 500-year flood discharges for Proctor Brook were adopted from Table 6, Essex County FIS, and are presented below in Table 4.1. Please consult the Essex County Effective FIS, last revised July 2018, for information regarding hydrologic computational procedures. As further described in the Stormwater Water prepared for this project, the peak flow rates have been adjusted to account for the proposed increase in impervious area. Table 4.1 also presents the proposed flow projections for the project area.

Table 4.1 – Summary of Discharges

Description	Alternative	10% Annual Chance [10-yr] (CFS)	4% Annual Chance [25-yr] (CFS)	2% Annual Chance [50-yr] (CFS)	1% Annual Chance [100-yr] (CFS)	0.2% Annual Chance [500-yr] (CFS)
North River andProctor Brook Upstream of Goldthwait Brook	FEMA FIS	240	285	360	420	610
	Proposed Conditions	243	290	366	428	618

4.2 Hydraulic Analysis

Green used a combination of the topographical survey and the proposed design of the brook crossings to create a proposed conditions hydraulic model in HEC-RAS. Cross sections were cut approximately every 100 to 200 ft and then imported into HEC-RAS. Backwater analyses using the USACE HEC-RAS computer program were performed for the 10-, 50-, and 100-, and 500-year return events in a manner consistent with the standards used to develop water surface profiles under the National Flood Insurance Program (NFIP).

The computed water surface elevations of this HEC-RAS analysis were compared to water surface elevations listed on the HEC-2 output received from FEMA.

Table 4.2 shows a comparison between the results of the HEC-2 data received from FEMA and Green's proposed model.

Table 4.2 – Comparison of FEMA and Proposed Base Flood Elevations (BFE - referenced to NAVD88) at several cross sections near the Proposed Structures

Adjusted datum to NAVD 88

As shown in Table 4.2, Proctor Brook will not have an increase in the Water Surface Elevation (WSEL) for the FEMA Base Flood Elevation.

Attachment A includes the 1977 HEC-2 model input/output report received from FEMA Headquarters. Attachment B includes the output of Green's Proposed Conditions HEC-RAS analyses for the proposed Independence Greenway Extension boardwalkover Proctor Brook with the new crossing culverts.

4.3 Scour Safety/Stability Analyses

We calculated the scour hole dimensions (length, width, and depth) using the Hydraulic Engineering Circular (HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 5: "Estimating Scour at Culvert Outlets" and using equation 5.1 for cohesionless soils shown below:

$$\left[\frac{h_s}{R_c}, \frac{W_s}{R_c}, \frac{L_s}{R_c}, \frac{V_s}{R_c^3}\right] = C_s C_h \left(\frac{\alpha}{\sigma^{1/3}}\right)\left(\frac{Q}{\sqrt{g}(R_c^{2.5})}\right)^{\beta}\left(\frac{t}{316}\right)^{\theta}$$

We used the river's 100-year flood as the scour design in this analysis. No scour potential under current conditions was assessed, as one of the structures has washed away and based on evidence, there are no indications of vertical or horizontal instability.

Peak 100-year flood proposed discharge used in this analysis was taken from Table 4.1.

Soil samples were taken at points within the brook, upstream of the culverts and the banks of the brook. These samples were analyzed, and the results are included in Attachment C. The grain size (D_x) was estimated for each soil sample. The D_x results of the samples were used in the scour analysis.

The results of the scour analyses are shown on Table 4.3.

Table 4.3 – Summary of Calculated Scour at Proposed Culverts

Alternative	Return Frequency (year)	Scour Hole Depth (Feet)	Scour Hole Width (Feet)	Scour Hole Length (Feet)	Scour Hole Volume (Cubic Feet)	Location of Maximum Scour (Feet)
Sta 329+85	Incipient	5.89	32.00	57.82	8,133.98	23.13
Sta 346+20	Incipient	4.69	23.64	44.11	3,527.78	17.65

Scour Countermeasures

The scour/stability analyses were performed using Hydraulic Engineering Circular (HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 10: "Riprap Basins and Aprons" and using equation 10.4 shown below:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right)$$

Table 4.4 displays dimensions for riprap apron at the proposed culverts.

Table 4.4 – Summary of Scour Countermeasure Design at Proposed Culverts

Alternative	Riprap Size D_{50} (Inches)	Riprap Class	Riprap Apron Length (Feet)	Riprap Apron Depth (Feet)	Riprap Apron Width (Feet)
Sta 329+85	6	2	24	2	34
Sta 346+20	5	1	22	1	31

Attachment D includes the scour analyses, and computations.

5.0 CONCLUSIONS

A. The HEC-RAS model under proposed conditions resulted in lower elevations than the effective FEMA FIS. Therefore, the project implementation will result in no increase to the waterway's Base (100-year) Flood Elevation (BFE) profile, and it will not necessitate alteration of the waterway's floodway delineation, anywhere within the affected community.

B. The natural stream bed will result in a scour depth at culvert at Station 329+85 of 5.89' during incipient flow.

C. The natural stream bed will result in a scour depth at culvert at Station 340+26 of 4.69' during incipient flow.

D. Riprap Countermeasures are proposed to mitigate against the risk of scour. The countermeasures have been designed in accordance with HEC-14 and HEC-23.

E. By placing riprap revetment at the ends of the culvert, it is anticipated that the scour depth will be negligible.

SEE FIS REPORT FOR DETAILED LEGEND AND INDEX MAP FOR FIRM PANEL LAYOUT

- **SPECIAL FLOOD HAZARD AREAS**
  - Without Base Flood Elevation (BFE) *Zone A, V, A99*
  - With BFE or Depth *Zone AE, AO, AH, VE, AR*
  - Regulatory Floodway
- **OTHER AREAS OF FLOOD HAZARD**
  - 0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile *Zone X*
  - Future Conditions 1% Annual Chance Flood Hazard *Zone X*
  - Area with Reduced Flood Risk due to Levee. See Notes. *Zone X*
  - Area with Flood Risk due to Levee *Zone D*
- **OTHER AREAS**
  - NO SCREEN — Area of Minimal Flood Hazard *Zone X*
  - Effective LOMRs
  - Area of Undetermined Flood Hazard *Zone D*
- **GENERAL STRUCTURES**
  - Channel, Culvert, or Storm Sewer
  - Levee, Dike, or Floodwall
- **OTHER FEATURES**
  - 20.2 / 17.5 — Cross Sections with 1% Annual Chance Water Surface Elevation
  - Coastal Transect
  - 513 — Base Flood Elevation Line (BFE)
  - Limit of Study
  - Jurisdiction Boundary
  - Coastal Transect Baseline
  - Profile Baseline
  - Hydrographic Feature
- **MAP PANELS**
  - Digital Data Available
  - No Digital Data Available
  - Unmapped

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 5/24/2019 at 9:07:12 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Appendix E: O&M Plan, LTPPP, and IDCS

- Stormwater Management System Operation and Maintenance (O&M) Plan
- Long Term Pollution Prevention Plan (LTPPP)
- Illicit Discharge Compliance Statement (IDCS)

To:	Brendan Callahan, City of Peabody, Assistant Director of Planning
Cc:	
From:	Danielle Spicer, P.E. Green International Affiliates, Inc. (Green)
Date:	February 2, 2023
Revised:	
Project:	Independence Greenway Extension – Peabody, MA (Green No. 17118)
Subject:	Stormwater Operation and Maintenance Plan & Long-Term Pollution Prevention Plan

Operation & Maintenance Plan

All Operation and Maintenance shall be done in accordance with the relevant O&M plan per the Department of Public Services for the City of Peabody, in addition to the items noted below.

OPERATION & MAINTENANCE PLAN – OUTFALLS

Level spreaders are required at the point of discharge to limit erosion. Outfalls should be inspected every six months during the first year and annually thereafter for sediment buildup, bare spots and vegetation health. Any erosion or low spots in the level spreader must be repaired.

OPERATION & MAINTENANCE PLAN – CATCH BASINS

Catch basins require regular cleaning. Inspect the catch basins at least four times per year, including at the end of foliage- and snow removal-season. Sediment must also be removed when the depth of deposits is greater than or equal to half of the depth from the bottom of the invert of the lowest pipe in the catch basin. More frequent cleaning may be necessary in critical areas or areas with higher potential pollutant loads. Vacuum trucks are preferable to clamshell buckets for cleaning, as vacuuming is faster and removes more sediment and supernatant.

OPERATION & MAINTENANCE PLAN – INFILTRATION TRENCH

Infiltration trenches shall be inspected after the first several rainfall events, after all major storms, and on regularly scheduled dates every six months once established. Routinely remove leaves and accumulated sediment from the surface of the trench.

When inspecting infiltration trenches look for ponded water. If there is ponded water at the surface of the trench, it is likely that the trench surface is clogged. To address surface clogging, remove and replace the first 6” layer of stone aggregate. If water is ponded inside the trench, it may indicate that the bottom of the trench has failed. To rehabilitate a failed trench, all accumulated sediment must be stripped from the bottom, the bottom of the trench must be scarified and tilled to induce infiltration, and all of the stone aggregate and filter fabric or media must be removed and replaced.

Long-Term Pollution Prevention Plan

In general, long-term pollution prevention and related maintenance activities will be conducted consistent with the City of Peabody's National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) Permit.

This LTPPP satisfies the requirements related to pollution prevention under Massachusetts Stormwater Standards 4, 5, 6, and 10.

Practices for Long-Term Pollution Prevention

For the facilities covered, long-term pollution prevention includes the following measures:

Litter Pick-up

The City of Peabody will conduct litter pick-up from the stormwater management facilities in conjunction with routine road maintenance activities.

Routine Inspection and Maintenance of SCMs

The City of Peabody will conduct inspection and maintenance of the stormwater control measures in accordance with the Project's O&M plan and Peabody's Department of Public Services (DPS) O&M for the City.

Maintenance of Landscaped Areas

Routine mowing will be conducted according to standard DPS practices. Embankments designed to impound water should be mowed as required to prevent establishment of woody vegetation.

Except in rare circumstances, the City does not use fertilizers, herbicides, and pesticides for the maintenance of facilities. Exceptions include using fertilizer to ensure the survival of new plantings and herbicides to control invasive plants. Use of fertilizers and herbicides shall be reviewed and approved by DPS prior to application. Local Conservation Commission review may also be required.

Snow and Ice Management

Snow and Ice Management will be conducted consistent with the practices outlined in the City's Snow and Ice Control Program.

Street Sweeping

Routine highway cleaning, with a brush-type street sweeper, will be conducted in accordance with standard DPS practices. Sweeping will occur annually in the Spring.

Prohibition of Illicit Discharges

The MassDEP Stormwater Management Standards prohibit illicit discharges to the stormwater management system. Illicit discharges are discharges that do not consist entirely of stormwater, except for certain specified non-stormwater discharges.

Examples of discharges from the following sources are not considered illicit discharges:

- Firefighting activities*
- Foundation drains
- Water line flushing
- Footing drains
- Landscape irrigation
- Residential car washing
- Uncontaminated groundwater
- Rising groundwater
- Riparian habitats/wetlands
- Potable water sources
- Dechlorinated swimming pool water
- Street sweeping
- Wash water from buildings (without detergents)
- Condensation from air conditioning units
- Run-on from private driveways caused by precipitation
- Lawn watering

*Water from firefighting activities is allowed under this permit and need only be addressed where they are identified as significant sources of pollutants to waters of the United States.

There are no known or proposed illicit connections associated with the project limits.

Spill Prevention and Response

This project does not discharge to a Zone I, Zone II or Zone A surface water supply protection area.

Response procedures will be implemented at the proposed infiltration trench for any significant release of hazardous materials such as fuels, oils, or chemical materials that have the potential of discharging to Proctor Brook.

Reportable quantities will immediately be reported to the applicable Federal, State, and local agencies as required by law. Reportable quantities of chemical, fuels, or oils are established under the Clean Water Act and enforced through MassDEP. The MassDEP Emergency Response Program shall be immediately notified in accordance with required procedures for the report of a release (telephone 888-304-1133).

In the case of a spill, applicable containment and clean-up procedures will be performed immediately. The Peabody Fire Department will be the first responders. Spill material collected during the response will be promptly removed and disposed of in accordance with Federal, State, and local requirements. If necessary, a licensed emergency response contractor will assist in cleanup of releases depending on the amount of the release and the ability of the responsible party to perform the required response.

Illicit Discharge Compliance Statement

Per Standard 10 of the Massachusetts Stormwater Handbook, the following is an Illicit Discharge Compliance Statement:

The design plans submitted for the Notice of Intent have been designed in full compliance with current standards.

The Long-Term Pollution Prevention Plan is part of the Operation and Maintenance Plan and includes measures to prevent illicit discharges. There are no known combined sewer outfalls and to the best of our knowledge all closed stormwater systems discharge per Massachusetts DEP requirements. Based on observations during a site visit in November 2022 the site does not contain any known existing illicit discharges.

Proposal No. 609211-132091

SHT002_HD(GENERAL NOTES).DWG Plotted on 5-Apr-24 5:36 PM

A00860 - 428

GENERAL NOTES

1. ALL UTILITY POLES REQUIRING RELOCATION ARE TO BE RELOCATED BY OTHERS.
2. THE CONTRACTOR SHALL MAINTAIN COMPLIANCE WITH THE AMERICANS WITH DISABILITIES ACT AND MASSACHUSETTS ARCHITECTURAL ACCESS BOARD AT ALL OBSTRUCTIONS.
3. PEDESTRIAN CURB RAMPS SHALL CONFORM TO THE CURRENT MASSDOT STANDARDS.
4. TRANSITION GRANITE CURB SHALL BE INSTALLED AT PROJECT LIMITS TO MATCH EXISTING ELEVATIONS (PAVEMENT OR EXISTING CURB).
5. THE CONTRACTOR SHALL RETAIN ALL CURBS, FENCES, WALLS, TREES, SHRUBS, POSTS, LANDSCAPE FEATURES, AND OTHER MISCELLANEOUS ITEMS WITHIN ABUTTING PROPERTIES, UNLESS OTHERWISE NOTED. WHEN RETAINING THOSE ITEMS IS NOT PRACTICAL IN THE OPINION OF THE ENGINEER, THE CONTRACTOR SHALL REMOVE, STOCKPILE, PROTECT AND RESET THE ITEMS. THE CONTRACTOR SHALL REPLACE ITEMS DAMAGED DURING REMOVAL, STOCKPILING, OR RESETTING DUE TO NEGLIGENCE, CARELESSNESS, OR MISHANDLING WITH EQUIVALENT NEW ITEMS AT NO COST TO THE OWNER.
6. ALL TREES WITHIN THE SLOPE LIMIT SHALL BE RETAINED AND PROTECTED UNLESS OTHERWISE NOTED.
7. ALL TREES CALLED OUT TO BE RETAINED SHALL BE PROTECTED USING ITEM NO. 102.511 TREE PROTECTION - ARMORING AND PRUNING AND ITEM NO. 102.521 TREE AND PLANT PROTECTION FENCE.
8. CONTRACTOR SHALL PROTECT ALL PROPERTY MARKERS OF ABUTTERS.
9. TREATMENT OF SLOPE AREAS SHALL BE REPLACED IN KIND UNLESS OTHERWISE NOTED.
10. THE CONTRACTOR SHALL EXERCISE CAUTION WHEN EXCAVATING ALONG THE ABUTMENT FOR THE SHARED-USE PATH AT THE ROUTE 128 UNDERPASS.

UTILITY NOTES:

1. THE LOCATION OF ALL UNDERGROUND UTILITIES ARE SHOWN APPROXIMATE AND WERE COMPILED USING FIELD SURVEY INFORMATION AND AVAILABLE RECORD INFORMATION. THE LOCATION OF EXISTING PIPES OR OTHER UNDERGROUND STRUCTURES OR PROPERTY LINES ARE NOT WARRANTED TO BE EXACT, NOR IS IT WARRANTED THAT ALL UNDERGROUND PIPES OR STRUCTURES ARE SHOWN. THE CONTRACTOR SHALL CALL "DIG SAFE" (1-888-344-7233) AND NOTIFY THE CITY OF PEABODY AND MASSDOT AT LEAST 72 HOURS (EXCLUDING SATURDAYS, SUNDAYS AND HOLIDAYS) PRIOR TO ANY EXCAVATION TO OBTAIN ACCURATE UTILITY LOCATIONS.
2. RECORD UTILITY INFORMATION FROM THE VARIOUS UTILITY COMPANIES AND PUBLIC AGENCIES ARE APPROXIMATE ONLY AND ACTUAL LOCATIONS MUST BE DETERMINED IN THE FIELD.
3. THE COMPLETION AND ACCURACY OF LATERAL UTILITY SERVICES IS NOT GUARANTEED AND MUST BE VERIFIED BY THE CONTRACTOR IN THE FIELD.
4. ALL UTILITY COMPANIES, PUBLIC AND PRIVATE MUST BE NOTIFIED, INCLUDING THOSE IN CONTROL OF UTILITIES NOT SHOWN ON THIS PLAN, (SEE CHAPTER 370, ACTS OF 1963, MASSACHUSETTS) PRIOR TO DESIGNING, EXCAVATING, BLASTING, INSTALLING, BACKFILLING, GRADING, PAVEMENT RESTORING OR REPAVING.
5. SUBSURFACE UTILITY LOCATIONS HAVE BEEN PLOTTED TO MEET UTILITY QUALITY LEVEL "C" AS DESCRIBED IN ASCE STANDARD 38-02 AND SUMMARIZED ON THIS SHEET. THE UNDERGROUND UTILITIES ARE SHOWN IN APPROXIMATE LOCATIONS BASED ON ABOVE-GROUND FIELD OBSERVATION AND EXISTING RECORD INFORMATION RECEIVED FROM UTILITY STAKE-HOLDERS.
6. INVERTS SHOWN ON PLAN ARE NOT GUARANTEED TO BE ACCURATE. DUE TO THE LIMITATIONS OF FIELD OBSERVATION AND SURVEY TECHNIQUES THE INVERTS ARE SHOWN AS APPROXIMATE ONLY AND SHALL NOT BE WARRANTED TO BE CORRECT. ADDITIONAL FIELD INVESTIGATION IS NECESSARY WHERE ACCURATE MEASUREMENTS ARE REQUIRED FOR DESIGN OF CRITICAL AREAS.
7. WHERE AN EXISTING UTILITY IS FOUND TO BE IN CONFLICT WITH THE PROPOSED WORK, THE CONTRACTOR SHALL ACCURATELY DETERMINE THE LOCATION, ELEVATION AND SIZE OF THE UTILITY AND FURNISH THE INFORMATION TO THE ENGINEER FOR RESOLUTION OF THE CONFLICT.
8. THE CONTRACTOR SHALL EXERCISE EXTREME CARE WHEN EXCAVATING NEAR AND BACKFILLING IN THE VICINITY OF EXISTING UTILITIES. THE CONTRACTOR SHALL USE HAND EXCAVATION WHERE APPROPRIATE TO PROTECT EXISTING UTILITIES.
9. THE CONTRACTOR SHALL MAINTAIN ALL EXISTING UTILITIES IN SERVICE AT ALL TIMES UNLESS NOTED ON THE PLANS OR APPROVED BY THE ENGINEER.
10. THE CONTRACTOR SHALL SUPPORT AND PROTECT EXISTING UTILITIES IN AND AROUND EXCAVATIONS, AND IN PARTICULAR, WHEN CROSSING OVER OR UNDER ANY DUCT OR PIPE. ALL PROTECTIVE MEASURES SHALL BE CONSIDERED INCIDENTAL WORK.
11. IF THE CONTRACTOR DAMAGES ANY UTILITY SYSTEM, HE OR SHE SHALL IMMEDIATELY NOTIFY THE RESPECTIVE UTILITY COMPANY AND SHALL REPAIR/REPLACE THE AFFECTED SYSTEM AT HIS OR HER OWN EXPENSE.
12. THE CONTRACTOR SHALL COORDINATE WITH PRIVATE UTILITY COMPANIES AND MAKE ARRANGEMENTS FOR ADJUSTMENTS, ALTERATIONS AND REPLACEMENT OF PRIVATE UTILITIES.
13. BELOW GROUND STRUCTURES ARE SHOWN SYMBOLIC UNLESS DIMENSIONED.
14. THE EXISTING CONDITIONS PLAN IS TO BE USED FOR THE SPECIFIED PROJECT ONLY AND IS NOT WARRANTED TO BE COMPLETE FOR ANY OTHER FUTURE PROJECTS.
15. THE EXISTING SEWER LINE WITHIN THE PROJECT LIMITS SHALL BE INSPECTED USING CLOSED CIRCUIT TV (CCTV) AT THE BEGINNING OF THE PROJECT, PRIOR TO ANY MAJOR WORK ACTIVITIES OR LARGE EQUIPMENT MOBILIZING ON SITE. A CCTV INSPECTION OF THE EXISTING SEWER LINE FOR THE SAME LIMITS SHALL ALSO BE PERFORMED AT THE END OF CONSTRUCTION TO CONFIRM ITS CONDITION HAS NOT CHANGED OVER THE COURSE OF THE PROJECT.
IN ADDITION TO THE PRE AND POST CONSTRUCTION CCTV INSPECTION OF THE EXISTING SEWER LINE FOR THE PROJECT LIMITS, INTERIM CCTV INSPECTION OF CERTAIN SEGMENTS OF THE SEWER LINE SHALL BE PERFORMED FOR SPECIFIC VIBRATION GENERATING ACTIVITIES. CCTV INSPECTION SHALL BE PERFORMED AT THE FOLLOWING LOCATIONS AND PROPOSED CONSTRUCTION ITEMS FOR EXCAVATION AND STONE INSTALLATION ACTIVITIES:

- STA 329+85 BOX CULVERT NO. 1
- STA 340+05 36" DIP PIPE CULVERT
- STA 342+25 24" DIP PIPE CULVERT
- STA 346+20 BOX CULVERT NO. 2
- STA 351+10 BOARDWALK WEST ABUTMENT
- STA 355+48 BOARDWALK EAST ABUTMENT
- STA 358+50 16" DUCTILE IRON PIPE

SUMMARY OF UTILITY MAPPING QUALITY LEVELS:

THE FOLLOWING IS A SUMMARY OF THE SURVEY MAPPING LEVELS FOR UTILITIES AS DESCRIBED IN ASCE STANDARD 38-02, "STANDARD GUIDELINE FOR THE DEPICTION OF EXISTING SUBSURFACE UTILITY DATA". THESE GUIDELINES ARE MORE FULLY DESCRIBED IN THE ASCE STANDARD.

UTILITY QUALITY LEVEL A:
PRECISE HORIZONTAL AND VERTICAL LOCATION OF UTILITIES OBTAINED BY THE ACTUAL EXPOSURE (OR VERIFICATION OF PREVIOUSLY EXPOSED AND SURVEYED UTILITIES) AND SUBSEQUENT MEASUREMENT OF SUBSURFACE UTILITIES, USUALLY AT A SPECIFIC POINT. MINIMALLY INTRUSIVE EXCAVATION EQUIPMENT IS TYPICALLY USED TO MINIMIZE THE POTENTIAL FOR UTILITY DAMAGE. A PRECISE HORIZONTAL AND VERTICAL LOCATION, AS WELL AS OTHER UTILITY ATTRIBUTES, IS SHOWN ON PLAN DOCUMENTS. ACCURACY IS TYPICALLY SET TO 15-MM VERTICAL AND TO APPLICABLE HORIZONTAL SURVEY AND MAPPING ACCURACY AS DEFINED OR EXPECTED BY THE PROJECT OWNER.

UTILITY QUALITY LEVEL B:
INFORMATION OBTAINED THROUGH THE APPLICATION OF APPROPRIATE SURFACE GEOPHYSICAL METHODS TO DETERMINE THE EXISTENCE AND APPROXIMATE HORIZONTAL POSITION OF SUBSURFACE UTILITIES. QUALITY LEVEL B DATA SHOULD BE REPRODUCIBLE BY SURFACE GEOPHYSICS AT ANY POINT OF THEIR DEPICTION. THIS INFORMATION IS SURVEYED TO APPLICABLE TOLERANCES DEFINED BY THE PROJECT AND REDUCED ONTO PLAN DOCUMENTS.

UTILITY QUALITY LEVEL C:
INFORMATION OBTAINED BY SURVEYING AND PLOTTING VISIBLE ABOVE-GROUND UTILITY FEATURES AND BY USING PROFESSIONAL JUDGMENT IN CORRELATING THIS INFORMATION TO QUALITY LEVEL D INFORMATION.

UTILITY QUALITY LEVEL D:
INFORMATION DERIVED FROM EXISTING RECORDS OR ORAL RECOLLECTIONS.

SURVEY NOTES

1. THE EXISTING CONDITIONS SHOWN ON THIS BASEMAP ARE THE RESULT OF AN ARIAL SURVEY PERFORMED BY SANBORN COMPANY IN JUNE, 2004 SUPPLEMENTED BY AN ON THE GROUND INSTRUMENT SURVEY PERFORMED IN SEPTEMBER, 2004 BY GREEN INTERNATIONAL AFFILIATES, INC. (GREEN). ADDITIONAL GROUND SURVEY WAS PERFORMED BETWEEN 2017 AND 2022 BY GREEN TO SUPPLEMENT EXISTING GROUND SURVEY.
2. HORIZONTAL DATUM IS BASED ON THE MASSACHUSETTS STATE PLANE COORDINATE SYSTEM, VERTICAL DATUM IS NAVD88. THE UNIT OF MEASUREMENTS IS US SURVEY FEET.
3. WETLANDS WERE DELINEATED BY GREEN ON 2/15/2018 AND REFLAGGED BY ECOSYSTEMS-SOLUTIONS IN 2022 ACCORDANCE WITH THE MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION AND FIELD LOCATED BY GREEN ON 2/20/2018. REFLAGGING DETERMINED BOUNDARIES HAD NOT CHANGED.
4. THE RIGHT OF WAY LINES SHOWN ON THIS PLAN ARE THE DIRECT RESULT OF AN INSTRUMENT SURVEY PERFORMED ON THE GROUND BY GREEN INTERNATIONAL AFFILIATES, INC. WITH AN ERROR OF CLOSURE LESS THAN 1:15,000, AND FROM PLANS AND DEEDS OF RECORD. PRIVATE PROPERTY LINES ARE COMPILED FROM DEEDS AND PLANS AND SHOULD BE CONSIDERED APPROXIMATE.
5. THE SAID PARCELS SHOWN HERE ARE SUBJECT TO RIGHTS AND EASEMENTS AS CONTAINED IN THE VARIOUS DEEDS OF RECORD DESCRIBING SAID PREMISES. THE LOCATIONS AND EXTENT OF SAID RIGHTS AND EASEMENTS ARE NOT THE SUBJECT OF THIS SURVEY.

EROSION AND SEDIMENT CONTROL

1. ALL EROSION CONTROL MEASURES SHALL BE INSTALLED PRIOR TO THE START OF ANY LAND DISTURBANCE/EARTHWORK ACTIVITIES.
2. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE MAINTENANCE, REPAIR AND REPLACEMENT OF ALL SEDIMENTATION/EROSION CONTROL MEASURES UNTIL ALL DISTURBED AREAS ARE STABILIZED.

25													
30													

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Borehole relocated approximately 25 feet from staked location due to access.
3. Driller noted increased drilling resistance at 6.5 feet below ground surface (bgs).
4. Gravel and Cobbles (less than 6 inches) observed in drill spoils at approximately 11 feet bgs.
5. Auger refusal at 15.3 feet bgs on possible bedrock. Borehole terminated.
6. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Auger refusal at 14.5 feet below ground surface (bgs) on possible bedrock. Advanced split spoon. Split spoon refusal at 14.7 feet bgs. Borehole terminated.
3. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

Boring No.: B-3

174019 PROPOSED PEABODY BIKEWAY.GPJ; STRATUM ONLY: 3/18/2019

BORING NOTES

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B-1
2. BORINGS TAKEN FOR THE PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES TO THE LEFT OF COLUMNS INDICATE DEPTH BELOW SURFACE AT BORING POINT.
5. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS PRODUCED BY A 30" FALL OF 140 POUND MASS HAMMER REQUIRED TO DRIVE 2" I.D. SPOON 1 FOOT.
6. BORING SAMPLE TAKEN 1/2/2019 - 1/3/2019.
7. BORING CONTRACTOR - NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH 03038
8. BORING SAMPLES WERE STORED AT A STORAGE FACILITY ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Hole appears to have blown in prior to sampling S-5. Blow counts at S-5 may be inaccurate. Driller removed augers and offset 4 feet southeast of staked location and continued hole with 4-inch casing. Samples S-6 through S-8 obtained using drive and wash drilling methods.
3. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

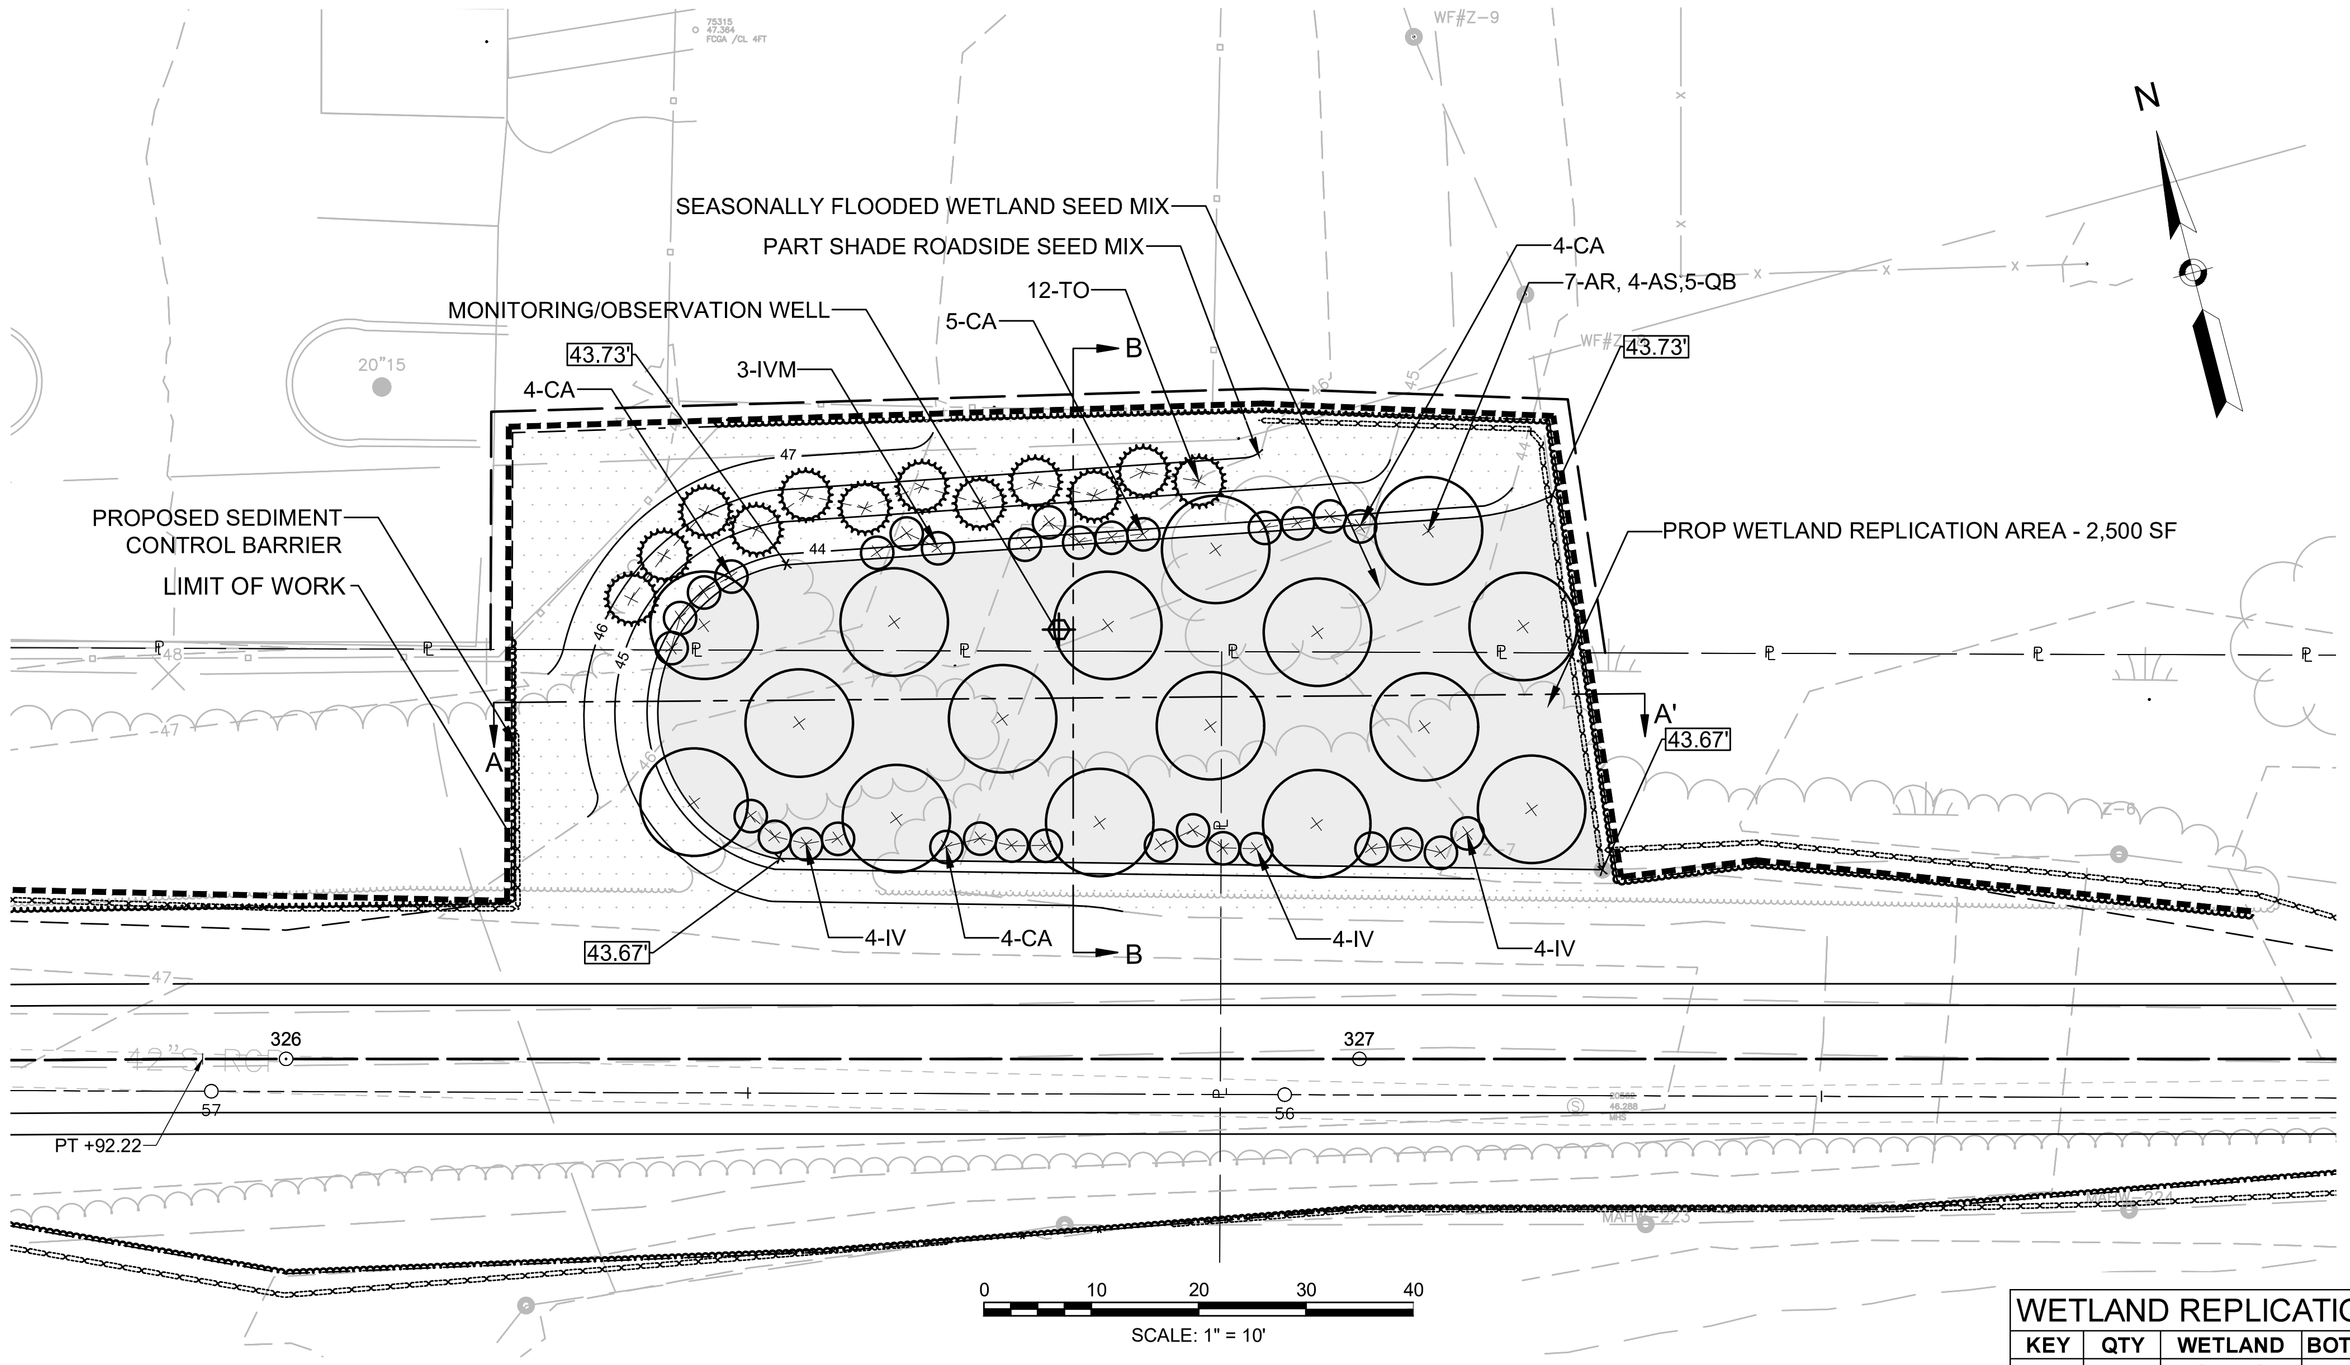
WETLAND REPLICATION PLAN



NOTES:

1. IMPACTS TO EXISTING TREES AND SOILS SHALL BE MINIMIZED TO THE EXTENT POSSIBLE.
2. CONTACT THE REPRESENTATIVE FROM MASSDOT LANDSCAPE DESIGN SECTION PRIOR TO THE START OF CONSTRUCTION. THE REPRESENTATIVE FOR THIS PROJECT IS MAXWELL R. MCNULTY MAXWELL.R.MCNULTY@DOT.STATE.MA.US.
3. FINAL GRADES TO BE TO MATCH ADJACENT WETLAND. MINOR ADJUSTMENTS IN FINAL GRADES SHALL BE MADE IN THE FIELD BY THE WETLAND SPECIALIST.
4. REPLICATION AREA SHALL BE EXCAVATED BELOW PROPOSED GRADES TO ALLOW FOR THE PLACEMENT OF WETLAND SOILS. THE DEPTH OF WETLAND SOILS SHALL BE 18" MAXIMUM AND SHALL MATCH THE DEPTH OF WETLAND SOIL IN THE ADJACENT WETLAND. DEPTH OF WETLAND SOIL SHALL BE DETERMINED BY THE WETLAND SPECIALIST. THE SALVAGED TOPSOIL MATERIAL AND B-HORIZON SUBSOIL MATERIAL EXCAVATED FROM THE WETLAND IMPACT AREAS SHALL BE PLACED IN SEPARATE STOCKPILES TO BE REUSED IN THE PROPOSED REPLICATION AREA IF SUITABLE.
5. REPLICATION AREA GRADES SHALL MATCH THE ELEVATIONS OF THE ABUTTING WETLAND TO MAINTAIN A HYDROLOGIC CONNECTION. WETLAND SPECIALIST SHALL INSPECT THE SUB-GRADE OF THE REPLICATION AREA TO ENSURE THAT THE PROPER HYDROLOGY HAS BEEN ESTABLISHED. MINOR MODIFICATIONS TO THIS GRADING PLAN MAY BE MADE IN THE FIELD BY THE QUALIFIED WETLAND SPECIALIST IN RESPONSE TO SUBSURFACE HYDROLOGIC CONDITIONS.
6. TREES AND SHRUBS IN THE REPLICATION AREA AND ADJACENT UPLAND AREA SHALL BE FIELD LOCATED BY THE WETLAND SPECIALIST.

PLANTING & SEEDING NOTES:

1. SEED SHALL BE MANUALLY BROADCAST. LIMITS SHOWN ARE APPROXIMATE. ACTUAL LIMITS SHALL BE AS DIRECTED BY THE WETLAND SPECIALIST.

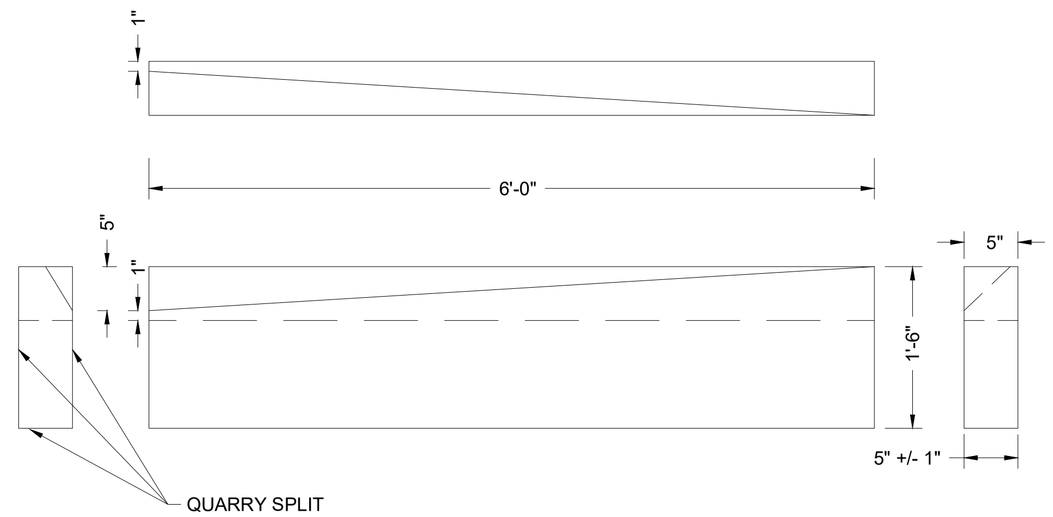
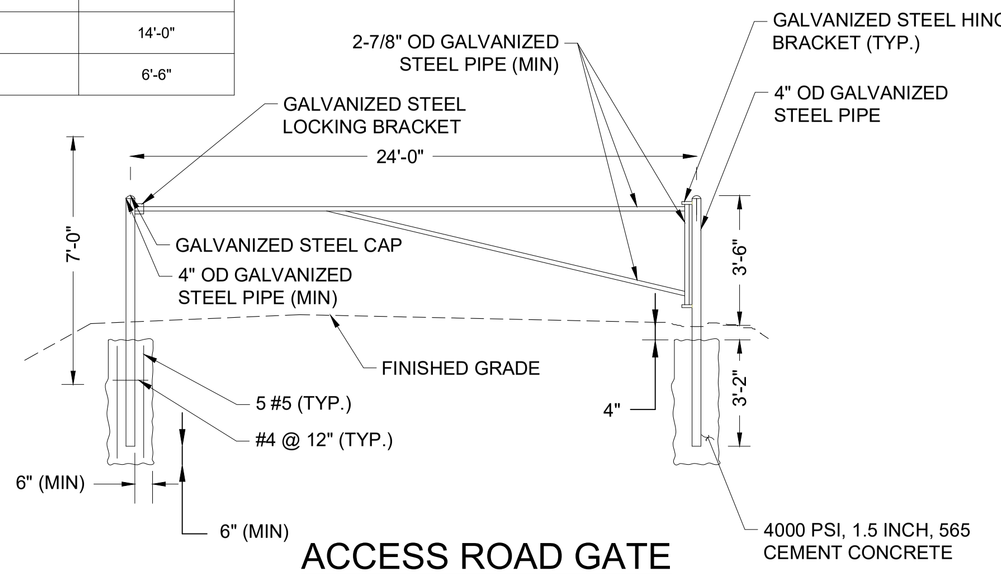
HMA DRIVEWAY WITHOUT SIDEWALK

NOT TO SCALE

CURB CUT DRIVEWAY DETAIL TABLE			
STATION	OFFSET	WIDTH OF DRIVEWAY	DEPTH OF DRIVEWAY
290+16.30	10.90 LT	31'-7"	10'-0"

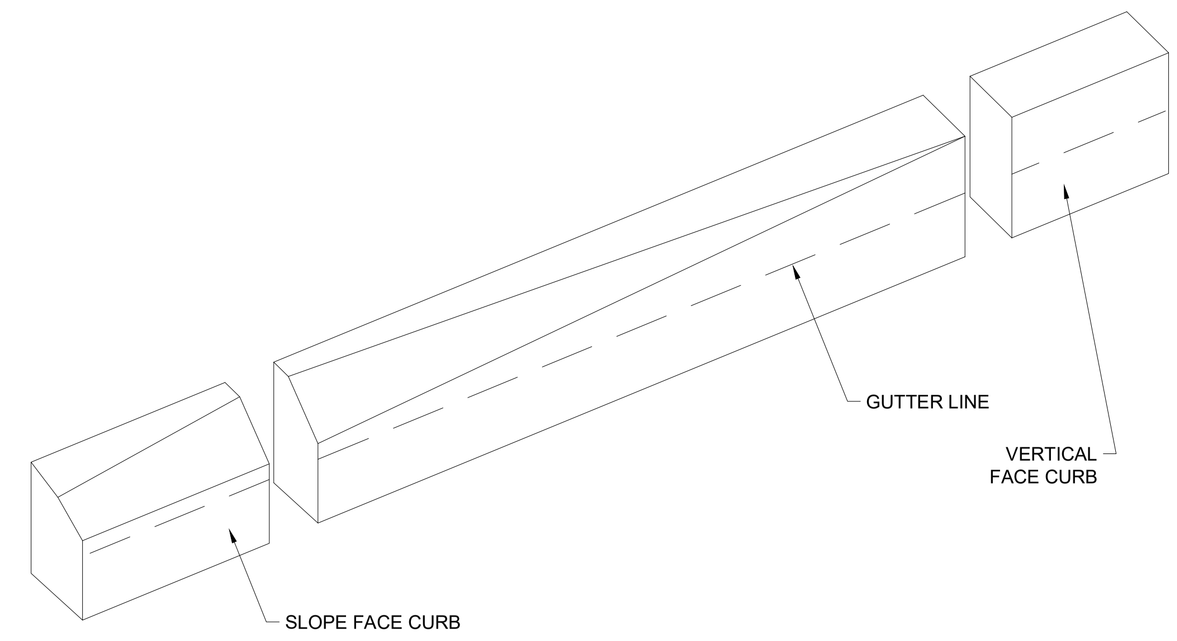




ACCESS ROAD GATE

NOT TO SCALE

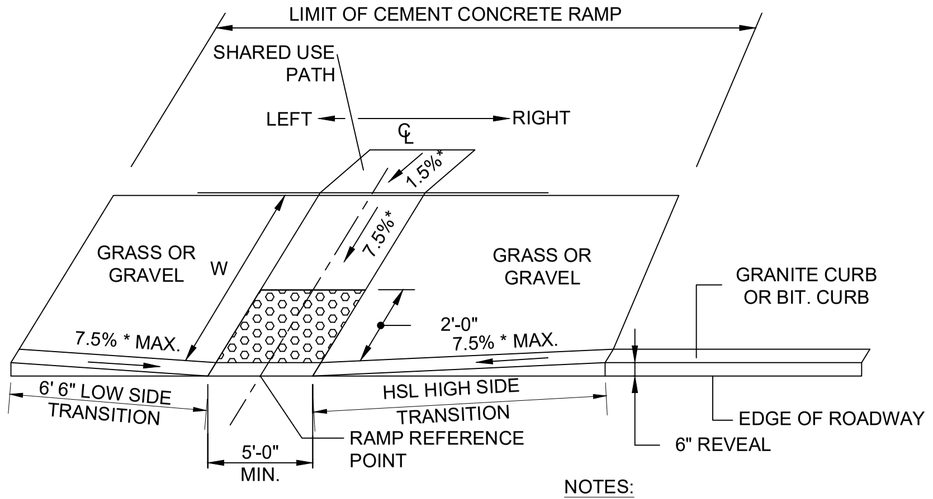
NOTE:
1. ALL GALVANIZED STEEL SHALL MEET GRADE B, Fy = 33,000 KSI AND SHALL BE IN ACCORDANCE WITH SUBSECTION 960.
2. THE GALVANIZED STEEL HINGE BRACKET AND GALVANIZED STEEL LOCKING BRACKET SHALL BE $\frac{1}{4}$" (MIN) COLD ROLLED GALVANIZED STEEL.
3. VENT HOLES SHALL BE INSTALLED IN GALVANIZED TUBES, PER MANUFACTURER'S RECOMMENDATIONS.
4. CONCRETE SHALL MEET THE REQUIREMENTS OF SUBSECTION 901 OF THE STANDARD SPECIFICATIONS.
5. STEEL REINFORCEMENT SHALL BE GRADE 60 REINFORCING LEVEL I.



GRANITE TRANSITION TYPE VB - SPLAYED END

NOT TO SCALE

NOTE:
1. TOP SURFACE AND SLOPED SURFACE TO BE DRESSED BY SAW. REMAINDER TO BE QUARRY SPLIT.
2. DETAIL SHOWS TRANSITION CURB FOR ONE DIRECTION. FOR OTHER DIRECTION USE OPPOSITE HAND.



NOTES:
* CONSTRUCTION TOLERANCE ± 0.5%
- DETECTABLE WARNING PANELS SHALL BE INSTALLED IN ACCORDANCE WITH CONSTRUCTION STD E 107.6.5
- PCR 9 LANDING TO BE CONSTRUCTED WITH HMA TO MATCH SHARED USE PATH
** TRANSITION LENGTHS FOR CURBS ONLY

CORNER CURB CUT RAMP (ADJACENT TO SHARED USE PATH)

SCALE 1" = 10'-0"

PLANTING NOTES

1. CONTRACTOR SHALL HAVE ALL SUBSURFACE UTILITIES MARKED PRIOR TO THE START OF WORK.
2. PLANT LOCATIONS ARE APPROXIMATE. PRIOR TO PLANTING, LOCATION OF ALL PLANT MATERIAL WILL BE APPROVED BY THE RESIDENT ENGINEER AND THE LANDSCAPE ARCHITECT.
3. ALL PLANT MATERIAL WILL HAVE TAGS INDICATING COMMON NAME, BOTANICAL NAME, CULTIVAR, & SIZE.
4. IMMEDIATELY AFTER ACCEPTANCE OF PLANTING, TAGS AND RIBBONS SHALL BE REMOVED.
5. ALL PLANTS WILL BE MULCHED PER PLANS AND SPECIFICATIONS.
6. ALL SHRUB AND PERENNIAL BEDS WILL BE WEEDED AND OTHERWISE NEATLY MAINTAINED FOR THE DURATION OF THE CONTRACT.
7. PLANTS AND PLANTING BEDS SHALL BE THOROUGHLY WATERED AS NECESSARY AND PER SPECIFICATIONS.

WATERING NOTES

1. IRRIGATION BAGS MAY BE USED FOR STREETSCAPE AND PARK PLANTINGS ONLY.
2. A SCHEDULE FOR FILLING AND REMOVAL SHALL BE SUBMITTED TO THE ENGINEER.
3. USE AND SCHEDULE MUST BE APPROVED BY THE MASSDOT LANDSCAPE ARCHITECT.
4. A MINIMUM OF 2 BAGS PER TREE SHALL BE USED. BAGS SHALL BE ATTACHED TO STAKES.
5. NO BAGS SHALL BE PLACED AROUND THE TREE TRUNK.
6. BAGS SHALL BE MAINTAINED FULL JUNE 1 - OCTOBER 1 OR AS APPROVED.
7. BAGS SHALL BE REMOVED AT THE END OF THE SEASON.

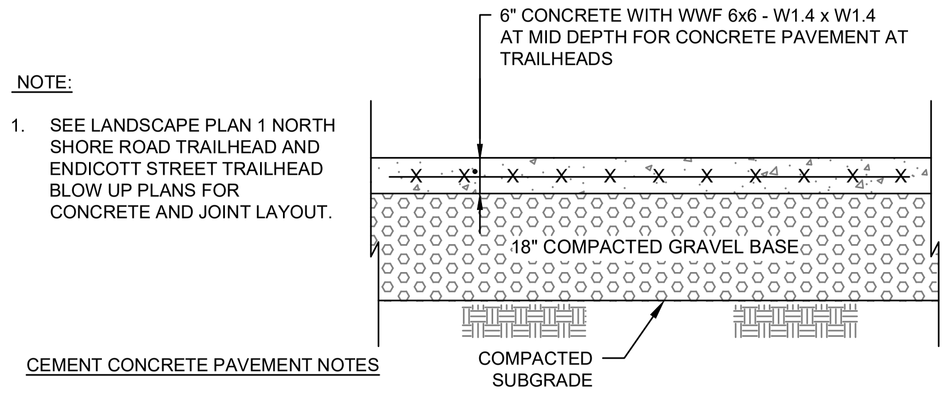
A00860 - 461



NOTE:

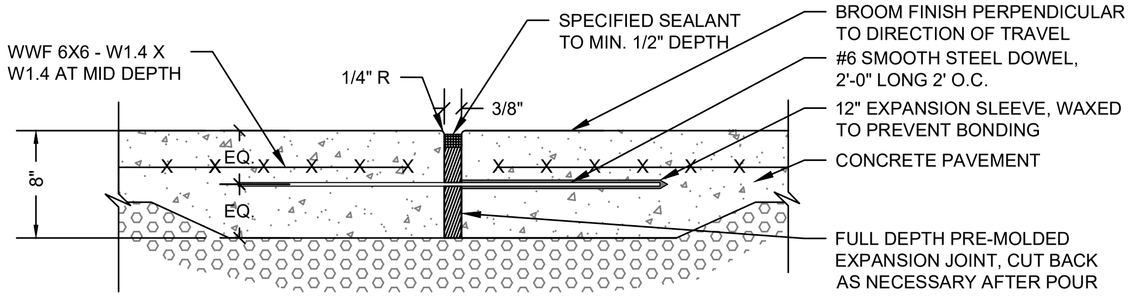
1. SEE LANDSCAPE PLAN 1 NORTH SHORE ROAD TRAILHEAD AND ENDICOTT STREET TRAILHEAD BLOW UP PLANS FOR CONCRETE AND JOINT LAYOUT.

CEMENT CONCRETE PAVEMENT NOTES

1. CEMENT CONCRETE PAVEMENT SHALL HAVE A 28-DAY COMPRESSIVE STRENGTH OF 4,000 PSI WITH 6% AIR-ENTRAINMENT AND MINIMUM CEMENT CONTENT OF 610 LBS/C.Y.
2. CONTRACTOR SHALL SUBMIT CONCRETE JOINT LAYOUT PLAN FOR APPROVAL. EXPANSION JOINTS SHALL BE TRANSVERSE PREFORMED EXPANSION JOINT FILLER (AASHTO M-213-65) ½ IN. THICKNESS.
3. PREFORMED EXPANSION JOINT FILLER SHALL BE PLACED ADJACENT TO OR AROUND EXISTING STRUCTURES AND WALKWAYS.
4. EXPANSION JOINTS SHALL BE CONSTRUCTED WITH DOWELS, AS INDICATED IN DETAIL 2 LANDSCAPE DETAIL SHEET 1.
5. AFTER CONSOLIDATION, CONCRETE DEPTH SHALL BE 6 INCHES IN DEPTH FOR TRAILHEADS.
6. ENSURE THAT NO BLED WATER OR WATER SHEEN EXISTS ON THE SURFACE OF THE CONCRETE AND THAT CONCRETE HAS STARTED TO STIFFEN BEFORE ANY FINISHING OPERATIONS ARE PERFORMED.
7. AFTER TROWELING, SURFACE SHALL BE BRUSHED BY DRAWING A SOFT-BRISTLED PUSHBROOM WITH A LONG HANDLE OVER THE SURFACE OF THE CONCRETE TO PRODUCE A NON-SLIP SURFACE.
8. THE FINISHING OF CONCRETE SURFACE SHALL BE DONE BY EXPERIENCED AND COMPETENT CEMENT CONCRETE FINISHERS.
9. FINISHING SHALL BE BROOM FINISH.
10. SAW CUT CONTROL JOINTS.
11. WHEN COMPLETED, CONCRETE SHALL BE KEPT MOIST AND PROTECTED FROM TRAFFIC AND WEATHER FOR AT LEAST 3 DAYS.
12. WELDED WIRE MESH SHALL BE 6"x6" No. 10 GAUGE AND SHALL BE SHEET MESH ONLY NOT ROLLED. MESH SHALL REST ON CONCRETE BLOCKS AND BE INSTALLED AT MID DEPTH IN CONCRETE.

1 CEMENT CONCRETE PAVEMENT AT TRAILHEADS

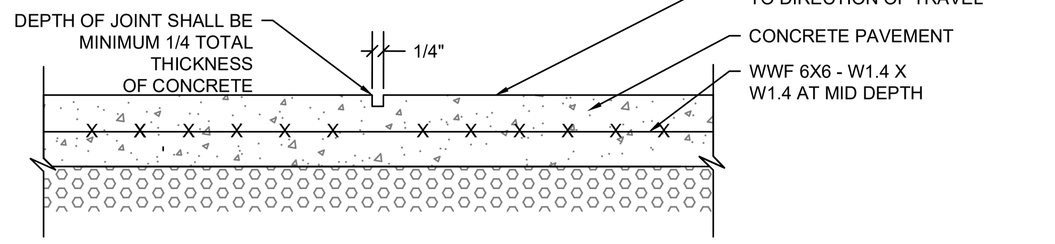
SCALE: N.T.S.



EXPANSION JOINT REQUIRED FOR EVERY +/- 225 SF OF PAVING OR EVERY 30FT ALONG WALKWAYS

EXPANSION JOINT NOTES:

1. DOWEL IS TYPICAL AT ALL EXPANSION JOINTS EXCEPT AGAINST VERTICAL JOINTS WITH WALLS, CURBS OR SITE IMPROVEMENTS.



SAWCUT CONTROL JOINT REQUIRED FOR EVERY 36 SF OF PAVING.

2 CONCRETE PAVEMENT JOINTS AT TRAILHEADS

SCALE: N.T.S.

THIRD STRUCTURAL SUBMISSION (S3)

Proposal No. 609211-132091

GENERAL NOTES

DESIGN:
IN ACCORDANCE WITH THE 2009 AASHTO LRFD GUIDE SPECIFICATION FOR DESIGN OF PEDESTRIAN BRIDGES WITH 2015 INTERIM REVISIONS, FOR 90 PSF DESIGN PEDESTRIAN LOADING.

MASSDOT BENCH MARK:
ELEVATIONS ARE BASED ON THE NORTH AMERICAN VERTICAL DATUM (NAVD) OF 1988.

BENCHMARK: 9 – MAG NAIL SET UP #28 ON WARREN ROAD
STATION: 347+49.19 – 8.971 LT
NORTHING: 3019612.4266
EASTING: 807741.8898
ELEVATION: 41.17'

BENCHMARK: 11 – MAG NAIL SET ABOUT 1' ABOVE GROUND AT LP#6 ON ENDICOTT STREET
STATION: 359+34.38 – 79.411 LT
NORTHING: 3018945.6274
EASTING: 808725.6506
ELEVATION: 37.33'

MASSDOT SURVEY:
THE EXISTING CONDITIONS SHOWN ON THIS BASEMAP ARE THE RESULTS OF AN AERIAL SURVEY PERFORMED BY SANBORN COMPANY IN JUNE, 2004 SUPPLEMENTED BY AN ON GROUND INSTRUMENT SURVEY PERFORMED IN SEPTEMBER, 2004 BY GREEN INTERNATIONAL AFFILIATES, INC. (GREEN). ADDITIONAL GROUND SURVEY WAS PERFORMED BETWEEN 2017 AND 2022 BY GREEN TO SUPPLEMENT EXISTING GROUND SURVEY.

SCALES:
SCALES NOTED ON THE PLANS ARE NOT APPLICABLE TO REDUCED SIZE PRINTS. DIVIDE SCALES BY 2 FOR HALF-SIZE PRINTS.

FOUNDATIONS:
FOUNDATIONS MAY BE ALTERED, IF NECESSARY, TO SUIT CONDITIONS ENCOUNTERED DURING CONSTRUCTION, WITH THE APPROVAL OF THE ENGINEER.

UNSUITABLE MATERIAL:
ALL UNSUITABLE MATERIAL SHALL BE REMOVED WITHIN THE LIMITS OF THE FOUNDATIONS OF THE STRUCTURE, AS DIRECTED BY THE ENGINEER.

GEOTECHNICAL REPORT:
REFER TO GEOTECHNICAL REPORT, DATED MAY 2023, PREPARED BY GZA GEO ENVIRONMENTAL.

EXISTING CONDITIONS:
CONTRACTOR SHALL DETERMINE AND ESTABLISH ALL DIMENSIONS AND DETAILS NECESSARY FOR COMPLETION OF ALL WORK BY FIELD MEASUREMENTS AND SURVEY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ADEQUACY THEREOF, AND SHALL NOT ORDER ANY MATERIAL OR COMMENCE ANY FABRICATION UNTIL HE/SHE HAS MADE THE REQUIRED MEASUREMENTS AND THE EXTENT OF THE PROPOSED WORK HAS BEEN APPROVED BY THE ENGINEER.

STRUCTURAL WOOD NOTES:
ALL DIMENSIONAL LUMBER SHALL BE SOUTHERN PINE STAMPED BY A MEMBER OF THE WWPA AND KILN DRIED TO 19% MAXIMUM MOISTURE CONTENT. ALL STRUCTURAL LUMBER SHALL BE SELECT STRUCTURAL GRADE. IN ACCORDANCE WITH AASHTO TABLE 8.4.1.1.4–1 AND THE 2018 NATIONAL DESIGN SPECIFICATIONS (NDS) FOR WOOD CONSTRUCTION ALL PROPOSED TIMBER ELEMENTS SHALL HAVE A MINIMUM MODULUS OF ELASTICITY OF 1800 KSI.

STRINGERS AND PIER BENTS SHALL NOT BE NOTCHED EXCEPT WHERE SHOWN IN DETAILS. OBTAIN STRUCTURAL ENGINEER'S APPROVAL FOR ANY HOLES THROUGH OR NOTCHES IN THE TOP OF HORIZONTAL MEMBERS.

FOR BLACK LOCUST DECKING MATERIAL REQUIREMENTS PLEASE REFER TO THE SPECIAL PROVISIONS.

PROPOSED WOOD SCREWS FOR TIMBER FRAMING ELEMENTS SHALL COMPLY WITH ASME B18.6 REQUIREMENTS AND SHALL BE GALVANIZED UNLESS OTHERWISE NOTED. WOOD SCREW SIZES AND LENGTHS SHALL BE AS SHOWN ON THE PLANS.

SEE SHEET 17 FOR CONNECTION HARDWARE NOTES.

GRS–IBS MATERIALS
SEE SPECIAL PROVISIONS FOR DETAILED REQUIREMENTS.

CONCRETE MASONRY UNIT (CMU) FACING ELEMENTS
FACING ELEMENTS CONSISTING OF SPLIT–FACE CMU BLOCK UNITS SHALL MEET ASTM C90–11B AND THE REQUIREMENTS OF THE SPECIAL PROVISIONS, WITH A MINIMUM REQUIRED COMPREHENSIVE STRENGTH OF 4000 PSI AND A MAXIMUM WATER ABSORPTION RATE OF 5 PERCENT AFTER 24 HOURS.

CONSTRUCTION JOINTS
CONSTRUCTION JOINTS, OTHER THAN THOSE SHOWN ON THE PLANS, WILL NOT BE PERMITTED WITHOUT PRIOR APPROVAL OF THE ENGINEER.

BACKFILL MATERIALS
A. GEOSYNTHETIC REINFORCED SOIL (GRS) BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.6 AND HAVE A MINIMUM ANGLE OF INTERNAL FRICTION OF 30 DEGREES AS CONFIRMED BY A DIRECT SHEAR TEST.
B. REINFORCED SOIL FOUNDATION (RSF) BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.4 AND HAVE A MINIMUM ANGLE OF INTERNAL FRICTION OF 38 DEGREES AS CONFIRMED BY A DIRECT SHEAR TEST.
C. INTEGRATED APPROACH BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.1.
D. LEVELING COURSE BACKFILL SHALL CONSIST OF CRUSHED STONE MEETING THE REQUIREMENTS OF M2.01.6.

GEOSYNTHETICS
FURNISH GEOSYNTHETICS CONSISTING OF GEOTEXTILE FOR THE GRS ABUTMENT, RSF AND INTEGRATED APPROACH. THE GEOSYNTHETIC MATERIAL SHALL BE MANUFACTURED FROM POLYPROPYLENE, HIGH–DENSITY POLYETHYLENE, OR POLYESTER AND MEET THE REQUIREMENTS OF THE SPECIAL PROVISIONS.

A. GEOSYNTHETIC REINFORCED SOIL SHALL INCLUDE A CLASS 1 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11 AND A REINFORCEMENT STRENGTH OF 1370 LB/FT AT 2 PERCENT STRAIN IN THE CROSS DIRECTION.
B. REINFORCED SOIL FOUNDATION SHALL INCLUDE A CLASS 1 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11 AND A REINFORCEMENT STRENGTH OF 1370 LB/FT AT 2 PERCENT STRAIN IN THE CROSS DIRECTION.
C. INTEGRATED APPROACH SOIL SHALL INCLUDE A CLASS 2 GEOTEXTILE WITH A MINIMUM ULTIMATE TENSILE STRENGTH OF 4800 LB/FT ACCORDING TO ASTM D 4595–11.

40													

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 5.5 feet south of staked location due to restricted access and overhead wires.
3. Continuous sampling performed from sampling depths 0 to 10 feet below ground surface (bgs). Driller advanced 4-inch casing down as sampling advanced. The casing was advanced to 14 feet bgs following sampling of S-5.
4. Standard sampling performed from sample depths 14 to 24.2 feet bgs.
5. Driller advanced 4-inch casing from 14 to 24 feet bgs.
6. Clayey Silt observed in drill cuttings from 17.5 to 19 feet bgs.
7. Weathered Bedrock fragments and increased drill effort observed at 23.8 feet bgs.
8. Cored bedrock with a downward pressure of 500 psi at 1,350 rpm in 3rd gear using an NX core barrel.
9. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 3.5 feet south due to restricted access.
3. Advanced boring using 4-inch casing from sample depths 0 to 29 feet below ground surface (bgs).
4. Consistent coarse sand-sized rock fragments observed in drill cuttings from sample depths 30 to 31 feet bgs.
5. Drill rig did not have a downward pressure or RPM gauge. Cored bedrock in 3rd gear using an NX core barrel.
6. Core barrel jammed with no loss of water at sample depths 35.1 and 38.3 feet bgs.
7. Borehole backfilled to approximate ground surface with drill cuttings.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

BORING LOGS 1 OF 3

BORING NOTES:

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B−#
2. BORINGS ARE TAKEN FOR PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS REQUIRED TO DRIVE A 1 3/8" I.D. SPLIT SPOON SAMPLER 6" USING A 140 POUND WEIGHT FALLING 30".
5. BORING SAMPLES ARE STORED AT A STORAGE FACILITY LOCATED ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.
6. B−7 AND B−8 WERE MADE IN JANUARY 2019 AND B−9 THROUGH B−12 WERE MADE IN FEBRUARY 2022.
7. BORINGS WERE MADE BY NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH, 03038.
8. THE NORTH AMERICAN VERTICAL DATUM (NAVD) OF 1988 IS USED THROUGHOUT.

30													

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitles "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc on 1/16/2019.
2. Driller advanced 4" diameter casing to approximately 20 feet below ground surface.
3. Driller noted difficult keeping casing straight from 10 to 15 feet below ground surface.
4. Sample S-6 appeared to consist of wash material.
5. Boring was terminated at approximately 22.6 feet below ground surface upon SPT refusal. Borehole was backfilled with natural soil cuttings.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

174019.00 PEABODY BIKE PHILGP2; STRATUM ONLY NORWOOD; 1/20/2023

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitles "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc on 1/16/2019.
2. Driller advanced 4" diameter casing to approximately 25 feet below ground surface.
3. Standard sampling performed from sample depths 0 to 9 feet below ground surface.
4. Continuous sampling performed from sample depths 9 to 27 feet below ground surface.
5. Significant difficulty advancing casing from 0–5 feet below ground surface. Wash appeared to be fine to coarse Sand.
6. Red/black mottling in sample S-7, S-8, and S-9.
7. Alternating layers of Sand, Clay and Silt in sample S-8 and S-9.
8. Borehole was backfilled with natural soil cuttings and sand.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitles "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc on 1/16/2019.
2. Driller advanced 4" diameter casing to approximately 25 feet below ground surface.
3. Red mottling observed in samples S-5 through S-7.
4. Significant drill chatter observed beginning at approximately 24.7 feet below ground surface.
5. Gravel in tip of sample S-10.
6. Borehole was backfilled with natural soil cuttings.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were mode.

HELICAL PILE LAYOUT PLAN 1

SCALE: 1" = 1'-0"

NOTES:

1. SEE SHEET 10 FOR HELICAL PILE STATION AND OFFSET.
2. SEE SHEET 11 FOR HELICAL PILE NOTES.
3. HELICAL PILE MINIMUM EMBEDMENT SHALL BE 11'-6" TO THE TOP HELICE FOR ALL P#-3 LOCATIONS WITH AN OFFSET LESS THAN 3'-6" BETWEEN THE CENTER OF PILE AND THE EDGE OF THE SEWER LINE AS DIMENSIONED ON THIS SHEET.
4. ALL DIMENSIONS SHOWN FOR THE SOUTH HELICAL PILES TO THE EXISTING SEWER LINE ARE APPROXIMATE AND TAKEN PERPENDICULAR TO THE SEWER LINE.
6. THE VERIFICATION TEST HELICAL PILES SHALL BE A SACRIFICIAL HELICAL PILE. THE VERIFICATION TEST SHALL BE PERFORMED PRIOR TO CONSTRUCTION OF PRODUCTION HELICAL PILES. THE VERIFICATION TEST LOCATIONS ARE APPROXIMATE AS SHOWN. CONTRACTOR TO SELECT THE EXACT LOCATION OF THE VERIFICATION TEST HELICAL PILES WITH APPROVAL BY THE ENGINEER.
7. PRIOR TO LAYOUT AND INSTALLATION OF THE HELICAL PILES, THE CONTRACTOR SHALL LOCATE THE EXISTING SEWER MANHOLES AND STAKE OUT THE 42" RCP PIPE ALIGNMENT BETWEEN MANHOLES WITHIN THE LIMITS OF THE PROPOSED BOARDWALK. THE CONTRACTOR SHALL PERFORM A MINIMUM OF TWO (2) TEST PITS ALONG THE STAKED OUT ALIGNMENT OF THE SEWER WITHIN THE PROXIMITY OF THE HELICAL PILES.

HELICAL PILE DETAILS

NOTES:

1. THE TABLE BELOW SUMMARIZES THE FACTORED AXIAL DESIGN LOADS PER PILE FOR AASHTO LRFD BRIDGE SPECIFICATIONS STRENGTH I LOAD COMBINATIONS. THE NOMINAL GEOTECHNICAL RESISTANCE, AND THE FACTORED GEOTECHNICAL RESISTANCE PER PILE:

	FACTORED DESIGN LOADS	NOMINAL GEOTECHNICAL RESISTANCE	FACTORED GEOTECHNICAL RESISTANCE**
HELICAL PILE (COMPRESSION)	10.00 KIPS	17.00 KIPS	11.90 KIPS
HELICAL PILE (TENSION)	5.00 KIPS	14.80 KIPS	10.35 KIPS

**FACTORED GEOTECHNICAL RESISTANCE IS THE PRODUCT OF THE NOMINAL GEOTECHNICAL RESISTANCE AND A RESISTANCE FACTOR OF 0.70.

2. THE TOP HELIX OF ALL PROPOSED HELICAL PILES SHALL BE TORQUED TO A MINIMUM EMBEDMENT OF 9 FEET BELOW EXISTING GRADE, EXCEPT AS NOTED ON SHEET 8 ADJACENT TO THE SEWER LINE.

3. THREE PRE-PRODUCTION VERIFICATION LOAD TESTS FOR THREE SACRIFICIAL PILES ARE REQUIRED TO CONFIRM THE HELICAL PILE NOMINAL RESISTANCE. LOAD TESTING SHALL BE PERFORMED IN ACCORDANCE WITH THE SPECIAL PROVISION REQUIREMENTS, THE GEOTECHNICAL REPORT RECOMMENDATIONS, AND THE SACRIFICIAL PILE LOCATIONS SHALL BE AGREED UPON BY THE CONTRACTOR AND ENGINEER. A RESISTANCE FACTOR OF 0.70 MAY BE UTILIZED UPON SUCCESSFUL COMPLETION OF STATIC LOAD TESTING.

4. THE CONTRACTOR SHALL SUBMIT A PILE SCHEDULE, PILE INSTALLATION, AND TESTING PLAN FOR REVIEW AND APPROVAL OF THE ENGINEER. THE CONTRACTOR SHALL SUBMIT SHOP DRAWINGS AND DESIGN CALCULATIONS FOR THE PROPOSED HELICAL PILES SIGNED AND STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE COMMONWEALTH OF MASSACHUSETTS.

5. ALTERNATIVE ATTACHMENT AND ASSEMBLIES CAN BE SUBMITTED THROUGH THE SHOP DRAWING PROCESS FOR REVIEW AND APPROVAL.

6. LATERAL PILES ALTERNATE DIRECTION EVERY BENT.

7. LATERAL AND LONGITUDINAL PILE ANGLE CAN RANGE BETWEEN 25° AND 35°.

8. LONGITUDINAL BATTERED PILES SHALL BE AT EVERY THIRD PIER BENT TO RESIST LONGITUDINAL LOADING.

9. HELICAL PILES AND CONNECTIONS SHALL BE HOT-DIPPED GALVANIZED.

10. REMOVAL OF SURFICIAL COBBLES/BOULDERS WILL BE REQUIRED PRIOR TO HELICAL PILE INSTALLATION. PRE-DRILLING MAY BE REQUIRED TO PENETRATE THE COBBLES AND BOULDERS.

11. HELICAL PILE MINIMUM EMBEDMENT SHALL BE 11'-6" TO THE TOP HELICE FOR ALL P#-3 LOCATIONS WITH AN OFFSET LESS THAN 3'-6" BETWEEN THE CENTER OF PILE AND THE EDGE OF THE SEWER LINE. MINIMUM EMBEDMENT FOR ALL REMAINING PILES SHALL BE 9'-0".

12. FOR ADDITIONAL HELICAL PILE REQUIREMENTS, SEE SPECIAL PROVISION ITEM NO. 943.20.

GRS-IBS ABUTMENT NOTES:

1. THE FACTORED BEARING PRESSURE = 0.897 KSF AS PER AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS STRENGTH I LOAD COMBINATION.
   FACTORED BEARING RESISTANCE = 5.8 KSF. FACTORED BEARING RESISTANCE IS THE PRODUCT OF THE NOMINAL BEARING RESISTANCE AND A RESISTANCE FACTOR OF 0.65.
2. CAST-IN-PLACE CONCRETE BEARING SEAT SHALL BE 5000 PSI HP CEMENT CONCRETE WITH ONE LAYER OF #4 WELDED WIRE FABRIC PLACED AT MID-HEIGHT.
3. THE GEOTEXTILE REINFORCEMENT SHALL EXTEND BETWEEN THE LAYERS OF CMU BLOCK.
4. ALL CMU BLOCKS ABOVE PROPOSED GRADE AND THE FIRST BLOCK BELOW GRADE SHALL BE HOLLOW AND FILLED WITH BLOCK WALL CONCRETE FILL. ALL CMU BLOCKS BELOW THAT POINT SHALL BE SOLID. SEE SECTION VIEW FOR LIMITS OF CONCRETE FILL CMU BLOCKS ABOVE GRADE.

SHEET 17 OF 17 SHEETS BRIDGE NO. P–03–020 (CAK)

DATE	DESCRIPTION
MMMM DD, YYYY	ISSUED FOR CONSTRUCTION

THIS SHEET IS APPROVED FOR CONSTRUCTION BY MASSDOT AUTHORIZED SIGNATORY: STATE BRIDGE ENGINEER

USE ONLY PRINTS OF LATEST DATE

June 4, 2024

To:	Danielle Spicer, P.E. Oxana Fartushnaya
Cc:	
From:	Brandon Faneuf, PWS
Date:	June 5, 2024
Project Name:	609211 Peabody – Independence Greenway Extension Proposed Wetland Replication Area
Project Number:	Green No. 17118
Subject:	Wetland Description - Independence Greenway Extension Proposed Wetland Replication Area, Peabody, MA

Introduction

This memo is to describe the types and extents of wetlands and wetland jurisdictional areas at the proposed wetland replication area site located at 265 Lowell St (A), Peabody, MA (see attached Locus Map Figure). Investigations were conducted on May 23, 2024 to identify, and delineate if present, the extent and location of jurisdictional wetlands and "Waters of the U.S." within the Project Area pursuant to the Federal Clean Water Act (Sections 401 and 404), and in Massachusetts, activities regulated under the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40) regulations. In conjunction with the U.S. Army Corps of Engineers (USACE), this program is administered by the Massachusetts Department of Environmental Protection (MassDEP). Jurisdictional wetlands were defined using the 1987 *U.S. Army Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory 1987) and subsequent guidance documents including the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (Version 2.0)* (US Corps of Engineers, January 2012). Waters of the U.S., which include all streams, adjacent wetlands, and other waterbodies, are defined in 33 CFR 328.3(a). Peabody has promulgated a local Wetlands & Rivers Protection Ordinance (The Ordinance) and Wetlands and Rivers Protection Regulations (Chapter 32) that exceed jurisdictional areas and performance standards of the WPA and 310 CMR 10.00.

The above-referenced proposed wetland replication area site is located at 265 Lowell St (A), Peabody, MA with site access off Gilmore Terrace. Investigations were conducted in order to determine a suitable place for the construction of a wetland replication area in accordance with 310 CMR 10.55 (4)(b) provisions. This proposed work will be conducted on and adjacent to a Bordering Vegetated Wetland (BVW) associated with Proctor Brook, making portions of the project subject to the Wetlands Protection Act (WPA).

Area of Interest (AOI)

Investigations were conducted at the parcel located at 265 Lowell St (A), Peabody, MA. The area of the AOI contains medium density residential single-family homes and wooded areas and abutted by non-forested wetland area associated with Proctor Brook to the north.

The land along the southern bank of Proctor Brook was investigated for wetland resource areas. Dominant non-native vegetation present in the AOI includes Norway maple (*Acer platanoides*), black locust (*Robinia pseudoacacia*), common buckthorn (*Rhamnus cathartica*), Oriental bittersweet (*Celastrus orbiculatus*), and garlic mustard (*Alliaria petiolata*). Associated native vegetation includes box elder (Acer negundo), black cherry (*Prunus serotina*), sugar maple (*Acer saccharum*), common elderberry (*Sambucus canadensis*), silky dogwood (*Cornus amomum*), smooth sumac (*Rhus glabra*), Virginia creeper (*Parthenocissus quinquefolia*), skunk cabbage (*Symplocarpus foetidus*), jewelweed (*Impatiens capensis*), and sensitive fern (*Onoclea sensibilis*). Soil samples revealed that the extant topsoil is likely fill. There is trash scattered throughout the AOI.

Wetland Resource Areas

A Bordering Vegetated Wetland (BVW) exists in the northern half of 265 Lowell St (A) parcel, south of Proctor Brook. The BVW is hydrologically connected with Proctor Brook, and is the sole wetland resource area present on the project site. The BVW was delineated using alpha-numerical flags. Each delineated section of the BVW retains a one-hundred foot (100') buffer zone per 310 CMR 10.00.

The following Wetland Resource Areas are present on site:

- Bordering Vegetated Wetland ("BVW"), as delineated in the field with 'RA' - series flags. These flags represent the edge of the BVW where it changes from vegetated wetland to upland. Per 310 CMR 10.00 , these receive 100' Buffer Zones.

- Bordering Land Subject to Flooding ("BLSF") associated with Proctor Brook. This is the 100-year floodplain as delineated by FEMA (see attached FEMA FIRMETTE). This follows Proctor Brook and includes contiguous portions of the delineated BVW. However, BLSF is not present in the AOI.200' Riverfront Area ("RFA") associated with Proctor Brook. The RFA extends perpendicularly from the Bank of the brook without regard for topography. The entire proposed replication area is located within a Riverfront Area.

Table 1. Delineated Wetland Resource Areas

Flag Series	Wetland Type	Approx. Location
RA1 – RA12 (pink flags)	Bordering Vegetated Wetland w/ 100' Buffer Zone per 310 CMR 10.00 and the Ordinance.	200' from the end of Gilmore Terrace. Bisecting the 265 Lowell St (A) parcel from the parcel boundary with 4 Karelitz Road to the parcel boundary with 10 Castle Circle.

Other Resources

A desktop analysis of the Project Area was conducted prior to performing field surveys and included the entire defined area of investigation. A search of other critical resources within the project area was conducted using GIS software and data available through various governmental agencies (FEMA, DEP, and others). The results of our search are listed in the table below.

Table 2. Selected MASSGIS Environmental Data Layers

Mapped Resource On or Within Proximity to Site	Yes	No
Area of Critical Environmental Concern		✓
NHESP Certified Vernal Pool		✓
NHESP Potential Vernal Pool		✓
NHESP Estimated Habitat of Rare Wildlife		✓
NHESP Priority Habitat of Rare species		✓
Outstanding Resource Waters		✓
FEMA Flood Zones (BLSF)		✓[1]
Surface Water Protection Area		✓
Interim Wellhead Protection Area		✓
Zone I Wellhead Protection Area		✓
Zone II Wellhead Protection Area		✓
Mass DFW Designated Coldwater Fisheries		✓

✓[1] BLSF follows Proctor Brook and includes contiguous portions of the delineated BVW. However, BLSF is not present in the AOI, which is limited to the outlined limit of work associated with the replication area.

Regulatory Jurisdiction

The wetland resource areas described above are regulated by the Massachusetts Wetlands Protection Act (WPA) and 310 CMR 10.00 which is administered by the City of Peabody Conservation Commission or (upon appeal) by Massachusetts Department of Environmental Protection (MassDEP).

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 6/5/2024 at 9:22 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Definitions of Vegetation Strata

Tree - Woody plants 3in. (7.62 cm) or more in diameter at breast height (DBH), regardless of height

Shrub / Sapling - Woody plants less than 3 in. (7.62 cm) DBH and greater than or equal to 3.3 fs (1 m) tall

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.3 ft. (1 m) tall

Woody vines - All woody vines greater than 3.3 ft. (1 m) in height

Cover Ranges

Range	Midpoint
1-5 %	3.0%
6-15 %	10.5%
15-25 %	20.5%
26-50%	38.0%
51-75 %	63.0%
76-95 %	85.5%
96-100 %	98.0%

Bordering Vegetated Wetland Determination Form

Project Site: 265 Lowell St (A) City/Town: Peabody Sampling Date: 5/23/2024

Applicant/Owner: City of Peabody Sampling Point or Zone: WETLAND RA-5

Invesigators: Brandon Faneuf Lat/Long: 42°32'01.25"N, 70°56'46.

Soil Map Unit Name 626B- Merrimac-Urban land complex NWI/DEP Classification: SM

Are climatic/hydrologic conditions on the site typical for this time of year? YES (If no, explain in Remarks)

Are vegetation [ ] Soil [X] or Hydrology [ ] significantly disturbed? (If yes, explain in Remarks)

Are vegetation [ ] Soil [ ] or Hydrology [ ] naturally problematic? (If yes, explain in Remarks)

SUMMARY OF FINDINGS - Attach site map and photograph log showing sampling locations, transects, etc.

Wetland vegetation criterion met? **YES** ***Is the Sampled Area within a wetland?*** **YES**

Hydric Soils criterion met? **NO**

Wetlands hydrology present? **YES**

Remarks, Photo Details, Flagging, etc.:
Site is on historic fill.

HYDROLOGY

Field Observation:

Surface Water Present? NO Depth (inches):

Water Table Present? YES Depth (inches): 10"

Saturation Present (including capillary fringe)? YES Depth (inches): 10"

Wetland Hydrology Indicators **(Enter x for all that apply)**

Reliable Indicators of Wetlands Hydrology	Indicators that can be Reliable with Proper Interpretation	Indicators of the Influence of Water
[ ] Water-stained Leaves	[ ] Hydrological records	[ ] Direct observation of inundation
[ ] Evidence of aquatic fauna	[X] Free water in a soil test hole	[ ] Drainage patterns
[ ] Iron deposits	[ ] Saturated soil	[ ] Drift lines
[ ] Algal mats or crusts	[ ] Water marks	[ ] Scoured areas
[ ] Oxidized rhizospheres/pore linings	[ ] Moss trim lines	[ ] Sediment deposits
[ ] Thin muck surfaces	[ ] Presence of reduced iron	[ ] Surface soil cracks
[ ] Plants with air-filled tissue(aerenchyma)	[ ] Woody plants w/ adventitious roots	[ ] Sparsely vegetated concave surface
[ ] Plants with polymorphic leaves	[ ] Trees with shallow root systems	[ ] Microtopographic relief
[ ] Plants with floating leaves	[ ] Woody plants with enlarged lenticels	[ ] Geographic position (depression, toe of slope, fringing lowland)
[ ] Hydrogen sulfide odor		

Remarks (describe recorded data from stream gauge, monitoring well, aerial photos, previous inspections, if available):

WETLAND REPLICATION PLAN
NOI REVISIONS, 6/5/2024

NOTES:

1. IMPACTS TO EXISTING TREES AND SOILS SHALL BE MINIMIZED TO THE EXTENT POSSIBLE.
2. CONTACT THE REPRESENTATIVE FROM MASSDOT LANDSCAPE DESIGN SECTION PRIOR TO THE START OF CONSTRUCTION. THE REPRESENTATIVE FOR THIS PROJECT IS MAXWELL R. MCNULTY MAXWELL.R.MCNULTY@DOT.STATE.MA.US.
3. FINAL GRADES TO BE TO MATCH ADJACENT WETLAND. MINOR ADJUSTMENTS IN FINAL GRADES SHALL BE MADE IN THE FIELD BY THE WETLAND SPECIALIST.
4. REPLICATION AREA SHALL BE EXCAVATED BELOW PROPOSED GRADES TO ALLOW FOR THE PLACEMENT OF WETLAND SOILS. THE DEPTH OF WETLAND SOILS SHALL BE 18" MAXIMUM AND SHALL MATCH THE DEPTH OF WETLAND SOIL IN THE ADJACENT WETLAND. DEPTH OF WETLAND SOIL SHALL BE DETERMINED BY THE WETLAND SPECIALIST. THE SALVAGED TOPSOIL MATERIAL AND B-HORIZON SUBSOIL MATERIAL EXCAVATED FROM THE WETLAND IMPACT AREAS SHALL BE PLACED IN SEPARATE STOCKPILES TO BE REUSED IN THE PROPOSED REPLICATION AREA IF SUITABLE.
5. REPLICATION AREA GRADES SHALL MATCH THE ELEVATIONS OF THE ABUTTING WETLAND TO MAINTAIN A HYDROLOGIC CONNECTION. WETLAND SPECIALIST SHALL INSPECT THE SUB-GRADE OF THE REPLICATION AREA TO ENSURE THAT THE PROPER HYDROLOGY HAS BEEN ESTABLISHED. MINOR MODIFICATIONS TO THIS GRADING PLAN MAY BE MADE IN THE FIELD BY THE QUALIFIED WETLAND SPECIALIST IN RESPONSE TO SUBSURFACE HYDROLOGIC CONDITIONS.
6. TREES AND SHRUBS IN THE REPLICATION AREA AND ADJACENT UPLAND AREA SHALL BE FIELD LOCATED BY THE WETLAND SPECIALIST.

PLANTING & SEEDING NOTES:

1. SEED SHALL BE MANUALLY BROADCAST. LIMITS SHOWN ARE APPROXIMATE. ACTUAL LIMITS SHALL BE AS DIRECTED BY THE WETLAND SPECIALIST.

B. Findings

1.Findings pursuant to the Massachusetts Wetlands Protection Act
Following the review of the the above-referenced Notice of Intent and based on the information provided in this application and presented at the public hearing, this Commission finds that the areas in which work is proposed is significant to the following interests of the Wetlands Protection Act.

Check all that apply:

a. ☑ Public Water Supply	b. ☐ Land Containing Shellfish	c. ☑ Prevention of Pollution
d. ☑ Private Water Supply	e. ☐ Fisheries	f. ☑ Protection of Wildlife Habitat
g. ☑ Ground Water Supply	h. ☑ Storm Damage Prevention	i. ☑ Flood Control

2. Commission hereby finds the project, as proposed, is:

Approved subject to:

a. ☑ The following conditions which are necessary in accordance with the performance standards set forth in the wetlands regulations. This Commission orders that all work shall be performed in accordance with the Notice of Intent referenced above, the following General Conditions, and any other special conditions attached to this Order. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, these conditions shall control.

Denied because:

b. ☐ The proposed work cannot be conditioned to meet the performance standards set forth in the wetland regulations. Therefore, work on this project may not go forward unless and until a new Notice of Intent is submitted which provides measures which are adequate to protect interests of the Act, and a final Order of Conditions is issued. **A description of the performance standards which the proposed work cannot meet is attached to this Order.**

c. ☐ The information submitted by the applicant is not sufficient to describe the site, the work or the effect of the work on the interests identified in the Wetlands Protection Act. Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides sufficient information and includes measures which are adequate to protect the interests of the Act , and a final Order of Conditions is issued. **A description of the specific information which is lacking and why it is necessary is attached to this Order as per 310 CMR 10.05(6)(c).**

3. ☐ Buffer Zone Impacts:Shortest distance between limit of project disturbance and the wetland resource area specified in 310CMR10.02(1)(a). _____ a. linear feet

Inland Resource Area Impacts:(For Approvals Only):

Resource Area	Proposed Alteration	Permitted Alteration	Proposed Replacement	Permitted Replacement

C. General Conditions Under Massachusetts Wetlands Protection Act

The following conditions are only applicable to Approved projects

1. Failure to comply with all conditions stated herein, and with all related statutes and other regulatory measures, shall be deemed cause to revoke or modify this Order.
2. The Order does not grant any property rights or any exclusive privileges; it does not authorize any injury to private property or invasion of private rights.
3. This Order does not relieve the permittee or any other person of the necessity of complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.
4. The work authorized hereunder shall be completed within three years from the date of this Order unless either of the following apply:
   a. the work is a maintenance dredging project as provided for in the Act; or
   b. the time for completion has been extended to a specified date more than three years, but less than five years, from the date of issuance. If this Order is intended to be valid for more than three years, the extension date and the special circumstances warranting the extended time period are set forth as a special condition in this Order.
5. This Order may be extended by the issuing authority for one or more periods of up to three years each upon application to the issuing authority at least 30 days prior to the expiration date of the Order.
6. If this Order constitutes an Amended Order of Conditions, this Amended Order of Conditions does not exceed the issuance date of the original Final Order of Conditions.
7. Any fill used in connection with this project shall be clean fill. Any fill shall contain no trash, refuse, rubbish, or debris, including but not limited to lumber, bricks, plaster, wire, lath, paper, cardboard, pipe, tires, ashes, refrigerators, motor vehicles, or parts of any of the foregoing.

8. This Order is not final until all administrative appeal periods from this Order have elapsed, or if such an appeal has been taken, until all proceedings before the Department have been completed.
9. No work shall be undertaken until the Order has become final and then has been recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land upon which the proposed work is to be done. In the case of the registered land, the Final Order shall also be noted on the Land Court Certificate of Title of the owner of the land upon which the proposed work is done. The recording information shall be submitted to the Conservation Commission on the form at the end of this Order, which form must be stamped by the Registry of Deeds, prior to the commencement of work..
10. A sign shall be displayed at the site not less then two square feet or more than three square feet in size bearing the words,

" Massachusetts Department of Environmental Protection"
[or 'MassDEP"]
File Number :"055-0939"

11. Where the Department of Environmental Protection is requested to issue a Superseding Order, the Conservation Commission shall be a party to all agency proceedings and hearings before Mass DEP.
12. Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8A) to the Conservation Commission.
13. The work shall conform to the plans and special conditions referenced in this order.
14. Any change to the plans identified in Condition #13 above shall require the applicant to inquire of the Conservation Commission in writing whether the change is significant enough to require the filing of a new Notice of Intent.
15. The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.
16. This Order of Conditions shall apply to any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.
17. Prior to the start of work, and if the project involves work adjacent to a Bordering Vegetated Wetland, the boundary of the wetland in the vicinity of the proposed work area shall be marked by wooden stakes or flagging. Once in place, the wetland boundary markers shall be maintained until a Certificate of Compliance has been issued by the Conservation Commission.
18. All sedimentation barriers shall be maintained in good repair until all disturbed areas have been fully stabilized with vegetation or other means. At no time shall sediments be deposited in a wetland or water body. During construction, the applicant or his/her designee shall inspect the erosion controls on a daily basis and shall remove accumulated sediments as needed. The applicant shall immediately control any erosion problems that occur at the site and shall also immediately notify the Conservation Commission, which reserves the right to require additional erosion and/or damage prevention controls it may deem necessary. Sedimentation barriers shall serve as the limit of work unless another limit of work line has been approved by this Order.

NOTICE OF STORMWATER CONTROL AND MAINTENANCE REQUIREMENTS

19. The work associated with this Order(the "Project") is (1) ☑ is not (2)☐ subject to the Massachusetts Stormwater Standards. If the work is subject to Stormwater Standards, then the project is subject to the following conditions;

a) All work, including site preparation, land disturbance, construction and redevelopment, shall be implemented in accordance with the construction period pollution prevention and erosion and sedimentation control plan and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollutant Discharge

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands
WPA Form 5 - Order of Conditions
Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File #:055-0939
eDEP Transaction #:1747021
City/Town:PEABODY

Elimination System Construction General Permit as required by Stormwater Standard 8. Construction period erosion, sedimentation and pollution control measures and best management practices (BMPs) shall remain in place until the site is fully stabilized.

b) No stormwater runoff may be discharged to the post-construction stormwater BMPs unless and until a Registered Professional Engineer provides a Certification that: *i.* all construction period BMPs have been removed or will be removed by a date certain specified in the Certification. For any construction period BMPs intended to be converted to post construction operation for stormwater attenuation, recharge, and/or treatment, the conversion is allowed by the MassDEP Stormwater Handbook BMP specifications and that the BMP has been properly cleaned or prepared for post construction operation, including removal of all construction period sediment trapped in inlet and outlet control structures; *ii.*. as-built final construction BMP plans are included, signed and stamped by a Registered Professional Engineer, certifying the site is fully stabilized; *iii.* any illicit discharges to the stormwater management system have been removed, as per the requirements of Stormwater Standard 10; *iv.* all post-construction stormwater BMPs are installed in accordance with the plans (including all planting plans) approved by the issuing authority, and have been inspected to ensure that they are not damaged and that they are in proper working condition; *v.* any vegetation associated with post-construction BMPs is suitably established to withstand erosion.

c) The landowner is responsible for BMP maintenance until the issuing authority is notified that another party has legally assumed responsibility for BMP maintenance. Prior to requesting a Certificate of Compliance, or Partial Certificate of Compliance, the responsible party (defined in General Condition 19(e)) shall execute and submit to the issuing authority an Operation and Maintenance Compliance Statement ("O&M Statement") for the Stormwater BMPs identifying the party responsible for implementing the stormwater BMP Operation and Maintenance Plan ("O&M Plan") and certifying the following: i.) the O&M Plan is complete and will be implemented upon receipt of the Certificate of Compliance, and ii.) the future responsible parties shall be notified in writing of their ongoing legal responsibility to operate and maintain the stormwater management BMPs and implement the Stormwater Pollution Prevention Plan.

d) Post-construction pollution prevention and source control shall be implemented in accordance with the long-term pollution prevention plan section of the approved Stormwater Report and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollutant Discharge Elimination System Multi-Sector General Permit.

e) Unless and until another party accepts responsibility, the landowner, or owner of any drainage easement, assumes responsibility for maintaining each BMP. To overcome this presumption, the landowner of the property must submit to the issuing authority a legally binding agreement of record, acceptable to the issuing authority, evidencing that another entity has accepted responsibility for maintaining the BMP, and that the proposed responsible party shall be treated as a permittee for purposes of implementing the requirements of Conditions 19(f) through 19(k) with respect to that BMP. Any failure of the proposed responsible party to implement the requirements of Conditions 19(f) through 19(k) with respect to that BMP shall be a violation of the Order of Conditions or Certificate of Compliance. In the case of stormwater BMPs that are serving more than one lot, the legally binding agreement shall also identify the lots that will be serviced by the stormwater BMPs. A plan and easement deed that grants the responsible party access to perform the required operation and maintenance must be submitted along with the legally binding agreement.

f) The responsible party shall operate and maintain all stormwater BMPs in accordance with the design plans, the O&M Plan, and the requirements of the Massachusetts Stormwater Handbook.

g) The responsible party shall:

1. Maintain an operation and maintenance log for the last three (3) consecutive calendar years of inspections, repairs, maintenance and/or replacement of the stormwater management system or any part thereof, and disposal (for disposal the log shall indicate the type of material and the disposal location);

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File #:055-0939
eDEP Transaction #:1747021
City/Town:PEABODY

2. Make the maintenance log available to MassDEP and the Conservation Commission ("Commission") upon request; and
3. Allow members and agents of the MassDEP and the Commission to enter and inspect the site to evaluate and ensure that the responsible party is in compliance with the requirements for each BMP established in the O&M Plan approved by the issuing authority.

h) All sediment or other contaminants removed from stormwater BMPs shall be disposed of in accordance with all applicable federal, state, and local laws and regulations.

i) Illicit discharges to the stormwater management system as defined in 310 CMR 10.04 are prohibited.

j) The stormwater management system approved in the Order of Conditions shall not be changed without the prior written approval of the issuing authority.

k) Areas designated as qualifying pervious areas for the purpose of the Low Impact Site Design Credit (as defined in the MassDEP Stormwater Handbook, Volume 3, Chapter 1, Low Impact Development Site Design Credits) shall not be altered without the prior written approval of the issuing authority.

l) Access for maintenance, repair, and/or replacement of BMPs shall not be withheld. Any fencing constructed around stormwater BMPs shall include access gates and shall be at least six inches above grade to allow for wildlife passage.

D. Findings Under Municipal Wetlands Bylaw or Ordinance

1. Is a municipal wetlands bylaw or ordinance applicable? ☑ Yes ☐ No

2. The Conservation Commission hereby(check one that applies):

a. ☐ DENIES the proposed work which cannot be conditioned to meet the standards set forth in a municipal ordinance or bylaw specifically:

1. Municipal Ordinance or Bylaw _____ 2. Citation _____

Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides measures which are adequate to meet these standards, and a final Order or Conditions is issued. Which are necessary to comply with a municipal ordinance or bylaw:

b. ☑ APPROVES the proposed work, subject to the following additional conditions.

1. Municipal Ordinance or Bylaw CHAPTER 32 2. Citation _____

3. The Commission orders that all work shall be performed in accordance with the following conditions and with the Notice of Intent referenced above. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, the conditions shall control.

The special conditions relating to municipal ordinance or bylaw are as follows:
SEE LOCAL CONDITIONS ON PAGES 9-12 ATTACHED HERETO AND MADE A PART HEREOF.

PEABODY CONSERVATION COMMISSION
CONDITIONS – DEP FILE # 55-939
PROJECT TITLE: INDEPENDENCE GREENWAY EXTENSION
(NEAR PROCTOR BROOK-ESSEX CENTER DR/NORTH SHORE RD/ENDICOTT ST/ FORMER RR
APPLICANT: BRENDAN CALLAHAN ON BEHALF OF THE CITY OF PEABODY
OWNERS: CITY OF PEABODY-24 LOWELL ST, PEABODY MA

ORDER OF CONDITIONS (OC)

GENERAL CONDITIONS (DEP): 1-20– SEE ATTACHED

21. This Order of Conditions also constitutes a special Order of Conditions pursuant to the Wetlands and Rivers Protection Regulations, Chapter 32 of the Code of the City of Peabody. Appeal to the Massachusetts Department of Environmental Protection (DEP), pursuant to the State Wetlands Protection Act (G.L. Chapter 131, Section 40) shall not operate to terminate or affect any of the provisions of said special Order of Conditions pursuant to the Wetlands and Rivers Protection Regulations, Chapter 32 of the Code of the City of Peabody.
22. A copy of this Order shall be present on the site at all times until the completion of all work and receipt of a Final Certification of Compliance by the Commission.
23. A copy of this Order of Conditions shall be included in all construction contracting and subcontracting documents dealing with the work proposed and shall supercede other contract requirements.
24. When the applicant applies to the Building Inspectors office for a building and/or foundation permit (or for any construction permit), within the buffer zone, the applicant must submit a copy of this Order of Conditions and accompanying plans to said Building Inspector. **Said Order of Conditions must be recorded at the Registry of Deeds and evidence of recording must be submitted to the Building Inspector and the Conservation Commission.**
25. **Prior to requesting an Occupancy Permit from the Building Inspector, the applicant shall obtain a Partial or Final Certificate of Compliance from this Order.**
26. Upon completion of the work described in a Final Order of Conditions, the applicant shall request in writing the issuance of a Certificate of Compliance stating that the work has been satisfactorily completed. In order to receive a Partial or Final Certificate of Compliance upon completion of the project, the applicant must send to the Commission two (2) hardcopies and an electronic copy of WPA Form 8A – Request for Certificate of Compliance (COC). If the project has been completed in accordance with plans stamped by a registered professional engineer, architect, landscape architect, or land surveyor, two (2) hardcopies and an electronic copy of a written statement by such a professional person certifying substantial compliance with the plans and setting forth what deviation, if any, exists from the plans approved in the order shall accompany the Request for Certificate of Compliance. In all other cases, the applicant shall provide the Commission with a signed letter stating that the work has been completed in accordance with the approved Order of Conditions. The Commission shall verify the substantial completion of the work by a site inspection, prior to issuance of a Certificate of Compliance. The applicant shall include two (2) copies of a locus map of the area and recorded Order of Conditions, including the appropriate Book and Page reference. ***AS BUILT PLANS are REQUIRED for commercial projects.**
27. **Prior to construction commencement, the applicant shall:**
    A. Provide a copy of the recorded Order of Conditions to the Commission.
    B. Notify the Conservation Commission in writing 48 hours prior to construction start-up that erosion controls are in place and ready for inspection. (The erosion controls shall be placed

prior to any construction on-site. Said erosion controls shall be maintained and replaced as needed until a Certificate of Compliance is issued.)

28 Erosion control measures and barriers shall be kept in good repair, monitored daily and maintained or reinforced as necessary to ensure and prevent erosion and siltation of wetland resource areas until a Final Certificate of Compliance is issued.

29 During construction, the Commission may require additional erosion and sediment controls to be installed in areas not currently noted on the plan to contain soil on-site and to prevent erosion and siltation of wetland resource areas.

30 All debris, fill and excavated material shall be stockpiled as far away from resource areas and buffer zones as reasonably possible and surrounded by staked strawbales/compost logs to prevent sediment from surface runoff entering the wetlands. At no time shall any debris or other material be buried or disposed of within that line marked on plan as a Resource Area or No Disturb Zone.

31 After proper grading, all disturbed areas located within a buffer zone, except those areas designated as compensatory wetlands, shall be loamed and seeded with not less than four (4) inches of good quality loam. The applicant shall:

A. Install all required erosion and sedimentation control (ESC) measures\devices;
B. Notify Commission that all ESC measures are in place and receive approval of said ESC measures from Commission Agent, said notification shall be in writing and occur at least 48 hours prior to anticipated commencement of project construction;
C. Clearly mark on the field the delineation of vegetated wetlands on the site by stakes placed at 25 feet intervals.

32 The applicant shall affix the Order of Conditions to the DEP sign in a plastic envelope for review of same as needed. For Commercial projects the Order shall be available in the construction site trailer.

33 Any siltation caused onto any wetland, waterway, or No Disturb Zone shall be reported promptly to the Commission and such areas shall be restored to the satisfaction of the Commission.

34 Temporary seeding, mulching or other suitable stabilization measures shall be used to protect exposed areas during prolonged construction or other disturbance.

35 All final earth grading shall be permanently stabilized by the application of loam and seed or sod.

36 After installation of new catch basins on site, the basins shall be enveloped with silt barriers until all tributary areas have been stabilized with permanent cover.

37 Absorption batten pillows shall be used in all traps and catch basins.

38 Fertilizers used for landscaping and lawn care shall be of low-nitrogen content/zero phosphorus and used in moderation. Pesticides and herbicides shall not be used for landscaping and lawn care within Buffer Zones, Resource Areas, or No Disturb Zones.

39 Temporary seeding, mulching, or other suitable stabilization measures shall be used to protect exposed areas during prolonged construction or other disturbances.

40 All re-vegetation of Resource Areas shall be performed according to approved and attached plans cited in this order. The proposed replacement area shall meet or exceed the General Performance Standards outlined in the Wetlands Protection Act (WPA) Regulations, 310 CMR, Section 10.55 (4) (b)-7. Should the replacement area fail to meet any of these standards the Commission reserves the right to require measures necessary to achieve compliance.

41 No work shall proceed until the applicant has received all other permits required by law, including, but not limited to any permit required by the Planning Board, Zoning Board of Appeals, Board of Health, Department of Environmental Protection or the Army Corp of Engineers.

42 Wetland flagging shall remain in place until the project has been completed and the Certificate of Compliance has been issued.

43 Signs shall be posted at the limit of work, to read as follows: **"Absolutely no work beyond this point."** Such signs shall be placed in an amount satisfactory to the Commission or its agent, with at a minimum, one such sign every **TWENTY feet along the limit of work**. Said signs shall be of such quality to last the duration of the project until a Certificate of Compliance is issued.

44 After completion of the work, the applicant shall permanently mark the edge of the wetland to ensure no further encroachment into the wetland and further the applicant shall instruct all agents to explain these markers to buyers, landscapers, tenants and all persons taking over the property from the applicant.

45 Any debris of "dumped" material placed in the resource areas shall be removed by the applicant.

46 There shall be no increase in the volume or rate of runoff, and no siltation of downstream areas as a result of the work herein permitted.

47 The Commission reserves the right to impose additional conditions on portions of this project or this site, to mitigate any actual or potential impacts resulting from the work herein permitted.

48 No earthen embankment in the Buffer Zone shall have a slope steeper than 2:1.

49 In the event a swimming pool is placed on this lot, the following condition shall apply: The content of water in swimming pools can be detrimental to wetlands plant and animal species. To remove harmful chemicals, it is the applicant's responsibility to leave the pool water standing without the addition of chlorine for a minimum of seven (7) days before draining (per the City's Stormwater System Ordinance). In this way chlorine concentration will be significantly reduced due to volatilization. All pool water, wherever possible, shall be drained through a dry well, rather than allowed to spread over the surface of the land. The City of Peabody Conservation Commission Office shall be notified prior to draining and shall approve the method of draining.

50 Work and maintenance shall be done in accordance with the following plans and reports:

►Massachusetts Department of Transportation Highway Division-Plan and Profile of Independence Greenway Extension Bridge P-03-020 (CAK) in the city of Peabody Essex County prepared by Green International Affiliates, Inc. stamped by Danielle Spicer with some sheets final revision date of June 11, 2024. (see full set of plans for each sheet date). Scale is as shown per sheet.

►Inland Wetland Replication Area narrative- MASSDOT Item 755.35

►Supplemental Plans labeled: Resource Area Impacts- Figure 6A, 6D and 6E (scale: 1"=40') revised date 6.11.24

►O&M Plan dated 2.5.23 as submitted with NOI.

51 A Pre-construction meeting must take place before work can commence. The meeting shall include The Conservation Agent, City Planning staff, the chosen contractor General Manager, commission members and other city staff as needed. A construction sequence and phasing schedule must be presented at this meeting.

52 Reports should be emailed to Conservation staff either on a monthly/quarterly or milestone basis. A monthly report is not necessary if no work has commenced. The commission needs to be kept up to date with each phase/milestone of said work. At minimum quarterly reports are due on the FIRST week of: **January/April/ June/September** once the project starts.

<u>SPECIAL CHECKLISTS:</u>

Checklist D –Proctor Brook - Channel/Culvert

1. Unless submitted with the Notice of Intent, a report, prepared by a Massachusetts Registered Professional Structural Engineer, shall be submitted to the Commission, for review and approval prior to construction. The report shall include but not be limited to the following:

- Any recommended work to repair and/or maintain the structural integrity of the channel/culvert;
- Structural Building Requirements over the culvert (foundation design, grade beams, etc.);
- Structural requirements where buildings, roadways, drives, or parking lots cross the culvert;
- Recommendations for debris removal within the channel/culvert on site;
- Results of Geotechnical Exploration.

Checklist J – Dewatering

1. Any dewatering activities on the project site in which water will be released to Resource Areas shall make use of a settling pond or similar device to remove sediment before water is released.

Checklist K – Projects Which Alter Bordering Land Subject to Flooding (BLSF)

1. The compensatory flood storage area shall be constructed prior to any filling of land subject to flooding.

Checklist L – Projects Which Alter Bordering Vegetated Wetlands (BVWs)

1. The compensatory Bordering Vegetated Wetland shall be constructed prior to any filling of Bordering Vegetated Wetland.

2. All revegetation of Resource Areas shall be performed according to the replication plan on file and dated **NOT DATED - labeled MASSDOT Item 755.35 Inland Wetland Replication Area.** The proposed replacement area shall meet or exceed the General Performance Standards outlined in Section 10.55(4)(b)-7 of 310CMR. Should the replacement area fail to meet any of these standards the Commission reserves the right to require measures necessary to achieve compliance.

3. A wetland specialist shall be on site during construction of the wetland replication area and shall supervise its construction. Two reports prepared by the Wetland Specialist shall be submitted annually to the Commission by May 1st and September 1st of each year for two years. Each report shall include an observed species list, relative abundance of each species, percent cover of wetland and upland species, the visibility of the plantings and proposed remedial measures to ensure that at least 75% of the surface of the replication area be re-established with indigenous wetland plant species within two growing seasons. Said report shall include enough photographs for proper coverage of issues/points being addressed. If monitoring data indicates that this objective cannot be met, a corrective plan of action shall be submitted to the Commission for approval and implemented under the supervision of the wetland specialist. No certificate of compliance will be granted by the Commission until such time as the replacement area has been found to meet these standards.

This Order of Conditions shall apply to any successors in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by the Order.

*As Built Plans are required when requesting a Certificate of Compliance.

F. Appeals

The applicant, the owner, any person aggrieved by this Order, any owner of land abutting the land subject to this Order, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate MassDEP Regional Office to issue a Superseding Order of Conditions. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and a completed Request for Departmental Action Fee Transmittal Form, as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Order. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant, if he/she is not the appellant.

Any appellants seeking to appeal the Department's Superseding Order associated with this appeal will be required to demonstrate prior participation in the review of this project. Previous participation in the permit proceeding means the submission of written information to the Conservation Commission prior to the close of the public hearing, requesting a Superseding Order, or providing written information to the Department prior to issuance of a Superseding Order.

The request shall state clearly and concisely the objections to the Order which is being appealed and how the Order does not contribute to the protection of the interests identified in the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), and is inconsistent with the wetlands regulations (310 CMR 10.00). To the extent that the Order is based on a municipal ordinance or bylaw, and not on the Massachusetts Wetlands Protection Act or regulations, the Department has no appellate jurisdiction.

From:	Danielle Spicer, P.E., Green International Affiliates, Inc.
Date:	July 26, 2024
Project Name:	Independence Greenway Extension, Peabody, MA
Project Number:	Green No. 17118
Subject:	Amendment Request for OOC (DEP File No. 055-0939)

This memorandum is a request for an Amendment of the Orders of Conditions dated 7/3/2024 (DEP File No. 055-0939), for the Independence Greenway Extension transportation improvement project in the City of Peabody, MA. This memorandum provides a list of minor design modifications resulting from the additional compensatory flood storage area provided along the bikeway, which was added to this project after Order of Conditions was granted on 7/3/2024. We respectfully request that the Peabody Conservation Commission review the minor design modifications for the subject OOC to approve the proposed addition resulting in minor plan modifications under General Condition #14.

The OOC was appealed during the 10-day appeal period by the Department of Environmetal Protection Northeast Regional Office (DEP-NERO), stating that the OOC issued by the Peabody Conservation Commission (the Commission) does not meet performance standards in accordance with 310 CMR 10.57(4)(a) for work in Bordering Land Subject to Flooding (BLSF). As a result, additional areas have been identified and designed for additional proposed compensatory flood storage in order to compensate for the project's net fill on a foot-by-foot basis and comply with the performance standards in accordance with 310 CMR 10.57(4)(a).

An additional area located north of the proposed bikeway between STA. 344+00 to STA. 346+50 was identified to provide further compensatory flood storage between the elevations of 37 and 44 feet in order to provide compensation on a foot-by-foot basis in compliance with the performance standards in accordance with 310 CMR 10.57(4)(a). Borings in the area indicate groundwater at elevation 37; therefore, compensation was not provided within the 36–37-foot increment. Therefore, two additional smaller areas are also proposed at the end of the project, at STA. 356+50 and STA. 358+00, in order to provide flood compensation for the net fill of the project between the elevations of 36 and 37 feet. The proposed incremental net cut/fill volumes for the three additional proposed compensatory flood storage areas are shown in Tables 2-5 below.

As shown in Table 1 below, the additional proposed compensatory flood storage areas resulted in minor changes to 200-Foot Riverfront Areas. There is an overall increase in the work within both the 100-foot and 200-foot Riverfront Areas due to the extension of the limit of work to include the three additional

compensatory flood storage areas. The changes to BLSF impacts were a result of reduced limit of riprap within 100-year floodplain at Culvert No. 1 (per DEP's request).

Table 1: Project Resource Area Impacts Change

Resource Area Impacts	Original OOC (7/3/2024)	Amended OOC
BLSF (SF)	69,340	65,491
Compensatory Flood Storage (SF, CF)	1,630 SF / 3,472 CF	15,824 SF / -36,873 CF
Riverfront Area (SF)	103,288	134,143
0-100 (SF)	77,465	107,723
100-200 (SF)	25,823	26,419

Table 5: Total Net Cut/Fill Across the Project & Compensatory Flood Storage

Elevation (FT)	Incremental Net Cut/Fill Volume (CF)	Original Compensatory Flood Storage Cut Volume (CF)	Additional Total Compensatory Flood Storage Cut Vol (CF)	Total Net Cut/Fill Volume (CF)

Additionally, during the 401/404 review process, the US ACOE requested to call out the Land Under Water (LUW)/Waters of the United States (WOTUS) impacts to the intermitted streams at Sta. 340+10 and 358+50. As a result, these impact numbers have also been added to WPA impacts to reflect the slight modifications and to be consistent with the impacts being permitted through the 401 WQC/404 PCN and are shown in Table 6 below. Also included as an attachment to this memorandum are the updated Figures 6 & 7 that reflect these resource area changes.

Table 1: Project Resource Area Impacts Change

Resource Area Impacts	Original OOC (7/3/2024)	Amended OOC
LUW – Permanent (SF)	8,287	8,661
LUW – Temporary (SF)	2,180	2,312

The following selected sheets were approved as part of the original OOC:

Sheet	Title	Prepared by	Date
1	Title Sheet & Index	Green International Affiliates, Inc	06/11/2024
2	Legend & Abbreviations	Green International Affiliates, Inc	06/11/2024
3	General Notes	Green International Affiliates, Inc	06/11/2024
4	Key Plan	Green International Affiliates, Inc	06/11/2024
5-6	Boring Logs	Green International Affiliates, Inc	06/11/2024
7-8	Typical Sections & Details 1	Green International Affiliates, Inc	06/11/2024
9-16	Construction Plans & Profiles	Green International Affiliates, Inc	06/11/2024
21-24	Drainage and Utility Plans	Green International Affiliates, Inc	06/11/2024
32	Compensatory Flood Storage Plan	Green International Affiliates, Inc	06/11/2024
33-34	Wetland Replication Plan and Sections	Green International Affiliates, Inc	06/11/2024
35-40	Culvert Plans	Green International Affiliates, Inc	06/11/2024
41-46	Construction Details	Green International Affiliates, Inc	06/11/2024
47-51	Landscape Plans	Green International Affiliates, Inc	06/11/2024
60-76	Bridge Plans	Green International Affiliates, Inc	06/11/2024

The Amended OOC plans include new and revised plan sheets reflecting the additional compensatory flood storage areas and are included for the Commissions' review and approval as part of this Amended OOC Permit Request as noted below.

Sheet	Title	Prepared by	Date
13, 14, 16	Construction Plan & Profile – 5, 6, & 8	Green International Affiliates, Inc	07/26/2024
23-24	Drainage & Utility Plans – 3 & 4	Green International Affiliates, Inc	07/26/2024
32-34	Compensatory Flood Storage Plans	Green International Affiliates, Inc	07/26/2024

As this is a Municipal project, the project is subject to local wetlands bylaw and abut ers notification is required per 310 CMR 10.05(4)(b) and has been initiated for this OOC Amendment request on 7/23/2024.

A. General Information (continued)

6. General Project Description:

The project proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, MA for a total project length of approximately 1.3 miles. The proposed project is located along the former railroad right-of-way, which is owned and maintained by the City of Peabody. (see Project Narrative for more details).

7a. Project Type Checklist: (Limited Project Types see Section A. 7b.)

1. ☐ Single Family Home
2. ☐ Residential Subdivision
3. ☐ Commercial/Industrial
4. ☐ Dock/Pier
5. ☐ Utilities
6. ☐ Coastal engineering Structure
7. ☐ Agriculture (e.g., cranberries, forestry)
8. ☒ Transportation
9. ☐ Other

7b. Is any portion of the proposed activity eligible to be treated as a limited project (including Ecological Restoration Limited Project) subject to 310 CMR 10.24 (coastal) or 310 CMR 10.53 (inland)?

1. ☒ Yes ☐ No

If yes, describe which limited project applies to this project. (See 310 CMR 10.24 and 10.53 for a complete list and description of limited project types)

310 CMR 10.52 (6), 310 CMR 10.53(3)(i), and 310 CMR 10.53(3)(f)
(see Project Narrative for more details).

If the proposed activity is eligible to be treated as an Ecological Restoration Limited Project (310 CMR10.24(8), 310 CMR 10.53(4)), complete and attach Appendix A: Ecological Restoration Limited Project Checklist and Signed Certification.

8. Property recorded at the Registry of Deeds for:

Peabody	
a. County	b. Certificate # (if registered land)
N/A	N/A
c. Book	d. Page Number

B. Buffer Zone & Resource Area Impacts (temporary & permanent)

1. ☐ Buffer Zone Only – Check if the project is located only in the Buffer Zone of a Bordering Vegetated Wetland, Inland Bank, or Coastal Resource Area.
2. ☒ Inland Resource Areas (see 310 CMR 10.54-10.58; if not applicable, go to Section B.3, Coastal Resource Areas).

Check all that apply below. Attach narrative and any supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

For all projects affecting other Resource Areas, please attach a narrative explaining how the resource area was delineated.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☒ Bank	588 (P); 166 (T) — 1. linear feet	618 will be restored — 2. linear feet
b. ☒ Bordering Vegetated Wetland	2,350 (P); 4,675 (T) — 1. square feet	2,500 will be replaced — 2. square feet
c. ☒ Land Under Waterbodies and Waterways	8,661 (P); 2,312 (T) — 1. square feet 1,142 — 3. cubic yards dredged	4,271 - natural stream bottom will be restored

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
d. ☒ Bordering Land Subject to Flooding	65,491 (includes fill and cut) — 1. square feet 2,982 — 3. cubic feet of flood storage lost	15,824 (comp.flood storage) — 2. square feet 36,873 — 4. cubic feet replaced
e. ☐ Isolated Land Subject to Flooding	1. square feet 2. cubic feet of flood storage lost	3. cubic feet replaced
f. ☒ Riverfront Area	Proctor Brook (inland) — 1. Name of Waterway (if available) - **specify coastal or inland**	

2. Width of Riverfront Area (check one):

☐ 25 ft. - Designated Densely Developed Areas only

☐ 100 ft. - New agricultural projects only

☒ 200 ft. - All other projects

3. Total area of Riverfront Area on the site of the proposed project: 294,400 square feet

4. Proposed alteration of the Riverfront Area:

a. total square feet	b. square feet within 100 ft.	c. square feet between 100 ft. and 200 ft.
134,143	107,723	26,419

5. Has an alternatives analysis been done and is it attached to this NOI? ☐ Yes ☒ No

6. Was the lot where the activity is proposed created prior to August 1, 1996? ☒ Yes ☐ No

3. ☐ Coastal Resource Areas: (See 310 CMR 10.25-10.35)

Note: for coastal riverfront areas, please complete **Section B.2.f**. above.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

Check all that apply below. Attach narrative and supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

Online Users: Include your document transaction number (provided on your receipt page) with all supplementary information you submit to the Department.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☐ Designated Port Areas	Indicate size under Land Under the Ocean, below	
b. ☐ Land Under the Ocean	1. square feet 2. cubic yards dredged	
c. ☐ Barrier Beach	Indicate size under Coastal Beaches and/or Coastal Dunes below	
d. ☐ Coastal Beaches	1. square feet	2. cubic yards beach nourishment
e. ☐ Coastal Dunes	1. square feet	2. cubic yards dune nourishment

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
f. ☐ Coastal Banks	1. linear feet	
g. ☐ Rocky Intertidal Shores	1. square feet	
h. ☐ Salt Marshes	1. square feet	2. sq ft restoration, rehab., creation
i. ☐ Land Under Salt Ponds	1. square feet 2. cubic yards dredged	
j. ☐ Land Containing Shellfish	1. square feet	
k. ☐ Fish Runs	Indicate size under Coastal Banks, inland Bank, Land Under the Ocean, and/or inland Land Under Waterbodies and Waterways, above 1. cubic yards dredged	
l. ☐ Land Subject to Coastal Storm Flowage	1. square feet	

4. ☐ Restoration/Enhancement

If the project is for the purpose of restoring or enhancing a wetland resource area in addition to the square footage that has been entered in Section B.2.b or B.3.h above, please enter the additional amount here.

a. square feet of BVW

b. square feet of Salt Marsh

5. ☒ Project Involves Stream Crossings

0
a. number of new stream crossings

6
b. number of replacement stream crossings

C. Other Applicable Standards and Requirements

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section C and complete Appendix A: Ecological Restoration Limited Project Checklists – Required Actions (310 CMR 10.11).

Streamlined Massachusetts Endangered Species Act/Wetlands Protection Act Review

1. Is any portion of the proposed project located in **Estimated Habitat of Rare Wildlife** as indicated on the most recent Estimated Habitat Map of State-Listed Rare Wetland Wildlife published by the Natural Heritage and Endangered Species Program (NHESP)? To view habitat maps, see the *Massachusetts Natural Heritage Atlas* or go to http://maps.massgis.state.ma.us/PRI_EST_HAB/viewer.htm.

a. ☐ Yes ☒ No

If yes, include proof of mailing or hand delivery of NOI to:

Natural Heritage and Endangered Species Program
Division of Fisheries and Wildlife
1 Rabbit Hill Road
Westborough, MA 01581

August 1, 2021
b. Date of map

If *yes*, the project is also subject to Massachusetts Endangered Species Act (MESA) review (321 CMR 10.18). To qualify for a streamlined, 30-day, MESA/Wetlands Protection Act review, please complete Section C.1.c, and include requested materials with this Notice of Intent (NOI); *OR* complete Section C.2.f, if applicable. *If MESA supplemental information is not included with the NOI, by completing Section 1 of this form, the NHESP will require a separate MESA filing which may take up to 90 days to review (unless noted exceptions in Section 2 apply, see below).*

c. Submit Supplemental Information for Endangered Species Review*

1. ☐ Percentage/acreage of property to be altered:

(a) within wetland Resource Area _____ percentage/acreage

(b) outside Resource Area _____ percentage/acreage

2. ☐ Assessor's Map or right-of-way plan of site

2. ☐ Project plans for entire project site, including wetland resource areas and areas outside of wetlands jurisdiction, showing existing and proposed conditions, existing and proposed tree/vegetation clearing line, and clearly demarcated limits of work **

(a) ☐ Project description (including description of impacts outside of wetland resource area & buffer zone)

(b) ☐ Photographs representative of the site

* Some projects **not** in Estimated Habitat may be located in Priority Habitat, and require NHESP review (see https://www.mass.gov/ma-endangered-species-act-mesa-regulatory-review).
Priority Habitat includes habitat for state-listed plants and strictly upland species not protected by the Wetlands Protection Act.

** MESA projects may not be segmented (321 CMR 10.16). The applicant must disclose full development plans even if such plans are not required as part of the Notice of Intent process.

C. Other Applicable Standards and Requirements (cont'd)

(c) ☐ MESA filing fee (fee information available at https://www.mass.gov/how-to/how-to-file-for-a-mesa-project-review).
Make check payable to "Commonwealth of Massachusetts - NHESP" and ***mail to NHESP*** at above address

*Projects altering **10 or more acres** of land, also submit:*

(d) ☐ Vegetation cover type map of site

(e) ☐ Project plans showing Priority & Estimated Habitat boundaries

(f) OR Check One of the Following

1. ☐ Project is exempt from MESA review.
Attach applicant letter indicating which MESA exemption applies. (See 321 CMR 10.14, https://www.mass.gov/service-details/exemptions-from-review-for-projectsactivities-in-priority-habitat; the NOI must still be sent to NHESP if the project is within estimated habitat pursuant to 310 CMR 10.37 and 10.59.)

2. ☐ Separate MESA review ongoing. a. NHESP Tracking # b. Date submitted to NHESP

3. ☐ Separate MESA review completed.
Include copy of NHESP "no Take" determination or valid Conservation & Management Permit with approved plan.

3. For coastal projects only, is any portion of the proposed project located below the mean high water line or in a fish run?

a. ☒ Not applicable – project is in inland resource area only b. ☐ Yes ☐ No

If yes, include proof of mailing, hand delivery, or electronic delivery of NOI to either:

South Shore - Cohasset to Rhode Island border, and the Cape & Islands:

Division of Marine Fisheries -
Southeast Marine Fisheries Station
Attn: Environmental Reviewer
836 South Rodney French Blvd.
New Bedford, MA 02744
Email: dmf.envreview-south@mass.gov

North Shore - Hull to New Hampshire border:

Division of Marine Fisheries -
North Shore Office
Attn: Environmental Reviewer
30 Emerson Avenue
Gloucester, MA 01930
Email: dmf.envreview-north@mass.gov

Also if yes, the project may require a Chapter 91 license. For coastal towns in the Northeast Region, please contact MassDEP's Boston Office. For coastal towns in the Southeast Region, please contact MassDEP's Southeast Regional Office.

c. ☐ Is this an aquaculture project? d. ☐ Yes ☐ No

If yes, include a copy of the Division of Marine Fisheries Certification Letter (M.G.L. c. 130, § 57).

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

C. Other Applicable Standards and Requirements (cont'd)

Online Users: Include your document transaction number (provided on your receipt page) with all supplementary information you submit to the Department.

4. Is any portion of the proposed project within an Area of Critical Environmental Concern (ACEC)?

   a. ☐ Yes ☒ No If yes, provide name of ACEC (see instructions to WPA Form 3 or MassDEP Website for ACEC locations). **Note:** electronic filers click on Website.

   b. ACEC

5. Is any portion of the proposed project within an area designated as an Outstanding Resource Water (ORW) as designated in the Massachusetts Surface Water Quality Standards, 314 CMR 4.00?

   a. ☐ Yes ☒ No

6. Is any portion of the site subject to a Wetlands Restriction Order under the Inland Wetlands Restriction Act (M.G.L. c. 131, § 40A) or the Coastal Wetlands Restriction Act (M.G.L. c. 130, § 105)?

   a. ☐ Yes ☒ No

7. Is this project subject to provisions of the MassDEP Stormwater Management Standards?

   a. ☒ Yes. Attach a copy of the Stormwater Report as required by the Stormwater Management Standards per 310 CMR 10.05(6)(k)-(q) and check if:

      1. ☐ Applying for Low Impact Development (LID) site design credits (as described in Stormwater Management Handbook Vol. 2, Chapter 3)

      2. ☒ A portion of the site constitutes redevelopment

      3. ☐ Proprietary BMPs are included in the Stormwater Management System.

   b. ☐ No. Check why the project is exempt:

      1. ☐ Single-family house

      2. ☐ Emergency road repair

      3. ☐ Small Residential Subdivision (less than or equal to 4 single-family houses or less than or equal to 4 units in multi-family housing project) with no discharge to Critical Areas.

D. Additional Information

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section D and complete Appendix A: Ecological Restoration Notice of Intent – Minimum Required Documents (310 CMR 10.12).

Applicants must include the following with this Notice of Intent (NOI). See instructions for details.

Online Users: Attach the document transaction number (provided on your receipt page) for any of the following information you submit to the Department.

1. ☒ USGS or other map of the area (along with a narrative description, if necessary) containing sufficient information for the Conservation Commission and the Department to locate the site. (Electronic filers may omit this item.)

2. ☒ Plans identifying the location of proposed activities (including activities proposed to serve as a Bordering Vegetated Wetland [BVW] replication area or other mitigating measure) relative to the boundaries of each affected resource area.

F. Signatures and Submittal Requirements

I hereby certify under the penalties of perjury that the foregoing Notice of Intent and accompanying plans, documents, and supporting data are true and complete to the best of my knowledge. I understand that the Conservation Commission will place notification of this Notice in a local newspaper at the expense of the applicant in accordance with the wetlands regulations, 310 CMR 10.05(5)(a).

I further certify under penalties of perjury that all abutters were notified of this application, pursuant to the requirements of M.G.L. c. 131, § 40. Notice must be made by Certificate of Mailing or in writing by hand delivery or certified mail (return receipt requested) to all abutters within 100 feet of the property line of the project location.

Brendan Callahan	04/09/24
1. Signature of Applicant	2. Date
3. Signature of Property Owner (if different)	4. Date
	4/09/2024
5. Signature of Representative (if any) Danielle Spicer	6. Date

For Conservation Commission:
Two copies of the completed Notice of Intent (Form 3), including supporting plans and documents, two copies of the NOI Wetland Fee Transmittal Form, and the city/town fee payment, to the Conservation Commission by certified mail or hand delivery.

For MassDEP:
One copy of the completed Notice of Intent (Form 3), including supporting plans and documents, one copy of the NOI Wetland Fee Transmittal Form, and a **copy** of the state fee payment to the MassDEP Regional Office (see Instructions) by certified mail or hand delivery.

Other:
If the applicant has checked the “yes” box in any part of Section C, Item 3, above, refer to that section and the Instructions for additional submittal requirements.

The original and copies must be sent simultaneously. Failure by the applicant to send copies in a timely manner may result in dismissal of the Notice of Intent.

B. Fees

To calculate filing fees, refer to the category fee list and examples in the instructions for filling out WPA Form 3 (Notice of Intent).

Fee should be calculated using the following process & worksheet. ***Please see Instructions before filling out worksheet.***

Step 1/Type of Activity: Describe each type of activity that will occur in wetland resource area and buffer zone.

Step 2/Number of Activities: Identify the number of each type of activity.

Step 3/Individual Activity Fee: Identify each activity fee from the six project categories listed in the instructions.

Step 4/Subtotal Activity Fee: Multiply the number of activities (identified in Step 2) times the fee per category (identified in Step 3) to reach a subtotal fee amount. Note: If any of these activities are in a Riverfront Area in addition to another Resource Area or the Buffer Zone, the fee per activity should be multiplied by 1.5 and then added to the subtotal amount.

Step 5/Total Project Fee: Determine the total project fee by adding the subtotal amounts from Step 4.

Step 6/Fee Payments: To calculate the state share of the fee, divide the total fee in half and subtract $12.50. To calculate the city/town share of the fee, divide the total fee in half and add $12.50.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

B. Findings

1.Findings pursuant to the Massachusetts Wetlands Protection Act
Following the review of the the above-referenced Notice of Intent and based on the information provided in this application and presented at the public hearing, this Commission finds that the areas in which work is proposed is significant to the following interests of the Wetlands Protection Act.

Check all that apply:

a. ☑ Public Water Supply	b. ☐ Land Containing Shellfish	c. ☑ Prevention of Pollution
d. ☑ Private Water Supply	e. ☐ Fisheries	f. ☑ Protection of Wildlife Habitat
g. ☑ Ground Water Supply	h. ☑ Storm Damage Prevention	i. ☑ Flood Control

2. Commission hereby finds the project, as proposed, is:

Approved subject to:

a. ☑ The following conditions which are necessary in accordance with the performance standards set forth in the wetlands regulations. This Commission orders that all work shall be performed in accordance with the Notice of Intent referenced above, the following General Conditions, and any other special conditions attached to this Order. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, these conditions shall control.

Denied because:

b. ☐ The proposed work cannot be conditioned to meet the performance standards set forth in the wetland regulations. Therefore, work on this project may not go forward unless and until a new Notice of Intent is submitted which provides measures which are adequate to protect interests of the Act, and a final Order of Conditions is issued. **A description of the performance standards which the proposed work cannot meet is attached to this Order.**

c. ☐ The information submitted by the applicant is not sufficient to describe the site, the work or the effect of the work on the interests identified in the Wetlands Protection Act. Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides sufficient information and includes measures which are adequate to protect the interests of the Act , and a final Order of Conditions is issued. **A description of the specific information which is lacking and why it is necessary is attached to this Order as per 310 CMR 10.05(6)(c).**

3. ☐ Buffer Zone Impacts:Shortest distance between limit of project disturbance and the wetland resource area specified in 310CMR10.02(1)(a). ____ a. linear feet

Inland Resource Area Impacts:(For Approvals Only):

Resource Area	Proposed Alteration	Permitted Alteration	Proposed Replacement	Permitted Replacement
4. ☑ Bank	754 a. linear feet	754 b. linear feet	588 c. linear feet	588 d. linear feet
5. ☑ Bordering Vegetated Wetland	7025 a. square feet	7025 b. square feet	2500 c. square feet	2500 d. square feet
6. ☑ Land under Waterbodies and Waterways	10467 a. square feet	10467 b. square feet	4271 c. square feet	4271 d. square feet

C. General Conditions Under Massachusetts Wetlands Protection Act

The following conditions are only applicable to Approved projects

1. Failure to comply with all conditions stated herein, and with all related statutes and other regulatory measures, shall be deemed cause to revoke or modify this Order.
2. The Order does not grant any property rights or any exclusive privileges; it does not authorize any injury to private property or invasion of private rights.
3. This Order does not relieve the permittee or any other person of the necessity of complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.
4. The work authorized hereunder shall be completed within three years from the date of this Order unless either of the following apply:
   a. the work is a maintenance dredging project as provided for in the Act; or
   b. the time for completion has been extended to a specified date more than three years, but less than five years, from the date of issuance. If this Order is intended to be valid for more than three years, the extension date and the special circumstances warranting the extended time period are set forth as a special condition in this Order.
5. This Order may be extended by the issuing authority for one or more periods of up to three years each upon application to the issuing authority at least 30 days prior to the expiration date of the Order.
6. If this Order constitutes an Amended Order of Conditions, this Amended Order of Conditions does not exceed the issuance date of the original Final Order of Conditions.
7. Any fill used in connection with this project shall be clean fill. Any fill shall contain no trash, refuse, rubbish, or debris, including but not limited to lumber, bricks, plaster, wire, lath, paper, cardboard, pipe, tires, ashes, refrigerators, motor vehicles, or parts of any of the foregoing.

8. This Order is not final until all administrative appeal periods from this Order have elapsed, or if such an appeal has been taken, until all proceedings before the Department have been completed.
9. No work shall be undertaken until the Order has become final and then has been recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land upon which the proposed work is to be done. In the case of the registered land, the Final Order shall also be noted on the Land Court Certificate of Title of the owner of the land upon which the proposed work is done. The recording information shall be submitted to the Conservation Commission on the form at the end of this Order, which form must be stamped by the Registry of Deeds, prior to the commencement of work..
10. A sign shall be displayed at the site not less then two square feet or more than three square feet in size bearing the words,

" Massachusetts Department of Environmental Protection"
[or 'MassDEP"]
File Number :"055-0939"

11. Where the Department of Environmental Protection is requested to issue a Superseding Order, the Conservation Commission shall be a party to all agency proceedings and hearings before Mass DEP.
12. Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8A) to the Conservation Commission.
13. The work shall conform to the plans and special conditions referenced in this order.
14. Any change to the plans identified in Condition #13 above shall require the applicant to inquire of the Conservation Commission in writing whether the change is significant enough to require the filing of a new Notice of Intent.
15. The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.
16. This Order of Conditions shall apply to any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.
17. Prior to the start of work, and if the project involves work adjacent to a Bordering Vegetated Wetland, the boundary of the wetland in the vicinity of the proposed work area shall be marked by wooden stakes or flagging. Once in place, the wetland boundary markers shall be maintained until a Certificate of Compliance has been issued by the Conservation Commission.
18. All sedimentation barriers shall be maintained in good repair until all disturbed areas have been fully stabilized with vegetation or other means. At no time shall sediments be deposited in a wetland or water body. During construction, the applicant or his/her designee shall inspect the erosion controls on a daily basis and shall remove accumulated sediments as needed. The applicant shall immediately control any erosion problems that occur at the site and shall also immediately notify the Conservation Commission, which reserves the right to require additional erosion and/or damage prevention controls it may deem necessary. Sedimentation barriers shall serve as the limit of work unless another limit of work line has been approved by this Order.

NOTICE OF STORMWATER CONTROL AND MAINTENANCE REQUIREMENTS

19. The work associated with this Order(the "Project") is (1) ☑ is not (2)☐ subject to the Massachusetts Stormwater Standards. If the work is subject to Stormwater Standards, then the project is subject to the following conditions;

a) All work, including site preparation, land disturbance, construction and redevelopment, shall be implemented in accordance with the construction period pollution prevention and erosion and sedimentation control plan and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollutant Discharge

Elimination System Construction General Permit as required by Stormwater Standard 8. Construction period erosion, sedimentation and pollution control measures and best management practices (BMPs) shall remain in place until the site is fully stabilized.

b) No stormwater runoff may be discharged to the post-construction stormwater BMPs unless and until a Registered Professional Engineer provides a Certification that: *i.* all construction period BMPs have been removed or will be removed by a date certain specified in the Certification. For any construction period BMPs intended to be converted to post construction operation for stormwater attenuation, recharge, and/or treatment, the conversion is allowed by the MassDEP Stormwater Handbook BMP specifications and that the BMP has been properly cleaned or prepared for post construction operation, including removal of all construction period sediment trapped in inlet and outlet control structures; *ii.*. as-built final construction BMP plans are included, signed and stamped by a Registered Professional Engineer, certifying the site is fully stabilized; *iii.* any illicit discharges to the stormwater management system have been removed, as per the requirements of Stormwater Standard 10; *iv.* all post-construction stormwater BMPs are installed in accordance with the plans (including all planting plans) approved by the issuing authority, and have been inspected to ensure that they are not damaged and that they are in proper working condition; *v.* any vegetation associated with post-construction BMPs is suitably established to withstand erosion.

c) The landowner is responsible for BMP maintenance until the issuing authority is notified that another party has legally assumed responsibility for BMP maintenance. Prior to requesting a Certificate of Compliance, or Partial Certificate of Compliance, the responsible party (defined in General Condition 19(e)) shall execute and submit to the issuing authority an Operation and Maintenance Compliance Statement ("O&M Statement") for the Stormwater BMPs identifying the party responsible for implementing the stormwater BMP Operation and Maintenance Plan ("O&M Plan") and certifying the following: i.) the O&M Plan is complete and will be implemented upon receipt of the Certificate of Compliance, and ii.) the future responsible parties shall be notified in writing of their ongoing legal responsibility to operate and maintain the stormwater management BMPs and implement the Stormwater Pollution Prevention Plan.

d) Post-construction pollution prevention and source control shall be implemented in accordance with the long-term pollution prevention plan section of the approved Stormwater Report and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollutant Discharge Elimination System Multi-Sector General Permit.

e) Unless and until another party accepts responsibility, the landowner, or owner of any drainage easement, assumes responsibility for maintaining each BMP. To overcome this presumption, the landowner of the property must submit to the issuing authority a legally binding agreement of record, acceptable to the issuing authority, evidencing that another entity has accepted responsibility for maintaining the BMP, and that the proposed responsible party shall be treated as a permittee for purposes of implementing the requirements of Conditions 19(f) through 19(k) with respect to that BMP. Any failure of the proposed responsible party to implement the requirements of Conditions 19(f) through 19(k) with respect to that BMP shall be a violation of the Order of Conditions or Certificate of Compliance. In the case of stormwater BMPs that are serving more than one lot, the legally binding agreement shall also identify the lots that will be serviced by the stormwater BMPs. A plan and easement deed that grants the responsible party access to perform the required operation and maintenance must be submitted along with the legally binding agreement.

f) The responsible party shall operate and maintain all stormwater BMPs in accordance with the design plans, the O&M Plan, and the requirements of the Massachusetts Stormwater Handbook.

g) The responsible party shall:

1. Maintain an operation and maintenance log for the last three (3) consecutive calendar years of inspections, repairs, maintenance and/or replacement of the stormwater management system or any part thereof, and disposal (for disposal the log shall indicate the type of material and the disposal location);

2. Make the maintenance log available to MassDEP and the Conservation Commission ("Commission") upon request; and
3. Allow members and agents of the MassDEP and the Commission to enter and inspect the site to evaluate and ensure that the responsible party is in compliance with the requirements for each BMP established in the O&M Plan approved by the issuing authority.

h) All sediment or other contaminants removed from stormwater BMPs shall be disposed of in accordance with all applicable federal, state, and local laws and regulations.

i) Illicit discharges to the stormwater management system as defined in 310 CMR 10.04 are prohibited.

j) The stormwater management system approved in the Order of Conditions shall not be changed without the prior written approval of the issuing authority.

k) Areas designated as qualifying pervious areas for the purpose of the Low Impact Site Design Credit (as defined in the MassDEP Stormwater Handbook, Volume 3, Chapter 1, Low Impact Development Site Design Credits) shall not be altered without the prior written approval of the issuing authority.

l) Access for maintenance, repair, and/or replacement of BMPs shall not be withheld. Any fencing constructed around stormwater BMPs shall include access gates and shall be at least six inches above grade to allow for wildlife passage.

Special Conditions:

D. Findings Under Municipal Wetlands Bylaw or Ordinance

1. Is a municipal wetlands bylaw or ordinance applicable? ☑ Yes ☐ No

2. The Conservation Commission hereby(check one that applies):

a. ☐ DENIES the proposed work which cannot be conditioned to meet the standards set forth in a municipal ordinance or bylaw specifically:

1. Municipal Ordinance or Bylaw _____ 2. Citation _____

Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides measures which are adequate to meet these standards, and a final Order or Conditions is issued. Which are necessary to comply with a municipal ordinance or bylaw:

b. ☑ APPROVES the proposed work, subject to the following additional conditions.

1. Municipal Ordinance or Bylaw CHAPTER 32 2. Citation _____

3. The Commission orders that all work shall be performed in accordance with the following conditions and with the Notice of Intent referenced above. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, the conditions shall control.

The special conditions relating to municipal ordinance or bylaw are as follows:
SEE LOCAL CONDITIONS ON PAGES 9-12 ATTACHED HERETO AND MADE A PART HEREOF.

PEABODY CONSERVATION COMMISSION
CONDITIONS – DEP FILE # 55-939
PROJECT TITLE: INDEPENDENCE GREENWAY EXTENSION
(NEAR PROCTOR BROOK-ESSEX CENTER DR/NORTH SHORE RD/ENDICOTT ST/ FORMER RR
APPLICANT: BRENDAN CALLAHAN ON BEHALF OF THE CITY OF PEABODY
OWNERS: CITY OF PEABODY-24 LOWELL ST, PEABODY MA

ORDER OF CONDITIONS (OC)

GENERAL CONDITIONS (DEP): 1-20– SEE ATTACHED

21. This Order of Conditions also constitutes a special Order of Conditions pursuant to the Wetlands and Rivers Protection Regulations, Chapter 32 of the Code of the City of Peabody. Appeal to the Massachusetts Department of Environmental Protection (DEP), pursuant to the State Wetlands Protection Act (G.L. Chapter 131, Section 40) shall not operate to terminate or affect any of the provisions of said special Order of Conditions pursuant to the Wetlands and Rivers Protection Regulations, Chapter 32 of the Code of the City of Peabody.
22. A copy of this Order shall be present on the site at all times until the completion of all work and receipt of a Final Certification of Compliance by the Commission.
23. A copy of this Order of Conditions shall be included in all construction contracting and subcontracting documents dealing with the work proposed and shall supercede other contract requirements.
24. When the applicant applies to the Building Inspectors office for a building and/or foundation permit (or for any construction permit), within the buffer zone, the applicant must submit a copy of this Order of Conditions and accompanying plans to said Building Inspector. **Said Order of Conditions must be recorded at the Registry of Deeds and evidence of recording must be submitted to the Building Inspector and the Conservation Commission.**
25. **Prior to requesting an Occupancy Permit from the Building Inspector, the applicant shall obtain a Partial or Final Certificate of Compliance from this Order.**
26. Upon completion of the work described in a Final Order of Conditions, the applicant shall request in writing the issuance of a Certificate of Compliance stating that the work has been satisfactorily completed. In order to receive a Partial or Final Certificate of Compliance upon completion of the project, the applicant must send to the Commission two (2) hardcopies and an electronic copy of WPA Form 8A – Request for Certificate of Compliance (COC). If the project has been completed in accordance with plans stamped by a registered professional engineer, architect, landscape architect, or land surveyor, two (2) hardcopies and an electronic copy of a written statement by such a professional person certifying substantial compliance with the plans and setting forth what deviation, if any, exists from the plans approved in the order shall accompany the Request for Certificate of Compliance. In all other cases, the applicant shall provide the Commission with a signed letter stating that the work has been completed in accordance with the approved Order of Conditions. The Commission shall verify the substantial completion of the work by a site inspection, prior to issuance of a Certificate of Compliance. The applicant shall include two (2) copies of a locus map of the area and recorded Order of Conditions, including the appropriate Book and Page reference. ***AS BUILT PLANS are REQUIRED for commercial projects.**
27. **Prior to construction commencement, the applicant shall:**
    A. Provide a copy of the recorded Order of Conditions to the Commission.
    B. Notify the Conservation Commission in writing 48 hours prior to construction start-up that erosion controls are in place and ready for inspection. (The erosion controls shall be placed

prior to any construction on-site. Said erosion controls shall be maintained and replaced as needed until a Certificate of Compliance is issued.)

28 Erosion control measures and barriers shall be kept in good repair, monitored daily and maintained or reinforced as necessary to ensure and prevent erosion and siltation of wetland resource areas until a Final Certificate of Compliance is issued.

29 During construction, the Commission may require additional erosion and sediment controls to be installed in areas not currently noted on the plan to contain soil on-site and to prevent erosion and siltation of wetland resource areas.

30 All debris, fill and excavated material shall be stockpiled as far away from resource areas and buffer zones as reasonably possible and surrounded by staked strawbales/compost logs to prevent sediment from surface runoff entering the wetlands. At no time shall any debris or other material be buried or disposed of within that line marked on plan as a Resource Area or No Disturb Zone.

31 After proper grading, all disturbed areas located within a buffer zone, except those areas designated as compensatory wetlands, shall be loamed and seeded with not less than four (4) inches of good quality loam. The applicant shall:

A. Install all required erosion and sedimentation control (ESC) measures\devices;
B. Notify Commission that all ESC measures are in place and receive approval of said ESC measures from Commission Agent, said notification shall be in writing and occur at least 48 hours prior to anticipated commencement of project construction;
C. Clearly mark on the field the delineation of vegetated wetlands on the site by stakes placed at 25 feet intervals.

32 The applicant shall affix the Order of Conditions to the DEP sign in a plastic envelope for review of same as needed. For Commercial projects the Order shall be available in the construction site trailer.

33 Any siltation caused onto any wetland, waterway, or No Disturb Zone shall be reported promptly to the Commission and such areas shall be restored to the satisfaction of the Commission.

34 Temporary seeding, mulching or other suitable stabilization measures shall be used to protect exposed areas during prolonged construction or other disturbance.

35 All final earth grading shall be permanently stabilized by the application of loam and seed or sod.

36 After installation of new catch basins on site, the basins shall be enveloped with silt barriers until all tributary areas have been stabilized with permanent cover.

37 Absorption batten pillows shall be used in all traps and catch basins.

38 Fertilizers used for landscaping and lawn care shall be of low-nitrogen content/zero phosphorus and used in moderation. Pesticides and herbicides shall not be used for landscaping and lawn care within Buffer Zones, Resource Areas, or No Disturb Zones.

39 Temporary seeding, mulching, or other suitable stabilization measures shall be used to protect exposed areas during prolonged construction or other disturbances.

40 All re-vegetation of Resource Areas shall be performed according to approved and attached plans cited in this order. The proposed replacement area shall meet or exceed the General Performance Standards outlined in the Wetlands Protection Act (WPA) Regulations, 310 CMR, Section 10.55 (4) (b)-7. Should the replacement area fail to meet any of these standards the Commission reserves the right to require measures necessary to achieve compliance.

41 No work shall proceed until the applicant has received all other permits required by law, including, but not limited to any permit required by the Planning Board, Zoning Board of Appeals, Board of Health, Department of Environmental Protection or the Army Corp of Engineers.

42 Wetland flagging shall remain in place until the project has been completed and the Certificate of Compliance has been issued.

43 Signs shall be posted at the limit of work, to read as follows: **"Absolutely no work beyond this point."** Such signs shall be placed in an amount satisfactory to the Commission or its agent, with at a minimum, one such sign every **TWENTY feet along the limit of work**. Said signs shall be of such quality to last the duration of the project until a Certificate of Compliance is issued.

44 After completion of the work, the applicant shall permanently mark the edge of the wetland to ensure no further encroachment into the wetland and further the applicant shall instruct all agents to explain these markers to buyers, landscapers, tenants and all persons taking over the property from the applicant.

45 Any debris of "dumped" material placed in the resource areas shall be removed by the applicant.

46 There shall be no increase in the volume or rate of runoff, and no siltation of downstream areas as a result of the work herein permitted.

47 The Commission reserves the right to impose additional conditions on portions of this project or this site, to mitigate any actual or potential impacts resulting from the work herein permitted.

48 No earthen embankment in the Buffer Zone shall have a slope steeper than 2:1.

49 In the event a swimming pool is placed on this lot, the following condition shall apply: The content of water in swimming pools can be detrimental to wetlands plant and animal species. To remove harmful chemicals, it is the applicant's responsibility to leave the pool water standing without the addition of chlorine for a minimum of seven (7) days before draining (per the City's Stormwater System Ordinance). In this way chlorine concentration will be significantly reduced due to volatilization. All pool water, wherever possible, shall be drained through a dry well, rather than allowed to spread over the surface of the land. The City of Peabody Conservation Commission Office shall be notified prior to draining and shall approve the method of draining.

50 Work and maintenance shall be done in accordance with the following plans and reports:

►Massachusetts Department of Transportation Highway Division-Plan and Profile of Independence Greenway Extension Bridge P-03-020 (CAK) in the city of Peabody Essex County prepared by Green International Affiliates, Inc. stamped by Danielle Spicer with some sheets final revision date of June 11, 2024. (see full set of plans for each sheet date). Scale is as shown per sheet.

►Inland Wetland Replication Area narrative- MASSDOT Item 755.35

►Supplemental Plans labeled: Resource Area Impacts- Figure 6A, 6D and 6E (scale: 1"=40') revised date 6.11.24

►O&M Plan dated 2.5.23 as submitted with NOI.

51 A Pre-construction meeting must take place before work can commence. The meeting shall include The Conservation Agent, City Planning staff, the chosen contractor General Manager, commission members and other city staff as needed. A construction sequence and phasing schedule must be presented at this meeting.

52 Reports should be emailed to Conservation staff either on a monthly/quarterly or milestone basis. A monthly report is not necessary if no work has commenced. The commission needs to be kept up to date with each phase/milestone of said work. At minimum quarterly reports are due on the FIRST week of: **January/April/ June/September** once the project starts.

<u>SPECIAL CHECKLISTS:</u>

Checklist D –Proctor Brook - Channel/Culvert

1. Unless submitted with the Notice of Intent, a report, prepared by a Massachusetts Registered Professional Structural Engineer, shall be submitted to the Commission, for review and approval prior to construction. The report shall include but not be limited to the following:

- Any recommended work to repair and/or maintain the structural integrity of the channel/culvert;
- Structural Building Requirements over the culvert (foundation design, grade beams, etc.);
- Structural requirements where buildings, roadways, drives, or parking lots cross the culvert;
- Recommendations for debris removal within the channel/culvert on site;
- Results of Geotechnical Exploration.

Checklist J – Dewatering

1. Any dewatering activities on the project site in which water will be released to Resource Areas shall make use of a settling pond or similar device to remove sediment before water is released.

Checklist K – Projects Which Alter Bordering Land Subject to Flooding (BLSF)

1. The compensatory flood storage area shall be constructed prior to any filling of land subject to flooding.

Checklist L – Projects Which Alter Bordering Vegetated Wetlands (BVWs)

1. The compensatory Bordering Vegetated Wetland shall be constructed prior to any filling of Bordering Vegetated Wetland.

2. All revegetation of Resource Areas shall be performed according to the replication plan on file and dated **NOT DATED - labeled MASSDOT Item 755.35 Inland Wetland Replication Area.** The proposed replacement area shall meet or exceed the General Performance Standards outlined in Section 10.55(4)(b)-7 of 310CMR. Should the replacement area fail to meet any of these standards the Commission reserves the right to require measures necessary to achieve compliance.

3. A wetland specialist shall be on site during construction of the wetland replication area and shall supervise its construction. Two reports prepared by the Wetland Specialist shall be submitted annually to the Commission by May 1st and September 1st of each year for two years. Each report shall include an observed species list, relative abundance of each species, percent cover of wetland and upland species, the visibility of the plantings and proposed remedial measures to ensure that at least 75% of the surface of the replication area be re-established with indigenous wetland plant species within two growing seasons. Said report shall include enough photographs for proper coverage of issues/points being addressed. If monitoring data indicates that this objective cannot be met, a corrective plan of action shall be submitted to the Commission for approval and implemented under the supervision of the wetland specialist. No certificate of compliance will be granted by the Commission until such time as the replacement area has been found to meet these standards.

This Order of Conditions shall apply to any successors in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by the Order.

*As Built Plans are required when requesting a Certificate of Compliance.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

F. Appeals

The applicant, the owner, any person aggrieved by this Order, any owner of land abutting the land subject to this Order, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate MassDEP Regional Office to issue a Superseding Order of Conditions. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and a completed Request for Departmental Action Fee Transmittal Form, as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Order. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant, if he/she is not the appellant.

Any appellants seeking to appeal the Department's Superseding Order associated with this appeal will be required to demonstrate prior participation in the review of this project. Previous participation in the permit proceeding means the submission of written information to the Conservation Commission prior to the close of the public hearing, requesting a Superseding Order, or providing written information to the Department prior to issuance of a Superseding Order.

The request shall state clearly and concisely the objections to the Order which is being appealed and how the Order does not contribute to the protection of the interests identified in the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), and is inconsistent with the wetlands regulations (310 CMR 10.00). To the extent that the Order is based on a municipal ordinance or bylaw, and not on the Massachusetts Wetlands Protection Act or regulations, the Department has no appellate jurisdiction.

Rev. 4/1/2010

Updated Certified Abutter Notification, dated 7/23/2024

Notification to Abutters
Under the Massachusetts Wetlands Protection Act

In accordance with the second paragraph of Massachusetts General Laws, Chapter 131, Section 40 and/or Chapter 32 the City of Peabody's Local Wetlands and Rivers Protection Act, you are hereby notified of the following:

A. The name of the **Applicant** is: The City of Peabody

B. The Applicant has filed a **NOI/RDA/ANOI/ANRAD/AMEND OOC** (circle one) with the PEABODY Conservation Commission for the seeking permission to remove, fill, dredge or alter an Area Subject to Protection (Wetland Resource Area and/or Buffer Zone) Under the Massachusetts Wetlands Protection Act (General Laws Chapter 131, Sec.40).

C. The **address** of the lot where the activity is proposed: Former B&M Railroad Easement, Northshore Road, Essex Center Drive, Endicott Street

D. The **proposed activity** is:

The project proposed to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, MA for a total project length of approximately 1.3 miles.

E. A **Public Hearing** regarding this application will be held on:
Wednesday, July 31, 2024 at 7 PM.

F. **Public Participation will be via Virtual Means Only** - At this time the Peabody Conservation Commission hearings will continue to be held remotely. Remote participation is allowed in accordance with Section 20 of Chapter 22 of the Acts of 2021 signed into law by Governor Baker on February 12, 2022, suspending provisions of the Open Meeting Law, G.L. c. 30A, Section 18. as extended by Section 20 of Chapter 22 of the Acts of 2022 and further extended by the Final Compromise Bill enacted by the House and Senate on March 23, 2023, and signed by Governor Maura Healey on March 29, 2023.

G The public may participate in this meeting via Remote Participation:

- From your computer, smart phone or tablet: https://zoom.us/join
- Meeting ID: **841 1498 2174**
- From your phone: Dial +1 646 558 8656; Meeting ID: **841 1498 2174**

H Copies of the application may be examined by contacting: The Conservation Commission Office at 978-538-5782 or the Applicant at the contact below.

I. Copies of the application may be obtained from either The Applicant, or the Applicant's representative Danielle Spicer, P.E., Green International Affiliates, by calling this telephone number: (978) 843-5218 between the hours of 9am-5pm, M-F.

Note: Public Hearing Notice, including its date, time, and place, will be published at least 5 days in advance in the *hearing* at the applicant's expense.

Note: You also may contact the Department of Environmental Protection (DEP) for more information about this application or the Wetlands Protection Act. To contact your local Conservation Agent at: lucia.delnegro@peabody-ma.gov or 978-538-5782

"At this time the Peabody Conservation Commission hearings will continue to be held remotely. Remote participation is allowed in accordance with Section 20 of Chapter 22 of the Acts of 2021 signed into law by Governor Baker on February 12, 2022, suspending provisions of the Open Meeting Law, G.L. c. 30A, Section 18. as extended by Section 20 of Chapter 22 of the Acts of 2022 and further extended by the Final Compromise Bill enacted by the House and Senate on March 23, 2023, and signed by Governor Maura Healey on March 29, 2023. In the event that we are unable to do so on matters not requiring a public hearing, we will post on the City of Peabody's website an audio or video recording, transcript, or other comprehensive recording as soon as possible after the meeting. The public may participate in this meeting via Remote Participation: A meeting ID will be provided on the Conservation Agenda posted on the City's website and outside/inside city hall at least 48 hours prior to the meeting: https://www.peabody-ma.gov/"

1. All or any of the members of the public body may choose to participate in a public meeting via remote access. Meetings may be virtual, in their entirety.
2. The public will be provided with alternative access through which they can watch or listen to meetings "in real time," and meeting notices will specify the manner in which members of the public may access audio or video of the meeting as it is occurring.
3. If, despite our best efforts, our technological capabilities do not adequately support public access to virtual or remote meetings, the Peabody will ensure that an audio or video recording, transcript, or other comprehensive record of the proceedings at the meeting is posted on the City's website as soon as possible after the meeting.
4. **Notices for public hearings will contain additional information about how the public may participate via electronic/technological means.** (youtube or facebook)
5. Where individuals have a right, or are required, to attend a public meeting or hearing, they will be provided with information about how to participate in the meeting/hearing remotely.
6. Meeting notices will still be posted at least 48 hours in advance (not counting Saturdays, Sundays, or legal holidays), unless it is an emergency meeting as defined under the Open Meeting Law (in which event, the meeting notice will be posted with as much advanced notice as is possible in the circumstances). Minutes will still be taken.

Please check individual meeting agendas on the calendar on the City's website, located at https://www.peabody-ma.gov/ for the latest information regarding meetings. Each meeting may experience unique circumstances that may require last minute changes in protocol, including cancellation or rescheduling. We appreciate your patience as we undergo this shift in a significant aspect of how the City of Peabody conducts business.

B. Findings

1.Findings pursuant to the Massachusetts Wetlands Protection Act
Following the review of the the above-referenced Notice of Intent and based on the information provided in this application and presented at the public hearing, this Commission finds that the areas in which work is proposed is significant to the following interests of the Wetlands Protection Act.

Check all that apply:

a. ☑ Public Water Supply	b. ☐ Land Containing Shellfish	c.☑ Prevention of Pollution
d. ☑ Private Water Supply	e. ☐ Fisheries	f. ☑ Protection of Wildlife Habitat
g. ☑ Ground Water Supply	h. ☑ Storm Damage Prevention	i. ☑ Flood Control

2. Commission hereby finds the project, as proposed, is:

Approved subject to:

a.☑ The following conditions which are necessary in accordance with the performance standards set forth in the wetlands regulations. This Commission orders that all work shall be performed in accordance with the Notice of Intent referenced above, the following General Conditions, and any other special conditions attached to this Order. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, these conditions shall control.

Denied because:

b.☐ The proposed work cannot be conditioned to meet the performance standards set forth in the wetland regulations. Therefore, work on this project may not go forward unless and until a new Notice of Intent is submitted which provides measures which are adequate to protect interests of the Act, and a final Order of Conditions is issued. **A description of the performance standards which the proposed work cannot meet is attached to this Order.**

c.☐ The information submitted by the applicant is not sufficient to describe the site, the work or the effect of the work on the interests identified in the Wetlands Protection Act. Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides sufficient information and includes measures which are adequate to protect the interests of the Act , and a final Order of Conditions is issued. **A description of the specific information which is lacking and why it is necessary is attached to this Order as per 310 CMR 10.05(6)(c).**

3.☐ Buffer Zone Impacts:Shortest distance between limit of project disturbance and the wetland resource area specified in 310CMR10.02(1)(a). _____ a. linear feet

Inland Resource Area Impacts:(For Approvals Only):

a. number of new stream crossings	b. number of replacement stream crossings

C. General Conditions Under Massachusetts Wetlands Protection Act

The following conditions are only applicable to Approved projects

1. Failure to comply with all conditions stated herein, and with all related statutes and other regulatory measures, shall be deemed cause to revoke or modify this Order.
2. The Order does not grant any property rights or any exclusive privileges; it does not authorize any injury to private property or invasion of private rights.
3. This Order does not relieve the permittee or any other person of the necessity of complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.
4. The work authorized hereunder shall be completed within three years from the date of this Order unless either of the following apply:
   a. the work is a maintenance dredging project as provided for in the Act; or
   b. the time for completion has been extended to a specified date more than three years, but less than five years, from the date of issuance. If this Order is intended to be valid for more than three years, the extension date and the special circumstances warranting the extended time period are set forth as a special condition in this Order.
5. This Order may be extended by the issuing authority for one or more periods of up to three years each upon application to the issuing authority at least 30 days prior to the expiration date of the Order.
6. If this Order constitutes an Amended Order of Conditions, this Amended Order of Conditions does not exceed the issuance date of the original Final Order of Conditions.
7. Any fill used in connection with this project shall be clean fill. Any fill shall contain no trash, refuse, rubbish, or debris, including but not limited to lumber, bricks, plaster, wire, lath, paper, cardboard, pipe, tires, ashes, refrigerators, motor vehicles, or parts of any of the foregoing.

City/Town:PEABODY

8. This Order is not final until all administrative appeal periods from this Order have elapsed, or if such an appeal has been taken, until all proceedings before the Department have been completed.
9. No work shall be undertaken until the Order has become final and then has been recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land upon which the proposed work is to be done. In the case of the registered land, the Final Order shall also be noted on the Land Court Certificate of Title of the owner of the land upon which the proposed work is done. The recording information shall be submitted to the Conservation Commission on the form at the end of this Order, which form must be stamped by the Registry of Deeds, prior to the commencement of work..
10. A sign shall be displayed at the site not less then two square feet or more than three square feet in size bearing the words,

" Massachusetts Department of Environmental Protection"
[or 'MassDEP"]
File Number :"055-0939"

11. Where the Department of Environmental Protection is requested to issue a Superseding Order, the Conservation Commission shall be a party to all agency proceedings and hearings before Mass DEP.
12. Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8A) to the Conservation Commission.
13. The work shall conform to the plans and special conditions referenced in this order.
14. Any change to the plans identified in Condition #13 above shall require the applicant to inquire of the Conservation Commission in writing whether the change is significant enough to require the filing of a new Notice of Intent.
15. The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.
16. This Order of Conditions shall apply to any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.
17. Prior to the start of work, and if the project involves work adjacent to a Bordering Vegetated Wetland, the boundary of the wetland in the vicinity of the proposed work area shall be marked by wooden stakes or flagging. Once in place, the wetland boundary markers shall be maintained until a Certificate of Compliance has been issued by the Conservation Commission.
18. All sedimentation barriers shall be maintained in good repair until all disturbed areas have been fully stabilized with vegetation or other means. At no time shall sediments be deposited in a wetland or water body. During construction, the applicant or his/her designee shall inspect the erosion controls on a daily basis and shall remove accumulated sediments as needed. The applicant shall immediately control any erosion problems that occur at the site and shall also immediately notify the Conservation Commission, which reserves the right to require additional erosion and/or damage prevention controls it may deem necessary. Sedimentation barriers shall serve as the limit of work unless another limit of work line has been approved by this Order.

NOTICE OF STORMWATER CONTROL AND MAINTENANCE REQUIREMENTS

19. The work associated with this Order(the "Project") is (1) ☑ is not (2)☐ subject to the Massachusetts Stormwater Standards. If the work is subject to Stormwater Standards, then the project is subject to the following conditions;
    a) All work, including site preparation, land disturbance, construction and redevelopment, shall be implemented in accordance with the construction period pollution prevention and erosion and sedimentation control plan and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollutant Discharge

Elimination System Construction General Permit as required by Stormwater Standard 8. Construction period erosion, sedimentation and pollution control measures and best management practices (BMPs) shall remain in place until the site is fully stabilized.

b) No stormwater runoff may be discharged to the post-construction stormwater BMPs unless and until a Registered Professional Engineer provides a Certification that: *i.* all construction period BMPs have been removed or will be removed by a date certain specified in the Certification. For any construction period BMPs intended to be converted to post construction operation for stormwater attenuation, recharge, and/or treatment, the conversion is allowed by the MassDEP Stormwater Handbook BMP specifications and that the BMP has been properly cleaned or prepared for post construction operation, including removal of all construction period sediment trapped in inlet and outlet control structures; *ii.*. as-built final construction BMP plans are included, signed and stamped by a Registered Professional Engineer, certifying the site is fully stabilized; *iii.* any illicit discharges to the stormwater management system have been removed, as per the requirements of Stormwater Standard 10; *iv.* all post-construction stormwater BMPs are installed in accordance with the plans (including all planting plans) approved by the issuing authority, and have been inspected to ensure that they are not damaged and that they are in proper working condition; *v.* any vegetation associated with post-construction BMPs is suitably established to withstand erosion.

c) The landowner is responsible for BMP maintenance until the issuing authority is notified that another party has legally assumed responsibility for BMP maintenance. Prior to requesting a Certificate of Compliance, or Partial Certificate of Compliance, the responsible party (defined in General Condition 19(e)) shall execute and submit to the issuing authority an Operation and Maintenance Compliance Statement ("O&M Statement") for the Stormwater BMPs identifying the party responsible for implementing the stormwater BMP Operation and Maintenance Plan ("O&M Plan") and certifying the following: i.) the O&M Plan is complete and will be implemented upon receipt of the Certificate of Compliance, and ii.) the future responsible parties shall be notified in writing of their ongoing legal responsibility to operate and maintain the stormwater management BMPs and implement the Stormwater Pollution Prevention Plan.

d) Post-construction pollution prevention and source control shall be implemented in accordance with the long-term pollution prevention plan section of the approved Stormwater Report and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollutant Discharge Elimination System Multi-Sector General Permit.

e) Unless and until another party accepts responsibility, the landowner, or owner of any drainage easement, assumes responsibility for maintaining each BMP. To overcome this presumption, the landowner of the property must submit to the issuing authority a legally binding agreement of record, acceptable to the issuing authority, evidencing that another entity has accepted responsibility for maintaining the BMP, and that the proposed responsible party shall be treated as a permittee for purposes of implementing the requirements of Conditions 19(f) through 19(k) with respect to that BMP. Any failure of the proposed responsible party to implement the requirements of Conditions 19(f) through 19(k) with respect to that BMP shall be a violation of the Order of Conditions or Certificate of Compliance. In the case of stormwater BMPs that are serving more than one lot, the legally binding agreement shall also identify the lots that will be serviced by the stormwater BMPs. A plan and easement deed that grants the responsible party access to perform the required operation and maintenance must be submitted along with the legally binding agreement.

f) The responsible party shall operate and maintain all stormwater BMPs in accordance with the design plans, the O&M Plan, and the requirements of the Massachusetts Stormwater Handbook.

g) The responsible party shall:

1. Maintain an operation and maintenance log for the last three (3) consecutive calendar years of inspections, repairs, maintenance and/or replacement of the stormwater management system or any part thereof, and disposal (for disposal the log shall indicate the type of material and the disposal location);

Massachusetts Department of Environmental Protection

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File #:055-0939
eDEP Transaction #:1768841
City/Town:PEABODY

2. Make the maintenance log available to MassDEP and the Conservation Commission ("Commission") upon request; and
3. Allow members and agents of the MassDEP and the Commission to enter and inspect the site to evaluate and ensure that the responsible party is in compliance with the requirements for each BMP established in the O&M Plan approved by the issuing authority.

h) All sediment or other contaminants removed from stormwater BMPs shall be disposed of in accordance with all applicable federal, state, and local laws and regulations.

i) Illicit discharges to the stormwater management system as defined in 310 CMR 10.04 are prohibited.

j) The stormwater management system approved in the Order of Conditions shall not be changed without the prior written approval of the issuing authority.

k) Areas designated as qualifying pervious areas for the purpose of the Low Impact Site Design Credit (as defined in the MassDEP Stormwater Handbook, Volume 3, Chapter 1, Low Impact Development Site Design Credits) shall not be altered without the prior written approval of the issuing authority.

l) Access for maintenance, repair, and/or replacement of BMPs shall not be withheld. Any fencing constructed around stormwater BMPs shall include access gates and shall be at least six inches above grade to allow for wildlife passage.

D. Findings Under Municipal Wetlands Bylaw or Ordinance

1. Is a municipal wetlands bylaw or ordinance applicable? ☑ Yes ☐ No

2. The Conservation Commission hereby(check one that applies):

a. ☐ DENIES the proposed work which cannot be conditioned to meet the standards set forth in a municipal ordinance or bylaw specifically:

1. Municipal Ordinance or Bylaw _____ 2. Citation _____

Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides measures which are adequate to meet these standards, and a final Order or Conditions is issued. Which are necessary to comply with a municipal ordinance or bylaw:

b. ☑ APPROVES the proposed work, subject to the following additional conditions.

1. Municipal Ordinance or Bylaw CH 32 2. Citation _____

3. The Commission orders that all work shall be performed in accordance with the following conditions and with the Notice of Intent referenced above. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, the conditions shall control.

The special conditions relating to municipal ordinance or bylaw are as follows:
SEE LOCAL CONDITIONS PAGES 9 - 12 ATTACHED HERETO AND A MADE A PART HEREOF.

AMENDMENT 55-939

PEABODY CONSERVATION COMMISSION
AMDNENDMENT TO ORDER OF CONDITIONS – DEP FILE # 55-939
PROJECT TITLE: INDEPENDENCE GREENWAY EXTENSION
(NEAR PROCTOR BROOK-ESSEX CENTER DR/NORTH SHORE RD/ENDICOTT ST/ FORMER RR
APPLICANT: BRENDAN CALLAHAN ON BEHALF OF THE CITY OF PEABODY
OWNERS: CITY OF PEABODY-24 LOWELL ST, PEABODY MA

ORDER OF CONDITIONS (OC)

GENERAL CONDITIONS (DEP): 1-20– SEE ATTACHED

21. This Order of Conditions also constitutes a special Order of Conditions pursuant to the Wetlands and Rivers Protection Regulations, Chapter 32 of the Code of the City of Peabody. Appeal to the Massachusetts Department of Environmental Protection (DEP), pursuant to the State Wetlands Protection Act (G.L. Chapter 131, Section 40) shall not operate to terminate or affect any of the provisions of said special Order of Conditions pursuant to the Wetlands and Rivers Protection Regulations, Chapter 32 of the Code of the City of Peabody.
22. A copy of this Order shall be present on the site at all times until the completion of all work and receipt of a Final Certification of Compliance by the Commission.
23. A copy of this Order of Conditions shall be included in all construction contracting and subcontracting documents dealing with the work proposed and shall supercede other contract requirements.
24. When the applicant applies to the Building Inspectors office for a building and/or foundation permit (or for any construction permit), within the buffer zone, the applicant must submit a copy of this Order of Conditions and accompanying plans to said Building Inspector. **Said Order of Conditions must be recorded at the Registry of Deeds and evidence of recording must be submitted to the Building Inspector and the Conservation Commission.**
25. **Prior to requesting an Occupancy Permit from the Building Inspector, the applicant shall obtain a Partial or Final Certificate of Compliance from this Order.**
26. Upon completion of the work described in a Final Order of Conditions, the applicant shall request in writing the issuance of a Certificate of Compliance stating that the work has been satisfactorily completed. In order to receive a Partial or Final Certificate of Compliance upon completion of the project, the applicant must send to the Commission two (2) hardcopies and an electronic copy of WPA Form 8A – Request for Certificate of Compliance (COC). If the project has been completed in accordance with plans stamped by a registered professional engineer, architect, landscape architect, or land surveyor, two (2) hardcopies and an electronic copy of a written statement by such a professional person certifying substantial compliance with the plans and setting forth what deviation, if any, exists from the plans approved in the order shall accompany the Request for Certificate of Compliance. In all other cases, the applicant shall provide the Commission with a signed letter stating that the work has been completed in accordance with the approved Order of Conditions. The Commission shall verify the substantial completion of the work by a site inspection, prior to issuance of a Certificate of Compliance. The applicant shall include two (2) copies of a locus map of the area and recorded Order of Conditions, including the appropriate Book and Page reference. ***AS BUILT PLANS are REQUIRED for commercial projects.**
27. **Prior to construction commencement, the applicant shall:**
    A. Provide a copy of the recorded Order of Conditions to the Commission.

B. Notify the Conservation Commission in writing 48 hours prior to construction start-up that erosion controls are in place and ready for inspection. (The erosion controls shall be placed prior to any construction on-site. Said erosion controls shall be maintained and replaced as needed until a Certificate of Compliance is issued.)

28 Erosion control measures and barriers shall be kept in good repair, monitored daily and maintained or reinforced as necessary to ensure and prevent erosion and siltation of wetland resource areas until a Final Certificate of Compliance is issued.

29 During construction, the Commission may require additional erosion and sediment controls to be installed in areas not currently noted on the plan to contain soil on-site and to prevent erosion and siltation of wetland resource areas.

30 All debris, fill and excavated material shall be stockpiled as far away from resource areas and buffer zones as reasonably possible and surrounded by staked strawbales/compost logs to prevent sediment from surface runoff entering the wetlands. At no time shall any debris or other material be buried or disposed of within that line marked on plan as a Resource Area or No Disturb Zone.

31 After proper grading, all disturbed areas located within a buffer zone, except those areas designated as compensatory wetlands, shall be loamed and seeded with not less than four (4) inches of good quality loam. The applicant shall:

A. Install all required erosion and sedimentation control (ESC) measures\devices;

B. Notify Commission that all ESC measures are in place and receive approval of said ESC measures from Commission Agent, said notification shall be in writing and occur at least 48 hours prior to anticipated commencement of project construction;

C. Clearly mark on the field the delineation of vegetated wetlands on the site by stakes placed at 25 feet intervals.

32 **The applicant shall affix the Order of Conditions to the DEP sign in a plastic envelope for review of same as needed. For Commercial projects the Order shall be available in the construction site trailer.**

33 Any siltation caused onto any wetland, waterway, or No Disturb Zone shall be reported promptly to the Commission and such areas shall be restored to the satisfaction of the Commission.

34 Temporary seeding, mulching or other suitable stabilization measures shall be used to protect exposed areas during prolonged construction or other disturbance.

35 All final earth grading shall be permanently stabilized by the application of loam and seed or sod.

36 After installation of new catch basins on site, the basins shall be enveloped with silt barriers until all tributary areas have been stabilized with permanent cover.

37 Absorption batten pillows shall be used in all traps and catch basins.

38 Fertilizers used for landscaping and lawn care shall be of low-nitrogen content/zero phosphorus and used in moderation. Pesticides and herbicides shall not be used for landscaping and lawn care within Buffer Zones, Resource Areas, or No Disturb Zones.

39 Temporary seeding, mulching, or other suitable stabilization measures shall be used to protect exposed areas during prolonged construction or other disturbances.

40 All re-vegetation of Resource Areas shall be performed according to approved and attached plans cited in this order. The proposed replacement area shall meet or exceed the General Performance Standards outlined in the Wetlands Protection Act (WPA) Regulations, 310 CMR, Section 10.55 (4) (b)-7. Should the replacement area fail to meet any of these standards the Commission reserves the right to require measures necessary to achieve compliance.

41 No work shall proceed until the applicant has received all other permits required by law, including, but not limited to any permit required by the Planning Board, Zoning Board of Appeals, Board of Health, Department of Environmental Protection or the Army Corp of Engineers.

42 **Wetland flagging shall remain in place until the project has been completed and the Certificate of Compliance has been issued.**

43 Signs shall be posted at the limit of work, to read as follows: **"Absolutely no work beyond this point."** Such signs shall be placed in an amount satisfactory to the Commission or its agent, with at

a minimum, one such sign every **TWENTY feet along the limit of work.** Said signs shall be of such quality to last the duration of the project until a Certificate of Compliance is issued.

44 After completion of the work, the applicant shall permanently mark the edge of the wetland to ensure no further encroachment into the wetland and further the applicant shall instruct all agents to explain these markers to buyers, landscapers, tenants and all persons taking over the property from the applicant.

45 Any debris of "dumped" material placed in the resource areas shall be removed by the applicant.

46 There shall be no increase in the volume or rate of runoff, and no siltation of downstream areas as a result of the work herein permitted.

47 The Commission reserves the right to impose additional conditions on portions of this project or this site, to mitigate any actual or potential impacts resulting from the work herein permitted.

48 No earthen embankment in the Buffer Zone shall have a slope steeper than 2:1.

49 In the event a swimming pool is placed on this lot, the following condition shall apply: The content of water in swimming pools can be detrimental to wetlands plant and animal species. To remove harmful chemicals, it is the applicant's responsibility to leave the pool water standing without the addition of chlorine for a minimum of seven (7) days before draining (per the City's Stormwater System Ordinance). In this way chlorine concentration will be significantly reduced due to volatilization. All pool water, wherever possible, shall be drained through a dry well, rather than allowed to spread over the surface of the land. The City of Peabody Conservation Commission Office shall be notified prior to draining and shall approve the method of draining.

50 Work and maintenance shall be done in accordance with the following plans and reports:

►Massachusetts Department of Transportation Highway Division-Plan and Profile of Independence Greenway Extension Bridge P-03-020 (CAK) in the city of Peabody Essex County prepared by Green International Affiliates, Inc. stamped by Danielle Spicer with some sheets final revision date of July 25, 2024. (see full set of plans for each sheet date). Scale is as shown per sheet. SHEETS REVISED FOR AMENDMENT ARE:

Also SEE REVISED figures as submitted with Amendment Memorandum:

•Resource Area Impacts-Figure 6A, Figure 6B, Figure 6C, Figure 6D, Figure 6E, Figure 6G and Figure 6H

•BLSF Impacts- Figure 7A, Figure 7B, Figure 7C, Figure 7D, Figure 7E, Figure 7F, Figure G and Figure 7H

► Inland Wetland Replication Area narrative- MASSDOT Item 755.35

► O&M Plan dated 2.5.23 as submitted with NOI.

51 A Pre-construction meeting must take place before work can commence. The meeting shall include The Conservation Agent, City Planning staff, the chosen contractor General Manager, commission members and other city staff as needed. A construction sequence and phasing schedule must be presented at this meeting.

52 Reports should be emailed to Conservation staff either on a monthly/quarterly or milestone basis. A monthly report is not necessary if no work has commenced. The commission needs to be kept up to date with each phase/milestone of said work. At minimum quarterly reports are due on the FIRST week of: **January/April/ June/September** once the project starts.

SPECIAL CHECKLISTS:

Checklist D –Proctor Brook - Channel/Culvert

1. Unless submitted with the Notice of Intent, a report, prepared by a Massachusetts Registered Professional Structural Engineer, shall be submitted to the Commission, for review and approval prior to construction. The report shall include but not be limited to the following:

- Any recommended work to repair and/or maintain the structural integrity of the channel/culvert;
- Structural Building Requirements over the culvert (foundation design, grade beams, etc.);
- Structural requirements where buildings, roadways, drives, or parking lots cross the culvert;
- Recommendations for debris removal within the channel/culvert on site;
- Results of Geotechnical Exploration.

Checklist J – Dewatering

1. Any dewatering activities on the project site in which water will be released to Resource Areas shall make use of a settling pond or similar device to remove sediment before water is released.

Checklist K – Projects Which Alter Bordering Land Subject to Flooding (BLSF)

1. The compensatory flood storage area shall be constructed prior to any filling of land subject to flooding.

Checklist L – Projects Which Alter Bordering Vegetated Wetlands (BVWs)

1. The compensatory Bordering Vegetated Wetland shall be constructed prior to any filling of Bordering Vegetated Wetland.

2. All revegetation of Resource Areas shall be performed according to the replication plan on file and dated **NOT DATED - labeled MASSDOT Item 755.35 Inland Wetland Replication Area.** The proposed replacement area shall meet or exceed the General Performance Standards outlined in Section 10.55(4)(b)-7 of 310CMR. Should the replacement area fail to meet any of these standards the Commission reserves the right to require measures necessary to achieve compliance.

3. A wetland specialist shall be on site during construction of the wetland replication area and shall supervise its construction. Two reports prepared by the Wetland Specialist shall be submitted annually to the Commission by May 1st and September 1st of each year for two years. Each report shall include an observed species list, relative abundance of each species, percent cover of wetland and upland species, the visibility of the plantings and proposed remedial measures to ensure that at least 75% of the surface of the replication area be re-established with indigenous wetland plant species within two growing seasons. Said report shall include enough photographs for proper coverage of issues/points being addressed. If monitoring data indicates that this objective cannot be met, a corrective plan of action shall be submitted to the Commission for approval and implemented under the supervision of the wetland specialist. No certificate of compliance will be granted by the Commission until such time as the replacement area has been found to meet these standards.

This Order of Conditions shall apply to any successors in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by the Order.

*As Built Plans are required when requesting a Certificate of Compliance.

Withdrawal of Appeal

Dear Mr. Callahan:

As you are aware, the Northeast Regional Office of the Department of Environmental Protection (MassDEP) appealed the above-referenced filing of its own volition in its letter of July 15, 2024. Upon receipt of an Amended Order of Conditions from the Peabody Conservation Commission dated August 2, 2024, MassDEP is hereby withdrawing its appeal.

This withdrawal thereby abrogates any further action by MassDEP in this matter and the associated appeal. You are further notified that the Amended Order of Conditions for DEP File #055-0939, as issued by the Peabody Conservation Commission on August 2, 2024, is now considered the Final Order of Conditions governing jurisdiction at this site.

If you have any questions regarding this letter, please do not hesitate to email me at jill.provencal@mass.gov.

Sincerely,

For - Jill Provencal

POLICY DIRECTIVE

Jonathan Gulliver (signature on original)
HIGHWAY ADMINISTRATOR

Off-Site Stockpiling of Soil from MassDOT Construction Projects

Purpose

The purpose of this Policy Directive is to formally establish a policy and procedures for managing and stockpiling soil generated and transported from MassDOT construction projects. This Policy Directive does not supersede any Federal, State, or Local regulations.

Date of Effect

This Policy Directive is effective immediately for all projects, including active construction projects.

For active construction projects and for other projects advertised prior to October 15, 2022, changes to the contract documents needed to implement the requirements of this Policy Directive will be considered on a case-by-case basis and shall be approved by the District Highway Director, as necessary.

For projects advertised on or after October 15, 2022, MassDOT will include the requirements and implementation procedures of this Policy Directive in the construction contract documents.

Policy Requirements

This policy is intended to prevent the off-site relocation of excavated soil generated from MassDOT projects to areas near residential receptors and to control potential fugitive dusts and/or contaminants. To that end, excavated soil may not be moved from the project site without knowledge of the content of the material. Knowledge may include visual field observations for presence of staining, odor, and/or debris, screening with a photoionization detector (PID), laboratory analysis, and/or site history. Pavement millings and other non-soil materials are not subject to the requirements of this Policy Directive.

Moving soil from a MassDOT project site to a temporary off-site storage location must be approved in writing by the District Highway Director.

The Contractor must select a storage location that is at least 500 feet away from residential receptors, as defined herein to include, but not be limited to, residential dwellings, residentially

zoned property, schools, daycare facilities, playgrounds, parks, recreational areas, hospitals, elderly housing and convalescent facilities.

Temporary off-site storage of excavated soil from a MassDOT project is only permissible at a location approved and permitted by MassDOT. The temporary storage location should be located within the same municipality where the soil was excavated, where possible. Stockpiled soil must be securely covered, and appropriate measures must be taken to minimize fugitive dust and erosion.

Signs indicating the source of the soil, the date the soil was generated, and contact information must be erected and maintained until the stockpiled soils are transported to a disposal facility or reused on the project site.

Implementation Procedures

To ensure that off-site storage of excavated soils is managed properly on MassDOT projects, this policy requires the following:

1. **Off-Site Stockpile Storage Locations**
    a. The Contractor shall provide proposed off-site storage locations to the Engineer for approval at least 30 days prior to transporting soil off site. Off-site storage locations should be in the same municipality as the work site.
    b. The Contractor shall keep excavated soil on site until adequately characterized to the satisfaction of the Engineer.
    c. The Contractor shall provide notification of the approved off-site storage location to the local Board of Health and the Town Manager's/Mayor's Office at least 7-days prior to transporting soil off site.
    d. The Contractor shall provide the Engineer with at least 3-days' notice prior to transporting soil off site.
    e. For off-site storage locations on MassDOT property, the Contractor is required to obtain an Access Permit through the District Permits Office prior to storage of soil or other materials. MassDOT will issue these permits at no cost to the Contractor. Information to be submitted by the Contractor as part of the permit application shall include:
        i. A description of material to be stored off-site, including available analytical data;
        ii. A figure of the location with distances to residences and residential receptors; and
        iii. Anticipated duration of temporary storage.
    f. Stockpile locations should not be within 500 feet of residential receptors (e.g., residential dwellings, residentially zoned property, schools, daycare facilities, playgrounds, parks, recreational areas, hospitals, elderly housing and convalescent facilities).
        i. If the stockpile location must be within 500 feet of residential receptors, then soil must be less than RCS-1 (per 310 CMR 40.1600) and free of potentially hazardous or regulated items.

g. For off-site storage locations on non-MassDOT property, the Contractor must notify the property owner(s) at least 7 days prior to transporting material.
h. Exceptions to these rules will be reviewed by MassDOT and may be approved by the District Highway Director on a case-by-case basis.

2. Off-Site Stockpile Management

a. The Contractor shall keep soil stockpiles on impermeable surfaces (e.g., asphalt or concrete) or on 10-mil polyethylene sheeting.
b. The Contractor shall cover soil stockpiles with 10-mil polyethylene sheeting and surround with a berm made of hay bales, straw wattles, or similar.
    i. Piles that are actively being worked on must be covered and re-secured at the end of the work shift.
c. The Contractor shall label stockpiles with signs, including:
    i. Location of origin (including any Release Tracking Numbers)
    ii. Stockpile ID number (including MassDOT District office-assigned tracking ID, if different)
    iii. Date of initial accumulation
    iv. Applicable telephone numbers for the Contractor and MassDOT.
d. The Contractor shall mitigate fugitive dust at storage locations under the direction of an appropriately trained/certified environmental professional.
e. The Contractor shall remedy noncompliance with this policy within 48 hours.
f. The Contractor shall remedy noncompliance with this policy on the SAME DAY for potentially hazardous material, as determined by the Engineer.
g. The Contractor shall handle excavated soil according to federal, state, and local regulations.
h. The Contractor shall use appropriate shipping documents for all movements of excavated soil on public roadways (e.g., Bill of Lading, Material Shipping Record, Manifest, Asbestos Waste Shipment Record, etc.).

Number: P-22-002
Date: 9/23/22

POLICY DIRECTIVE

Jonathan Gulliver (signature on original)
HIGHWAY ADMINISTRATOR

Use of MassDOT Property for Staging and other Construction-Related Operations

Purpose

This Policy Directive is intended to address the use of MassDOT property by MassDOT Contractors for construction staging and other construction-related operations that are not specifically defined in the construction contract. Such use of MassDOT property will only be allowed if permitted by the District Office in accordance with 700 CMR 13.00, Approval of Access to MassDOT Highways and Other Property. This includes the use of MassDOT property for staging, laydown, and storage of equipment and materials, including soil excavated from a project site.

This Policy Directive requires the Contractor/applicant to obtain a Non-Vehicular Access Permit from MassDOT to use MassDOT property for these purposes.

This Policy Directive is effective immediately and applies to all MassDOT construction projects.

General Permit Considerations and Conditions

In addition to other normal MassDOT Access Permit procedures, MassDOT shall consider the following during the application, review, implementation and monitoring processes of Access Permits required by this Policy Directive:

- Storage and placement of the Contractor's equipment and materials should not be allowed within the clear zone of the roadway.
- Stockpiled soils should not be located within 500 feet of residential receptors, as defined herein to include, but not be limited to, residential dwellings, residentially zoned property, schools, daycare facilities, playgrounds, parks, recreational areas, hospitals, elderly housing and convalescent facilities.
- The Contractor/applicant shall identify the access/egress locations of the proposed storage areas. MassDOT will only approve locations determined to be safe for roadway users, construction workers and the general public.
- The Contractor may be required to submit a Traffic Management Plan and/or Lighting Plan for MassDOT review and approval as part of the permit application, depending on the proposed use of the area.

- The Contractor shall submit the permit application through MassDOT's online State Highway Access Permit System (SHAPS).
- MassDOT will waive the permit application fee for any application received from a MassDOT Contractor for any permit required by this Policy Directive and will waive any subsequent amendment and extension fees that may otherwise be required.
- MassDOT will review the permit application in accordance with applicable standard procedures and will apply standard permit terms and conditions, as necessary.
- The Resident Engineer will verify that the permit is approved before allowing the Contractor to use the affected area for the requested purpose.
- Areas permitted are for use by the approved applicant only and are not to be shared with or used by other vendors. Subcontractors specifically engaged with the applicant working on the specific MassDOT project will be allowed to use the area in accordance with the terms of the permit.
- Permits are issued on an annual basis and will require the Contractor to file for an extension each year to continue use.

Exemptions from Permit Requirements

Equipment and materials being used for active construction operations and located within the work zone of the construction contract are exempt from this permit requirement, provided they do not interfere with the safety or operation of the roadway or the work zone. Examples of these types of exempt uses are:

- Equipment and materials parked or stored within a protected (barriered) work zone.
- Materials placed in the work zone prior to same-day installation or use.
- Soils excavated temporarily and scheduled to be replaced, such as for trenching operations or for installation of drainage structures.

DOCUMENT B00420

PROPOSAL

PEABODY

For: **Independence Greenway Extension**

COMMONWEALTH OF MASSACHUSETTS

LOCATION

The work referred to herein is in the City of PEABODY in Essex County, in the Commonwealth of Massachusetts, and is shown by the locus map (Document 00331) in the Proposal Pamphlet, the work locations extend as follows:

Essex Center Drive

Beginning – Station 289+45.00 +/-

Endicott Street

Ending –Station 20+05.00 +/-

Bridge P-03-020 (CAK)

The contract prices shall include the furnishing of all materials (except as otherwise herein specified), the performing of all the labor requisite or proper, the providing of all necessary machinery, tools, apparatus and other means of construction, the doing of all the abovementioned work in the manner set forth, described and shown in the specifications and on the drawings for the work, and in the form of contract, and the completion thereof within **889 CALENDAR DAYS** upon receipt of a Notice to Proceed, except that if the completion date falls between December 1 and March 15 then the same number of days beyond December 1st will be extended after March 15th.

The Work of this project is described by the following Items and quantities.

DBE Letter of Intent

(To be completed by the DBE – Page 1 of 2)

The DBE firm will also include the latest MassUCP letter with this Letter of Intent.

To: _____ (Prime Bidder)

From: _____ (DBE Firm)

Federal Aid Project No.: TAP/CMQ-0034(027)X Bid Opening or Due Date: _____

Project Name: _____ Project Location: PEABODY

I, _____, authorized signatory of the above-reference DBE firm hereby declare:

(Print Name)

(a) My company is currently certified as a Disadvantaged Business Enterprise (DBE) by the Massachusetts Supplier Diversity Office (SDO), as a (check all that apply):

☐ CONTRACTOR ☐ REGULAR DEALER ☐ OTHER
☐ MANUFACTURER ☐ TRUCKING OPERATIONS ☐ PROFESSIONAL SERVICES

[Additional guidance is available at Title 49, Code of Federal Regulations, Part 26.55 (49 CFR Part 26.55)]

(b) My firm has the ability to manage, supervise and perform the activity described on page 3 of this Letter of Intent. If you are awarded the contract, my company intends to enter into a contract with your firm to perform the items of work or other activity described on the following sheet for the prices indicated.

(c) There have been no changes affecting the ownership, control or independence of my company since my last certification review on _____. If any such change is planned or occurs prior to my company's completion of this proposed work, I will give prior written notification to your firm and to the Office of Diversity and Civil Rights (ODCR)(MBTA/MassDOT) and SDO.

(d) I have read the MassDOT proposal for the Project, and acknowledge that my company will comply with that document and the requirements of 49 CFR Part 26.

(e) For the purpose of obtaining subcontractor approval from the MassDOT, my firm will provide to you:

a. ***The following construction work:***
   i. a complete list of contact information for proposed Superintendent, i.e., address, phone number and e-mail address, and;
   ii. a list of projects completed in the last 10 years. I shall also include, for each project: the name and telephone number of a contact person for the contracting authority, person, or organization; project title / location (City/State), dollar value of the work; a description of the work; and the date project completed .

b. The following professional services work:
   i. resume, stating the qualifications and experience of person responsible for project oversight and contact information, i.e., address, phone number and e-mail address.
   ii. proposed team and organization,
   iii. resumes of key personnel;
   iv. example projects

c. The following services, materials or supplies:
   i. a written agreement and invoices for the materials or supplies, and any other documents evidencing the terms of providing such items to be sent to the Office of Diversity and Civil Rights Government Compliance Unit designee;
   ii. information concerning brokers fees and commissions for providing services or materials.

DBE JOINT CHECK ARRANGEMENT APPROVAL FORM

(to be submitted by Prime Contractor)

Contract No: 132091 **Project No.** 609211 **Federal Aid No.:** TAP/CMQ-0034(027)X

Location: PEABODY **Bid Opening Date:** _____

Project Description: Independence Greenway Extension

We have received the attached request for the use of a joint check arrangement from _____ _____ , a DBE on the above- referenced Contract and _____ _____, a Material Supplier/Vendor for the subject Contract. The DBE has complied with the requirements of 49 CFR Part 26.55(c)(1). In particular, the DBE has:

- a written agreement with the material supplier/vendor;
- applied for credit with the subject material supplier and has supplied the vendor's response;
- shown that it will place all orders to the subject material supplier/vendor;
- made and retains all decision-making responsibilities concerning the materials; and
- provided a Joint Check Agreement that is acceptable to MassDOT;

As the Contractor for the Project, we agree to issue joint checks (made payable to the Material Supplier/Vendor and the DBE) for payment of sums due pursuant to invoices from the Supplier/Vendor and DBE.
