NOTICE TO CONTRACTORS

Electronic proposals for the following project will be received through the internet using www.bidx.com until the date and time stated below and will be posted on www.bidx.com forthwith after the bid submission deadline. No paper copies of bids will be accepted. All Bidders must have a valid vendor code issued by MassDOT in order to bid on projects. Bidders need to apply for a Digital ID at least 14 days prior to a scheduled bid opening date with www.bidx.com.

TUESDAY, SEPTEMBER 23, 2025 at 2:00 P.M. **
PEABODY
Federal Aid Project No. TAP/CMQ-0034(027)X
Independence Greenway Extension

****Date Subject to Change**

PROJECT VALUE = $7,233,000.00

Bidders must be pre-qualified by the Department in the HIGHWAY - CONSTRUCTION or HIGHWAY – BIKE PATHS category to bid on the above project. An award will not be made to a Contractor who is not pre-qualified by the Department prior to the opening of Proposals.

All prospective Bidders who intend to bid on this project must obtain "Request Proposal Form (R109)". The blank "Request Proposal Form (R109)" can be obtained at: https://www.mass.gov/prequalification-of-horizontal-construction-firms.

All prospective Bidders must complete and e-mail an electronic copy of "Request Proposal Form (R109)" to the MassDOT Director of Prequalification for approval: prequal.r109@dot.state.ma.us.

Proposal documents for official bidders are posted on www.bidx.com. Other interested parties may receive informational Contract Documents containing the Plans and Special Provisions, free of charge.

Bids will be considered, and the contract awarded in accordance with statutes governing such contracts in accordance with Massachusetts General Laws Chapter 30 § 39M.

The Project Bids File Attachments folder for proposals at www.bidx.com shall be used for submitting at the time of bid required information such as the Bid Bond required document, and other documents that may be requested in the proposal.

NOTICE TO CONTRACTORS (Continued)

All parties who wish to have access to information plans and specification must send a "Request for Informational Documents" to MassDOTBidDocuments@dot.state.ma.us.

A Proposal Guaranty in the amount of 5% of the value of the bid is required.

This project is subject to the schedule of prevailing wage rates as determined by the Commissioner of the Massachusetts Department of Labor and Workforce Development, and the Division of Occupational Safety, and the United States Department of Labor.

The Massachusetts Department of Transportation, in accordance with Title VI of the Civil Rights Act of 1964 (78 Stat. 252, 42 U.S.C. §§ 2000d to 2000d-4) and the Regulations, hereby affirmatively ensures that for any contract entered into pursuant to this advertisement, all bidders, including disadvantaged business enterprises, will be afforded full and fair opportunity to submit bids in response to this invitation and will not be discriminated against on the grounds of race, color, national origin in consideration for an Award.

This Proposal contains the "STANDARD FEDERAL EQUAL EMPLOYMENT OPPORTUNITY CONTRACT SPECIFICATIONS (EXECUTIVE ORDER 11246)". The goals and timetables applicable to this proposal for minority and female participation, expressed in percentage terms for the Contractor's aggregate work force in each trade on all work, are contained in Appendices A and B-80 of the above specifications.

The Contractor (hereinafter includes consultants) will comply with the Acts and Regulations relative to Non-discrimination in Federally-assisted programs of the U.S. Department of Transportation, Federal Highway Administration (FHWA), as they may be amended from time to time, which are herein incorporated by reference and made a part of this Contract as contained in Appendices C and D of the above specifications.

NOTICE TO CONTRACTORS (Continued)

PRICE ADJUSTMENTS

This Contract contains price adjustments for hot mix asphalt and Portland cement mixtures, diesel fuel, and gasoline. For reference the base prices are as follows: liquid asphalt $635.00 per ton, Portland cement $425.13 per ton, diesel fuel $2.924 per gallon, and gasoline $2.449 per gallon, and Steel Base Price Index 354.8. MassDOT posts the **Price Adjustments** on their Highway Division's website at
https://www.mass.gov/massdot-contract-price-adjustments

This Contract contains Price Adjustments for steel. See Document 00813 - PRICE ADJUSTMENT FOR STRUCTURAL STEEL AND REINFORCING STEEL for their application and base prices.

MassDOT projects are subject to the rules and regulations of the Architectural Access Board (521 CMR 1.00 et seq.)

Prospective bidders and interested parties can access this information and more via the internet at WWW.COMMBUYS.COM.

REQUIREMENTS OF MASSACHUSETTS GENERAL LAWS
CHAPTER 30, SECTION 39R;
CHAPTER 30, SECTION 39O

July 1, 1981, updated October 2016

M.G.L. c. 30, § 39R. Award of Contracts; Accounting Statements; Annual Financial Statements; Definitions.

(a) The words defined herein shall have the meaning stated below whenever they appear in this section:

(1) “Contractor" means any person, corporation, partnership, joint venture, sole proprietorship, or other entity awarded a contract pursuant to sections thirty-eight A1/2 to thirty-eight O, inclusive, of chapter seven and any contract awarded or executed pursuant to section eleven C of chapter twenty-five A, section thirty-nine M of chapter thirty, or sections forty-four A to forty-four H, inclusive, of chapter one hundred and forty-nine, which is for an amount or estimated amount greater than one hundred thousand dollars.

(2) "Contract" means any contract awarded or executed pursuant to sections thirty-eight A1/2 to thirty-eight O, inclusive, of chapter seven and any contract awarded or executed pursuant to section eleven C of chapter twenty-five A, section thirty-nine M of chapter thirty, or sections forty-four A through forty-four H, inclusive, of chapter one hundred and forty-nine, which is for amount or estimated amount greater than one hundred thousand dollars.

(3) “Records" means books of original entry, accounts, checks, bank statements and all other banking documents, correspondence, memoranda, invoices, computer printouts, tapes, discs, papers and other documents or transcribed information of any type, whether expressed in ordinary or machine language.

(4) “Independent Certified Public Accountant" means a person duly registered in good standing and entitled to practice as a certified public accountant under the laws of the place of his residence or principal office and who is in fact independent. In determining whether an accountant is independent with respect to a particular person, appropriate consideration should be given to all relationships between the accountant and that person or any affiliate thereof. Determination of an accountant's independence shall not be confined to the relationships existing in connection with the filing of reports with the awarding authority.

(5) “Audit", when used in regard to financial statements, means an examination of records by an independent certified public accountant in accordance with generally accepted accounting principles and auditing standards for the purpose of expressing a certified opinion thereon, or, in the alternative, a qualified opinion or a declination to express an opinion for stated reasons.

(6) "Accountant's Report", when used in regard to financial statements, means a document in which an independent certified public accountant indicates the scope of the audit which he has made and sets forth his opinion regarding the financial statements taken as a whole with a listing of noted exceptions and qualifications, or an assertion to the effect that an overall opinion cannot be expressed. When an overall opinion cannot be expressed the reason therefor shall be stated. An accountant's report shall include as a part thereof a signed statement by the responsible corporate officer attesting that management has fully disclosed all material facts to the independent certified public accountant, and that the audited financial statement is a true and complete statement of the financial condition of the contractor.

(7) “Management", when used herein, means the chief executive officers, partners, principals or other person or persons primarily responsible for the financial and operational policies and practices of the contractor.

(8) Accounting terms, unless otherwise defined herein, shall have a meaning in accordance with generally accepted accounting principles and auditing standards.

(b) Subsection (a)(2) hereof notwithstanding, every agreement or contract awarded or executed pursuant to sections thirty-eight A 1/2 to thirty-eight O, inclusive, of chapter seven, or eleven C of chapter twenty-five A, and pursuant to section thirty-nine M of chapter thirty or to section forty-four A through H, inclusive, of chapter one hundred and forty-nine, shall provide that:

(1) The contractor shall make, and keep for at least six years after final payment, books, records, and accounts which in reasonable detail accurately and fairly reflect the transactions and dispositions of the contractor, and

(2) Until the expiration of six years after final payment, the office of inspector general, and the commissioner of capital asset management and maintenance shall have the right to examine any books, documents, papers or records of the contractor or of his subcontractors that directly pertain to, and involve transactions relating to, the contractor or his subcontractors, and

(3) If the agreement is a contract as defined herein, the contractor shall describe any change in the method of maintaining records or recording transactions which materially affect any statements filed with the awarding authority, including in his description the date of the change and reasons therefor, and shall accompany said description with a letter from the contractor's independent certified public accountant approving or otherwise commenting on the changes, and

(4) If the agreement is a contract as defined herein, the contractor has filed a statement of management on internal accounting controls as set forth in paragraph (c) below prior to the execution of the contract, and

(5) If the agreement is a contract as defined herein, the contractor has filed prior to the execution of the contracts and will continue to file annually, an audited financial statement for the most recent completed fiscal year as set forth in paragraph (d) below.

(c) Every contractor awarded a contract shall file with the awarding authority a statement of management as to whether the system of internal accounting controls of the contractor and its subsidiaries reasonably assures that:

(1) transactions are executed in accordance with management's general and specific authorization;

(2) transactions are recorded as necessary

i. to permit preparation of financial statements in conformity with generally accepted accounting principles, and

ii. to maintain accountability for assets;

(3) access to assets is permitted only in accordance with management's general or specific authorization; and

(4) the recorded accountability for assets is compared with the existing assets at reasonable intervals and appropriate action was taken with respect to any difference.

Every contractor awarded a contract shall also file with the awarding authority a statement prepared and signed by an independent certified public accountant, stating that he has examined the statement of management on internal accounting controls, and expressing an opinion as to:

(1) whether the representations of management in response to this paragraph and paragraph (b) above are consistent with the result of management's evaluation of the system of internal accounting controls; and

(2) whether such representations of management are, in addition, reasonable with respect to transactions and assets in amounts which would be material when measured in relation to the applicant's financial statements.

(d) Every contractor awarded a contract by the commonwealth or by any political subdivision thereof shall annually file with the commissioner of capital asset management and maintenance during the term of the contract a financial statement prepared by an independent certified public accountant on the basis of an audit by such accountant. The final statement filed shall include the date of final payment. All statements shall be accompanied by an accountant's report. Such statements shall be made available to the awarding authority upon request.

(e) The office of inspector general, the commissioner of capital asset management and maintenance and any other awarding authority shall enforce the provisions of this section. The commissioner of capital asset management and maintenance may after providing an opportunity for the inspector general and other interested parties to comment, promulgate pursuant to the provisions of chapter thirty A such rules, regulations and guidelines as are necessary to effectuate the purposes of this section. Such rules, regulations and guidelines may be applicable to all awarding authorities. A contractor's failure to satisfy any of the requirements of this section may be grounds for debarment pursuant to section forty-four C of chapter one hundred and forty-nine.

(f) Records and statements required to be made, kept or filed under the provisions of this section shall not be public records as defined in section seven of chapter four and shall not be open to public inspection; provided, however, that such records and statements shall be made available pursuant to the provisions of clause (2) of paragraph (b).

M.G.L. c. 30, § 39O: Suspension, Delay, or Interruption or Failure to Act by Awarding Authority; Adjustment in Contract Price; Submission of Claims.

Section 39O. Every contract subject to the provisions of section thirty-nine M of this chapter or subject to section forty-four A of chapter one hundred forty-nine shall contain the following provisions (a) and (b) in their entirety and, in the event a suspension, delay, interruption or failure to act of the awarding authority increases the cost of performance to any subcontractor, that subcontractor shall have the same rights against the general contractor for payment for an increase in the cost of his performance as provisions (a) and (b) give the general contractor against the awarding authority, but nothing in provisions (a) and (b) shall in any way change, modify or alter any other rights which the general contractor or the subcontractor may have against each other.

(a) The awarding authority may order the general contractor in writing to suspend, delay, or interrupt all or any part of the work for such period of time as it may determine to be appropriate for the convenience of the awarding authority; provided however, that if there is a suspension, delay or interruption for fifteen days or more or due to a failure of the awarding authority to act within the time specified in this contract, the awarding authority shall make an adjustment in the contract price for any increase in the cost of performance of this contract but shall not include any profit to the general contractor on such increase; and provided further, that the awarding authority shall not make any adjustment in the contract price under this provision for any suspension, delay, interruption or failure to act to the extent that such is due to any cause for which this contract provides for an equitable adjustment of the contract price under any other contract provisions.

(b) The general contractor must submit the amount of a claim under provision (a) to the awarding authority in writing as soon as practicable after the end of the suspension, delay, interruption or failure to act and, in any event, not later than the date of final payment under this contract and, except for costs due to a suspension order, the awarding authority shall not approve any costs in the claim incurred more than twenty days before the general contractor notified the awarding authority in writing of the act or failure to act involved in the claim.

NOTICE OF AVAILABILITY

The STANDARD SPECIFICATIONS FOR HIGHWAYS AND BRIDGES dated 2025, the SUPPLEMENTAL SPECIFICATIONS, the 1990 STANDARD DRAWINGS FOR SIGNS AND SUPPORTS; the 1968 STANDARD DRAWINGS FOR TRAFFIC SIGNALS AND HIGHWAY LIGHTING and the CONSTRUCTION STANDARD DETAILS are available online at https://www.mass.gov/massdot-highway-division-manuals-and-publications

SPECIAL PROVISIONS FOR RIGHT-TO-KNOW ACT REQUIREMENTS

The Contractor's attention is directed to Massachusetts General Laws, Chapter 111F, commonly known as the Right-To-Know Act, and to the regulations promulgated pursuant thereto. Among the provisions of the Right-To-Know Act is a requirement that employers make available to employees Materials Safety Data Sheets (MSDS) for any substance on the Massachusetts Substance List (MSL) to which employees are, have been, or may be exposed.

To ensure prompt compliance with these regulations and legislation, the Contractor shall:

1. Deliver to the Department, prior to the start of any work under this contract, copies of MSDS for all MSL substances to be used, stored, processed or manufactured at the worksite by the Contractor.

2. Train employees of the Department, who may be exposed to MSL substances as a result of the Contractor's work under this contract, with regard to those specific substances in accordance with requirements of the Right-To-Know Act.

3. Observe all safety precautions recommended on the MSDS for any MSL substance to be used, stored, processed, or manufactured at the worksite by the Contractor.

4. Inform the Department in writing regarding specific protective equipment recommended in the MSDS for MSL substances to which employees of the Department may be exposed as a result of the Contractor's work under this contract.

The Department shall not be liable for any delay or suspension of work caused by the refusal of its employees to perform any work due to the Contractor's failure to comply with the Right-To-Know Act. The Contractor agrees to hold the Department or the Commissioner of the Department harmless and fully indemnified for any and all claims, demands, fines, actions, complaints, and causes of action resulting from or arising out of the Contractor's failure to comply with the requirements of the Right-To-Know Act.

ALTERNATIVE DISPUTE RESOLUTION
Forum, Choice of Law and Mediations:

Any actions arising out of a contract shall be governed by the laws of Massachusetts and shall be brought and maintained in a State or federal court in Massachusetts which shall have exclusive jurisdiction thereof. MassDOT and the Contractor may both agree to mediation of any claim and will share the costs of such mediation pro rata based on the number of parties involved.

DOCUMENT 00715

SUPPLEMENTAL SPECIFICATIONS

JUNE 30, 2025

The 2025 *Standard Specifications for Highways and Bridges* are amended by the following modifications, additions and deletions. These Supplemental Specifications prevail over those published in the Standard Specifications.

The Specifications Committee has issued these Supplemental Specifications for inclusion into each proposal until such time as they are updated or incorporated into the next Standard Specifications.

Contractors are cautioned that these Supplemental Specifications are dated and will change as they are updated.

DIVISION I

GENERAL REQUIREMENTS AND COVENANTS

SECTION 2.00: PROPOSAL REQUIREMENTS AND CONDITIONS

Subsection 2.09: Rejection of Proposals
Replace the first bullet in the third paragraph with the following:

- award of the contract would result in the Bidder exceeding the Aggregate Bonding Capacity or the Single Bonding Capacity established by its Surety Company, or the Bidder's Proposal exceeds its Single Contract Limit, or the Bidder was not prequalified in the specified class of work on or before the time of bid opening; or

SECTION 7.00: LEGAL RELATIONS AND RESPONSIBILITY TO PPUBLIC

Subsection 7.05: Insurance Requirements
Change the title of paragraph A to Workers' Compensation Insurance

Subsection 7.22: Labor, Lodging, Board, Maximum Hours of Employment, Weekly Payment, Keeping of Payroll Records.
In the second paragraph replace the word "workman" to "worker" and the word "workmen" to "workers".

Replace the third paragraph with the following:

Attention of Bidders is called to MGL Chapter 149, Section 148 requiring the weekly payment of employee wages.

SECTION 9.00: MEASUREMENT AND PAYMENT

Subsection 9.03: Payment for Extra Work

Replace paragraph B., first paragraph, numbers (2) and (3) with the following.

(2) Plus 13 percent of direct labor, for the estimated costs of Federal Insurance Contribution Act (FICA) including Medicare; Federal Unemployment Tax Act (FUTA); State Unemployment Tax Act (SUTA), which includes Unemployment Insurance, the Workforce Training Fund Program,-Employer Medical Assistance Contribution, and COVID-19 Recovery Assessment; Earned Sick Time (EST) Law (940 CMR 33.00); and Paid Family and Medical Leave (PFML) Act (458 CMR 2.00); or, as an alternative to the above 13 percent, the Contractor may elect to use actual rates for FICA, FUTA, SUTA, EST and PFML provided the actual rates are supported with verifiable documentation and shall be subject to review by MassDOT Audit Operations.

(3) Plus the estimated cost of Workers' Compensation and Liability Insurance, Health, Welfare and Pension benefits, and such additional fringe benefits which the Contractor is required to pay as a result of Union Labor Agreements and/or is required by authorized governmental agencies;

In paragraph B., second paragraph, number (3), replace the word "Workmen's" with "Workers'".

DIVISION II

CONSTRUCTION DETAILS

SECTION 300: WATER SYSTEMS

SUBSECTION 301: WATER SYSTEMS

Subsection 301.60G: Laying Pipe
Revise the third paragraph to read as follows:

Pipe sections shall be laid with the bell on the upgrade end. Before laying the pipe, the outside of the spigot and the inside of the bell shall be wire brushed and wiped clean and dry.

Subsection 301.80: Method of Measurement
Delete the words cast iron in the first paragraph.

Replace the second paragraph with the following:

Fittings, consisting of bends, tees, caps, wyes, sleeves, reducers, increasers, blow-off fittings and other special fittings, apply only when new materials are necessary and which are not specifically provided for under other items in the Proposal. Fittings other than new will not be paid separately but only under the applicable pipe items. When new fittings are measured separately for payment, the length of pipe occupied by the fittings will not be measured for payment.

SECTION 800: TRAFFIC CONTROL DEVICES

SUBECTION 850: TRAFFIC CONTROLS FOR CONSTRUCTION AND MAINTENANCE OPERATIONS

Subsection 850.29: Temporary Barrier and Temporary Barrier Removed and Reset
Delete this subsection.

Subsection 850.49: Temporary Barrier
Delete this subsection.

Subsection 850.69: Temporary Barrier and Temporary Barrier Removed and Reset
Delete this subsection.

Subsection 850.80: Method of Measurement
Delete the fifth paragraph from the end of this subsection.

Subsection 850.81: Basis of Payment
Delete the sixth and seventh paragraphs from the end of this subsection.

SUBECTION 853: TEMPORARY BARRIER

Subsection 853.: Temporary Barrier
Add this new subsection:

DESCRIPTION

853.20: General

Work under this Subsection consists of furnishing, placing, adjusting, resetting, maintaining, and removing temporary barrier.

MATERIALS

853.40: General

Materials shall meet the requirements specified in the following Subsections of Division III, Materials:

Material	Section
Precast, Prestressed, and Prefabricated Concrete Products	M4.09.0
Temporary Barrier	M10.16.0
Limited Deflection Temporary Barrier	M10.16.1
Delineators for Temporary Barrier	M10.16.2

The Contractor shall supply a temporary barrier system that meets or exceeds the Test Level (TL) designated in the description of the bid item.

If the Contractor uses a proprietary temporary barrier system, it shall be listed on the QTCE.

Temporary barrier segments that appear to be damaged or in otherwise unsuitable condition may be rejected or ordered to be replaced by the Engineer at no additional cost.

853.41: Deflection

The deflection of a temporary barrier system is defined as the measured deflection, permanent and/or dynamic, during MASH Test Designation 2-11 (for TL-2) or Test Designation 3-11 (for TL-3).

The Contractor shall supply a temporary barrier system that is equal to or less than the maximum allowable deflection (permanent and/or dynamic) for each run of temporary barrier, as shown in the Plans or stated in the Special Provisions. If no distinction between permanent and temporary deflection is shown in the plans or Special Provisions, then dynamic deflection shall govern.

853.42: Precast Concrete Barriers

Precast Concrete Barriers used as temporary barriers shall be fabricated in accordance with M4.09.0: Precast, Prestressed, and Prefabricated Concrete Products. The Contractor shall submit a Certificate of Compliance (CoC) attesting to meeting this requirement.

853.43: Delineation

Delineators installed at 20-ft intervals throughout the entire barrier run shall be included. The delineators shall conform to M10.16.2: Delineators for Temporary Barrier. Delineators that may act as a washer on a bolted connection shall not be used unless specifically allowed by the barrier manufacturer. Delineators that are damaged, are no longer reflective, or go missing while temporary barrier is deployed shall be replaced in kind by the Contractor.

Delineators may be top or side-mounted to the barrier and oriented in a manner to maximize reflectivity to approaching traffic.

Temporary barrier placed on the right side of the travel way, or top-mounted and separating two or more lanes traveling in the same direction, shall use white delineators. Temporary barrier placed on the left side of the travel way shall use amber or yellow delineators; if separating two-way traffic and top-mounted, the delineator shall be double-sided.

853.44: Anchored Barrier

Temporary barrier systems that include an anchor system in order to meet performance requirements of the contract and/or meet MASH testing requirements may be accepted for use at the discretion of the Department.

Barrier that utilizes an anchor system shall use the same pattern, placement, and material of anchors that was used in MASH crash testing.

853.45: Shop Drawings

Within 30 days of the Notice to Proceed, the Contractor shall provide Shop Drawings showing the proposed temporary barrier system and confirming that it conforms to 853.40: General and will meet the allowable deflection requirements as described in 853.41: Deflection.

If anchors are proposed, the means, methods, pattern, placement, and materials for anchoring and subsequent pavement and/or deck repairs following removal of the temporary barrier system shall be included in the Shop Drawing submittal. If the use of an anchor system is rejected by the Department, the Contractor shall select an unanchored system that meets or exceeds the contract specified performance requirements, at no additional cost.

Shop Drawings for proprietary barrier systems shall include manufacturer's instructions for installation.

CONSTRUCTION METHODS

853.60: General

A Traffic Management Plan approved by the Department is required prior to the installation of the temporary barrier system.

The Contractor shall install temporary barrier systems in accordance with the Plans.

Barrier ends shall not be exposed to approaching traffic during installation. Crashworthy shielding or attenuation shall be provided at all times.

Proprietary temporary barrier systems shall be installed per the manufacturer's instructions.

The Contractor shall not place any breaks in the temporary barrier system that will result in sections that are shorter than the tested minimum length-of-need (LON) under MASH Test 2-11 (for TL-2) or 3-11 (for TL-3). Exceptions shall be allowed for gate systems or changeable length segments placed over expansion joints, if those barrier segment types have been determined to be crashworthy per MASH.

Temporary barrier shall not be placed on unpaved surfaces, unless otherwise shown in the Plans.

The Contractor shall not store materials, vehicles, or other equipment within the measured dynamic deflection envelope, as defined in 853.41: Deflection.

853.61: Temporary Barrier Removed and Reset

Temporary Barrier Removed and Reset consists of relocating a string of temporary barrier from one alignment to another to support the sequence and phasing of construction, as shown in the Plans.

Temporary Barrier Removed and Reset does not include moving all or a portion of the temporary barrier system to gain access to a work area, for the convenience of the Contractor, or to realign units that have moved due to construction activities or a traffic incident.

853.62: Quality Control Inspection

After temporary barrier installation is completed, the Contractor shall perform a Quality Control (QC) Inspection in the presence of the Engineer. QC Inspection activities shall include, but are not limited to the following reviews:

- Installation location per the approved Plans.
- Alignment and connection mechanism between adjacent barrier segments.
- Alignment and connection mechanism between barrier segment and attenuator, if present.
- Anchor system installation, if present.

For proprietary barrier systems, the QC Inspection shall also include any manufacturer-specific inspection details or criteria found in the installation instructions.

Work behind the barrier shall not commence until the QC Inspection has been accepted by the Engineer.

COMPENSATION

853.80: Method of Measurement

Temporary Barrier will be measured by the foot installed, in place.

Temporary Barrier Removed and Reset will be measured by the foot removed and reset.

853.81: Basis of Payment

Temporary Barrier will be paid for at the contract unit price per foot which shall provide full compensation for fabrication, storage, transport, furnishment, installation, delineation, alignment, maintenance, repair, and final removal of the temporary barrier.

Temporary Barrier Removed and Reset will be paid for at the contract unit price per foot which shall provide full compensation for removing, relocating, transporting, and installing new anchorage (if used). If more than one accepted temporary barrier system is approved for use in a single contract, the unit cost for Temporary Barrier Removed and Reset shall not differ among systems.

All costs associated with fabrication, installation, and maintenance of temporary barrier delineators shall be considered incidental to the cost of the item.

All costs associated with Shop Drawings and COCs shall be considered incidental to the item.

All costs associated with patching or repairing the road surface or bridge deck due to the installation and removal of temporary barrier and/or anchors for a temporary barrier system shall be considered incidental to the cost of the item.

853.82: Payment Items

Item number	Description	Unit
853.2	Temporary Barrier (TL-2)	Foot
853.21	Temporary Barrier Removed and Reset	Foot
853.23	Temporary Barrier (TL-3)	Foot
853.33	Temporary Barrier – Limited Deflection (TL-3)	Foot

SECTION 900: STRUCTURES

SUBECTION 902: ULTA HIGH PERFORMANCE CONCRETE

Subsection 902.32: Mockup
In Table 902.32-1 change the Link Slab width to 2 ft – 0 in. and change the Joint Header width to 0 ft – 6 in.

Subsection 902.32: - 902.38
Renumber section 902.32 Surface Preparation to 902.33 Surface Preparation and renumber section 902.33 through 902.38 to 902.34 through 902.39.

DIVISION III

MATERIALS SPECIFICATIONS

SECTION M2: AGGREGATES AND RELATED MATERIALS

Subsection M2.01.0 Crushed Stone
Replace the fourth paragraph and the associated asterisk notes with the following;

The crushed stone shall have a maximum 45% wear as determined by the Los Angeles Abrasion Test (AASHTO T 96)

SECTION M5: PIPE, CULVERT SECTIONS AND CONDUIT

Subsection M5.01.0 Joint Materials for Pipe
Replace this subsection with the following:

- Jute or oakum furnished for use in pipe joints shall be of an accepted grade approved for common usage.
- Mortar shall conform to the requirements of M4.04.0: Cementitious Grout, Mortar and Concrete Products
- Standard couplers as approved by the manufacturer shall be used to join corrugated metal pipe
- Rubber ring or plastic gaskets for concrete pipe joints, or manholes section joints shall be of tough, flexible, chemical-resistant material, and of such size and shape as to ensure satisfactory pipe joints when incorporated in the work and shall conform to AWWA C153.
- Rubber gasket joints for ductile iron pipe shall be Styrene-Butadiene Rubber (SBR), Ethylene Propylene Diene Monomer (EPDM) or Nitrile and conform to AWWA C111

Subsection M5.05.03.B Gate Valves
Replace this subsection with the following:

Gate valves shall conform to the requirements of AWWA Standard C500 and/or to the type used by the municipality as specified in the Special Provisions.

SECTION M7: PAINTS, PROTECTIVE COATINGS AND PAVEMENT MARKINGS

Subsection M7.01.04 Fast Drying White and Yellow Waterborne Traffic Paint
Replace the subsection with the following:

Approved waterborne traffic paint shall be tested in accordance with AASHTO M 348 and be listed on the QCML The dry paint film shall be under the Toxicity Characteristic Leaching Procedure (TCLP) limits for all contaminants listed in 40 CFR 261.24. The markings shall be installed using reflective glass beads meeting the requirements of M7.01.07. For waterborne yellow paint use Organic Yellow No. 65 or No. 75 pigment.

SECTION M9: MISCELLANEOUS MATERIALS

Subsection M9.12.0 Reflectors for Barriers
Delete this subsection.

SECTION M10: TRAFFIC CONTROL DEVICES

Subsection M10.16.0: Temporary Barrier
Subsection M10.16.1: Limited Deflection Temporary Barrier
Subsection M10.16.2: Delineators for Temporary Barrier
Add these new subsections.

M10.16.0: Temporary Barrier

All Temporary Barrier shall be tested to MASH crash testing standards and the results of the following crash test designations must fall within the acceptable impact tolerances and evaluation criteria shown in Table 2-2A of MASH:

- Test Level 2: 2-10, 2-11
- Test Level 3: 3-10, 3-11

M10.16.1: Limited Deflection Temporary Barrier

To be classified as a Limited Deflection Temporary Barrier, the results of MASH Test Designation 3-11 must result in a measured dynamic deflection of 24 in. or less.

M10.16.2: Delineators for Temporary Barrier

Delineators for Temporary Barrier shall consist of a housing, retroreflective material, and an adhesive or mechanical fastener.

Housings for Delineators for Temporary Barrier shall be fabricated from a lightweight polymer material. Metal housings shall not be permitted.

Retroreflection shall be achieved using an acrylic reflector or retroreflective sheeting directly applied to the housing. If used, retroreflective sheeting shall be factory applied and conform to ASTM D4956 Type IV, Type V, or Type IX. A minimum of 8 $in.^2$ of reflective material shall be visible on any traffic-facing portion of the delineator.

Delineators shall be attached to temporary barriers using a manufacturer-approved adhesive or mechanical fastener.

POLICY

The Massachusetts Department of Transportation (MassDOT) receives Federal financial assistance from the Federal Highway Administration (FHWA), United States Department of Transportation (U.S. DOT), and as a condition of receiving this assistance, has signed an assurance that it will comply with 49 CFR Part 26 (Participation By Disadvantaged Business Enterprises In Department Of Transportation Financial Assistance Programs). The U.S. DOT Disadvantaged Business Enterprise Program is authorized by the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users ("SAFETEA-LU"), as amended, at Title 23, United States Code, § 1101.

Accordingly, MassDOT has established a Disadvantaged Business Enterprise (DBE) Program in accordance with 49 CFR Part 26. It is the policy of MassDOT to ensure that DBEs have an equal opportunity to receive and participate in U.S. DOT assisted Contracts, without regard to race, color, national origin, or sex. To this end, MassDOT shall not directly, or through contractual or other arrangements, use criteria or methods of administration that have the effect of defeating or substantially impairing accomplishment of the program objectives stated below:

- To ensure nondiscrimination in the award and administration of U.S. DOT assisted Contracts;
- To create a level playing field on which DBEs can compete fairly for U.S. DOT assisted Contracts;
- To ensure that the DBE Program is narrowly tailored in accordance with applicable law;
- To ensure that only firms that fully meet 49 CFR Part 26 eligibility standards are permitted to participate as DBEs;
- To help remove barriers to the participation of DBEs in U.S. DOT assisted Contracts; and
- To assist the development of firms that can compete successfully in the market place outside the DBE Program.

The Director of Civil Rights of MassDOT has been designated as the DBE Liaison Officer. The DBE Liaison Officer is responsible for implementing all aspects of the DBE Program. Other MassDOT employees are responsible for assisting the Office of Civil Rights in carrying out this obligation. Implementation of the DBE Program is accorded the same priority as compliance with all other legal obligations incurred by MassDOT in its financial assistance agreements with each operating administration of the U.S. DOT. Information on the Federal requirements and MassDOT's policies and information can be found at:

1. DEFINITIONS

As used in these provisions, the terms set out below are defined as follows:

"Broker", for purposes of these provisions, shall mean a DBE Entity that has entered into a legally binding relationship to provide goods or services delivered or performed by a third party. A broker may be a DBE Entity that arranges or expedites transactions but performs no work or installation services.

"Contractor", "General" or "Prime" Contractor, "Bidder," and "DB Entity" shall mean a person, firm, or other entity that has contracted directly with MassDOT to provide contracted work or services.

"Contract" shall mean the Contract for work between the Contractor and MassDOT.

"DBB" or "Design-Bid-Build" shall mean the traditional design, bid and project delivery method consisting of separate contracts between awarding authority and a designer resulting in a fully designed project; and a separate bidding process and Contract with a construction Contractor or Bidder.

"DB" or "Design-Build" shall mean an accelerated design, bid and project delivery method consisting of a single contract between the awarding authority and a DB Entity, consisting of design and construction companies that will bring a project to full design and construction.

"Disadvantaged Business Enterprise" or "DBE" shall mean a for-profit, small business concern:

(a) that is at least fifty-one (51%) percent owned by one or more individuals who are both socially and economically disadvantaged, or, in the case of any corporation, in which at least fifty-one (51%) percent of the stock is owned by one or more such individuals; and

(b) where the management and daily business operations are controlled by one or more of the socially and economically disadvantaged individuals who own it.

"FHWA" shall mean the Federal Highway Administration," an agency within U.S. DOT that supports State and local governments in the design, and maintenance of the Nation's highway system (Federal Aid Highway Program).

"Good faith efforts" shall mean efforts to achieve a DBE participation goal or other requirement of these Special Provisions that, by their scope, intensity, and appropriateness to the objective, can reasonably be expected to fulfill the program requirement. Such efforts must be deemed acceptable by MassDOT.

"Joint Venture" shall mean an association of a DBE firm and one or more other firms to carry out a single, for-profit business enterprise, for which the parties combine their property, capital, efforts, skills and knowledge, and in which the DBE is responsible for a distinct, clearly defined portion of the work of the Contract and whose share in the capital contribution, control, management, risks, and profits of the joint venture are commensurate with its ownership interest.

"Approved Joint Venture" shall mean a joint venture, as defined above, which has been approved by MassDOT's Prequalification Office and Office of Civil Rights for DBE participation on a particular Contract.

"Manufacturer" shall mean a firm that operates or maintains a factory or establishment that produces, on the premises, the materials, supplies, articles or equipment required under the contract and of the general character described by the specifications.

"Regular Dealer" shall mean a DBE firm that owns, operates, or maintains a store, warehouse, or other establishment in which materials, supplies, articles or equipment of the general character described by the specifications and required under the Contract are bought, kept in stock, and regularly sold or leased to the public in the usual course of business.

(a) To be a regular dealer, the firm must be an established, regular business that engages, as its principal business, and under its own name, in the purchase and sale of the products in question.

(b) A person may be a regular dealer in such bulk items as petroleum products, steel, cement, gravel, stone, or asphalt without owning, operating, or maintaining a place of business as provided above if the person both owns and operates distribution equipment for the products. Any supplementing of regular dealers' own distribution equipment shall be by long term lease agreement and not on an ad hoc or contract by contract basis.

(c) Packagers, brokers, manufacturers' representatives, or other persons who arrange or expedite transactions are not regular dealers within the meaning of this definition.

"Responsive" and "Responsible" refers to the bidder's submittal meeting all of the requirements of the advertised request for proposal. The term responsible refers to the ability of the Contractor to perform the work. This ability can be determined prior to bid invitations.

"Small Business or Small Business Concern" shall mean a small business concern or company as defined in Section 3 of the Small Business Act and SBA regulations implementing it (13 CFR Part 121); and is a business that does not exceed the cap on annual average gross receipts established by the U.S. Secretary of Transportation pursuant to 49 CFR Part 26.65; see also 49 CFR Part 26.39.

"SDO" shall mean the Massachusetts Supplier Diversity Office, formerly known as the State Office of Minority and Women Business Assistance (SOMWBA). In 2010, SOMWBA was abolished and the SDO was established. *See* St. 2010, c. 56. The SDO has assumed all the functions of SOWMBA. SDO is an agency within the Commonwealth of Massachusetts Executive office of Administration and Finance (ANF) Operational Services Division (OSD). The SDO mandate is to help promote the development of business enterprises and non-profit organizations owned and operated by minorities and women.

"Socially and economically disadvantaged individuals" shall mean individuals who are citizens of the United States (or lawfully admitted permanent residents) and who are:

(a) Individuals found by SDO to be socially and economically disadvantaged individuals on a case by case basis.

(b) Individuals in the following groups, members of which are rebuttably presumed to be socially and economically disadvantaged:

(1) "Black Americans" which includes persons having origin in any of the Black racial groups of Africa; (2) "Hispanic Americans" which include persons of Mexican, Puerto Rican, Cuban, Dominican, Central or South American, or other Spanish or Portuguese culture or origin, regardless of race; (3) "Native Americans" which include persons who are American Indians, Eskimos, Aleuts, or Native Hawaiians; (4) "Asian Pacific Americans" which includes persons whose origins are from Japan, China, Taiwan, Korea, Burma (Myanmar), Vietnam, Laos, Cambodia (Kampuchea), Thailand, Malaysia, Indonesia, the Philippines, Brunei, Samoa, Guam, the U.S. Trust Territories of the Pacific Islands (Republic of Palau), the Commonwealth of the Northern Marianas Islands, Macao, Fiji, Tonga, Kiribati, Tuvalu, Nauru, Federated States of Micronesia, or Hong Kong; (5) "Subcontinent Asian Americans" which includes persons whose origins are from India, Pakistan, Bangladesh, Bhutan, the Maldives Islands, Nepal or Sri Lanka; (6) Women; or (7) Any additional groups whose members are designated as socially and economically disadvantaged by the Small Business Administration (SBA), at such time as the SBA designation becomes effective.

Other terms and definitions applicable to the U.S. DOT DBE Program may be found at 49 CFR Part 26 and related appendices and guidance pages.

2. DBE PARTICIPATION

a. Goal

On this Contract, MassDOT has established the following goal(s) for participation by firms owned and controlled by socially and economically disadvantaged persons. At least half of the goal must be met in the form of DBE Subcontractor construction activity as opposed to material supplies or other services. The applicable goal remains in effect throughout the life of the contract regardless of whether pre-identified DBE Subcontractors remain on the Project or under Contract.

☒ Design-Bid-Build Projects: DBE Participation Goal **0 %**
(*One half of this goal shall be met in the form of Subcontractor construction activity*)

☐ Design-Build Projects: DBE Design Participation Goal ____**%** and DBE Construction Participation Goal **%**
(One half of the Construction Goal shall be met in the form of Subcontractor construction activity)

b. Bidders List

Pursuant to the provisions of 49 CFR Part 26.11(c), Recipients such as MassDOT, must collect from all Bidders who seek work on Federally assisted Contracts the firm full company name(s), addresses and telephone numbers of all firms that have submitted bids or quotes to the Bidders in connection with this Project. All bidders should refer to the Special Provision Document "A00801" of the Project proposal for this requirement.

In addition, MassDOT must provide to U.S. DOT, information concerning contractors firm status as a DBE or non-DBE, the age of the firm, and the annual gross receipts of the firm within a series of brackets (e.g., less than $500,000; $500,000–$1 million; $1–2 million; $2–5 million, etc.). The status, firm age, and annual gross receipt information will be sought by MassDOT regularly prior to setting its DBE participation goal for submission to U.S. DOT. MassDOT will survey each individual firm for this information directly.

Failure to comply with a written request for this information within fifteen (15) business days may result in the suspension of bidding privileges or other such sanctions, as provided for in Section 9 of this provision, until the information is received.

3. CONTRACTOR ASSURANCES

No Contractor or any Subcontractor shall discriminate on the basis of race color, national origin, or sex in the performance of this contract. The Contractor shall carry out applicable requirements of 49 CFR Part 26 in all respects and as applicable prior to, or subsequent to, award of U.S. DOT assisted Contracts. The Contractor agrees to affirmatively seek out and consider DBE firms as Contractors, Subcontractors, and/or suppliers of materials and services for this Contract. No Contract will be approved until MassDOT has reviewed Bidders'/Contractors' affirmative actions concerning DBEs. Failure to carry out these requirements is a material breach of this Contract which may result in the termination of the Contract or such other remedy as MassDOT or FHWA deem appropriate.

4. REQUIRED SUBCONTRACT PROVISIONS

The Prime Contractor shall include the provisions of Section 3 above in every subcontract, making those provisions binding on each Subcontractor; in addition, the Prime Contractor shall include a copy of this Special Provision, in its entirety, in every subcontract with a DBE firm which is, or may be, submitted for credit toward the Contract participation goal.

5. ELIGIBILITY OF DBES

Only firms that have been certified by SDO and confirmed by MassDOT as eligible in accordance with 49 CFR Part 26 to participate as DBEs on federally aided MassDOT Contracts may be used on this Contract for credit toward the DBE participation goal.

a. Massachusetts DBE Directory

MassDOT makes available to all bidders the most current Massachusetts Disadvantaged Business Enterprise Directory. This directory is made available for Contractors' convenience and is informational only. The Directory lists those firms that have been certified as eligible in accordance with the criteria of 49 CFR Part 26 to participate as DBEs on federally aided MassDOT contracts. The Directory also lists the kinds of work each firm is certified to perform but does not constitute an endorsement of the quality of performance of any business and does not represent MassDOT Subcontractor approval.

Contractors are encouraged to make use of the DBE Directory maintained by SDO on the Internet. This listing is updated daily and may be accessed at the SDO's website at:
https://www.diversitycertification.mass.gov/BusinessDirectory/BusinessDirectorySearch.aspx

b. DBE Certification

A firm must apply to SDO, currently acting as certification agent for MassDOT, for DBE certification to participate on federally aided MassDOT Contracts. A DBE application may be made in conjunction with a firm's application to SDO for certification to participate in state-funded minority and women business enterprise programs or may be for DBE certification only. An applicant for DBE certification must identify the area(s) of work it seeks to perform on U.S. DOT funded projects.

c. Joint Venture Approval

To obtain recognition as an approved DBE Joint Venture, the parties to the joint venture must provide to MassDOT's Office of Civil Rights and Prequalification Office, at least fourteen (14) business days before the bid opening date, an Affidavit of DBE/Non-DBE Joint Venture in the form attached hereto, and including, but not limited to the following:

1. a copy of the Joint Venture Agreement;
2. a description of the distinct, clearly defined portion of the contract work that the DBE will perform with its own forces; and,
3. all such additional information as may be requested by MassDOT for the purpose of determining whether the joint venture is eligible.

6. COUNTING DBE PARTICIPATION TOWARDS DBE PARTICIPATION GOALS

In order for DBE participation to count toward the Contract participation goal, the DBE(s) must have served a commercially useful function in the performance of the Contract and must have been paid in full for acceptable performance.

a. Commercially Useful Function

(1) In general, a DBE performs a commercially useful function when it is responsible for execution of the work of the contract and is carrying out its responsibilities by actually performing, managing, and supervising the work involved. With respect to materials and supplies used on the Contract, the DBE must be responsible for negotiating price, determining quality and quantity, ordering the material, installing (where applicable) and paying for the material itself.

(2) To determine whether a DBE is performing a commercially useful function, MassDOT will evaluate the amount of work subcontracted, industry practices, whether the amount the firm is to be paid under the Contract is commensurate with the work it is actually performing and the DBE credit claimed for its performance of the work, and other relevant factors.

(3) A DBE does not perform a commercially useful function if its role is limited to that of an extra participant in a transaction, contract, or project through which funds are passed in order to obtain the appearance of DBE participation. In determining whether a DBE is such an extra participant, MassDOT will examine similar transactions, particularly those in which DBEs do not participate.

b. Counting Participation Toward The Contract Participation Goal

DBE participation which serves a commercially useful function shall be counted toward the DBE participation goal in accordance with the Provisions of 49 CFR Part 26.55(a) to (h), as follows:

(1) When a DBE participates in a construction Contract, MassDOT will count the value of the work performed by the DBE's own forces. MassDOT will count the cost of supplies and materials obtained by the DBE for the work of its contract, including supplies purchased or equipment leased by the DBE. Supplies, labor, or equipment the DBE Subcontractor uses, purchases, or leases from the Prime Contractor or any affiliate of the Prime Contractor will not be counted.

(2) MassDOT will count the entire amount of fees or commissions charged by a DBE firm for providing bona fide services, such as professional, technical, consultant, or managerial services, or for providing bonds or insurance specifically required for the performance of a U.S. DOT assisted Contract, toward DBE participation goals, provided it is determined that the fee is reasonable and not excessive as compared with fees customarily allowed for similar services.

(3) When a DBE performs as a participant in a joint venture, MassDOT will count toward DBE participation goals a portion of the total dollar value of the contract that is equal to the distinct, clearly defined portion of the work of the Contract that the DBE performs with its own forces.

(4) MassDOT will use the following factors in determining whether a DBE trucking company is performing a commercially useful function:

(i) the DBE must be responsible for the management and supervision of the entire trucking operation for which it is responsible on a particular contract; there cannot be a contrived arrangement for the purpose of meeting DBE participation goals.

(ii) the DBE must itself own and operate at least one fully licensed, insured, and operational truck used on the Contract.

(iii) the Contractor will receive DBE credit for the total value of the transportation services the DBE provides on the Contract using trucks owned, insured, and operated by the DBE itself and using drivers the DBE employs alone.

(iv) the DBE may lease trucks from another DBE firm, including an owner-operator who is certified as a DBE. The Contractor who has a contract with a DBE who leases trucks from another DBE will receive credit for the total value of the transportation services of the lease.

(v) the DBE may also lease trucks from a non-DBE firm, including an owner-operator. The Contractor who has a Contract with a DBE who leases trucks from a non-DBE is entitled to credit for the total value of the transportation services provided by non-DBE lessees not to the exceed the value of transportation services provided by DBE-owned trucks on the Contract. Additional participation by non-DBE lessees receives credit only for the fee or commission it receives as a result of the lease arrangement, fee or commission it receives as a result of the lease arrangement. The DBE does not receive credit for the total value of the transportation services provided by the lessee, since these services are not provided by a DBE.

(vi) the lease must indicate that the DBE has exclusive use of, and control over, the truck. This does not preclude the leased truck from working for others during the term of the lease with the consent of the DBE, so long as the lease gives the DBE absolute priority for use of the leased truck. Leased trucks must display the name and identification number of the DBE.

(5) MassDOT will count the Prime Contractor's expenditures with DBEs for materials or supplies toward DBE participation goals as follows:

(i) if the materials or supplies are obtained from a DBE manufacturer, as defined in Section 1 above, MassDOT will count one hundred (100%) percent of the cost of the materials or supplies toward DBE participation goals, provided the DBE meets the other requirements of the regulations.

(ii) if the materials or supplies are purchased from a DBE regular dealer, as defined in Section 1 above, MassDOT will count sixty (60%) percent of the cost of the materials or supplies toward the Contract participation goal, provided the DBE meets the other requirements of the regulations.

(iii) for materials or supplies purchased from a DBE which is neither a manufacturer nor a regular dealer, MassDOT will count the entire amount of fees or commissions charged for assistance in the procurement of the materials and supplies, or fees or transportation charges for the delivery of materials or supplies required on a job site toward the Contract participation goal, provided that MassDOT determines the fees to be reasonable and not excessive as compared with fees customarily allowed for similar services; the cost of the materials and supplies themselves will not be counted; and provided the DBE meets the other requirements of the regulations.

c. Joint Check Policy

MassDOT recognizes that the use of joint checks may be a business practice required by material suppliers and vendors in the construction industry. A joint check is a two-party check issued by a/the Prime Contractor to a DBE third party such as a regular dealer of material or supplies. The Prime Contractor issues the check as payor to the DBE and the third party jointly as payees to guarantee payment to the third party for materials or supplies obtained or to be used by the DBE. FHWA has established criteria to ensure that DBEs are in fact performing a commercially useful function ("CUF") while using a joint check arrangement. Contractors and DBEs must meet and conform to these conditions and criteria governing the use of joint checks.

In the event that a Contractor or DBE Subcontractor desires to a use joint check, MassDOT will require prior notice and will closely monitor the arrangement for compliance with FHWA regulations and guidance. MassDOT may allow a joint check arrangement and give credit to a Contractor for use of the DBE where one or more of the following conditions exist:

- The use of a joint check is in fact required by this type of vendor or supplier as a standard industry practice that applies to all Contractors (DBEs and non-DBEs); or is required by a specific vendor or supplier;
- Payment for supplies or materials would be delayed for an unreasonably extended period without the joint check arrangement;
- The DBE (or any of its Subcontractors) has a pattern or history of not paying a vendor or supplier within a reasonable time or has not established enough of a credit history with the supplier or vendor; and/or
- The presence of severe adverse economic conditions, where credit resources may be limited and such practices may be necessary or required to effect timely payments.

Other factors MassDOT may consider:

- Whether there is a requirement by the Prime Contractor that a DBE should use a specific vendor or supplier to meet their Subcontractor specifications;
- Whether there is a requirement that a DBE use the Prime Contractor's negotiated price;
- The independence of the DBE;
- Whether approval has been sought prior to use of a joint check arrangement; and
- Whether any approved joint check arrangement has exceeded a reasonable period of use;
- The operation of the joint check arrangement; and
- Whether the DBE has made an effort to establish alternate arrangements for following periods (i.e., the DBE must show it can, or has, or why it has not, established or increased a credit line with the vendor or supplier).

Even with the use of a Joint Check, both the Contractor and DBE remain responsible for compliance with all other elements under 49 CFR § 26.55 (c) (1), and must still be able to prove that a commercially useful function is being performed for the Contractor.

d. Joint Check Procedure(s)

- The DBE advises its General or Prime Contractor that it will have to use a Joint Check and provide proof of such requirement.
- The General or the Prime Contractor submits a request for approval to MassDOT, using MassDOT's approved Joint Check Request form (Document B00855) and by notification on the DBE Letter of Intent (Document B00854), and any other relevant documents. Requests that are not initiated during the bid process should be made in writing and comply with the procedure.
- The MassDOT Office of Civil Rights will review the request and render a decision as part of the approval process for DBE Schedules and Letters of Intent.
- Review and Approval will be project specific and relevant documents will be made part of the project Contract file.
- Payments should be made in the name of both the DBE and vendor or supplier. Payments should be issued and signed by the Contractor as only the guarantor for prompt payment of purchases to the vendor or supplier. The payment to the vendor or supplier should be handled by the DBE (i.e. if possible, funds or the joint check should be processed by the DBE and sent by the DBE to the vendor or supplier).
- MassDOT may request copies of cancelled checks (front and back) and transmittal information to verify any payments made to the DBE and vendor or supplier.
- MassDOT may request other information and documents, and may ask questions of the Contractor, Subcontractor and vendor or supplier prior to, during, and after the project performance to ascertain whether the Subcontractor is performing a commercially useful function and all parties are complying with DBE Program policies and procedures as part of the Subcontractor approval process.

7. AWARD DOCUMENTATION AND PROCEDURES

a. The two lowest bidders/the two bidders with the lowest price per quality score point, shall submit, by the close of business on the third (3rd) business day after the bid opening, a completed Schedule of Participation by DBEs (Document B00853) which shall list:

(1) The full company name, address and telephone number of each DBE with whom the bidder intends to make a commitment.

(2) The contract item(s), by number(s) and quantity(ies), if applicable, or specific description of other business activity to be performed by each DBE as set forth in the Letters of Intent. The Bidder shall list only firms which have the capacity to perform, manage and supervise the work proposed in accordance with the requirements of 49 CFR Part 26 and Section **6.b** of these Special Provisions.

(3) The total dollar amount to be paid to each DBE. (Bidders are cautioned that at least one half of the participation goal must be met with construction activity work.)

(4) The total dollar amount to be paid to each DBE that is eligible for credit toward the DBE participation goal under the counting rules set out in Section **6.b**.

(5) The total creditable DBE participation as a percentage of the total bid price.

b. All firms listed on the Schedule must be currently certified.

c. The two lowest bidders/the two bidders with the lowest price per quality score point, shall each submit, with their Schedules of Participation, fully completed, signed Letters of Intent (Document B00854) from each of the DBEs listed on the Schedule. The Letters of Intent shall be in the form attached and shall identify specifically the contract activity the DBE proposes to perform, expressed as contract item number, if applicable, description of the activity, NAICS code, quantity, unit price and total price. In the event of discrepancy between the Schedule and the Letter of Intent, the Letter of Intent shall govern.

d. Evidence of good faith efforts will be evaluated by MassDOT in the selection of the lowest responsible bidder.

All information requested by MassDOT for the purpose of evaluating the Contractor's efforts to achieve the participation goal must be provided within three (3) calendar days and must be accurate and complete in every detail. The apparent low bidder's attainment of the DBE participation goal or a satisfactory demonstration of good faith efforts is a prerequisite for award of the Contract.

e. Failure to meet, or to demonstrate good faith efforts to meet, the requirements of these Special Provisions shall render a bid non-responsive. Therefore, in order to be eligible for award, the bidder (1) must list all DBE's it plans to employ on the Schedule of Participation; and provide the required Letters of Intent for, DBE participation which meets or exceeds the Contract goal in accordance with the terms of these Special Provisions or (2) must demonstrate, to the satisfaction of MassDOT, that good faith efforts were made to achieve the participation goal. MassDOT will adhere to the guidance provided in Appendix A to 49 CFR Part 26 on the determination of a Contractor's good faith efforts to meet the DBE participation goal(s) set forth in Section 2 herein.

f. If MassDOT finds that the percentage of DBE participation submitted by the bidder on its Schedule does not meet the Contract participation goal, or that Schedule and Letters of Intent were not timely filed, and that the bidder has not demonstrated good faith efforts to comply with these requirements, it shall propose that the bidder be declared ineligible for award. In that case, the bidder may request administrative reconsideration. Such requests must be sent in writing within three (3) calendar days of receiving notice of proposed ineligibility to: The Office of the General Counsel, Massachusetts Department of Transportation, 10 Park Plaza, Boston, MA, 02116.

g. If, after administrative reconsideration, MassDOT finds that the bidder has not shown that sufficient good faith efforts were made to comply with the requirements of these Special Provisions, it shall reject the bidder's proposal and may retain the proposal guaranty.

h. Actions which constitute evidence of good faith efforts to meet a DBE participation goal include, but are not limited to, the following examples, which are set forth in 49 CFR Part 26, Appendix A:

(1) Soliciting through all reasonable and available means (e.g., attendance at pre-bid meetings, advertising and/or written notices) the interest of all certified DBEs who have the capability to perform the work of the Contract. The bidder must solicit this interest within sufficient time to allow the DBEs to respond to the solicitation. The bidder must determine with certainty if the DBEs are interested by taking appropriate steps to follow up initial solicitations.

(2) Selecting portions of the work to be performed by DBEs in order to increase the likelihood that the DBE participation goal will be achieved. This includes, where appropriate, breaking out contract work items into economically feasible units to facilitate DBE participation, even when the Prime Contractor might otherwise prefer to perform these work items with its own forces.

(3) Providing interested DBEs with adequate information about the plans, specifications, and requirements of the contract in a timely manner to assist them in responding to a solicitation.

(4) Negotiating in good faith with interested DBEs. It is the bidder's responsibility to make a portion of the work available to DBE Subcontractors and suppliers and to select those portions of the work or material needs consistent with the available DBE Subcontractors and suppliers, so as to facilitate DBE participation. Evidence of such negotiation includes the names, addresses, and telephone number of DBEs that were considered; a description of the information provided regarding the plans and specifications for the work selected for subcontracting; and evidence as to why additional agreements could not be reached for DBEs to perform the work.

A bidder using good business judgment would consider a number of factors in negotiating with Subcontractors, including DBE Subcontractors, and would take a firm's price and capabilities as well as Contract participation goals into consideration. However, the fact that there may be some additional costs involved in finding and using DBEs is not in itself sufficient reason for a bidder's failure to meet the Contract DBE participation goal, as long as such costs are reasonable. Also, the ability or desire of a Prime Contractor to perform the work of a Contract with its own organization does not relieve the bidder of the responsibility to make good faith efforts. Prime Contractors are not, however, required to accept higher quotes from DBEs if the price difference is excessive or unreasonable.

(5) Not rejecting DBEs as being unqualified without sound reasons based on a thorough investigation of their capabilities. Contractors should be careful of adding additional requirements of performance that would in effect limit participation by DBEs or any small business. The Contractor's standing within its industry, membership in specific groups, organizations, or associations and political or social affiliations (for example union vs. nonunion employee status) are not legitimate causes for the rejection or non-solicitation of bids in the Contractor's efforts to meet the Contract participation goal.

(6) Making efforts to assist interested DBEs in obtaining bonding, lines of credit, or insurance as required by the recipient or contractor.

(7) Making efforts to assist interested DBEs in obtaining necessary equipment, supplies, materials, or related assistance or services.

(8) Effectively using the services of available minority/women community organizations; minority/women contractors' groups; local, state, and federal minority/women business assistance offices; and other organizations as allowed on a case by case basis to provide assistance in the recruitment and placement of DBEs.

8. COMPLIANCE

a. All activity performed by a DBE for credit toward the Contract participation goal must be performed, managed and supervised by the DBE in accordance with all commercially useful function requirements of 49 CFR Part 26. The Prime Contractor shall not enter into, or condone, any other arrangement.

b. The Prime Contractor shall not perform with its own organization, or assign to any other business, an activity designated for the DBE(s) named on the Schedule(s) submitted by the Prime Contractor under Section 7 or under paragraph **8.f** of this section, without the approval of MassDOT in accordance with the requirements of paragraphs **8.f** and **8.j** of this section.

c. MassDOT may suspend payment for any activity that was not performed by the DBE to whom the activity was committed on the approved Schedule of Participation, or that was not performed in accordance with the requirements of Section 6.

d. MassDOT retains the right to approve or disapprove of any or all Subcontractors. Requests by the Prime Contractor for approval of participation by a DBE Subcontractor for credit toward the Contract participation goal must include, in addition to any other requirements for Subcontractor approval, the following:

(1) A copy of the proposed subcontract. The subcontract must be for at least the dollar amount, and for the work described, in the Bidder's Schedule of Participation.

(2) A resume stating the qualifications and experience of the DBE Superintendent and/or foreperson who will supervise the on-site work. A new resume will be required for any change in supervisory personnel during the progress of the work.

(3) A Schedule of Operations indicating when the DBE is expected to perform the work.

(4) A list of (1) equipment owned by the DBE to be used on the Project, and (2) equipment to be leased by the DBE for use on the Project.

(5) A list of: (1) all projects (public and private) which the DBE is currently performing; (2) all projects (public and private) to which the DBE is committed; and (3) all projects (public and private) to which the DBE intends to make a commitment. For each Contract, list the contracting organization, the name and telephone number of a contact person for the contracting organization, the dollar value of the work, a description of the work, and the DBE's work schedule for each project.

e. If, pursuant to the Subcontractor approval process, MassDOT finds that a DBE Subcontractor does not have sufficient experience or resources to perform, manage and supervise work of the kind proposed in accordance with the requirements of 49 CFR Part 26, approval of the DBE Subcontractor may be denied. In the event of such denial, the Prime Contractor shall proceed in accordance with the requirements paragraphs **8.f** and **8.j** of this section.

f. If, for reasons beyond its control, the Prime Contractor cannot comply with its DBE participation commitment in accordance with the Schedule of Participation submitted under Section 7, the Prime Contractor shall submit to MassDOT the reasons for its inability to comply with its obligations and shall submit, and request approval for, a revised Schedule of Participation. If approved by MassDOT, the revised Schedule shall govern the Prime Contractor's performance in meeting its obligations under these Special Provisions.

g. A Prime Contractor's compliance with the participation goal in Section 2 shall be determined by reference to the established percentage of the total contract price, provided, however, that no decrease in the dollar amount of a bidder's commitment to any DBE shall be allowed without the approval of MassDOT.

h. If the contract amount is increased, the Prime Contractor may be required to submit a revised Schedule of Participation in accordance with paragraphs **8.f** and **8.j** of this section.

i. In the event of the decertification of a DBE scheduled to participate on the Contract for credit toward the participation goal, but not under subcontract, the Contractor shall proceed in accordance with paragraphs **8.f** and **8.j** of this section.

j. The Prime Contractor shall notify MassDOT immediately of any facts that come to its attention indicating that it may or will be unable to comply with any aspect of its DBE obligation under this Contract.

k. Any notice required by these Special Provisions shall be given in writing to: (1) the Resident Engineer; (2) the District designated Compliance Officer; and (3) the DBE Liaison Officer, MassDOT Office of Civil Rights, 10 Park Plaza, – 3rd Floor - West, Boston, MA, 02116 and cc'd to the Deputy Chief of External Programs.

l. The Prime Contractor and its Subcontractors shall comply with MassDOT's Electronic Reporting System Requirements (MassDOT Document 00821) and submit all information required by MassDOT related to the DBE Special Provisions through the Equitable Business Opportunity Solution ("EBO"). MassDOT reserves the right to request reports in the format it deems necessary anytime during the performance of the Contract.

m. Termination of DBE by Prime Contractor

(1) A Prime Contractor shall not terminate a DBE Subcontractor or an approved substitute DBE firm without the prior written consent of MassDOT. This includes, but is not limited to, instances in which a Prime Contractor seeks to perform work originally designated for a DBE Subcontractor with its own forces or those of an affiliate, a non-DBE firm, or with another DBE firm.

(2) MassDOT may provide such written consent only if MassDOT agrees, for reasons stated in its concurrence document, that the Prime Contractor has good cause to terminate the DBE firm.

(3) For purposes of this paragraph, good cause includes the following circumstances:

(i) The DBE Subcontractor fails or refuses to execute a written contract;

(ii) The DBE Subcontractor fails or refuses to perform the work of its subcontract in a way consistent with normal industry standards. Good cause, however, does not exist if the failure or refusal of the DBE Subcontractor to perform its work on the subcontract results from the bad faith or discriminatory action of the Prime Contractor;

(iii) The DBE Subcontractor fails or refuses to meet the Prime Contractor's reasonable, nondiscriminatory bond requirements.

(iv) The DBE Subcontractor becomes bankrupt, insolvent, or exhibits credit unworthiness;

(v) The DBE Subcontractor is ineligible to work on public works projects because of suspension and debarment proceedings pursuant 2 CFR Parts 180, 215 and 1,200 or applicable State law;

(vi) (vii) MassDOT has determined that the listed DBE Subcontractor is not a responsible contractor;

(vii) The listed DBE Subcontractor voluntarily withdraws from the Project and provides written notice of its withdrawal;

(viii) The listed DBE is ineligible to receive DBE credit for the type of work required;

(ix) A DBE owner dies or becomes disabled with the result that the listed DBE Contractor is unable to complete its work on the Contract;

(x) Other documented good cause that MassDOT determines compels the termination of the DBE Subcontractor. Good cause, however, does not exist if the Prime Contractor seeks to terminate a DBE it relied upon to obtain the Contract so that the Prime Contractor can self-perform the DBE work or substitute another DBE or non-DBE Contractor after Contract Award.

(4) Before transmitting to MassDOT a request to terminate and/or substitute a DBE Subcontractor, the Prime Contractor must give notice in writing to the DBE Subcontractor, with a copy to MassDOT, of its intent to request to terminate and/or substitute, and the reason for the request.

(5) The Prime Contractor must give the DBE five (5) business days to respond to the Prime Contractor's notice. The DBE must advise MassDOT and the Contractor of the reasons, if any, why it objects to the proposed termination of its subcontract and why MassDOT should not approve the Prime Contractor's action. If required in a particular case as a matter of public necessity (e.g., safety), MassDOT may provide a response period shorter than five (5) business days.

(6) In addition to post-award terminations, the provisions of this section apply to pre-award deletions of or substitutions for DBE firms.

n. Prompt Payment.

Contractors are required to promptly pay Subcontractors under this Prime Contract within ten (10) business days from the receipt of each payment the Prime Contractor receives from MassDOT. Failure to comply with this requirement may result in the withholding of payment to the Prime Contractor until such time as all payments due under this provision have been received by the Subcontractor(s) and/or referral to the Prequalification Committee for action which may affect the Contractor's prequalification status.

9. SANCTIONS

If the Prime Contractor does not comply with the terms of these Special Provisions and cannot demonstrate to the satisfaction of MassDOT that good faith efforts were made to achieve such compliance, MassDOT may, in addition to any other remedy provided for in the Contract, and notwithstanding any other provision in the Contract:

a. Retain, in connection with final acceptance and final payment processing, an amount determined by multiplying the total contract amount by the percentage in Section 2, less the amount paid to approved DBE(s) for work performed under the Contract in accordance with the provisions of Section 8.

b. Suspend, terminate or cancel this Contract, in whole or in part, and call upon the Prime Contractor's surety to perform all terms and conditions in the Contract.

c. In accordance with 720 CMR 5.05(1)(f), modify or revoke the Prime Contractor's Prequalification status or recommend that the Prime Contractor not receive award of a pending Contract. The Prime Contractor may appeal the determination of the Prequalification Committee in accordance with the provisions of 720 CMR 5.06.

d. Initiate debarment proceedings pursuant to M.G.L. c. 29 §29F and, as applicable, 2 CFR Parts 180, 215 and 1,200.

e. Refer the matter to the Massachusetts Attorney General for review and prosecution, if appropriate, of any false claim or pursuant to M.G.L. c. 12, §§ 5A to 5O (the Massachusetts False Claim Act).

f. Refer the matter to the U.S. DOT's Office of the Inspector General or other agencies for prosecution under Title 18, U.S.C. § 1001, 49 CFR Parts 29 and 31, and other applicable laws and regulations.

10. FURTHER INFORMATION; ENFORCEMENT, COOPERATION AND CONFIDENTIALITY.

a. Any proposed DBE, bidder, or Contractor shall provide such information as is necessary in the judgment of MassDOT to ascertain its compliance with the terms of this Special Provision. Further, pursuant to 49 CFR, Part 26.107:

(1) If you are a firm that does not meet the eligibility criteria of 49 CFR, Parts 26.61 to 26.73 ("subpart D"), that attempts to participate in a DOT- assisted program as a DBE on the basis of false, fraudulent, or deceitful statements or representations or under circumstances indicating a serious lack of business integrity or honesty, MassDOT or FHWA may initiate suspension or debarment proceedings against you under 49 CFR Part 29.

(2) If you are a firm that, in order to meet DBE Contract participation goals or other DBE Program requirements, uses or attempts to use, on the basis of false, fraudulent or deceitful statements or representations or under circumstances indicating a serious lack of business integrity or honesty, another firm that does not meet the eligibility criteria of subpart D, FHWA may initiate suspension or debarment proceedings against you under 49 CFR Part 29.

(3) In a suspension or debarment proceeding brought either under subparagraph a.(1) or b.(2) of this section, the concerned operating administration may consider the fact that a purported DBE has been certified by a recipient. Such certification does not preclude FHWA from determining that the purported DBE, or another firm that has used or attempted to use it to meet DBE participation goals, should be suspended or debarred.

(4) FHWA may take enforcement action under 49 CFR Part 31, Program Fraud and Civil Remedies, against any participant in the DBE Program whose conduct is subject to such action under 49 CFR Part 31.

(5) FHWA may refer to the Department of Justice, for prosecution under 18 U.S.C. 1001 or other applicable provisions of law, any person who makes a false or fraudulent statement in connection with participation of a DBE in any DOT-assisted program or otherwise violates applicable Federal statutes.

b. Pursuant to 49 CFR Part 26.109, the rules governing information, confidentiality, cooperation, and intimidation or retaliation are as follows:

(1) Availability of records.

(i) In responding to requests for information concerning any aspect of the DBE Program, FHWA complies with provisions of the Federal Freedom of Information and Privacy Acts (5 U.S.C. 552 and 552a). FHWA may make available to the public any information concerning the DBE Program release of which is not prohibited by Federal law.

(ii) MassDOT shall safeguard from disclosure to unauthorized persons information that may reasonably be considered as confidential business information, consistent with Federal and Massachusetts General Law (M.G.L. c. 66, § 10, M.G.L. c. 4, §7 (26), 950 CMR 32.00).

(2) Confidentiality of information on complainants. Notwithstanding the provisions of subparagraph b.(1) of this section, the identity of complainants shall be kept confidential, at their election. If such confidentiality will hinder the investigation, proceeding or hearing, or result in a denial of appropriate administrative due process to other parties, the complainant must be advised for the purpose of waiving the privilege. Complainants are advised that, in some circumstances, failure to waive the privilege may result in the closure of the investigation or dismissal of the proceeding or hearing.

(3) Cooperation. All participants in FHWA's DBE Program (including, but not limited to, recipients, DBE firms and applicants for DBE certification, complainants and appellants, and Contractors using DBE firms to meet Contract participation goals) are required to cooperate fully and promptly with U.S. DOT and recipient compliance reviews, certification reviews, investigations, and other requests for information. Failure to do so shall be a ground for appropriate action against the party involved (e.g., with respect to recipients, a finding of noncompliance; with respect to DBE firms, denial of certification or removal of eligibility and/or suspension and debarment; with respect to a complainant or appellant, dismissal of the complaint or appeal; with respect to a Contractor which uses DBE firms to meet participation goals, findings of non-responsibility for future Contracts and/or suspension and debarment).

(4) Intimidation and retaliation. No recipient, Contractor, or any other participant in the program, may intimidate, threaten, coerce, or discriminate against any individual or firm for the purpose of interfering with any right or privilege secured by this part or because the individual or firm has made a complaint, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under this part. If any recipient or contractor violates this prohibition, that entity is in noncompliance with this 49 CFR Part 26.

11. LIST OF ADDITIONAL DOCUMENTS.

a. The following documents shall be completed and signed by the bidder and designated DBEs in accordance with Section 7 - Award Documentation and Procedures. These documents must be returned by the bidder to MassDOT's Bid Document Distribution Center:

- □ Schedule of DBE Participation (Document B00853)
- □ Letter of Intent (Document B00854)
- □ DBE Joint Check Arrangement Approval Form (Document B00855), if Contractor and DBE plan, or if DBE is required to use a Joint Check

b. The following document shall be signed and returned by Contractor and Subcontractors/DBEs to the MassDOT District Office overseeing the Project, as applicable:

- □ Contractor/Subcontractor Certification Form (Document No. 00859) (a checklist of other documents to be included with every subcontract (DBEs and non-DBEs alike)).

c. The following document shall be provided to MassDOT's Office of Civil Rights and Prequalification Office at least fourteen (14) business days before the bid opening date, if applicable:

- □ Affidavit of DBE/Non-DBE Joint Venture (Document B00856)

d. The following document shall be provided to MassDOT's District Office of Civil Rights within 30 calendar days after the work of the DBE is completed, or no later than 30 calendar days after the work of the DBE is on a completed and processed CQE. This document shall be completed and submitted by the Prime Contractor:

- □ Certificate of Completion by a Minority/Women or Disadvantaged Business Enterprise (M/W/DBE) (Form No. CSD-100)

FHWA-1273 – Revised October 23, 2023

REQUIRED CONTRACT PROVISIONS
FEDERAL-AID CONSTRUCTION CONTRACTS

I. General
II. Nondiscrimination
III. Non-segregated Facilities
IV. Davis-Bacon and Related Act Provisions
V. Contract Work Hours and Safety Standards Act Provisions
VI. Subletting or Assigning the Contract
VII. Safety: Accident Prevention
VIII. False Statements Concerning Highway Projects
IX. Implementation of Clean Air Act and Federal Water Pollution Control Act
X. Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion
XI. Certification Regarding Use of Contract Funds for Lobbying
XII. Use of United States-Flag Vessels:

ATTACHMENTS

A. Employment and Materials Preference for Appalachian Development Highway System or Appalachian Local Access Road Contracts (included in Appalachian contracts only)

I. GENERAL

1. Form FHWA-1273 must be physically incorporated in each construction contract funded under title 23, United States Code, as required in 23 CFR 633.102(b) (excluding emergency contracts solely intended for debris removal). The contractor (or subcontractor) must insert this form in each subcontract and further require its inclusion in all lower tier subcontracts (excluding purchase orders, rental agreements and other agreements for supplies or services). 23 CFR 633.102(e).

The applicable requirements of Form FHWA-1273 are incorporated by reference for work done under any purchase order, rental agreement or agreement for other services. The prime contractor shall be responsible for compliance by any subcontractor, lower-tier subcontractor or service provider. 23 CFR 633.102(e).

Form FHWA-1273 must be included in all Federal-aid design-build contracts, in all subcontracts and in lower tier subcontracts (excluding subcontracts for design services, purchase orders, rental agreements and other agreements for supplies or services) in accordance with 23 CFR 633.102. The design-builder shall be responsible for compliance by any subcontractor, lower-tier subcontractor or service provider.

Contracting agencies may reference Form FHWA-1273 in solicitation-for-bids or request-for-proposals documents, however, the Form FHWA-1273 must be physically incorporated (not referenced) in all contracts, subcontracts and lower-tier subcontracts (excluding purchase orders, rental agreements and other agreements for supplies or services related to a construction contract). 23 CFR 633.102(b).

2. Subject to the applicability criteria noted in the following sections, these contract provisions shall apply to all work performed on the contract by the contractor's own organization and with the assistance of workers under the contractor's immediate superintendence and to all work performed on the contract by piecework, station work, or by subcontract. 23 CFR 633.102(d).

3. A breach of any of the stipulations contained in these Required Contract Provisions may be sufficient grounds for withholding of progress payments, withholding of final payment, termination of the contract, suspension / debarment or any other action determined to be appropriate by the contracting agency and FHWA.

4. Selection of Labor: During the performance of this contract, the contractor shall not use convict labor for any purpose within the limits of a construction project on a Federal-aid highway unless it is labor performed by convicts who are on parole, supervised release, or probation. 23 U.S.C. 114(b). The term Federal-aid highway does not include roadways functionally classified as local roads or rural minor collectors. 23 U.S.C. 101(a).

II. NONDISCRIMINATION (23 CFR 230.107(a); 23 CFR Part 230, Subpart A, Appendix A; EO 11246)

The provisions of this section related to 23 CFR Part 230, Subpart A, Appendix A are applicable to all Federal-aid construction contracts and to all related construction subcontracts of $10,000 or more. The provisions of 23 CFR Part 230 are not applicable to material supply, engineering, or architectural service contracts.

In addition, the contractor and all subcontractors must comply with the following policies: Executive Order 11246, 41 CFR Part 60, 29 CFR Parts 1625-1627, 23 U.S.C. 140, Section 504 of the Rehabilitation Act of 1973, as amended (29 U.S.C. 794), Title VI of the Civil Rights Act of 1964, as amended (42 U.S.C. 2000d et seq.), and related regulations including 49 CFR Parts 21, 26, and 27; and 23 CFR Parts 200, 230, and 633.

The contractor and all subcontractors must comply with: the requirements of the Equal Opportunity Clause in 41 CFR 60-1.4(b) and, for all construction contracts exceeding $10,000, the Standard Federal Equal Employment Opportunity Construction Contract Specifications in 41 CFR 60-4.3.

Note: The U.S. Department of Labor has exclusive authority to determine compliance with Executive Order 11246 and the policies of the Secretary of Labor including 41 CFR Part 60, and 29 CFR Parts 1625-1627. The contracting agency and the FHWA have the authority and the responsibility to ensure compliance with 23 U.S.C. 140, Section 504 of the Rehabilitation Act of 1973, as amended (29 U.S.C. 794), and Title VI of the Civil Rights Act of 1964, as amended (42 U.S.C. 2000d et seq.), and related regulations including 49 CFR Parts 21, 26, and 27; and 23 CFR Parts 200, 230, and 633.

The following provision is adopted from 23 CFR Part 230, Subpart A, Appendix A, with appropriate revisions to conform to the U.S. Department of Labor (US DOL) and FHWA requirements.

1. Equal Employment Opportunity: Equal Employment Opportunity (EEO) requirements not to discriminate and to take affirmative action to assure equal opportunity as set forth under laws, executive orders, rules, regulations (*see* 28 CFR Part 35, 29 CFR Part 1630, 29 CFR Parts 1625-1627, 41 CFR Part 60 and 49 CFR Part 27) and orders of the Secretary of Labor as modified by the provisions prescribed herein, and imposed pursuant to 23 U.S.C. 140, shall constitute the EEO and specific affirmative action standards for the contractor's project activities under this contract. The provisions of the Americans with Disabilities Act of 1990 (42 U.S.C. 12101 et seq.) set forth under 28 CFR Part 35 and 29 CFR Part 1630 are incorporated by reference in this contract. In the execution of this contract, the contractor agrees to comply with the following minimum specific requirement activities of EEO:

a. The contractor will work with the contracting agency and the Federal Government to ensure that it has made every good faith effort to provide equal opportunity with respect to all of its terms and conditions of employment and in their review of activities under the contract. 23 CFR 230.409 (g)(4) & (5).

b. The contractor will accept as its operating policy the following statement:

"It is the policy of this Company to assure that applicants are employed, and that employees are treated during employment, without regard to their race, religion, sex, sexual orientation, gender identity, color, national origin, age or disability. Such action shall include: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship, pre-apprenticeship, and/or on-the-job training."

2. EEO Officer: The contractor will designate and make known to the contracting officers an EEO Officer who will have the responsibility for and must be capable of effectively administering and promoting an active EEO program and who must be assigned adequate authority and responsibility to do so.

3. Dissemination of Policy: All members of the contractor's staff who are authorized to hire, supervise, promote, and discharge employees, or who recommend such action or are substantially involved in such action, will be made fully cognizant of and will implement the contractor's EEO policy and contractual responsibilities to provide EEO in each grade and classification of employment. To ensure that the above agreement will be met, the following actions will be taken as a minimum:

a. Periodic meetings of supervisory and personnel office employees will be conducted before the start of work and then not less often than once every six months, at which time the contractor's EEO policy and its implementation will be reviewed and explained. The meetings will be conducted by the EEO Officer or other knowledgeable company official.

b. All new supervisory or personnel office employees will be given a thorough indoctrination by the EEO Officer, covering all major aspects of the contractor's EEO obligations within thirty days following their reporting for duty with the contractor.

c. All personnel who are engaged in direct recruitment for the project will be instructed by the EEO Officer in the contractor's procedures for locating and hiring minorities and women.

d. Notices and posters setting forth the contractor's EEO policy will be placed in areas readily accessible to employees, applicants for employment and potential employees.

e. The contractor's EEO policy and the procedures to implement such policy will be brought to the attention of employees by means of meetings, employee handbooks, or other appropriate means.

4. Recruitment: When advertising for employees, the contractor will include in all advertisements for employees the notation: "An Equal Opportunity Employer." All such advertisements will be placed in publications having a large circulation among minorities and women in the area from which the project work force would normally be derived.

a. The contractor will, unless precluded by a valid bargaining agreement, conduct systematic and direct recruitment through public and private employee referral sources likely to yield qualified minorities and women. To meet this requirement, the contractor will identify sources of potential minority group employees and establish with such identified sources procedures whereby minority and women applicants may be referred to the contractor for employment consideration.

b. In the event the contractor has a valid bargaining agreement providing for exclusive hiring hall referrals, the contractor is expected to observe the provisions of that agreement to the extent that the system meets the contractor's compliance with EEO contract provisions. Where implementation of such an agreement has the effect of discriminating against minorities or women, or obligates the contractor to do the same, such implementation violates Federal nondiscrimination provisions.

c. The contractor will encourage its present employees to refer minorities and women as applicants for employment. Information and procedures with regard to referring such applicants will be discussed with employees.

5. Personnel Actions: Wages, working conditions, and employee benefits shall be established and administered, and personnel actions of every type, including hiring, upgrading, promotion, transfer, demotion, layoff, and termination, shall be taken without regard to race, color, religion, sex, sexual orientation, gender identity, national origin, age or disability. The following procedures shall be followed:

a. The contractor will conduct periodic inspections of project sites to ensure that working conditions and employee facilities do not indicate discriminatory treatment of project site personnel.

b. The contractor will periodically evaluate the spread of wages paid within each classification to determine any evidence of discriminatory wage practices.

c. The contractor will periodically review selected personnel actions in depth to determine whether there is evidence of discrimination. Where evidence is found, the contractor will promptly take corrective action. If the review indicates that the discrimination may extend beyond the actions reviewed, such corrective action shall include all affected persons.

d. The contractor will promptly investigate all complaints of alleged discrimination made to the contractor in connection with its obligations under this contract, will attempt to resolve such complaints, and will take appropriate corrective action

within a reasonable time. If the investigation indicates that the discrimination may affect persons other than the complainant, such corrective action shall include such other persons. Upon completion of each investigation, the contractor will inform every complainant of all of their avenues of appeal.

6. Training and Promotion:

a. The contractor will assist in locating, qualifying, and increasing the skills of minorities and women who are applicants for employment or current employees. Such efforts should be aimed at developing full journey level status employees in the type of trade or job classification involved.

b. Consistent with the contractor's work force requirements and as permissible under Federal and State regulations, the contractor shall make full use of training programs (i.e., apprenticeship and on-the-job training programs for the geographical area of contract performance). In the event a special provision for training is provided under this contract, this subparagraph will be superseded as indicated in the special provision. The contracting agency may reserve training positions for persons who receive welfare assistance in accordance with 23 U.S.C. 140(a).

c. The contractor will advise employees and applicants for employment of available training programs and entrance requirements for each.

d. The contractor will periodically review the training and promotion potential of employees who are minorities and women and will encourage eligible employees to apply for such training and promotion.

7. Unions: If the contractor relies in whole or in part upon unions as a source of employees, the contractor will use good faith efforts to obtain the cooperation of such unions to increase opportunities for minorities and women. 23 CFR 230.409. Actions by the contractor, either directly or through a contractor's association acting as agent, will include the procedures set forth below:

a. The contractor will use good faith efforts to develop, in cooperation with the unions, joint training programs aimed toward qualifying more minorities and women for membership in the unions and increasing the skills of minorities and women so that they may qualify for higher paying employment.

b. The contractor will use good faith efforts to incorporate an EEO clause into each union agreement to the end that such union will be contractually bound to refer applicants without regard to their race, color, religion, sex, sexual orientation, gender identity, national origin, age, or disability.

c. The contractor is to obtain information as to the referral practices and policies of the labor union except that to the extent such information is within the exclusive possession of the labor union and such labor union refuses to furnish such information to the contractor, the contractor shall so certify to the contracting agency and shall set forth what efforts have been made to obtain such information.

d. In the event the union is unable to provide the contractor with a reasonable flow of referrals within the time limit set forth in the collective bargaining agreement, the contractor will, through independent recruitment efforts, fill the employment vacancies without regard to race, color, religion, sex, sexual orientation, gender identity, national origin, age, or disability; making full efforts to obtain qualified and/or qualifiable minorities and women. The failure of a union to provide sufficient referrals (even though it is obligated to provide exclusive referrals under the terms of a collective bargaining agreement) does not relieve the contractor from the requirements of this paragraph. In the event the union referral practice prevents the contractor from meeting the obligations pursuant to Executive Order 11246, as amended, and these special provisions, such contractor shall immediately notify the contracting agency.

8. Reasonable Accommodation for Applicants / Employees with Disabilities: The contractor must be familiar with the requirements for and comply with the Americans with Disabilities Act and all rules and regulations established thereunder. Employers must provide reasonable accommodation in all employment activities unless to do so would cause an undue hardship.

9. Selection of Subcontractors, Procurement of Materials and Leasing of Equipment: The contractor shall not discriminate on the grounds of race, color, religion, sex, sexual orientation, gender identity, national origin, age, or disability in the selection and retention of subcontractors, including procurement of materials and leases of equipment. The contractor shall take all necessary and reasonable steps to ensure nondiscrimination in the administration of this contract.

a. The contractor shall notify all potential subcontractors, suppliers, and lessors of their EEO obligations under this contract.

b. The contractor will use good faith efforts to ensure subcontractor compliance with their EEO obligations.

10. Assurances Required:

a. The requirements of 49 CFR Part 26 and the State DOT's FHWA-approved Disadvantaged Business Enterprise (DBE) program are incorporated by reference.

b. The contractor, subrecipient or subcontractor shall not discriminate on the basis of race, color, national origin, or sex in the performance of this contract. The contractor shall carry out applicable requirements of 49 CFR part 26 in the award and administration of DOT-assisted contracts. Failure by the contractor to carry out these requirements is a material breach of this contract, which may result in the termination of this contract or such other remedy as the recipient deems appropriate, which may include, but is not limited to:
(1) Withholding monthly progress payments;
(2) Assessing sanctions;
(3) Liquidated damages; and/or
(4) Disqualifying the contractor from future bidding as non-responsible.

c. The Title VI and nondiscrimination provisions of U.S. DOT Order 1050.2A at Appendixes A and E are incorporated by reference. 49 CFR Part 21.

11. Records and Reports: The contractor shall keep such records as necessary to document compliance with the EEO requirements. Such records shall be retained for a period of three years following the date of the final payment to the contractor for all contract work and shall be available at reasonable times and places for inspection by authorized representatives of the contracting agency and the FHWA.

a. The records kept by the contractor shall document the following:

(1) The number and work hours of minority and non-minority group members and women employed in each work classification on the project;

(2) The progress and efforts being made in cooperation with unions, when applicable, to increase employment opportunities for minorities and women; and

(3) The progress and efforts being made in locating, hiring, training, qualifying, and upgrading minorities and women.

b. The contractors and subcontractors will submit an annual report to the contracting agency each July for the duration of the project indicating the number of minority, women, and non-minority group employees currently engaged in each work classification required by the contract work. This information is to be reported on Form FHWA-1391. The staffing data should represent the project work force on board in all or any part of the last payroll period preceding the end of July. If on-the-job training is being required by special provision, the contractor will be required to collect and report training data. The employment data should reflect the work force on board during all or any part of the last payroll period preceding the end of July.

III. NONSEGREGATED FACILITIES

This provision is applicable to all Federal-aid construction contracts and to all related construction subcontracts of more than $10,000. 41 CFR 60-1.5.

As prescribed by 41 CFR 60-1.8, the contractor must ensure that facilities provided for employees are provided in such a manner that segregation on the basis of race, color, religion, sex, sexual orientation, gender identity, or national origin cannot result. The contractor may neither require such segregated use by written or oral policies nor tolerate such use by employee custom. The contractor's obligation extends further to ensure that its employees are not assigned to perform their services at any location under the contractor's control where the facilities are segregated. The term "facilities" includes waiting rooms, work areas, restaurants and other eating areas, time clocks, restrooms, washrooms, locker rooms and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing provided for employees. The contractor shall provide separate or single-user restrooms and necessary dressing or sleeping areas to assure privacy between sexes.

IV. DAVIS-BACON AND RELATED ACT PROVISIONS

This section is applicable to all Federal-aid construction projects exceeding $2,000 and to all related subcontracts and lower-tier subcontracts (regardless of subcontract size), in accordance with 29 CFR 5.5. The requirements apply to all projects located within the right-of-way of a roadway that is functionally classified as Federal-aid highway. 23 U.S.C. 113. This excludes roadways functionally classified as local roads or rural minor collectors, which are exempt. 23 U.S.C. 101. Where applicable law requires that projects be treated as a project on a Federal-aid highway, the provisions of this subpart will apply regardless of the location of the project. Examples include: Surface Transportation Block Grant Program projects funded under 23 U.S.C. 133 [excluding recreational trails projects], the Nationally Significant Freight and Highway Projects funded under 23 U.S.C. 117, and National Highway Freight Program projects funded under 23 U.S.C. 167.

The following provisions are from the U.S. Department of Labor regulations in 29 CFR 5.5 “Contract provisions and related matters” with minor revisions to conform to the FHWA-1273 format and FHWA program requirements.

1. Minimum wages (29 CFR 5.5)

a. *Wage rates and fringe benefits.* All laborers and mechanics employed or working upon the site of the work (or otherwise working in construction or development of the project under a development statute), will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3)), the full amount of basic hourly wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics. As provided in paragraphs (d) and (e) of 29 CFR 5.5, the appropriate wage determinations are effective by operation of law even if they have not been attached to the contract. Contributions made or costs reasonably anticipated for bona fide fringe benefits under the Davis-Bacon Act (40 U.S.C. 3141(2)(B)) on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph 1.e. of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics must be paid the appropriate wage rate and fringe benefits on the wage determination for the classification(s) of work actually performed, without regard to skill, except as provided in paragraph 4. of this section. Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: *Provided,* That the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classifications and wage rates conformed under paragraph 1.c. of this section) and the Davis-Bacon poster (WH–1321) must be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers.

b. *Frequently recurring classifications.* (1) In addition to wage and fringe benefit rates that have been determined to be prevailing under the procedures set forth in 29 CFR part 1, a wage determination may contain, pursuant to § 1.3(f), wage and fringe benefit rates for classifications of laborers and mechanics for which conformance requests are regularly submitted pursuant to paragraph 1.c. of this section, provided that:

(i) The work performed by the classification is not performed by a classification in the wage determination for which a prevailing wage rate has been determined;

(ii) The classification is used in the area by the construction industry; and

(iii) The wage rate for the classification bears a reasonable relationship to the prevailing wage rates contained in the wage determination.

(2) The Administrator will establish wage rates for such classifications in accordance with paragraph 1.c.(1)(iii) of this section. Work performed in such a classification must be paid at no less than the wage and fringe benefit rate listed on the wage determination for such classification.

c. *Conformance.* (1) The contracting officer must require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract be classified in conformance with the wage determination. Conformance of an additional classification and wage rate and fringe benefits is appropriate only when the following criteria have been met:

(i) The work to be performed by the classification requested is not performed by a classification in the wage determination; and

(ii) The classification is used in the area by the construction industry; and

(iii) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(2) The conformance process may not be used to split, subdivide, or otherwise avoid application of classifications listed in the wage determination.

(3) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the contracting officer agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), a report of the action taken will be sent by the contracting officer by email to DBAconformance@dol.gov. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification action within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30–day period that additional time is necessary.

(4) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the contracting officer do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the contracting officer will, by email to DBAconformance@dol.gov, refer the questions, including the views of all interested parties and the recommendation of the contracting officer, to the Administrator for determination. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30–day period that additional time is necessary.

(5) The contracting officer must promptly notify the contractor of the action taken by the Wage and Hour Division under paragraphs 1.c.(3) and (4) of this section. The contractor must furnish a written copy of such determination to each affected worker or it must be posted as a part of the wage determination. The wage rate (including fringe benefits where appropriate) determined pursuant to paragraph 1.c.(3) or (4) of this section must be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

d. *Fringe benefits not expressed as an hourly rate.* Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor may either pay the benefit as stated in the wage determination or may pay another bona fide fringe benefit or an hourly cash equivalent thereof.

e. *Unfunded plans.* If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, *Provided,* That the Secretary of Labor has found, upon the written request of the contractor, in accordance with the criteria set forth in § 5.28, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

f. *Interest.* In the event of a failure to pay all or part of the wages required by the contract, the contractor will be required to pay interest on any underpayment of wages.

2. Withholding (29 CFR 5.5)

a. *Withholding requirements.* The contracting agency may, upon its own action, or must, upon written request of an authorized representative of the Department of Labor, withhold or cause to be withheld from the contractor so much of the accrued payments or advances as may be considered necessary to satisfy the liabilities of the prime contractor or any subcontractor for the full amount of wages and monetary relief, including interest, required by the clauses set forth in this section for violations of this contract, or to satisfy any such liabilities required by any other Federal contract, or federally assisted contract subject to Davis-Bacon labor standards, that is held by the same prime contractor (as defined in § 5.2). The necessary funds may be withheld from the contractor under this contract, any other Federal contract with the same prime contractor, or any other federally assisted contract that is subject to Davis-Bacon labor standards requirements and is held by the same prime contractor, regardless of whether the other contract was awarded or assisted by the same agency, and such funds may be used to satisfy the contractor liability for which the funds were withheld. In the event of a contractor's failure to pay any laborer or mechanic, including any apprentice or helper working on the site of the work all or part of the wages required by the contract, or upon the contractor's failure to submit the required records as discussed in paragraph 3.d. of this section, the contracting agency may on its own initiative and after written notice to the contractor, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

b. *Priority to withheld funds.* The Department has priority to funds withheld or to be withheld in accordance with paragraph

2.a. of this section or Section V, paragraph 3.a., or both, over claims to those funds by:

(1) A contractor's surety(ies), including without limitation performance bond sureties and payment bond sureties;

(2) A contracting agency for its reprocurement costs;

(3) A trustee(s) (either a court-appointed trustee or a U.S. trustee, or both) in bankruptcy of a contractor, or a contractor's bankruptcy estate;

(4) A contractor's assignee(s);

(5) A contractor's successor(s); or

(6) A claim asserted under the Prompt Payment Act, 31 U.S.C. 3901–3907.

3. Records and certified payrolls (29 CFR 5.5)

a. *Basic record requirements* (1) *Length of record retention.* All regular payrolls and other basic records must be maintained by the contractor and any subcontractor during the course of the work and preserved for all laborers and mechanics working at the site of the work (or otherwise working in construction or development of the project under a development statute) for a period of at least 3 years after all the work on the prime contract is completed.

(2) *Information required.* Such records must contain the name; Social Security number; last known address, telephone number, and email address of each such worker; each worker's correct classification(s) of work actually performed; hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in 40 U.S.C. 3141(2)(B) of the Davis-Bacon Act); daily and weekly number of hours actually worked in total and on each covered contract; deductions made; and actual wages paid.

(3) *Additional records relating to fringe benefits.* Whenever the Secretary of Labor has found under paragraph 1.e. of this section that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in 40 U.S.C. 3141(2)(B) of the Davis-Bacon Act, the contractor must maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits.

(4) *Additional records relating to apprenticeship.* Contractors with apprentices working under approved programs must maintain written evidence of the registration of apprenticeship programs, the registration of the apprentices, and the ratios and wage rates prescribed in the applicable programs.

b. *Certified payroll requirements* (1) *Frequency and method of submission.* The contractor or subcontractor must submit weekly, for each week in which any DBA- or Related Acts-covered work is performed, certified payrolls to the contracting agency. The prime contractor is responsible for the submission of all certified payrolls by all subcontractors. A contracting agency or prime contractor may permit or require contractors to submit certified payrolls through an electronic system, as long as the electronic system requires a legally valid electronic signature; the system allows the contractor, the contracting agency, and the Department of Labor to access the certified payrolls upon request for at least 3 years after the work on the prime contract has been completed; and the contracting agency or prime contractor permits other methods of submission in situations where the contractor is unable or limited in its ability to use or access the electronic system.

(2) *Information required.* The certified payrolls submitted must set out accurately and completely all of the information required to be maintained under paragraph 3.a.(2) of this section, except that full Social Security numbers and last known addresses, telephone numbers, and email addresses must not be included on weekly transmittals. Instead, the certified payrolls need only include an individually identifying number for each worker (*e.g.,* the last four digits of the worker's Social Security number). The required weekly certified payroll information may be submitted using Optional Form WH–347 or in any other format desired. Optional Form WH–347 is available for this purpose from the Wage and Hour Division website at *https://www.dol.gov/sites/dolgov/files/WHD/legacy/files/wh347/.pdf* or its successor website. It is not a violation of this section for a prime contractor to require a subcontractor to provide full Social Security numbers and last known addresses, telephone numbers, and email addresses to the prime contractor for its own records, without weekly submission by the subcontractor to the contracting agency.

(3) *Statement of Compliance.* Each certified payroll submitted must be accompanied by a “Statement of Compliance,” signed by the contractor or subcontractor, or the contractor's or subcontractor's agent who pays or supervises the payment of the persons working on the contract, and must certify the following:

(i) That the certified payroll for the payroll period contains the information required to be provided under paragraph 3.b. of this section, the appropriate information and basic records are being maintained under paragraph 3.a. of this section, and such information and records are correct and complete;

(ii) That each laborer or mechanic (including each helper and apprentice) working on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in 29 CFR part 3; and

(iii) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification(s) of work actually performed, as specified in the applicable wage determination incorporated into the contract.

(4) *Use of Optional Form WH–347.* The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH–347 will satisfy the requirement for submission of the “Statement of Compliance” required by paragraph 3.b.(3) of this section.

(5) *Signature.* The signature by the contractor, subcontractor, or the contractor's or subcontractor's agent must be an original handwritten signature or a legally valid electronic signature.

(6) *Falsification.* The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under 18 U.S.C. 1001 and 31 U.S.C. 3729.

(7) *Length of certified payroll retention.* The contractor or subcontractor must preserve all certified payrolls during the course of the work and for a period of 3 years after all the work on the prime contract is completed.

c. *Contracts, subcontracts, and related documents.* The contractor or subcontractor must maintain this contract or subcontract and related documents including, without limitation, bids, proposals, amendments, modifications, and extensions. The contractor or subcontractor must preserve these contracts, subcontracts, and related documents during the course of the work and for a period of 3 years after all the work on the prime contract is completed.

d. *Required disclosures and access* (1) *Required record disclosures and access to workers.* The contractor or subcontractor must make the records required under paragraphs 3.a. through 3.c. of this section, and any other documents that the contracting agency, the State DOT, the FHWA, or the Department of Labor deems necessary to determine compliance with the labor standards provisions of any of the applicable statutes referenced by § 5.1, available for inspection, copying, or transcription by authorized representatives of the contracting agency, the State DOT, the FHWA, or the Department of Labor, and must permit such representatives to interview workers during working hours on the job.

(2) *Sanctions for non-compliance with records and worker access requirements.* If the contractor or subcontractor fails to submit the required records or to make them available, or refuses to permit worker interviews during working hours on the job, the Federal agency may, after written notice to the contractor, sponsor, applicant, owner, or other entity, as the case may be, that maintains such records or that employs such workers, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available, or to permit worker interviews during working hours on the job, may be grounds for debarment action pursuant to § 5.12. In addition, any contractor or other person that fails to submit the required records or make those records available to WHD within the time WHD requests that the records be produced will be precluded from introducing as evidence in an administrative proceeding under 29 CFR part 6 any of the required records that were not provided or made available to WHD. WHD will take into consideration a reasonable request from the contractor or person for an extension of the time for submission of records. WHD will determine the reasonableness of the request and may consider, among other things, the location of the records and the volume of production.

(3) *Required information disclosures.* Contractors and subcontractors must maintain the full Social Security number and last known address, telephone number, and email address of each covered worker, and must provide them upon request to the contracting agency, the State DOT, the FHWA, the contractor, or the Wage and Hour Division of the Department of Labor for purposes of an investigation or other compliance action.

4. Apprentices and equal employment opportunity (29 CFR 5.5)

a. *Apprentices* (1) *Rate of pay.* Apprentices will be permitted to work at less than the predetermined rate for the work they perform when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Office of Apprenticeship (OA), or with a State Apprenticeship Agency recognized by the OA. A person who is not individually registered in the program, but who has been certified by the OA or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice, will be permitted to work at less than the predetermined rate for the work they perform in the first 90 days of probationary employment as an apprentice in such a program. In the event the OA or a State Apprenticeship Agency recognized by the OA withdraws approval of an apprenticeship program, the contractor will no longer be permitted to use apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(2) *Fringe benefits.* Apprentices must be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator determines that a different practice prevails for the applicable apprentice classification, fringe benefits must be paid in accordance with that determination.

(3) *Apprenticeship ratio.* The allowable ratio of apprentices to journeyworkers on the job site in any craft classification must not be greater than the ratio permitted to the contractor as to the entire work force under the registered program or the ratio applicable to the locality of the project pursuant to paragraph 4.a.(4) of this section. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated in paragraph 4.a.(1) of this section, must be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under this section must be paid not less than the applicable wage rate on the wage determination for the work actually performed.

(4) *Reciprocity of ratios and wage rates.* Where a contractor is performing construction on a project in a locality other than the locality in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyworker's hourly rate) applicable within the locality in which the construction is being performed must be observed. If there is no applicable ratio or wage rate for the locality of the project, the ratio and wage rate specified in the contractor's registered program must be observed.

b. *Equal employment opportunity.* The use of apprentices and journeyworkers under this part must be in conformity with

the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR part 30.

c. Apprentices and Trainees (programs of the U.S. DOT).

Apprentices and trainees working under apprenticeship and skill training programs which have been certified by the Secretary of Transportation as promoting EEO in connection with Federal-aid highway construction programs are not subject to the requirements of paragraph 4 of this Section IV. 23 CFR 230.111(e)(2). The straight time hourly wage rates for apprentices and trainees under such programs will be established by the particular programs. The ratio of apprentices and trainees to journeyworkers shall not be greater than permitted by the terms of the particular program.

5. Compliance with Copeland Act requirements. The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract as provided in 29 CFR 5.5.

6. Subcontracts. The contractor or subcontractor must insert FHWA-1273 in any subcontracts, along with the applicable wage determination(s) and such other clauses or contract modifications as the contracting agency may by appropriate instructions require, and a clause requiring the subcontractors to include these clauses and wage determination(s) in any lower tier subcontracts. The prime contractor is responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in this section. In the event of any violations of these clauses, the prime contractor and any subcontractor(s) responsible will be liable for any unpaid wages and monetary relief, including interest from the date of the underpayment or loss, due to any workers of lower-tier subcontractors, and may be subject to debarment, as appropriate. 29 CFR 5.5.

7. Contract termination: debarment. A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.

8. Compliance with Davis-Bacon and Related Act requirements. All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract as provided in 29 CFR 5.5.

9. Disputes concerning labor standards. As provided in 29 CFR 5.5, disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and the contracting agency, the U.S. Department of Labor, or the employees or their representatives.

10. Certification of eligibility. a. By entering into this contract, the contractor certifies that neither it nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of 40 U.S.C. 3144(b) or § 5.12(a).

b. No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of 40 U.S.C. 3144(b) or § 5.12(a).

c. The penalty for making false statements is prescribed in the U.S. Code, Title 18 Crimes and Criminal Procedure, 18 U.S.C. 1001.

11. Anti-retaliation. It is unlawful for any person to discharge, demote, intimidate, threaten, restrain, coerce, blacklist, harass, or in any other manner discriminate against, or to cause any person to discharge, demote, intimidate, threaten, restrain, coerce, blacklist, harass, or in any other manner discriminate against, any worker or job applicant for:

a. Notifying any contractor of any conduct which the worker reasonably believes constitutes a violation of the DBA, Related Acts, this part, or 29 CFR part 1 or 3;

b. Filing any complaint, initiating or causing to be initiated any proceeding, or otherwise asserting or seeking to assert on behalf of themselves or others any right or protection under the DBA, Related Acts, this part, or 29 CFR part 1 or 3;

c. Cooperating in any investigation or other compliance action, or testifying in any proceeding under the DBA, Related Acts, this part, or 29 CFR part 1 or 3; or

d. Informing any other person about their rights under the DBA, Related Acts, this part, or 29 CFR part 1 or 3.

V. CONTRACT WORK HOURS AND SAFETY STANDARDS ACT

Pursuant to 29 CFR 5.5(b), the following clauses apply to any Federal-aid construction contract in an amount in excess of $100,000 and subject to the overtime provisions of the Contract Work Hours and Safety Standards Act. These clauses shall be inserted in addition to the clauses required by 29 CFR 5.5(a) or 29 CFR 4.6. As used in this paragraph, the terms laborers and mechanics include watchpersons and guards.

1. Overtime requirements. No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek. 29 CFR 5.5.

2. Violation; liability for unpaid wages; liquidated damages. In the event of any violation of the clause set forth in paragraph 1. of this section the contractor and any subcontractor responsible therefor shall be liable for the unpaid wages and interest from the date of the underpayment. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or

mechanic, including watchpersons and guards, employed in violation of the clause set forth in paragraph 1. of this section, in the sum currently provided in 29 CFR 5.5(b)(2)* for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph 1. of this section.

* $31 as of January 15, 2023 (See 88 FR 88 FR 2210) as may be adjusted annually by the Department of Labor, pursuant to the Federal Civil Penalties Inflation Adjustment Act of 1990.

3. Withholding for unpaid wages and liquidated damages

a. *Withholding process.* The FHWA or the contracting agency may, upon its own action, or must, upon written request of an authorized representative of the Department of Labor, withhold or cause to be withheld from the contractor so much of the accrued payments or advances as may be considered necessary to satisfy the liabilities of the prime contractor or any subcontractor for any unpaid wages; monetary relief, including interest; and liquidated damages required by the clauses set forth in this section on this contract, any other Federal contract with the same prime contractor, or any other federally assisted contract subject to the Contract Work Hours and Safety Standards Act that is held by the same prime contractor (as defined in § 5.2). The necessary funds may be withheld from the contractor under this contract, any other Federal contract with the same prime contractor, or any other federally assisted contract that is subject to the Contract Work Hours and Safety Standards Act and is held by the same prime contractor, regardless of whether the other contract was awarded or assisted by the same agency, and such funds may be used to satisfy the contractor liability for which the funds were withheld.

b. *Priority to withheld funds.* The Department has priority to funds withheld or to be withheld in accordance with Section IV paragraph 2.a. or paragraph 3.a. of this section, or both, over claims to those funds by:

(1) A contractor's surety(ies), including without limitation performance bond sureties and payment bond sureties;

(2) A contracting agency for its reprocurement costs;

(3) A trustee(s) (either a court-appointed trustee or a U.S. trustee, or both) in bankruptcy of a contractor, or a contractor's bankruptcy estate;

(4) A contractor's assignee(s);

(5) A contractor's successor(s); or

(6) A claim asserted under the Prompt Payment Act, 31 U.S.C. 3901–3907.

4. Subcontracts. The contractor or subcontractor must insert in any subcontracts the clauses set forth in paragraphs 1. through 5. of this section and a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor is responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs 1. through 5. In the event of any violations of these clauses, the prime contractor and any subcontractor(s) responsible will be liable for any unpaid wages and monetary relief, including interest from the date of the underpayment or loss, due to any workers of lower-tier subcontractors, and associated liquidated damages and may be subject to debarment, as appropriate.

5. Anti-retaliation. It is unlawful for any person to discharge, demote, intimidate, threaten, restrain, coerce, blacklist, harass, or in any other manner discriminate against, or to cause any person to discharge, demote, intimidate, threaten, restrain, coerce, blacklist, harass, or in any other manner discriminate against, any worker or job applicant for:

a. Notifying any contractor of any conduct which the worker reasonably believes constitutes a violation of the Contract Work Hours and Safety Standards Act (CWHSSA) or its implementing regulations in this part;

b. Filing any complaint, initiating or causing to be initiated any proceeding, or otherwise asserting or seeking to assert on behalf of themselves or others any right or protection under CWHSSA or this part;

c. Cooperating in any investigation or other compliance action, or testifying in any proceeding under CWHSSA or this part; or

d. Informing any other person about their rights under CWHSSA or this part.

VI. SUBLETTING OR ASSIGNING THE CONTRACT

This provision is applicable to all Federal-aid construction contracts on the National Highway System pursuant to 23 CFR 635.116.

1. The contractor shall perform with its own organization contract work amounting to not less than 30 percent (or a greater percentage if specified elsewhere in the contract) of the total original contract price, excluding any specialty items designated by the contracting agency. Specialty items may be performed by subcontract and the amount of any such specialty items performed may be deducted from the total original contract price before computing the amount of work required to be performed by the contractor's own organization (23 CFR 635.116).

a. The term “perform work with its own organization” in paragraph 1 of Section VI refers to workers employed or leased by the prime contractor, and equipment owned or rented by the prime contractor, with or without operators. Such term does not include employees or equipment of a subcontractor or lower tier subcontractor, agents of the prime contractor, or any other assignees. The term may include payments for the costs of hiring leased employees from an employee leasing firm meeting all relevant Federal and State regulatory requirements. Leased employees may only be included in this term if the prime contractor meets all of the following conditions: (based on longstanding interpretation)

(1) the prime contractor maintains control over the supervision of the day-to-day activities of the leased employees;
(2) the prime contractor remains responsible for the quality of the work of the leased employees;

(3) the prime contractor retains all power to accept or exclude individual employees from work on the project; and

(4) the prime contractor remains ultimately responsible for the payment of predetermined minimum wages, the submission of payrolls, statements of compliance and all other Federal regulatory requirements.

b. "Specialty Items" shall be construed to be limited to work that requires highly specialized knowledge, abilities, or equipment not ordinarily available in the type of contracting organizations qualified and expected to bid or propose on the contract as a whole and in general are to be limited to minor components of the overall contract. 23 CFR 635.102.

2. Pursuant to 23 CFR 635.116(a), the contract amount upon which the requirements set forth in paragraph (1) of Section VI is computed includes the cost of material and manufactured products which are to be purchased or produced by the contractor under the contract provisions.

3. Pursuant to 23 CFR 635.116(c), the contractor shall furnish (a) a competent superintendent or supervisor who is employed by the firm, has full authority to direct performance of the work in accordance with the contract requirements, and is in charge of all construction operations (regardless of who performs the work) and (b) such other of its own organizational resources (supervision, management, and engineering services) as the contracting officer determines is necessary to assure the performance of the contract.

4. No portion of the contract shall be sublet, assigned or otherwise disposed of except with the written consent of the contracting officer, or authorized representative, and such consent when given shall not be construed to relieve the contractor of any responsibility for the fulfillment of the contract. Written consent will be given only after the contracting agency has assured that each subcontract is evidenced in writing and that it contains all pertinent provisions and requirements of the prime contract. (based on long-standing interpretation of 23 CFR 635.116).

5. The 30-percent self-performance requirement of paragraph (1) is not applicable to design-build contracts; however, contracting agencies may establish their own self-performance requirements. 23 CFR 635.116(d).

VII. SAFETY: ACCIDENT PREVENTION

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts.

1. In the performance of this contract the contractor shall comply with all applicable Federal, State, and local laws governing safety, health, and sanitation (23 CFR Part 635). The contractor shall provide all safeguards, safety devices and protective equipment and take any other needed actions as it determines, or as the contracting officer may determine, to be reasonably necessary to protect the life and health of employees on the job and the safety of the public and to protect property in connection with the performance of the work covered by the contract. 23 CFR 635.108.

2. It is a condition of this contract, and shall be made a condition of each subcontract, which the contractor enters into pursuant to this contract, that the contractor and any subcontractor shall not permit any employee, in performance of the contract, to work in surroundings or under conditions which are unsanitary, hazardous or dangerous to his/her health or safety, as determined under construction safety and health standards (29 CFR Part 1926) promulgated by the Secretary of Labor, in accordance with Section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3704). 29 CFR 1926.10.

3. Pursuant to 29 CFR 1926.3, it is a condition of this contract that the Secretary of Labor or authorized representative thereof, shall have right of entry to any site of contract performance to inspect or investigate the matter of compliance with the construction safety and health standards and to carry out the duties of the Secretary under Section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3704).

VIII. FALSE STATEMENTS CONCERNING HIGHWAY PROJECTS

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts.

In order to assure high quality and durable construction in conformity with approved plans and specifications and a high degree of reliability on statements and representations made by engineers, contractors, suppliers, and workers on Federal-aid highway projects, it is essential that all persons concerned with the project perform their functions as carefully, thoroughly, and honestly as possible. Willful falsification, distortion, or misrepresentation with respect to any facts related to the project is a violation of Federal law. To prevent any misunderstanding regarding the seriousness of these and similar acts, Form FHWA-1022 shall be posted on each Federal-aid highway project (23 CFR Part 635) in one or more places where it is readily available to all persons concerned with the project:

18 U.S.C. 1020 reads as follows:

"Whoever, being an officer, agent, or employee of the United States, or of any State or Territory, or whoever, whether a person, association, firm, or corporation, knowingly makes any false statement, false representation, or false report as to the character, quality, quantity, or cost of the material used or to be used, or the quantity or quality of the work performed or to be performed, or the cost thereof in connection with the submission of plans, maps, specifications, contracts, or costs of construction on any highway or related project submitted for approval to the Secretary of Transportation; or

Whoever knowingly makes any false statement, false representation, false report or false claim with respect to the character, quality, quantity, or cost of any work performed or to be performed, or materials furnished or to be furnished, in connection with the construction of any highway or related project approved by the Secretary of Transportation; or

Whoever knowingly makes any false statement or false representation as to material fact in any statement, certificate, or report submitted pursuant to provisions of the Federal-aid Roads Act approved July 11, 1916, (39 Stat. 355), as amended and supplemented;

Shall be fined under this title or imprisoned not more than 5 years or both."

IX. IMPLEMENTATION OF CLEAN AIR ACT AND FEDERAL WATER POLLUTION CONTROL ACT (42 U.S.C. 7606; 2 CFR 200.88; EO 11738)

This provision is applicable to all Federal-aid construction contracts in excess of $150,000 and to all related subcontracts. 48 CFR 2.101; 2 CFR 200.327.

By submission of this bid/proposal or the execution of this contract or subcontract, as appropriate, the bidder, proposer, Federal-aid construction contractor, subcontractor, supplier, or vendor agrees to comply with all applicable standards, orders or regulations issued pursuant to the Clean Air Act (42 U.S.C. 7401-7671q) and the Federal Water Pollution Control Act, as amended (33 U.S.C. 1251-1387). Violations must be reported to the Federal Highway Administration and the Regional Office of the Environmental Protection Agency. 2 CFR Part 200, Appendix II.

The contractor agrees to include or cause to be included the requirements of this Section in every subcontract, and further agrees to take such action as the contracting agency may direct as a means of enforcing such requirements. 2 CFR 200.327.

X. CERTIFICATION REGARDING DEBARMENT, SUSPENSION, INELIGIBILITY AND VOLUNTARY EXCLUSION

This provision is applicable to all Federal-aid construction contracts, design-build contracts, subcontracts, lower-tier subcontracts, purchase orders, lease agreements, consultant contracts or any other covered transaction requiring FHWA approval or that is estimated to cost $25,000 or more – as defined in 2 CFR Parts 180 and 1200. 2 CFR 180.220 and 1200.220.

1**. Instructions for Certification – First Tier Participants:**

a. By signing and submitting this proposal, the prospective first tier participant is providing the certification set out below.

b. The inability of a person to provide the certification set out below will not necessarily result in denial of participation in this covered transaction. The prospective first tier participant shall submit an explanation of why it cannot provide the certification set out below. The certification or explanation will be considered in connection with the department or agency's determination whether to enter into this transaction. However, failure of the prospective first tier participant to furnish a certification or an explanation shall disqualify such a person from participation in this transaction. 2 CFR 180.320.

c. The certification in this clause is a material representation of fact upon which reliance was placed when the contracting agency determined to enter into this transaction. If it is later determined that the prospective participant knowingly rendered an erroneous certification, in addition to other remedies available to the Federal Government, the contracting agency may terminate this transaction for cause of default. 2 CFR 180.325.

d. The prospective first tier participant shall provide immediate written notice to the contracting agency to whom this proposal is submitted if any time the prospective first tier participant learns that its certification was erroneous when submitted or has become erroneous by reason of changed circumstances. 2 CFR 180.345 and 180.350.

e. The terms "covered transaction," "debarred," "suspended," "ineligible," "participant," "person," "principal," and "voluntarily excluded," as used in this clause, are defined in 2 CFR Parts 180, Subpart I, 180.900-180.1020, and 1200. “First Tier Covered Transactions” refers to any covered transaction between a recipient or subrecipient of Federal funds and a participant (such as the prime or general contract). “Lower Tier Covered Transactions” refers to any covered transaction under a First Tier Covered Transaction (such as subcontracts). “First Tier Participant” refers to the participant who has entered into a covered transaction with a recipient or subrecipient of Federal funds (such as the prime or general contractor). “Lower Tier Participant” refers any participant who has entered into a covered transaction with a First Tier Participant or other Lower Tier Participants (such as subcontractors and suppliers).

f. The prospective first tier participant agrees by submitting this proposal that, should the proposed covered transaction be entered into, it shall not knowingly enter into any lower tier covered transaction with a person who is debarred, suspended, declared ineligible, or voluntarily excluded from participation in this covered transaction, unless authorized by the department or agency entering into this transaction. 2 CFR 180.330.

g. The prospective first tier participant further agrees by submitting this proposal that it will include the clause titled "Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion-Lower Tier Covered Transactions," provided by the department or contracting agency, entering into this covered transaction, without modification, in all lower tier covered transactions and in all solicitations for lower tier covered transactions exceeding the $25,000 threshold. 2 CFR 180.220 and 180.300.

h. A participant in a covered transaction may rely upon a certification of a prospective participant in a lower tier covered transaction that is not debarred, suspended, ineligible, or voluntarily excluded from the covered transaction, unless it knows that the certification is erroneous. 2 CFR 180.300; 180.320, and 180.325. A participant is responsible for ensuring that its principals are not suspended, debarred, or otherwise ineligible to participate in covered transactions. 2 CFR 180.335. To verify the eligibility of its principals, as well as the eligibility of any lower tier prospective participants, each participant may, but is not required to, check the System for Award Management website (https://www.sam.gov/). 2 CFR 180.300, 180.320, and 180.325.

i. Nothing contained in the foregoing shall be construed to require the establishment of a system of records in order to render in good faith the certification required by this clause. The knowledge and information of the prospective participant is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

j. Except for transactions authorized under paragraph (f) of these instructions, if a participant in a covered transaction knowingly enters into a lower tier covered transaction with a person who is suspended, debarred, ineligible, or voluntarily excluded from participation in this transaction, in addition to other remedies available to the Federal Government, the department or agency may terminate this transaction for cause or default. 2 CFR 180.325.

* * * * *

2. Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion – First Tier Participants:

a. The prospective first tier participant certifies to the best of its knowledge and belief, that it and its principals:

(1) Are not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participating in covered transactions by any Federal department or agency, 2 CFR 180.335;.

(2) Have not within a three-year period preceding this proposal been convicted of or had a civil judgment rendered against them for commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State, or local) transaction or contract under a public transaction; violation of Federal or State antitrust statutes or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, or receiving stolen property, 2 CFR 180.800;

(3) Are not presently indicted for or otherwise criminally or civilly charged by a governmental entity (Federal, State or local) with commission of any of the offenses enumerated in paragraph (a)(2) of this certification, 2 CFR 180.700 and 180.800; and

(4) Have not within a three-year period preceding this application/proposal had one or more public transactions (Federal, State or local) terminated for cause or default. 2 CFR 180.335(d).

(5) Are not a corporation that has been convicted of a felony violation under any Federal law within the two-year period preceding this proposal (USDOT Order 4200.6 implementing appropriations act requirements); and

(6) Are not a corporation with any unpaid Federal tax liability that has been assessed, for which all judicial and administrative remedies have been exhausted, or have lapsed, and that is not being paid in a timely manner pursuant to an agreement with the authority responsible for collecting the tax liability (USDOT Order 4200.6 implementing appropriations act requirements).

b. Where the prospective participant is unable to certify to any of the statements in this certification, such prospective participant should attach an explanation to this proposal. 2 CFR 180.335 and 180.340.

* * * * *

3. **Instructions for Certification - Lower Tier Participants:**

(Applicable to all subcontracts, purchase orders, and other lower tier transactions requiring prior FHWA approval or estimated to cost $25,000 or more - 2 CFR Parts 180 and 1200). 2 CFR 180.220 and 1200.220.

a. By signing and submitting this proposal, the prospective lower tier participant is providing the certification set out below.

b. The certification in this clause is a material representation of fact upon which reliance was placed when this transaction was entered into. If it is later determined that the prospective lower tier participant knowingly rendered an erroneous certification, in addition to other remedies available to the Federal Government, the department, or agency with which this transaction originated may pursue available remedies, including suspension and/or debarment.

c. The prospective lower tier participant shall provide immediate written notice to the person to which this proposal is submitted if at any time the prospective lower tier participant learns that its certification was erroneous by reason of changed circumstances. 2 CFR 180.365.

d. The terms "covered transaction," "debarred," "suspended," "ineligible," "participant," "person," "principal," and "voluntarily excluded," as used in this clause, are defined in 2 CFR Parts 180, Subpart I, 180.900 – 180.1020, and 1200. You may contact the person to which this proposal is submitted for assistance in obtaining a copy of those regulations. “First Tier Covered Transactions” refers to any covered transaction between a recipient or subrecipient of Federal funds and a participant (such as the prime or general contract). “Lower Tier Covered Transactions” refers to any covered transaction under a First Tier Covered Transaction (such as subcontracts). “First Tier Participant” refers to the participant who has entered into a covered transaction with a recipient or subrecipient of Federal funds (such as the prime or general contractor). “Lower Tier Participant” refers any participant who has entered into a covered transaction with a First Tier Participant or other Lower Tier Participants (such as subcontractors and suppliers).

e. The prospective lower tier participant agrees by submitting this proposal that, should the proposed covered transaction be entered into, it shall not knowingly enter into any lower tier covered transaction with a person who is debarred, suspended, declared ineligible, or voluntarily excluded from participation in this covered transaction, unless authorized by the department or agency with which this transaction originated. 2 CFR 1200.220 and 1200.332.

f. The prospective lower tier participant further agrees by submitting this proposal that it will include this clause titled "Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion-Lower Tier Covered Transaction," without modification, in all lower tier covered transactions and in all solicitations for lower tier covered transactions exceeding the $25,000 threshold. 2 CFR 180.220 and 1200.220.

g. A participant in a covered transaction may rely upon a certification of a prospective participant in a lower tier covered transaction that is not debarred, suspended, ineligible, or voluntarily excluded from the covered transaction, unless it knows that the certification is erroneous. A participant is responsible for ensuring that its principals are not suspended, debarred, or otherwise ineligible to participate in covered transactions. To verify the eligibility of its principals, as well as the eligibility of any lower tier prospective participants, each participant may, but is not required to, check the System for Award Management website (https://www.sam.gov/), which is compiled by the General Services Administration. 2 CFR 180.300, 180.320, 180.330, and 180.335.

h. Nothing contained in the foregoing shall be construed to require establishment of a system of records in order to render in good faith the certification required by this clause. The knowledge and information of participant is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

i. Except for transactions authorized under paragraph e of these instructions, if a participant in a covered transaction knowingly enters into a lower tier covered transaction with a person who is suspended, debarred, ineligible, or voluntarily

excluded from participation in this transaction, in addition to other remedies available to the Federal Government, the department or agency with which this transaction originated may pursue available remedies, including suspension and/or debarment. 2 CFR 180.325.

* * * * *

4. Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion--Lower Tier Participants:

a. The prospective lower tier participant certifies, by submission of this proposal, that neither it nor its principals:

(1) is presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participating in covered transactions by any Federal department or agency, 2 CFR 180.355;

(2) is a corporation that has been convicted of a felony violation under any Federal law within the two-year period preceding this proposal (USDOT Order 4200.6 implementing appropriations act requirements); and

(3) is a corporation with any unpaid Federal tax liability that has been assessed, for which all judicial and administrative remedies have been exhausted, or have lapsed, and that is not being paid in a timely manner pursuant to an agreement with the authority responsible for collecting the tax liability. (USDOT Order 4200.6 implementing appropriations act requirements)

b. Where the prospective lower tier participant is unable to certify to any of the statements in this certification, such prospective participant should attach an explanation to this proposal.

* * * * *

XI. CERTIFICATION REGARDING USE OF CONTRACT FUNDS FOR LOBBYING

This provision is applicable to all Federal-aid construction contracts and to all related subcontracts which exceed $100,000. 49 CFR Part 20, App. A.

1. The prospective participant certifies, by signing and submitting this bid or proposal, to the best of his or her knowledge and belief, that:

a. No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any Federal agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.

b. If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any Federal agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure Form to Report Lobbying," in accordance with its instructions.

2. This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by 31 U.S.C. 1352. Any person who fails to file the required certification shall be subject to a civil penalty of not less than $10,000 and not more than $100,000 for each such failure.

3. The prospective participant also agrees by submitting its bid or proposal that the participant shall require that the language of this certification be included in all lower tier subcontracts, which exceed $100,000 and that all such recipients shall certify and disclose accordingly.

XII. USE OF UNITED STATES-FLAG VESSELS:

This provision is applicable to all Federal-aid construction contracts, design-build contracts, subcontracts, lower-tier subcontracts, purchase orders, lease agreements, or any other covered transaction. 46 CFR Part 381.

This requirement applies to material or equipment that is acquired for a specific Federal-aid highway project. 46 CFR 381.7. It is not applicable to goods or materials that come into inventories independent of an FHWA funded-contract.

When oceanic shipments (or shipments across the Great Lakes) are necessary for materials or equipment acquired for a specific Federal-aid construction project, the bidder, proposer, contractor, subcontractor, or vendor agrees:

1. To utilize privately owned United States-flag commercial vessels to ship at least 50 percent of the gross tonnage (computed separately for dry bulk carriers, dry cargo liners, and tankers) involved, whenever shipping any equipment, material, or commodities pursuant to this contract, to the extent such vessels are available at fair and reasonable rates for United States-flag commercial vessels. 46 CFR 381.7.

2. To furnish within 20 days following the date of loading for shipments originating within the United States or within 30 working days following the date of loading for shipments originating outside the United States, a legible copy of a rated, ‘on-board’ commercial ocean bill-of-lading in English for each shipment of cargo described in paragraph (b)(1) of this section to both the Contracting Officer (through the prime contractor in the case of subcontractor bills-of-lading) and to the Office of Cargo and Commercial Sealift (MAR-620), Maritime Administration, Washington, DC 20590. (MARAD requires copies of the ocean carrier's (master) bills of lading, certified onboard, dated, with rates and charges. These bills of lading may contain business sensitive information and therefore may be submitted directly to MARAD by the Ocean Transportation Intermediary on behalf of the contractor). 46 CFR 381.7.

ATTACHMENT A - EMPLOYMENT AND MATERIALS PREFERENCE FOR APPALACHIAN DEVELOPMENT HIGHWAY SYSTEM OR APPALACHIAN LOCAL ACCESS ROAD CONTRACTS (23 CFR 633, Subpart B, Appendix B) This provision is applicable to all Federal-aid projects funded under the Appalachian Regional Development Act of 1965.

1. During the performance of this contract, the contractor undertaking to do work which is, or reasonably may be, done as on-site work, shall give preference to qualified persons who regularly reside in the labor area as designated by the DOL wherein the contract work is situated, or the subregion, or the Appalachian counties of the State wherein the contract work is situated, except:

a. To the extent that qualified persons regularly residing in the area are not available.

b. For the reasonable needs of the contractor to employ supervisory or specially experienced personnel necessary to assure an efficient execution of the contract work.

c. For the obligation of the contractor to offer employment to present or former employees as the result of a lawful collective bargaining contract, provided that the number of nonresident persons employed under this subparagraph (1c) shall not exceed 20 percent of the total number of employees employed by the contractor on the contract work, except as provided in subparagraph (4) below.

2. The contractor shall place a job order with the State Employment Service indicating (a) the classifications of the laborers, mechanics and other employees required to perform the contract work, (b) the number of employees required in each classification, (c) the date on which the participant estimates such employees will be required, and (d) any other pertinent information required by the State Employment Service to complete the job order form. The job order may be placed with the State Employment Service in writing or by telephone. If during the course of the contract work, the information submitted by the contractor in the original job order is substantially modified, the participant shall promptly notify the State Employment Service.

3. The contractor shall give full consideration to all qualified job applicants referred to him by the State Employment Service. The contractor is not required to grant employment to any job applicants who, in his opinion, are not qualified to perform the classification of work required.

4. If, within one week following the placing of a job order by the contractor with the State Employment Service, the State Employment Service is unable to refer any qualified job applicants to the contractor, or less than the number requested, the State Employment Service will forward a certificate to the contractor indicating the unavailability of applicants. Such certificate shall be made a part of the contractor's permanent project records. Upon receipt of this certificate, the contractor may employ persons who do not normally reside in the labor area to fill positions covered by the certificate, notwithstanding the provisions of subparagraph (1c) above.

5. The provisions of 23 CFR 633.207(e) allow the contracting agency to provide a contractual preference for the use of mineral resource materials native to the Appalachian region.

6. The contractor shall include the provisions of Sections 1 through 4 of this Attachment A in every subcontract for work which is, or reasonably may be, done as on-site work.

DOCUMENT 00811

SPECIAL PROVISIONS
MONTHLY PRICE ADJUSTMENT FOR HOT MIX ASPHALT (HMA) MIXTURES
Revised: 02/03/2023

This provision applies to all projects using greater than 100 tons of hot mix asphalt (HMA) mixtures containing liquid asphalt cement as stipulated in the Notice to Contractors section of the bid documents.

Price Adjustments will be based on the variance in price, for the liquid asphalt component only, between the Base Price and the Period Price. They shall not include transportation or other charges. Price Adjustments will occur on a monthly basis.

Base Price
The Base Price of liquid asphalt on a project as listed in the Notice to Contractors section of the bid documents is a fixed price determined by the Department at the time of the bid using the same method as the determination of the Period Price detailed below. The Base Price shall be used in all bids.

Period Price
The Period Price is the price of liquid asphalt for each monthly period as determined by the Department using the average selling price per standard ton of PG64-28 paving grade (primary binder classification) asphalt, FOB manufacturer's terminal, as listed under the "East Coast Market - New England, Boston, Massachusetts area" section of the Poten & Partners, Inc. "Asphalt Weekly Monitor". This average selling price is listed in the issue having a publication date of the second Friday of the month and will be posted as the Period Price for that month. The Department will post this Period Price on its website at https://www.mass.gov/service-details/massdot-current-contract-price-adjustments following its receipt of the relevant issue of the "Asphalt Weekly Monitor". Poten and Partners has granted the Department the right to publish this specific asphalt price information sourced from the Asphalt Weekly Monitor.

Price Adjustment Determination, Calculation and Payment
The Contract Price of the HMA mixture will be paid under the respective item in the Contract. Price Adjustments, as herein provided, either upwards or downwards, will be made after the work has been performed using the monthly period price for the month during which the work was performed.

Price Adjustments will be paid only if the variance from the Base Price is 5% or more for a monthly period. The complete adjustment will be paid in all cases with no deduction of the 5% from either upward or downward adjustments.

The Price Adjustment applies only to the actual virgin liquid asphalt content in the mixture placed on the job in accordance with the approved Job Mix Formula.

Price Adjustments will be separate payment items. The pay item numbers are 999.401 for a positive price adjustment (a payment) and 999.402 for a negative price adjustment (a deduction). Price Adjustments will be calculated using the following equation:

Price Adjustment = Tons of HMA Placed X Liquid Asphalt Content % X RAP Factor X (Period Price - Base Price)

No Price Adjustment will be allowed beyond the Completion Date of this Contract, unless there is a Department-approved extension of time.

DOCUMENT 00812

SPECIAL PROVISIONS
MONTHLY PRICE ADJUSTMENT FOR DIESEL FUEL AND GASOLINE –
ENGLISH UNITS
Revised: 02/01/2021

This monthly fuel price adjustment is inserted in this contract because the national and worldwide energy situation has made the future cost of fuel unpredictable. This adjustment will provide for either additional compensation to the Contractor or repayment to the Commonwealth, depending on an increase or decrease in the average price of diesel fuel or gasoline.

This adjustment will be based on fuel usage factors for various items of work developed by the Highway Research Board in Circular 158, dated July 1974. These factors will be multiplied by the quantities of work done in each item during each monthly period and further multiplied by the variance in price from the Base Price to the Period Price.

The Base Price of Diesel Fuel and Gasoline will be the price as indicated in the Department's web site https://www.mass.gov/service-details/massdot-current-contract-price-adjustments for the month in which the contract was bid, which includes State Tax.

The Period Price will be the average of prices charged to the State, including State Tax for the bulk purchases made during each month.

This adjustment will be effected only if the variance from the Base Price is 5% or more for a monthly period. The complete adjustment will be paid in all cases with no deduction of the 5% from either upward or downward adjustments.

No adjustment will be paid for work done beyond the extended completion date of any contract.

Any adjustment (increase or decrease) to estimated quantities made to each item at the time of final payment will have the fuel price adjustment figured at the average period price for the entire term of the project for the difference of quantity.

The fuel price adjustment will apply only to the following items of work at the fuel factors shown:

ITEMS COVERED	FUEL FACTORS	
	Diesel	Gasoline
Excavation: and Borrow Work: Items 120, 120.1, 121, 123, 124, 125, 127, 129.3, 140, 140.1, 141, 142, 143, 144, 150, 150.1, 151 and 151.1 (Both Factors used)	0.29 Gallons / CY.	0.15 Gallons / CY
Surfacing Work: All Items containing Hot Mix Asphalt	2.90 Gallons / Ton	Does Not Apply

DOCUMENT 00813

SPECIAL PROVISIONS

PRICE ADJUSTMENTS FOR STRUCTURAL STEEL AND REINFORCING STEEL

August 14, 2025

This special provision applies to all projects containing the use of structural steel and/or reinforcing steel as specified elsewhere in the Contract work. It applies to all structural steel and all reinforcing steel, as defined below, on the project. Compliance with this provision is mandatory, i.e., there are no "opt-in" or "opt-out" clauses. Price adjustments will be handled as described below and shall only apply to unfabricated reinforcing steel bars and unfabricated structural steel material, consisting of rolled shapes, plate steel, sheet piling, pipe piles, steel castings and steel forgings.

Price adjustments will be variances between Base Prices and Period Prices. Base Prices and Period Prices are defined below.

Price adjustments will only be made if the variances between Base Prices and Period Prices are 5% or more. A variance can result in the Period Price being either higher or lower than the Base Price. Once the 5% threshold has been achieved, the adjustment will apply to the full variance between the Base Price and the Period Price.

Price adjustments will be calculated by multiplying the number of pounds of unfabricated structural steel material or unfabricated reinforcing steel bars on a project by the index factor calculated as shown below under Example of a Period Price Calculation.

Price adjustments will ***not*** include guardrail panels or the costs of shop drawing preparation, handling, fabrication, coatings, transportation, storage, installation, profit, overhead, fuel costs, fuel surcharges, or other such charges not related to the cost of the unfabricated structural steel and unfabricated reinforcing steel.

The weight of steel subject to a price adjustment shall not exceed the final shipping weight of the fabricated part by more than 10%.

Base Prices and Period Prices are defined as follows:

Base Prices of unfabricated structural steel and unfabricated reinforcing steel on a project are fixed prices determined by the Department and found in the table below. While it is the intention of the Department to make this table comprehensive, some of a project's unfabricated structural steel and/or unfabricated reinforcing steel may be inadvertently omitted. Should this occur, the Contractor shall bring the omission to the Department's attention so that a contract alteration may be processed that adds the missing steel to the table and its price adjustments to the Contract.

The Base Price Date is the month and year of the most recent finalized period price index at the time that MassDOT opened bids for the project. The Base Price Index for this contract is the Steel PPI listed in the Notice to Contractors.

Period Prices of unfabricated structural steel and unfabricated reinforcing steel on a project are variable prices that have been calculated using the Period Price Date and an index of steel prices to adjust the Base Price.

The Period Price Date is the date the steel was delivered to the fabricator as evidenced by an official bill of lading submitted to the Department containing a description of the shipped materials, weights of the shipped materials and the date of shipment. This date is used to select the Period Price Index.

The index used for the calculation of Period Prices is the U.S. Department of Labor Bureau of Labor Statistics Producer Price Index (PPI) Series ID WPU101702 (Not Seasonally Adjusted, Group: Metals and Metal Products, Item: Semi-finished Steel Mill Products.) As this index is subject to revision for a period of up to four (4) months after its original publication, no price adjustments will be made until the index for the period is finalized, i.e., the index is no longer suffixed with a "(P)".

Period Prices are determined as follows:

Period Price = Base Price X Index Factor
Index Factor = Period Price Index / Base Price Index

Example of a Period Price Calculation:

Calculate the Period Price for December 2009 using a Base Price from March 2009 of $0.82/Pound for 1,000 Pounds of ASTM A709 (AASHTO M270) Grade A36 Structural Steel Plate.

The Period Price Date is December 2009. From the PPI website*, the Period Price Index = 218.0.

The Base Price Date is March 2009. From the PPI website*, the Base Price Index = 229.4.

Index Factor = Period Price Index / Base Price Index = 218.0 / 229.4 = 0.950
Period Price = Base Price X Index Factor = $0.82/Pound X 0.950 = $0.78/Pound

Since $0.82 - $0.78 = $0.04 is less than 5% of $0.82, no price adjustment is required.

If the $0.04 difference shown above was greater than 5% of the Base Price, then the price adjustment would be 1,000 Pounds X $0.04/Pound = $40.00. Since the Period Price of $0.78/Pound is less than the Base Price of $0.82/Pound, indicating a drop in the price of steel between the bid and the delivery of material, a credit of $40.00 would be owed to MassDOT. When the Period Price is higher than the Base Price, the price adjustment is owed to the Contractor.

* To access the PPI website and obtain a Base Price Index or a Period Price Index, go to http://data.bls.gov/cgi-bin/srgate

End of example.

The Contractor will be paid for unfabricated structural steel and unfabricated reinforcing steel under the respective contract pay items for all components constructed of either structural steel or reinforced Portland cement concrete under their respective Contract Pay Items.

Price adjustments, as herein provided for, will be paid separately as follows:

Structural Steel
Pay Item Number 999.449 for positive (+) pay adjustments (payments to the Contractor)

Pay Item Number 999.457 for negative (-) pay adjustments (credits to MassDOT Highway Division)

Reinforcing Steel
Pay Item Number 999.466 for positive (+) pay adjustments (payments to the Contractor)

Pay Item Number 999.467 for negative (-) pay adjustments (credits to MassDOT Highway Division)

No price adjustment will be made for price changes after the Contract Completion Date, unless the MassDOT Highway Division has approved an extension of Contract Time for the Contract.

TABLE

Steel Type		Price per Pound
1	ASTM A615/A615M Grade 60 (AASHTO M31 Grade 60 or 420) Reinforcing Steel	$0.55
2	ASTM A27 (AASHTO M103) Steel Castings, H-Pile Points & Pipe Pile Shoes (See Note below.)	$0.76
3	ASTM A668 / A668M (AASHTO M102) Steel Forgings	$0.76
4	ASTM A108 (AASHTO M169) Steel Forgings for Shear Studs	$0.78
5	ASTM A709/A709M Grade 36 / AASHTO M270M/M270 Grade 36 or 250 Structural Steel Plate	$0.82
6	ASTM A709/A709M Grade 36 / AASHTO M270M/M270 Grade 36 or 250 Structural Steel Shapes	$0.77
7	ASTM A709/A709M Grade 50 / AASHTO M270M/M270 Grade 50 or 345 Structural Steel Plate	$0.82
8	ASTM A709/A709M Grade 50 / AASHTO M270M/M270 Grade 50 or 345 Structural Steel Shapes	$0.77
9	ASTM A709/A709M Grade 50WT / AASHTO M270M/M270 Grade 50WT or 345WT Structural Steel Plate	$0.85
10	ASTM A709/A709M Grade 50WT / AASHTO M270M/M270 Grade 50WT or 345WT Structural Steel Shapes	$0.78
11	ASTM A709/A709M Grade 50W / AASHTO M270M/M270 Grade 50W 345W Structural Steel Plate	$0.85
12	ASTM A709/A709M Grade 50W / AASHTO M270M/M270 Grade 50W or 345W Structural Steel Shapes	$0.78
13	ASTM A709/A709M Grade HPS 50W / AASHTO M270M/M270 Grade HPS 50W or 345W Structural Steel Plate	$0.89
14	ASTM A709/A709M Grade HPS 70W / AASHTO M270M/M270 Grade HPS 70W or 485W Structural Steel Plate	$0.96
15	ASTM A514/A514M-05 Grade HPS 100W / AASHTO M270M/M270 Grade HPS 100W or 690W Structural Steel Plate	$1.47
16	ASTM A992/A992M Grade 50S / AASHTO M270M/M270 Grade 50S or 345S Structural Steel Plate	$0.85
17	ASTM A992/A992M Grade 50S / AASHTO M270M/M270 Grade 50S or 345S Structural Steel Shapes	$0.78
18	ASTM A276 Type 316 Stainless Steel	$4.42
19	ASTM A240 Type 316 Stainless Steel	$4.42
20	ASTM A148 Grade 80/50 Steel Castings (See Note below.)	$1.52
21	ASTM A53 Grade B Structural Steel Pipe	$0.96
22	ASTM A500 Grades A, B, 36 & 50 Structural Steel Pipe	$0.96
23	ASTM A252, Grades 240 (36 KSI) & 414 (60 KSI) Pipe Pile	$0.76
24	ASTM 252, Grade 2 Permanent Steel Casing	$0.76
25	ASTM A36 (AASHTO M183) for H-piles, steel supports and sign supports	$0.80
26	ASTM A328 / A328M, Grade 50 (AASHTO M202) Steel Sheetpiling	$1.45
27	ASTM A572 / A572M, Grade 50 Sheetpiling	$1.45
28	ASTM A36/36M, Grade 50	$0.82
29	ASTM A570, Grade 50	$0.80
30	ASTM A572 (AASHTO M223), Grade 50 H-Piles	$0.82
31	ASTM A1085 Grade A (50 KSI) Steel Hollow Structural Sections (HSS), heat-treated per ASTM A1085 Supplement S1	$0.96
32	AREA 140 LB Rail and Track Accessories	$0.50

NOTE: Steel Castings are generally used only on moveable bridges. Cast iron frames, grates and pipe are not “steel” castings and will not be considered for price adjustments.

DOCUMENT 00814

SPECIAL PROVISIONS
PRICE ADJUSTMENT FOR PORTLAND CEMENT CONCRETE MIXES

January 12, 2009

This provision applies to all projects using greater than 100 Cubic Yards (76 Cubic Meters) of Portland cement concrete containing Portland cement as stipulated in the Notice to Contractors section of the Bid Documents. This Price Adjustment will occur on a monthly basis.

The Price Adjustment will be based on the variance in price for the Portland cement component only from the Base Price to the Period Price. It shall not include transportation or other charges.

The Base Price of Portland cement on a project is a fixed price determined at the time of bid by the Department by using the same method as for the determination of the Period Price (see below) and found in the Notice to Contractors.

The Period Price of Portland cement will be determined by using the latest published price, in dollars per ton (U.S.), for Portland cement (Type I) quoted for Boston, U.S.A. in the **Construction Economics** section of *ENR Engineering News-Record* magazine or at the ENR website http://www.enr.com under **Construction Economics**. The Period Price will be posted on the MassDOT website the Wednesday immediately following the publishing of the monthly price in ENR, which is normally the first week of the month.

The Contract Price of the Portland cement concrete mix will be paid under the respective item in the Contract. The price adjustment, as herein provided, upwards or downwards, will be made after the work has been performed, using the monthly period price for the month during which the work was performed.

The price adjustment applies only to the actual Portland cement content in the mix placed on the job in accordance with the Standard Specifications for Highways and Bridges, Division III, Section M4.02.01. No adjustments will be made for any cement replacement materials such as fly ash or ground granulated blast furnace slag.

The Price Adjustment will be a separate payment item. It will be determined by multiplying the number of cubic yards of Portland cement concrete placed during each monthly period times the Portland cement content percentage times the variance in price between the Base Price and Period Price of Portland cement.

This Price Adjustment will be paid only if the variance from the Base Price is 5% or more for a monthly period. The complete adjustment will be paid in all cases with no deduction of the 5% from either upward or downward adjustments.

No Price Adjustment will be allowed beyond the Completion Date of this Contract, unless there is a Department-approved extension of time.

DOCUMENT 00820

THE COMMONWEALTH OF MASSACHUSETTS SUPPLEMENTAL EQUAL EMPLOYMENT OPPORTUNITY, NON-DISCRIMINATION AND AFFIRMATIVE ACTION PROGRAM

I. Definitions

For purposes of this contract,

"Minority" means a person who meets one or more of the following definitions:

(a) American Indian or Native American means: all persons having origins in any of the original peoples of North America and who are recognized as an Indian by a tribe or tribal organization.
(b) Asian means: All persons having origins in any of the original peoples of the Far East, Southeast Asia, the Indian sub-continent, or the Pacific Islands, including, but Not limited to China, Japan, Korea, Samoa, India, and the Philippine Islands.
(c) Black means: All persons having origins in any of the Black racial groups of Africa, including, but not limited to, African-Americans, and all persons having origins in any of the original peoples of the Cape Verdean Islands.
(d) Eskimo or Aleut means: All persons having origins in any of the peoples of Northern Canada, Greenland, Alaska, and Eastern Siberia.
(e) Hispanic means: All persons having their origins in any of the Spanish-speaking peoples of Mexico, Puerto Rico, Cuba, Central or South America, or the Caribbean Islands.

"State construction contract" means a contract for the construction, reconstruction, installation, demolition, maintenance or repair of a building or capital facility, or a contract for the construction, reconstruction, alteration, remodeling or repair of a public work undertaken by a department, agency, board, or commission of the commonwealth.

"State assisted construction contract" means a contract for the construction, reconstruction, installation, demolition, maintenance or repair of a building or capital facility undertaken by a political subdivision of the commonwealth, or two or more political subdivisions thereof, an authority, or other instrumentality and whose costs of the contract are paid for, reimbursed, grant funded, or otherwise supported, in whole or in part, by the commonwealth.

II. Equal Opportunity, Non-Discrimination and Affirmative Action

During the performance of this Contract, the Contractor and all subcontractors (hereinafter collectively referred to as "the Contractor") for a state construction contract or a state assisted construction contract, for him/herself, his/her assignees and successors in interest, agree to comply with all applicable equal employment opportunity, non-discrimination and affirmative action requirements, including but not limited to the following:

In connection with the performance of work under this contract, the Contractor shall not discriminate against any employee or applicant for employment because of race, color, religious creed, national origin, sex, sexual orientation, genetic information, military service, age, ancestry or disability, shall not discriminate in the selection or retention of subcontractors, and shall not discriminate in the procurement of materials and rentals of equipment.

The aforesaid provision shall include, but not be limited to, the following: employment upgrading, demotion, or transfer; recruitment advertising, layoff or termination; rates of pay or other forms of compensation; conditions or privileges of employment; and selection for apprenticeship or on-the-job training opportunity. The Contractor shall comply with the provisions of chapter 151B of the Massachusetts General Laws, as amended, and all other applicable anti-discrimination and equal opportunity laws, all of which are herein incorporated by reference and made a part of this Contract.

The Contractor shall post hereafter in conspicuous places, available for employees and applicants for employment, notices to be provided by the Massachusetts Commission Against Discrimination setting forth the provisions of the Fair Employment Practices Law of the Commonwealth (Massachusetts General Laws Chapter l51 B).

In connection with the performance of work under this contract, the Contractor shall undertake, in good faith, affirmative action measures to eliminate any discriminatory barriers in the terms and conditions of employment on the grounds of race, color, religious creed, national origin, sex, sexual orientation, genetic information, military service, age, ancestry or disability. Such affirmative action measures shall entail positive and aggressive measures to ensure nondiscrimination and to promote equal opportunity in the areas of hiring, upgrading, demotion or transfer, recruitment, layoff or termination, rate of compensation, apprenticeship and on-the-job training programs. A list of positive and aggressive measures shall include, but not be limited to, advertising employment opportunities in minority and other community news media; notifying minority, women and other community-based organizations of employment opportunities; validating all job specifications, selection requirements, and tests; maintaining a file of names and addresses of each worker referred to the Contractor and what action was taken concerning such worker; and notifying the administering agency in writing when a union with whom the Contractor has a collective bargaining agreement has failed to refer a minority or woman worker. These and other affirmative action measures shall include all actions required to guarantee equal employment opportunity for all persons, regardless of race, color, religious creed, national origin, sex, sexual orientation, genetic information, military service, age, ancestry or disability. One purpose of this provision is to ensure to the fullest extent possible an adequate supply of skilled tradesmen for this and future Commonwealth public construction projects.

III. Minority and Women Workforce Participation

Pursuant to his/her obligations under the preceding section, the Contractor shall strive to achieve on this project the labor participation goals contained herein. Said participation goals shall apply in each job category on this project including but not limited to bricklayers, carpenters, cement masons, electricians, ironworkers, operating engineers and those classes of work enumerated in Section 44F of Chapter 149 of the Massachusetts General Laws. The participation goals for this project shall be 15.3% for minorities and 6.9% for women. The participation goals, as set forth herein, shall not be construed as quotas or set-asides; rather, such participation goals will be used to measure the progress of the Commonwealth's equal opportunity, non-discrimination and affirmative action program. Additionally, the participation goals contained herein should not be seen or treated as a floor or as a ceiling for the employment of particular individuals or group of individuals.

IV. Liaison Committee

At the discretion of the agency that administers the contract for the construction project there may be established for the life of the contract a body to be known as the Liaison Committee. The Liaison Committee shall be composed of one representative each from the agency or agencies administering the contract for the construction project, hereinafter called the administering agency, a representative from the Office of Affirmative action, and such other representatives as may be designated by the administering agency. The Contractor (or his/her agent, if any, designated by him/her as the on-site equal employment opportunity officer) shall recognize the Liaison Committee as an affirmative action body, and shall establish a continuing working relationship with the Liaison Committee, consulting with the Liaison Committee on all matters related to minority recruitment, referral, employment and training.

V. Reports and Records

The Contractor shall prepare projected workforce tables on a quarterly basis when required by the administering agency. These shall be broken down into projections, by week, of workers required in each trade. Copies shall be furnished one week in advance of the commencement of the period covered, and also, when updated, to the administering agency and the Liaison Committee when required.

The Contractor shall prepare weekly reports in a form approved by the administering agency, unless information required is required to be reported electronically by the administering agency, the number of hours worked in each trade by each employee, identified as woman, minority, or non-minority. Copies of these shall be provided at the end of each such week to the administering agency and the Liaison Committee.

Records of employment referral orders, prepared by the Contractor, shall be made available to the administering agency on request.

The Contractor will provide all information and reports required by the administering agency on instructions issued by the administering agency and will permit access to its facilities and any books, records, accounts and other sources of information which may be determined by the administering agency to effect the employment of personnel. This provision shall apply only to information pertinent to the Commonwealth's supplementary non-discrimination, equal opportunity and access and opportunity contract requirements. Where information required is in the exclusive possession of another who fails or refuses to furnish this information, the Contractor shall so certify to the administering agency and shall set forth what efforts he has made to obtain the information.

VI. Access to Work Site

A designee of the administering agency and a designee of the Liaison Committee shall each have a right to access the work site.

VII. Solicitations for Subcontracts, and for the Procurement of Materials and Equipment

In all solicitations either by competitive bidding or negotiation made by the Contractor either for work to be performed under a subcontract or for the procurement of materials or equipment, each potential subcontractor or supplier shall be notified in writing by the Contractor of the Contractor's obligations under this contract relative to non-discrimination and equal opportunity.

VIII. Sanctions

Whenever the administering agency believes the General or Prime Contractor or any subcontractor may not be operating in compliance with the provisions of the Fair Employment Practices Law of the Commonwealth (Massachusetts General Laws Chapter 151B), the administering agency may refer the matter to the Massachusetts Commission Against Discrimination ("Commission") for investigation.

Following the referral of a matter by the administering agency to the Massachusetts Commission Against Discrimination, and while the matter is pending before the MCAD, the administering agency may withhold payments from contractors and subcontractors when it has documentation that the contractor or subcontractor has violated the Fair Employment Practices Law with respect to its activities on the Project, or if the administering agency determines that the contractor has materially failed to comply with its obligations and the requirements of this Section. The amount withheld shall not exceed a withhold of payment to the General or Prime Contractor of 1/100 or 1% of the contract award price or $5,000, whichever sum is greater, or, if a subcontractor is in non-compliance, a withhold by the administering agency from the General Contractor, to be assessed by the General Contractor as a charge against the subcontractor, of 1/100 or 1% of the subcontractor price, or $1,000 whichever sum is greater, for each violation of the applicable law or contract requirements. The total withheld from anyone General or Prime Contractor or subcontractor on a Project shall not exceed $20,000 overall. No withhold of payments or investigation by the Commission or its agent shall be initiated without the administering agency providing prior notice to the Contractor.

If, after investigation, the Massachusetts Commission Against Discrimination finds that a General or Prime Contractor or subcontractor, in commission of a state construction contract or state-assisted construction contract, violated the provisions of the Fair Employment Practices Law, the administering agency may convert the amount withheld as set forth above into a permanent sanction, as a permanent deduct from payments to the General or Prime Contractor or subcontractor, which sanction will be in addition to any such sanctions, fines or penalties imposed by the Massachusetts Commission Against Discrimination.

No sanction enumerated under this Section shall be imposed by the administering agency except after notice to the General or Prime Contractor or subcontractor and an adjudicatory proceeding, as that term is used, under Massachusetts General Laws Chapter 30A, has been conducted.

IX. Severability

The provisions of this section are severable, and if any of these provisions shall be held unconstitutional by any court of competent jurisdiction, the decision of such court shall not affect or impair any of the remaining provisions.

X. Contractor's Certification

After award and prior to the execution of any contract for a state construction contract or a state assisted construction contract, the Prime or General Contractor shall certify that it will comply with all provisions of this Document 00820 Supplemental Equal Employment Opportunity, Non-Discrimination and Affirmative Action Program, by executing Document 00859 Contractor/Subcontractor Certification Form.

XI. Subcontractor Requirements

Prior to the award of any subcontract for a state construction contract or a state assisted construction contract, the Prime or General Contractor shall provide all prospective subcontractors with a complete copy of this Document 00820 entitled "Supplemental Equal Employment Opportunity, Non-Discrimination and Affirmative Action Program" and will incorporate the provisions of this Document 00820 into any and all contracts or work orders for all subcontractors providing work on the Project. In order to ensure that the said subcontractor's certification becomes a part of all subcontracts under the prime contract, the Prime or General Contractor shall certify in writing to the administering agency that it has complied with the requirements as set forth in the preceeding paragraph by executing Document 00859 Contractor/Subcontractor Certification Form.

ELECTRONIC REPORTING REQUIREMENTS
CIVIL RIGHTS PROGRAMS AND CERTIFIED PAYROLL

Implemented on March 2, 2009 Revised June 04, 2019

The Massachusetts Department Of Transportation (MassDOT) has replaced the CHAMP reporting system with Equitable Business Opportunity Solution (EBO), a new web-based civil rights reporting software system. This system is capable of handling both civil rights reporting requirements and certified payrolls. The program's functions include the administration of Equal Employment Opportunity (EEO) requirements, On-The-Job Training requirements (OJT), Disadvantage Business Enterprise (DBE) and/or Minority / Women's Business Enterprise (M/WBE) subcontracting requirements, and the electronic collection of certified payrolls associated with MassDOT projects. In addition, this system is used to generate various data required as part of the American Recovery and Reinvestment Act (ARRA). Contractors are responsible for all coordination with all sub-contractors to ensure timely and accurate electronic submission of all required data.

Contractor and Sub-Contractor EBO User Certification

All contractors and sub-contractors must use the EBO software system. The software vendor, Internet Government Solutions (IGS), has developed an online EBO Training Module that is available to contractors and sub-contractors. This module is a self-tutorial which allows all users in the company to access the training, complete the tutorial, and become certified as EBO users for a one time fee of $75.00. This is the only cost to contractors and sub-contractors associated with the EBO software system. The online EBO Training Module can be accessed at www.ebotraining.com. Click the "Register My Company" button on the login page to begin your training registration. Questions regarding EBO online training should be directed to Gerry Anguilano, IGS at (440) 238-1684.

MassDOT will track contractors and sub-contractors who have successfully completed the on-line training module. All persons performing civil rights program and/or certified payroll functions should be EBO certified.

Vetting of Firms and Designated Firm Individuals

Contractors must authorize a Primary Log-In ID Holder who has completed EBO on-line training to have access to the EBO system by completing and submitting the "Request For EBO System Log-In/Password Form" located on the MassDOT website at: https://www.mass.gov/how-to/how-to-get-an-ebo-login
Contractors must also agree to comply with the EBO system user agreement located on the MassDOT website.

All subcontracts entered into on a project must include language that identifies the submission and training requirements that the sub-contractor must perform. Sub-contractors will be approved by the respective District Office of MassDOT through the existing approval process. When new sub-contractors, who have not previously worked for MassDOT, are initially selected by a general contractor, the new sub-contractor must be approved by the District before taking the EBO on-line training module.

Interim Reporting Requirements

Until MassDOT is satisfied that the EBO system is fully operational and functioning as designed, contractors and sub-contractors will be required to submit certified payrolls manually. There will be a transition period where dual reporting, through manual and electronic submission, will be required. MassDOT, however, will notify contractors and sub-contractors when they may cease manual submission of certified payrolls.

PART 2

PART 2 SUBCONTRACTOR CERTIFICATION: I hereby certify, as an authorized official of this company, that the required documents in Part 1 above were physically incorporated in our Agreement/Subcontract with the Contractor and give assurance that this company will fully comply or make every good faith effort to comply with the same. I further certify that:

1. This company recognizes that if this is a Federal-Aid Project, then this Contract is covered by the equal employment opportunity laws administered and enforced by the United States Department of Labor ("USDOL"), Office of Federal Contract Compliance Programs ('OFCCP"). By signing below, we acknowledge that this company has certain reporting obligations to the OFCCP, as specified by 41 CFR Part 60-4.2.
2. This company further acknowledges that any contractor with fifty (50) or more employees on a Federal-aid Contract with a value of fifty-thousand ($50,000) dollars or more must annually file an EEO-1 Report (SF 100) to the EEOC, Joint Reporting Committee, on or before September 30th, each year, as specified by 41 CFR Part 60-1.7a.
3. For more information regarding the federal reporting requirements, please contact the USDOL, OFCCP Regional Office, at 1-646-264-3170 or EEO-1, Joint Reporting Committee at 1-866-286-6440.
4. This company ☐ has, ☐ has not, participated in a previous contract or subcontract subject to the Equal Opportunity clauses set forth in 41 CFR Part 60-4 and Executive Order 11246, and where required, has filed with the Joint Reporting Committee, the Director of the Office of Federal Contract Compliance Programs or the EEO Commission all reports due under the applicable filing requirements.
5. This company is in full compliance with applicable Federal and Commonwealth of Massachusetts laws, rules, and regulations and is not currently debarred or disqualified from bidding on or participating in construction contracts in any jurisdiction of the United States. See : https://www.mass.gov/service-details/contractors-and-vendors-suspended-or-debarred-by-massdot
6. This company is properly registered and in good standing with the Office of the Secretary of the Commonwealth.

DOCUMENT 00860

COMMONWEALTH OF MASSACHUSETTS PUBLIC EMPLOYMENT LAWS

Revised February 20, 2019

The Contractor's attention is directed to Massachusetts General Laws, Chapter 149, Sections 26 through 27H, and 150A. This contract is considered to fall within the ambit of that law, which provides that in general, the Prevailing Rate or Total Rate must be paid to employees working on projects funded by the Commonwealth of Massachusetts or any political subdivision including Massachusetts Department of Transportation (MassDOT).

A Federal Aid project is also subject to the Federal Minimum Wage Rate law for construction. When comparing a state minimum wage rate, monitored by the Massachusetts Attorney General, versus federal minimum wage rate, monitored by the U.S. Department of Labor Wage and Hour Division, for a particular job classification the higher wage is at all times to be paid to the affected employee.

Every contractor or subcontractor engaged in this contract to which sections twenty-seven and twenty-seven A apply will keep a true and accurate record of all mechanics and apprentices, teamsters, chauffeurs and laborers employed thereon, showing the name, address and occupational classification of each such employee on this contract, and the hours worked by, and the wages paid to, each such employee, and shall furnish to the MassDOT's Resident Engineer, on a weekly basis, a copy of said record, in a form approved by MassDOT and in accordance with M.G.L. c. 149, § 27B, signed by the employer or his/her authorized agent under the penalties of perjury.

Each such contractor or subcontractor shall preserve its payroll records for a period of three years from the date of completion of the contract.

The Prevailing Wage Rate generally includes the following:

> Minimum Hourly Wage + Employer Contributions to Benefit Plans = Prevailing Wage Rate or Total Rate
>
> Any employer who does not make contributions to Benefit Plans must pay the total Prevailing Wage Rate directly to the employee.

Any deduction from the Prevailing Wage Rate or Total Rate for contributions to benefit plans can only be for a Health & Welfare, Pension, or Supplementary Unemployment plan meeting the requirements of the Employee Retirement Income Security Act (ERISA) of 1974. The maximum allowable deduction for these benefits from the prevailing wage rate cannot be greater than the amount allowed by Executive Office of Labor (EOL) for the specified benefits. Any additional expense of providing benefits to the employees is to be borne by the employer and cannot be deducted from the Minimum Hourly Wage. If the employer's benefit expense is less than that so provided by EOL the difference will be paid directly to the employee. The rate established must be paid to all employees who perform work on the project.

When an employer makes deductions from the Minimum Hourly Wage for an employee's contribution to social security, state taxes, federal taxes, and/or other contribution programs, allowed by law, the employer shall furnish each employee a suitable pay slip, check stub or envelope notifying the employee of the amount of the deductions.

No contractor or subcontractor contracting for any part of the contract week shall require or permit any laborer or mechanic to be employed on such work in excess of forty hours in any workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times his basic rate of pay for all hours worked in excess of forty hours in such workweek, whichever is the greater number of overtime hours.

Apprentice Rates are permitted only when there is an Apprentice Agreement registered with the Massachusetts Division of Apprentice Training in accordance with M.G.L. c. 23, § 11E-11L.

The Prevailing Wage Rates issued for each project shall be the rates paid for the entire project. The Prevailing Wage Rates must be posted on the job site at all times and be visible from a public way.

In addition, each such contractor and subcontractor shall furnish to the MassDOT's Resident Engineer, within fifteen days after completion of its portion of the work, a statement, executed by the contractor or subcontractor or by any authorized officer or employee of the contractor or subcontractor who supervises the payment of wages, in the following form:

STATEMENT OF COMPLIANCE

Date: _____

I , _____do hereby state:
(Name of signatory party) (Title)

That I pay or supervise the payment of the persons employed by:

_____
(Contractor or Subcontractor)

on the _____
(MassDOT Project Location and Contract Number)

and that all mechanics and apprentices, teamsters, chauffeurs and laborers employed on said project have been paid in accordance with wages determined under the provisions of sections twenty-six and twenty-seven of chapter one hundred and forty-nine of the General Laws.

Signature _____

Title _____

The above-mentioned copies of payroll records and statements of compliance shall be available for inspection by any interested party filing a written request to the MassDOT's Resident Engineer for such inspection and copying.

Massachusetts General Laws c. 149, §27, requires annual updates to prevailing wage schedules for all public construction contracts lasting longer than one year. MassDOT will request the required updates and furnish them to the Contractor. The Contractor is required to pay no less than the wage rates indicated on the annual updated wage schedules.

MassDOT will request the updates no later that two week before the anniversary of the Notice to Proceed date of the contract to allow for adequate processing by the Department of Labor Standards (DLS). The effective date for the new rates will be the anniversary date of the contract (i.e. the notice to proceed date), regardless of the date of issuance on the schedule from DLS.

All bidders are cautioned that the aforementioned laws require that employers pay to covered employees no less than the applicable minimum wages. In addition, the same laws require that the applicable prevailing wages become incorporated as part of this contract. The prevailing minimum wage law establishes serious civil and criminal penalties for violations, including imprisonment and exclusion from future public contracts. Bidders are cautioned to carefully read the relevant sections of the Massachusetts General Laws.

Awarding Authority:	MassDOT Highway	**City/Town:**	PEABODY
Contract Number:	132091		
Description of Work:	PEABODY - Federal Aid Project No. TAP/CMQ-0034(027)X Independence Greenway Extension		
Job Location:	Independence Greenway Extension		

Information about Prevailing Wage Schedules for Awarding Authorities and Contractors

- The wage rates will remain in effect for the duration of the project, except in the case of multi-year public construction projects. For construction projects lasting longer than one year, awarding authorities must request an updated wage schedule no later than two weeks before the anniversary of the date the contract was executed by the awarding authority and the general contractor. For multi-year CM AT RISK projects, the awarding authority must request an annual update no later than two weeks before the anniversary date, determined as the earlier of: (a) the execution date of the GMP Amendment, or (b) the execution date of the first amendment to permit procurement of construction services. The updated wage schedule must be provided to all contractors, including general and sub-contractors, working on the construction project.
- This annual update requirement is generally not applicable to 27F “rental of equipment” contracts. For such contracts, the prevailing wage rates issued by DLS shall remain in effect for the duration of the contract term. However, if the prevailing wage rate sheet issued does not contain wage rates for each year covered by the contract term, the Awarding Authority must request updated rate sheets from DLS and provide them to the contractor to ensure the correct rates are being paid throughout the duration of the contract. Additionally, if an Awarding Authority exercises an option to renew or extend the contract term, they must request updated rate sheets form DLS and provide them to the contractor.
- This wage schedule applies only to the specific project referenced at the top of this page and uniquely identified by the “Wage Request Number” on all pages of this schedule.
- An Awarding Authority must request an updated wage schedule if it has not opened bids or selected a contractor within 90 days of the date of issuance of the wage schedule. For CM AT RISK projects (bid pursuant to G.L. c.149A), the earlier of: (a) the execution date of the GMP Amendment, or (b) the bid for the first construction scope of work must be within 90-days of the wage schedule issuance date.
- The wage schedule shall be incorporated in any advertisement or call for bids for the project as required by M.G.L. c. 149, § 27. The wage schedule shall be made a part of the contract awarded for the project. The wage schedule must be posted in a conspicuous place at the work site for the life of the project in accordance with M.G.L. c. 149 § 27. The wages listed on the wage schedule must be paid to employees performing construction work on the project whether they are employed by the prime contractor, a filed sub-bidder, or a sub-contractor.
- Apprentices working on the project are required to be registered with the Massachusetts Division of Apprentice Standards (DAS). Apprentices must keep their apprentice identification card on their persons during all work hours on the project. An apprentice registered with DAS may be paid the lower apprentice wage rate at the applicable step as provided on the prevailing wage schedule. **Any apprentice not registered with DAS regardless of whether they are registered with another federal, state, local, or private agency must be paid the journeyworker's rate.**
- Every contractor or subcontractor working on the construction project must submit weekly payroll reports and a Statement of Compliance directly to the awarding authority by mail or email and keep them on file for three years. Each weekly payroll report must contain: the employee’s name, address, occupational classification, hours worked, and wages paid. Do not submit weekly payroll reports to DLS. For a sample payroll reporting form go to http://www.mass.gov/dols/pw.
- Contractors with questions about the wage rates or classifications included on the wage schedule have an affirmative obligation to inquire with DLS at (617) 626-6953.
- Contractors must obtain the wage schedules from awarding authorities. Failure of a contractor or subcontractor to pay the prevailing wage rates listed on the wage schedule to all employees who perform construction work on the project is a violation of the law and subjects the contractor or subcontractor to civil and criminal penalties.
- Employees not receiving the prevailing wage rate set forth on the wage schedule may file a complaint with the Fair Labor Division of the office of the Attorney General at (617) 727-3465.

Additional Apprentice Information

All apprentices must be registered with the Division of Apprenticeship Training(DAS) in accordance with M.G.L.c. 23, §§ 11E-11L. Minimum wage rates for apprentices employed on public works projects are listed above as a percentage of the hourly prevailing wage rate established by the Commissioner under the provisions of M.G.L.c. 149, §§ 26-27D.

Apprentice ratios are established by DAS pursuant to M.G.L.c. 23, §§ 11E-11L. Ratios are expressed as the allowable number of apprentices to journeymen or fraction thereof, unless otherwise specified. The ratios listed herein have been taken from relevant private collective bargaining agreements(CBAs) and are provided for illustrative purposes only. They have not been independently verified as being accurate or continuing to be accurate.

Parties having questions regarding what ratio to use should contact DAS.

DOCUMENT 00870

STANDARD FEDERAL EQUAL EMPLOYMENT OPPORTUNITY CONSTRUCTION CONTRACT SPECIFICATIONS
(EXECUTIVE ORDER 11246)
Revised April 9, 2019

1. As used in these specifications:

   a. "Covered area" means the geographical area described in the solicitation from which this contract resulted:

   b. "Director" means Director, Office of Federal Contract Compliance Programs, United States Department of Labor, or any person to whom the Director delegates authority.

   c. "Employer identification number" means the Federal Social Security number used on the Employer's Quarterly Federal Tax Return, U.S. Treasury Department Form 941.

   d. "Minority" includes:

      (i) Black (all persons having origins in any of the black African racial groups not of Hispanic origin);
      (ii) Hispanic (all persons of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish Culture or origin, regardless of race);
      (iii) Asian and Pacific Islander (all persons having origins in any of the original peoples of the Far East, Southeast Asia, the Indian Subcontinent, or the Pacific Islands); and
      (iv) American Indian or Alaskan Native (all persons having origins in any of the original peoples of North America and maintaining identifiable tribal affiliations through membership and participation or community identification).

2. Whenever the Contractor, or any Subcontractor at any tier, subcontracts a portion of the work involving any construction trade, it shall physically include in each subcontract in excess of $ 10,000 the provisions of the specifications and the Notice which contains the applicable goals for minority and female participation and which is set forth in the solicitations from which this contract resulted.

3. If the Contractor is participating (pursuant to 41 CFR 60-4.5) in a Hometown Plan approved by the U.S. Department of Labor in the covered area either individually or through an association, its affirmative action obligations on all work in the Plan area (including goals and timetables) shall be in accordance with that Plan for those trades which have unions participating in the Plan. Contractors must be able to demonstrate their participation in and compliance with the provisions of any such Hometown Plan. Each Contractor or Subcontractor participating in an approved Plan is individually required to comply with its obligations under the EEO clause, and to make a good faith effort to achieve each goal under the plan in each trade in which it has employees. The overall good faith performance by other Contractors or Subcontractors toward a goal in an approved Plan does not excuse any covered Contractor's or Subcontractor's failure to take good faith efforts to achieve the Plan goals and timetables.

4. The Contractor shall implement the specific affirmative action standards provided in Paragraphs 7a through p of these specifications. The goals set forth in the solicitation from which this contract resulted are expressed as percentages of the total hours of employment and training of minority and female utilization the Contractor should reasonably be able to achieve in each construction trade in which it has employees in the covered area. The Contractor is expected to make substantially uniform progress toward its goals in each craft during the period specified.

5. Neither the provisions of any collective bargaining agreement, nor the failure by a union with whom the Contractor has a collective bargaining agreement, to refer either minorities or women shall excuse the Contractor's obligations under these specifications, Executive Order 11246, or the regulations promulgated pursuant thereto.

6. In order for the nonworking training hours of apprentices and trainees to be counted in meeting the goals, such apprentices and trainees must be employed by the Contractor during the training period, and the Contractor must have made a commitment to employ the apprentices and trainees at the completion of their training, subject to the availability of employment opportunities. Trainees must be trained pursuant to training programs approved by the U.S. Department of Labor.

7. The Contractor shall take specific affirmative actions to ensure equal employment opportunity. The evaluation of the Contractor's compliance with these specifications shall be based upon its effort to achieve maximum results from its actions. The Contractor shall document these efforts fully, and shall implement affirmative action steps at least as extensive as the following:

   a. Ensure and maintain a working environment free of harassment, intimidation, and coercion at all sites, and all facilities at which the Contractor's employees are assigned to work. The Contractor, where possible, will assign two or more women to each construction project. The Contractor shall specifically ensure that all foremen, superintendents, and other on-site supervisory personnel are aware of and carry out the Contractor's obligation to maintain such a working environment, with specific attention to minority or female individuals working at such sites or in such facilities.

   b. Establish and maintain a current list of minority and female recruitment sources, provide written notification to minority and female recruitment sources and to community organizations when the Contractor or its unions have employment opportunities available, and maintain a record of the organizations' responses.

   c. Maintain a current file of the names, addresses and telephone numbers of each minority and female off-the-street applicant and minority or female referral from a union, a recruitment source or community organization and of what action was taken with respect to each such individual. If such individual was sent to the union hiring hall for referral and was not referred back to the Contractor by the union or, if referred, not employed by the Contractor, this shall be documented in the file with the reason therefor, along with whatever additional actions the Contractor may have taken.

   d. Provide immediate written notification to the Director when the union or unions with which the Contractor has a collective bargaining agreement has not referred to the Contractor a minority person or woman sent by the Contractor, or when the Contractor has other information that the union referral process has impeded the Contractor's efforts to meet its obligations.

   e. Develop on-the-job training opportunities and/or participate in training programs for the area which expressly include minorities and women, including upgrading programs and apprenticeship and trainee programs relevant to the Contractor's employment needs, especially those programs funded or approved by the Department of Labor. The Contractor shall provide notice of these programs to the sources compiled under 7b above.

   f. Disseminate the Contractor's EEO policy by providing notice of the policy to unions and training programs and requesting their cooperation in assisting the Contractor in meeting its EEO obligations; by including it in any policy manual and collective bargaining agreement; by publicizing it in the company newspaper, annual report, etc; by specific review of the policy with all management personnel and with all minority and female employees at least once a year; and by posting the company EEO policy on bulletin boards accessible to all employees at each location where construction work is performed.

   g. Review, at least annually, the company's EEO policy and affirmative action obligations under these specifications with all employees having any responsibility for hiring, assignment, layoff, termination or other employment decisions including specific review of these items with on-site supervisory personnel such as Superintendents, General Foremen, etc., prior to the initiation of construction work at any job site. A written record shall be made and maintained identifying the time and place of these meetings, persons attending, subject matter discussed, and disposition of the subject matter.

   h. Disseminate the Contractor's EEO policy externally by including it in any advertising in the news media, specifically including minority and female news media, and providing written notification to and discussing the Contractor's EEO policy with other Contractors and Subcontractors with whom the Contractor does or anticipates doing business.

i. Direct its recruitment efforts both oral and written, to minority, female and community organizations, to schools with minority and female students and to minority and female recruitment and training organizations serving the Contractor's recruitment area and employment needs. Not later than one month prior to the date for the acceptance of applications for apprenticeship or other training by any recruitment source, the Contractor shall send written notification to organizations such as the above, describing the openings, screening procedures, and tests to be used in the selection process.

j. Encourage present minority and female employees to recruit other minority persons and women and, where reasonable, provide after school, summer and vacation employment to minority and female youth both on the site and in other areas of a Contractor's work force.

k. Validate all tests and other selection requirements where there is an obligation to do so under 41 CFR Part 60-3.

l. Conduct, at least annually, an inventory and evaluation at least of all minority and female personnel for promotional opportunities and encourage these employees to seek or to prepare for, through appropriate training, etc., such opportunities.

m. Ensure that seniority practices, job classifications, work assignments and other personnel practices, do not have a discriminatory effect by continually monitoring all personnel and employment related activities to ensure that the EEO policy and the Contractor's obligations under these specifications are being carried out.

n. Ensure that all facilities and company activities are nonsegregated except that separate or single-user toilet and necessary changing facilities shall be provided to assure privacy between the sexes.

o. Document and maintain a record of all solicitations of offers for subcontracts from minority and female construction contractors and suppliers, including circulation of solicitations to minority and female contractor associations and other business associations.

p. Conduct a review, at least annually, of all supervisor's adherence to and performance under the Contractor's EEO policies and affirmative action obligations.

8. Contractors are encouraged to participate in voluntary associations which assist in fulfilling one or more of their affirmative action obligations (7a through p). The efforts of a contractor association, joint contractor-union, contractor-community, or other similar group of which the contractor is a member and participant, may be asserted as fulfilling any one or more of its obligations under 7a through p of these Specifications provided that the Contractor actively participates in the group, makes every effort to assure that the group has a positive impact on the employment of minorities and women in the industry, ensures that the concrete benefits of the program are reflected in the Contractor's minority and female work force participation, makes a good faith effort to meet its individual goals and timetables, and can provide access to documentation which demonstrates the effectiveness of actions taken on behalf of the Contractor. The obligation to comply, however, is the Contractor's and failure of such a group to fulfill an obligation shall not be a defense for the Contractor's noncompliance.

9. A single goal for minorities and a separate single goal for women have been established. The Contractor, however, is required to provide equal employment opportunity and to take affirmative action for all minority groups, both male and female, and all women, both minority and non-minority. Consequently, the Contractor may be in violation of the Executive Order if a particular group is employed in a substantially disparate manner (for example, even though the Contractor has achieved its goals for women generally, the Contractor may be in violation of the Executive Order if a specific minority group of women is underutilized).

10. The Contractor shall not use the goals and timetables of affirmative action standards to discriminate against any person because of race, color, religion, sex, or national origin.

11 The Contractor shall not enter into any Subcontract with any person or firm debarred from Government contracts pursuant to Executive Order 11246.

12. The Contractor shall carry out such sanctions and penalties for violation of these specifications and of the Equal Opportunity Clause, including suspension, termination and cancellation of existing subcontracts as may be imposed or ordered pursuant to Executive Order 11246, as amended, and its implementing regulations, by the Office of Federal Contract Compliance programs. Any Contractor who fails to carry out such sanctions and penalties shall be in violation of these specifications and Executive Order 11246, as amended.

13. The Contractor, in fulfilling its obligations under these specifications, shall implement specific affirmative action steps, at least as extensive as those standards prescribed in paragraph 7 of these specifications so as to achieve maximum results from its efforts to ensure equal employment opportunity. If the Contractor fails to comply with the requirements of the Executive Order, the implementing regulations, or these specifications, the Director shall proceed in accordance with 41 CFR 60-4.8.

14. The Contractor shall designate a responsible official to monitor all employment related activity to ensure that the company EEO policy is being carried out, to submit reports relating to the provisions hereof as many be required by the Government and keep records. Records shall at least include for each employee the name, address, telephone numbers, construction trade, union affiliation if any, employee identification number when assigned, social security number, race, sex, status (e.g., mechanic, apprentice, trainee, helper, or laborer), dates of changes in status, hours worked per week in the indicated trade, rate of pay, and locations at which the work was performed. Records shall be maintained in an easily understandable and retrievable form; however, to the degree that existing records satisfy this requirement, contractors shall not be required to maintain separate records.

15. Nothing herein provided shall be construed as a limitation upon the application of other laws which establish different standards of compliance or upon the application of requirements for the hiring of local or other area residents (e.g., those under the Public Works Employment Act of 1977 and the Community Development Block Grant Program).

APPENDIX A

The following goals and timetables for female utilization shall be included in all Federal and federally assisted construction contracts and subcontracts in excess of $ 10,000. The goals are applicable to the Contractor's aggregate on-site construction workforce whether or not part of that workforce is performing work on a Federal or federally-assisted construction contract or subcontract.

Area covered: Goal for Women apply nationwide

Goals and Timetables

Timetable	Goals (percent)
From Apr. 1, 1980 until further notice	6.9

APPENDIX B-80

Until further notice, the following goals for minority utilization in each construction craft and trade shall included in all Federal or federally assisted construction contracts and subcontracts in excess of $ 10,000 to be performed in the respective geographical areas. The goals are applicable to each nonexempt contractor's total on- site construction workforce, regardless of whether or not part of that workforce is performing work on a Federal, federally assisted or nonfederally related project, contract or subcontract.

Construction contractors participating in an approved Hometown Plan (see 41 CFR 6-4.5) are required to comply with the goals of the Hometown Plan with regard to construction work they perform in the area covered by the Hometown Plan. With regard to all their other covered construction work, such contractors are required to comply with the applicable SMSA or EA goal contained in this Appendix B-80.

APPENDIX C

During the performance of this contract, the contractor, for itself, its assignees, and successors in interest (hereinafter referred to as the "contractor") agrees as follows:

1. **Compliance with Regulations:** The contractor (hereinafter includes consultants) will comply with the Acts and Regulations relative to Non-discrimination in Federally-assisted programs of the U.S. Department of Transportation, Federal Highway Administration (FHWA), as they may be amended from time to time, which are herein incorporated by reference and made a part of this contract.

2. **Non-discrimination:** The contractor, with regard to the work performed by it during the contract, will not discriminate on the grounds of race, color, national origin (including limited English proficiency), age, sex, disability, or low-income status in the selection and retention of subcontractors, including procurements of materials and leases of equipment. The contractor will not participate directly or indirectly in the discrimination prohibited by the Acts and the Regulations, including employment practices when the contract covers any activity, project, or program set forth in Appendix B of 49 CFR Part 21.

3. **Solicitations for Subcontractors, including Procurements of Materials and Equipment:** In all solicitations, either by competitive bidding, or negotiation made by the contractor for work to be performed under a subcontract, including procurements of materials, or leases of equipment, each potential subcontractor or supplier will be notified by the contractor of the contractor's obligations under this contract and the Acts and the Regulations relative to nondiscrimination on the grounds of race, color, national origin (including limited English proficiency), age, sex, disability, or low-income status.

4. **Information and Reports:** The contractor will provide all information and reports required by the Acts, the Regulations, and directives issued pursuant thereto, and will permit access to its books, records, accounts, other sources of information, and its facilities as may be determined by the Massachusetts Department of Transportation (MassDOT) or FHWA to be pertinent to ascertain compliance with such Acts, Regulations, and instructions. Where any information required of a contractor is in the exclusive possession of another who fails or refuses to furnish this information, the contractor will so certify to MassDOT or FHWA, as appropriate, and will set forth what efforts it has made to obtain the information.

5. **Sanctions for Noncompliance:** In the event of a contractor's noncompliance with the Nondiscrimination provisions of this contract, MassDOT will impose such contract sanctions as it or FHWA may determine to be appropriate, including, but not limited to:

    a. withholding payments to the contractor under the contract until the contractor complies; and/or
    b. cancelling, terminating, or suspending a control, in whole or in part.

6. **Incorporation of Provisions:** The contractor will include the provisions of paragraphs one through six in every subcontract, including procurements of materials and leases of equipment, unless exempt by the Acts, the Regulations, and directives issued pursuant thereto. The contractor will take action with respect to any subcontract or procurement as MassDOT or FHWA may direct as a means of enforcing such provisions including sanctions for noncompliance. Provided, that if the contractor becomes involved in, or is threatened with litigation by a subcontractor, or supplier because of such direction, the contractor may request MassDOT to enter into any litigation to protect the interests of MassDOT. In addition, the contractor may request the United States to enter into the litigation to protect the interests of the United States.

APPENDIX D

During the performance of this contact, the contractor, for itself, its assignees, and successors in interest (hereinafter referred to as the "contractor," which includes consultants) agrees to comply with the following non-discrimination statutes and authorities; including but not limited to:

PERTINENT NON-DISCRIMINATION AUTHORITIES:

- Title VI of the Civil Rights Act of 1964 (42 U.S.C. § 2000d *et seq.*, 78 stat. 252) (prohibits discrimination on the basis of race, color, national origin); and 49 CFR Part 21

- The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (42 U.S.C. § 4601) (prohibits unfair treatment of persons displaced or whose property has been acquired because of Federal or Federal-Aid programs and projects)

- Federal-Aid Highway Act of 1973 (23 U.S.C. § 324 *et seq.*) (prohibits discrimination on the basis of sex)

- Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. § 794 *et seq.*), as amended (prohibits discrimination on the basis of disability) and 49 CFR Part 27

- The Age Discrimination Act of 1975, as amended (42 U.S.C. § 6101 *et seq.*) (prohibits discrimination on the basis of age)

- Airport and Airway Improvement Act of 1982 (49 U.S.C. § 471, Section 47123), as amended (prohibits discrimination based on race, creed, color, national origin, or sex)

- The Civil Rights Restoration Act of 1987 (PL 100-209) (broadened the scope, coverage, and applicability of Title VI of the Civil Rights Act of 1964, the Age Discrimination Act of 1975, and Section 504 of the Rehabilitation Act of 1973, by expanding the definition of the terms "programs or activities" to include all of the programs or activities of Federal-Aid recipients, sub-recipients, and contractors, whether such programs or activities are Federally funded or not)

- Titles II and III of the Americans with Disabilities Act (42 U.S.C. §§ 12131-12189), as implemented by Department of Transportation regulations at 49 CFR parts 37 and 38 (prohibits discrimination on the basis of disability in the operation of public entities, public and private transportation systems, places of public accommodation, and certain testing entities)

- The Federal Aviation Administration's Non-Discrimination Statute (49 U.S.C. § 47123) (prohibits discrimination on the basis of race, color, national origin, and sex)

- Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (ensures discrimination against minority populations by discouraging programs, policies, and activities with disproportionately high and adverse human health or environmental effects on minority and low-income populations)

- Executive Order 13166, Improving Access to Services for People with Limited English Proficiency, and resulting agency guidance, national origin discrimination includes discrimination because of limited English proficiency (LEP). To ensure compliance with Title VI, you must take reasonable steps to ensure that LEP persons have meaningful access to your programs (70 Fed. Reg. at 74087 to 74100)

- Title IX of the Education Amendments Act of 1972, as amended (20 U.S.C. 1681 *et seq.*) (prohibits discrimination on the basis of sex in education programs or activities)

DEPARTMENT OF LABOR

Employment Standards Administration

MINIMUM WAGES FOR FEDERAL AND FEDERALLY ASSISTED CONTRACTS

THIS PAGE INTENTIONALLY LEFT BLANK

"General Decision Number: MA20250018 07/18/2025

Superseded General Decision Number: MA20240018

State: Massachusetts

Construction Type: Highway

County: Essex County in Massachusetts.

HIGHWAY CONSTRUCTION PROJECTS

Note: Contracts subject to the Davis-Bacon Act are generally
required to pay at least the applicable minimum wage rate required under Executive Order 14026 or Executive Order 13658.
Please note that these Executive Orders apply to covered contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but do not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(1).

If the contract is entered into on or after January 30, 2022, or the contract is renewed or extended (e.g., an option is exercised) on or after January 30, 2022:	. Executive Order 14026 generally applies to the contract. . The contractor must pay all covered workers at least $17.75 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours

	spent performing on the contract in 2025.
If the contract was awarded on or between January 1, 2015 and January 29, 2022, and the contract is not renewed or extended on or after January 30, 2022:	. Executive Order 13658 generally applies to the contract. . The contractor must pay all covered workers at least $13.30 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on that contract in 2025.

The applicable Executive Order minimum wage rate will be adjusted annually. If this contract is covered by one of the Executive Orders and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must still submit a conformance request.

Additional information on contractor requirements and worker protections under the Executive Orders is available at http://www.dol.gov/whd/govcontracts.

TRUCK DRIVER: Dump Truck	$ 38.92	9.73
TRUCK DRIVER: Flatbed Truck	$ 48.53	0.00

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including

preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at https://www.dol.gov/agencies/whd/government-contracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (iii)).

The body of each wage determination lists the classifications and wage rates that have been found to be prevailing for the type(s) of construction and geographic area covered by the wage determination. The classifications are listed in alphabetical order under rate identifiers indicating whether the particular rate is a union rate (current union negotiated rate), a survey rate, a weighted union average rate, a state adopted rate, or a supplemental classification rate.

Union Rate Identifiers

A four-letter identifier beginning with characters other than ""SU"", ""UAVG"", ?SA?, or ?SC? denotes that a union rate was prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2024. PLUM is an identifier of the union whose collectively bargained rate prevailed in the survey for this classification, which in this example would be Plumbers.
0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. The date, 07/01/2024 in the example, is the effective date of the most current negotiated rate.

Union prevailing wage rates are updated to reflect all changes over time that are reported to WHD in the rates in the collective bargaining agreement (CBA) governing the classification.

Union Average Rate Identifiers

The UAVG identifier indicates that no single rate prevailed for those classifications, but that 100% of the data reported for the classifications reflected union rates. EXAMPLE: UAVG-OH-0010 01/01/2024. UAVG indicates that the rate is a weighted union average rate. OH indicates the State of Ohio.
The next number, 0010 in the example, is an internal number used in producing the wage determination. The date, 01/01/2024 in the example, indicates the date the wage determination was updated to reflect the most current union average rate.

A UAVG rate will be updated once a year, usually in January, to reflect a weighted average of the current rates in the

collective bargaining agreements on which the rate is based.

Survey Rate Identifiers

The ""SU"" identifier indicates that either a single non-union rate prevailed (as defined in 29 CFR 1.2) for this classification in the survey or that the rate was derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As a weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SUFL2022-007 6/27/2024. SU indicates the rate is a single non-union prevailing rate or a weighted average of survey data for that classification. FL indicates the State of Florida. 2022 is the year of the survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. The date, 6/27/2024 in the example, indicates the survey completion date for the classifications and rates under that identifier.

?SU? wage rates typically remain in effect until a new survey is conducted. However, the Wage and Hour Division (WHD) has the discretion to update such rates under 29 CFR 1.6(c)(1).

State Adopted Rate Identifiers

The ""SA"" identifier indicates that the classifications and prevailing wage rates set by a state (or local) government were adopted under 29 C.F.R 1.3(g)-(h). Example: SAME2023-007 01/03/2024. SA reflects that the rates are state adopted. ME

refers to the State of Maine. 2023 is the year during which the state completed the survey on which the listed classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. The date, 01/03/2024 in the example, reflects the date on which the classifications and rates under the ?SA? identifier took effect under state law in the state from which the rates were adopted.

WAGE DETERMINATION APPEALS PROCESS

1) Has there been an initial decision in the matter? This can be:

a) a survey underlying a wage determination
b) an existing published wage determination
c) an initial WHD letter setting forth a position on a wage determination matter
d) an initial conformance (additional classification and rate) determination

On survey related matters, initial contact, including requests for summaries of surveys, should be directed to the WHD Branch of Wage Surveys. Requests can be submitted via email to davisbaconinfo@dol.gov or by mail to:

Branch of Wage Surveys
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

Regarding any other wage determination matter such as conformance decisions, requests for initial decisions should be

directed to the WHD Branch of Construction Wage Determinations.
Requests can be submitted via email to BCWD-Office@dol.gov or
by mail to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2) If an initial decision has been issued, then any interested
party (those affected by the action) that disagrees with the
decision can request review and reconsideration from the Wage
and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7).
Requests for review and reconsideration can be submitted via
email to dba.reconsideration@dol.gov or by mail to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the
interested party's position and any information (wage payment
data, project description, area practice material, etc.) that
the requestor considers relevant to the issue.

3) If the decision of the Administrator is not favorable, an
interested party may appeal directly to the Administrative
Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210.

END OF GENERAL DECISION"

"General Decision Number: MA20250008 08/01/2025

Superseded General Decision Number: MA20240008

State: Massachusetts

Construction Types: Heavy (Heavy and Marine)

Counties: Barnstable, Bristol, Dukes, Essex, Middlesex, Nantucket, Norfolk, Plymouth and Suffolk Counties in Massachusetts.

HEAVY AND MARINE CONTRUCTION PROJECTS

Note: Contracts subject to the Davis-Bacon Act are generally
required to pay at least the applicable minimum wage rate required under Executive Order 14026 or Executive Order 13658.
Please note that these Executive Orders apply to covered contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but do not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(1).

If the contract is entered into on or after January 30, 2022, or the contract is renewed or extended (e.g., an option is exercised) on or after January 30, 2022:	. Executive Order 14026 generally applies to the contract. . The contractor must pay all covered workers at least $17.75 per hour (or the applicable wage rate listed on this wage determination, if it is

		higher) for all hours
		spent performing on the
		contract in 2025.
If the contract was awarded on or between January 1, 2015 and January 29, 2022, and the contract is not renewed or extended on or after January 30, 2022:	. Executive Order 13658 generally applies to the contract. . The contractor must pay all covered workers at least $13.30 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on that contract in 2025.	

The applicable Executive Order minimum wage rate will be adjusted annually. If this contract is covered by one of the Executive Orders and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must still submit a conformance request.

Additional information on contractor requirements and worker protections under the Executive Orders is available at http://www.dol.gov/whd/govcontracts.

---

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at https://www.dol.gov/agencies/whd/government-contracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (iii)).

The body of each wage determination lists the classifications and wage rates that have been found to be prevailing for the

type(s) of construction and geographic area covered by the wage determination. The classifications are listed in alphabetical order under rate identifiers indicating whether the particular rate is a union rate (current union negotiated rate), a survey rate, a weighted union average rate, a state adopted rate, or a supplemental classification rate.

Union Rate Identifiers

A four-letter identifier beginning with characters other than ""SU"", ""UAVG"", ?SA?, or ?SC? denotes that a union rate was prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2024. PLUM is an identifier of the union whose collectively bargained rate prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. The date, 07/01/2024 in the example, is the effective date of the most current negotiated rate.

Union prevailing wage rates are updated to reflect all changes over time that are reported to WHD in the rates in the collective bargaining agreement (CBA) governing the classification.

Union Average Rate Identifiers

The UAVG identifier indicates that no single rate prevailed for those classifications, but that 100% of the data reported for

the classifications reflected union rates. EXAMPLE: UAVG-OH-0010 01/01/2024. UAVG indicates that the rate is a weighted union average rate. OH indicates the State of Ohio.
The next number, 0010 in the example, is an internal number used in producing the wage determination. The date, 01/01/2024
in the example, indicates the date the wage determination was
updated to reflect the most current union average rate.

A UAVG rate will be updated once a year, usually in January, to
reflect a weighted average of the current rates in the collective bargaining agreements on which the rate is based.

Survey Rate Identifiers

The ""SU"" identifier indicates that either a single non-union
rate prevailed (as defined in 29 CFR 1.2) for this classification in the survey or that the rate was derived by
computing a weighted average rate based on all the rates reported in the survey for that classification. As a weighted
average rate includes all rates reported in the survey, it may
include both union and non-union rates. Example: SUFL2022-007
6/27/2024. SU indicates the rate is a single non-union prevailing rate or a weighted average of survey data for that
classification. FL indicates the State of Florida. 2022 is the
year of the survey on which these classifications and rates are
based. The next number, 007 in the example, is an internal number used in producing the wage determination. The date, 6/27/2024 in the example, indicates the survey completion date
for the classifications and rates under that identifier.

?SU? wage rates typically remain in effect until a new survey

is conducted. However, the Wage and Hour Division (WHD) has the
discretion to update such rates under 29 CFR 1.6(c)(1).

State Adopted Rate Identifiers

The ""SA"" identifier indicates that the classifications and
prevailing wage rates set by a state (or local) government were
adopted under 29 C.F.R 1.3(g)-(h). Example: SAME2023-007
01/03/2024. SA reflects that the rates are state adopted. ME
refers to the State of Maine. 2023 is the year during which the
state completed the survey on which the listed classifications
and rates are based. The next number, 007 in the example, is an
internal number used in producing the wage determination.
The date, 01/03/2024 in the example, reflects the date on which
the classifications and rates under the ?SA? identifier took
effect under state law in the state from which the rates were
adopted.

WAGE DETERMINATION APPEALS PROCESS

1) Has there been an initial decision in the matter? This can
be:

a) a survey underlying a wage determination
b) an existing published wage determination
c) an initial WHD letter setting forth a position on
a wage determination matter
d) an initial conformance (additional classification
and rate) determination

On survey related matters, initial contact, including requests

for summaries of surveys, should be directed to the WHD Branch
of Wage Surveys. Requests can be submitted via email to davisbaconinfo@dol.gov or by mail to:

Branch of Wage Surveys
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

Regarding any other wage determination matter such as conformance decisions, requests for initial decisions should be
directed to the WHD Branch of Construction Wage Determinations.
Requests can be submitted via email to BCWD-Office@dol.gov or
by mail to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2) If an initial decision has been issued, then any interested
party (those affected by the action) that disagrees with the
decision can request review and reconsideration from the Wage
and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7).
Requests for review and reconsideration can be submitted via
email to dba.reconsideration@dol.gov or by mail to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the

interested party's position and any information (wage payment
data, project description, area practice material, etc.) that
the requestor considers relevant to the issue.

3) If the decision of the Administrator is not favorable, an
interested party may appeal directly to the Administrative
Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210.

==========

END OF GENERAL DECISION"

"General Decision Number: MA20250006 02/21/2025

Superseded General Decision Number: MA20240006

State: Massachusetts

Construction Type: Heavy Dredging

Counties: Massachusetts Statewide.
STATEWIDE

Massacusetts All Dredging, except self-propelled hopper dredges, on the Atlantic Coast & tributary waters emptying into
the Atlantic Ocean.

Note: Contracts subject to the Davis-Bacon Act are generally
required to pay at least the applicable minimum wage rate required under Executive Order 14026 or Executive Order 13658.
Please note that these Executive Orders apply to covered contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but do not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(1).

If the contract is entered into on or after January 30, 2022, or the contract is renewed or extended (e.g., an option is exercised) on or after January 30, 2022:	. Executive Order 14026 generally applies to the contract. . The contractor must pay all covered workers at least $17.75 per hour (or the applicable wage rate listed on this wage

		determination, if it is
		higher) for all hours
		spent performing on the
		contract in 2025.
If the contract was awarded on or between January 1, 2015 and January 29, 2022, and the contract is not renewed or extended on or after January 30, 2022:	. Executive Order 13658 generally applies to the contract. . The contractor must pay all covered workers at least $13.30 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on that contract in 2025.	

The applicable Executive Order minimum wage rate will be adjusted annually. If this contract is covered by one of the
Executive Orders and a classification considered necessary for
performance of work on the contract does not appear on this wage determination, the contractor must still submit a conformance request.

Additional information on contractor requirements and worker

protections under the Executive Orders is available at http://www.dol.gov/whd/govcontracts.

Operator over 1000 HP (Assigned as Master) (USCG licensed
Master of Towing Vessels (MOTV) $1.80; Licensed Boat Operator (Assigned as lead boat captain) USCG licensed boat operator $1.30; Engineer (QMED and Tankerman endorsement or licensed engineer (USCG) $1.80
Oiler (QMED and Tankerman endorsement (USCG) $1.80; All classifications (Tankerman endorsement only) USCG $1.55; Deckhand or Mate (AB with Lifeboatman endorsement (USCG) $1.80; All classifications (lifeboatman endorsement only (USCG) $1.55; Welder (ABS certification) $1.55

FOOTNOTES APPLICABLE TO ABOVE CRAFTS:
a. PAID HOLIDAYS: New Year's Day, Martin Luther King, Jr.'s
Birthday, Memorial Day, Good Friday, Independence Day, Labor Day, Veterans' Day, Thanksgiving Day and Christmas Day
b. VACATION: Eight percent (8%) of the straight time rate,
multiplied by the total hours worked.

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave
for Federal Contractors applies to all contracts subject to the
Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this
contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their
own illness, injury or other health-related needs, including

preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at https://www.dol.gov/agencies/whd/government-contracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (iii)).

The body of each wage determination lists the classifications and wage rates that have been found to be prevailing for the type(s) of construction and geographic area covered by the wage determination. The classifications are listed in alphabetical order under rate identifiers indicating whether the particular rate is a union rate (current union negotiated rate), a survey rate, a weighted union average rate, a state adopted rate, or a supplemental classification rate.

Union Rate Identifiers

A four-letter identifier beginning with characters other than ""SU"", ""UAVG"", ?SA?, or ?SC? denotes that a union rate was prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2024. PLUM is an identifier of the union whose collectively bargained rate prevailed in the survey for this classification, which in this example would be Plumbers.
0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. The date, 07/01/2024 in the example, is the effective date of the most current negotiated rate.

Union prevailing wage rates are updated to reflect all changes over time that are reported to WHD in the rates in the collective bargaining agreement (CBA) governing the classification.

Union Average Rate Identifiers

The UAVG identifier indicates that no single rate prevailed for those classifications, but that 100% of the data reported for the classifications reflected union rates. EXAMPLE: UAVG-OH-0010 01/01/2024. UAVG indicates that the rate is a weighted union average rate. OH indicates the State of Ohio.
The next number, 0010 in the example, is an internal number used in producing the wage determination. The date, 01/01/2024 in the example, indicates the date the wage determination was updated to reflect the most current union average rate.

A UAVG rate will be updated once a year, usually in January, to reflect a weighted average of the current rates in the

collective bargaining agreements on which the rate is based.

Survey Rate Identifiers

The ""SU"" identifier indicates that either a single non-union rate prevailed (as defined in 29 CFR 1.2) for this classification in the survey or that the rate was derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As a weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SUFL2022-007 6/27/2024. SU indicates the rate is a single non-union prevailing rate or a weighted average of survey data for that classification. FL indicates the State of Florida. 2022 is the year of the survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. The date, 6/27/2024 in the example, indicates the survey completion date for the classifications and rates under that identifier.

?SU? wage rates typically remain in effect until a new survey is conducted. However, the Wage and Hour Division (WHD) has the discretion to update such rates under 29 CFR 1.6(c)(1).

State Adopted Rate Identifiers

The ""SA"" identifier indicates that the classifications and prevailing wage rates set by a state (or local) government were adopted under 29 C.F.R 1.3(g)-(h). Example: SAME2023-007 01/03/2024. SA reflects that the rates are state adopted. ME

refers to the State of Maine. 2023 is the year during which the
state completed the survey on which the listed classifications
and rates are based. The next number, 007 in the example, is an
internal number used in producing the wage determination.
The date, 01/03/2024 in the example, reflects the date on which
the classifications and rates under the ?SA? identifier took
effect under state law in the state from which the rates were
adopted.

WAGE DETERMINATION APPEALS PROCESS

1) Has there been an initial decision in the matter? This can
be:

a) a survey underlying a wage determination
b) an existing published wage determination
c) an initial WHD letter setting forth a position on
a wage determination matter
d) an initial conformance (additional classification
and rate) determination

On survey related matters, initial contact, including requests
for summaries of surveys, should be directed to the WHD Branch
of Wage Surveys. Requests can be submitted via email to
davisbaconinfo@dol.gov or by mail to:

Branch of Wage Surveys
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

Regarding any other wage determination matter such as
conformance decisions, requests for initial decisions should be

directed to the WHD Branch of Construction Wage Determinations.
Requests can be submitted via email to BCWD-Office@dol.gov or
by mail to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2) If an initial decision has been issued, then any interested
party (those affected by the action) that disagrees with the
decision can request review and reconsideration from the Wage
and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7).
Requests for review and reconsideration can be submitted via
email to dba.reconsideration@dol.gov or by mail to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the
interested party's position and any information (wage payment
data, project description, area practice material, etc.) that
the requestor considers relevant to the issue.

3) If the decision of the Administrator is not favorable, an
interested party may appeal directly to the Administrative
Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210.

END OF GENERAL DECISION"

THIS PAGE INTENTIONALLY LEFT BLANK

DOCUMENT A00801

SPECIAL PROVISIONS

PEABODY
Federal Aid Project No. TAP/CMQ-0034(027)X
Independence Greenway Extension

Labor participation goals for this Project shall be 15.3% for minorities and 6.9% for women for each job category. The goals are applicable to both Contractor's and Subcontractor's on-site construction workforce. Refer to Document 00820 for details.

SCOPE OF WORK

All work under this Contract shall be done in conformance with the *2025 Standard Specifications for Highways and Bridges, the Supplemental Specifications* contained in this book, the *Construction Standard Details* in effect as of June, 2025, the *1990 Standard Drawings for Signs and Supports*, the 2015 *Overhead Signal Structure and Foundation Standard Drawings*, the *2009 Manual on Uniform Traffic Control Devices (MUTCD) with Revisions 1, 2, and 3 and the November 2022 Massachusetts Amendments to the MUTCD, the 1968 Standard Drawings for Traffic Signals and Highway Lighting*, the latest edition of The *American Standard for Nursery Stock*, the Plans and these Special Provisions.

The work under this Contract consists of the construction of the Independence Greenway Extension in the City of Peabody. The project is approximately 1.3 miles in length. The work included in this project will consist of clearing and grubbing; paving; installing wood rail fence; installing granite curb, pedestrian curb ramps and sidewalks; installing drainage structures; installing new catch basins; installing 2 precast concrete culverts; furnishing and installing traffic signals, signs and pavement markings; placing loam and seed; planting trees and shrubs; landscape amenities; constructing a timber bridge boardwalk; and other incidental items of work listed in the proposal.

The multi-span timber boardwalk carries the path over Proctor Brook and continues through the wetlands for approximately 440-feet. The boardwalk will be comprised of structural timber framing and railing system, with Black Locust decking and coated or stainless steel hardware. The boardwalk will be supported by steel helical piles, and GRS-IBS Abutments are the beginning and end of the boardwalk.

SUBSECTION 7.05 INSURANCE REQUIREMENTS
B. Public Liability Insurance

The insurance requirements set forth in this subsection are in addition to the requirements of the Standard Specifications and supersede all other requirements.

Paragraphs 1 and 2

The Massachusetts Department of Transportation and applicable railroads shall be named as additional insureds.

Paragraph 4

Asbestos Liability Insurance shall be obtained for this project. The Contractor and the Massachusetts Department of Transportation shall be named as additional insureds.

CONTRACTOR QUESTIONS AND ADDENDUM ACKNOWLEDGEMENTS

Prospective bidders are required to submit all questions to the Construction Contracts Engineer by 3:00 P.M. on the Tuesday of the previous week before the scheduled bid opening date. Any questions received after this time will not be considered for review by the Department.

Contractors should email questions and addendum acknowledgements to the following email address massdotspecifications@dot.state.ma.us The MassDOT proposal number and municipality is to be placed in the subject line.

HOLIDAY WORK RESTRICTIONS
(Supplementing Subsection 7.09)

The District Highway Director (DHD) may authorize work to continue during these specified time periods if it is determined by the District that the work will not negatively impact the traveling public. DHD may allow work in those areas on a case by case basis and where work is behind barrier and will not impact traffic

Below are the holiday work restrictions:

New Years Day (Federal Holiday)
No work on major arterial roadways from 5:00 AM on the day before until the normal start of business on the next subsequent business day. No work on local roadways on the holiday without permission by the DHD and the local police chief.

HOLIDAY WORK RESTRICTIONS (Continued)

Martin Luther King's Birthday (Federal Holiday)
No work restrictions due to traffic concerns, however work on local roadways requires permission by the DHD and local police chief.

President's Day (Federal Holiday)
No work restrictions due to traffic concerns, however work on local roadways requires permission by the DHD and local police chief.

Evacuation Day (Suffolk County State Holiday)
No work restrictions due to traffic concerns.

Patriot's Day (State Holiday)
Work restrictions will be in place for Districts 3 and 6 along the entire Boston Marathon route and any other locations that the DHD in those districts determine are warranted so as to not to impact the marathon. All other districts work restrictions will be as per DHD.

Mother's Day
No work on Western Turnpike and Metropolitan Highway System from 5:00 AM on the Friday before, until the normal start of business on the following day.

Memorial Day (Federal Holiday)
No work on major arterial roadways from 5:00 AM on the Friday before, until the normal start of business on the following day.

Bunker Hill Day (Suffolk County State Holiday)
No work restrictions due to traffic concerns.

Juneteenth
No work restrictions due to traffic concerns, however work on local roadways requires permission by the DHD and local police chief.

Independence Day (Federal Holiday)
No work on major arterial roadways from 5:00 AM on the day before until the normal start of business on the next subsequent business day. No work on local roadways on the holiday without permission by the DHD and the local police chief.

Labor Day (Federal Holiday)
No work on major arterial roadways from 5:00 AM on the Friday before, until the normal start of business on the following day.

Columbus Day (Federal Holiday)
No work on major arterials from 5:00 AM on the Friday before, until the normal start of business on the following day

HOLIDAY WORK RESTRICTIONS (Continued)

Veterans' Day (Federal Holiday)
No work restrictions due to traffic concerns.

Thanksgiving Day (Federal Holiday)
No work on major arterials from 5:00 AM two days before until the normal start of business on the following Monday.

Christmas Day (Federal Holiday)
No work on major arterial roadways from 5:00 AM on the day before until the normal start of business on the next subsequent business day.

LANE CLOSURE RESTRICTIONS
(Supplementing Subsection 7.09)

Work requiring lane closures shall be performed between 9:30 a.m. and 3:30 p.m. for daytime work or between 8:00 p.m. and 6:00 a.m. for nighttime work.

PROTECTION AND RESTORATION OF PROPERTY
(Supplementing Subsection 7.13)

If available, existing bridge plans indicate the location of the existing known utilities in the vicinity of the work. As the accuracy and completeness of the plans are not guaranteed in any manner, it is the Contractor's responsibility to make their own investigation to assure that no damage to existing structures, drainage lines, traffic signal conduits, etc., will occur.

NOTICE TO OWNERS OF UTILITIES
(Supplementing Subsection 7.13)

Written notice shall be given by the Contractor to all public service corporations or officials owning or having charge of publicly or privately owned utilities of the Contractor's intention to commence operations affecting such utilities at least one week in advance of the commencement of such operations and the Contractor shall at that time file a copy of such notice with the Engineer.

A list of public and private utilities can be found on the MassDOT website at:
https://www.mass.gov/info-details/utility-contacts-by-district-and-municipality
Select the District, select the City/Town, and then locate the utility. The utility contact list is for guidance only and is not guaranteed to be complete or up to date.

SOIL STOCKPILING DIRECTIVE P-22-001

Any stockpiling of soil must be performed in compliance with Policy Directive P-22-001, Off-Site Stockpiling of Soil from MassDOT Construction Projects. This directive limits the allowable locations for off-site stockpiling of soil generated during MassDOT projects and includes various requirements that must be satisfied by the contractor prior to off-site stockpiling. The Contractor is responsible for identifying a suitable stockpile location.

SUBSECTION 8.02 SCHEDULE OF OPERATIONS
Replace this subsection with the following:

An integrated cost and schedule controls program shall be implemented by the Contractor to track and document the progress of the Work from Notice to Proceed (NTP) through the Contractor Field Completion (CFC) Milestone. The Contractor's schedules will be used by the Engineer to monitor project progress, plan the level-of-effort required by the Department's work force and consultants and as a critical decision-making tool. Accordingly, the Contractor shall ensure that it complies fully with the requirements specified herein and that its schedules are both accurate and updated as required by the specification throughout the life of the project. Detailed requirements are provided in Division II, Section 722 Construction Scheduling.

SUBSECTION 8.06 LIMITATIONS OF OPERATIONS

Add/amend the following at the end of the Section:

Access Restraints:

This contract will contain Access Restraint(s) to provide an anticipated start date for certain portions of the Work that are restrained by a Utility Party or by another party. An Access Restraint is a restriction of physical work, of a specific area or operation in the Contract, to allow all bidders to evaluate anticipated work restrictions, equally, during the pre-bid planning stages.

In respect to utilities, the Contract Time (duration) has considered these portions of the utility work and has been developed with the initial information that has been provided by the Utility Party and accepted by MassDOT. The Contractor shall be required to communicate and coordinate with all affected Utilities and may be required to perform support aspects of the utility relocation (as noted in the Contract Documents) well in advance of the start of the applicable utility relocation. As part of this work, the Contactor is to demonstrate proper coordination and notification with the impacted Utility(s), no less than 45 days before the start of the work.

The Contractor must clearly identify all aspects of this work in the preparation of the Construction Schedule and throughout the contract duration. This contract contains the following Access Restraints that are to be included in the Contractor's Baseline Schedule submission:

AR#01 – Access Restraint #01: The Contractor shall complete all utility work between Northshore Road and Endicott Street by May 25th, 2027, to avoid any delays to the project.

AR#02 – Access Restraint #02: The Contractor shall carry out all in-water work at Proctor Brook between June 1st and October 1st.

AR#03 – Access Restraint #03: The Contractor shall perform Native Seeding only during the periods of April 1st to May 15th and October 1st to December 1st for dormant seeding.

AR#04 – Access Restraint #04: The Contractor shall perform planting in the wetland replication area only from May 15th to June 15th and Sepetember 1st to November 1st.

AR#05 – Access Restraint #05: The Contractor shall perform Deciduous plantings only between April 1st and June 15th, and between September 15th and November 15th.

AR#06 – Access Restraint #06: The Contractor shall perform Evergreen plantings in the wetland replication area only between April 15th and June 15th, and between September 1st and October 14th.

TRUCK SAFETY DEVICES
(Supplementing Subsection 7.04: Motor Vehicles)

All motor vehicles subject to Section 7 of Chapter 90 to be operated under this Contract shall be equipped with safety devices as provided therein and in 540 CMR 4.00.

By December 31, 2025, the Contractor shall certify to the Registry of Motor Vehicles, in a manner prescribed by the Registrar, that all applicable vehicles are equipped with Lateral Protective Devices, Convex Mirrors, Cross Over Mirror(s) and Back Up Cameras in accordance with the requirements of 540 CMR 4.00.

The Contractor shall provide evidence satisfactory to the Department to demonstrate compliance with the above certification requirement for all applicable vehicles operated under this Contract by the Contractor and its subcontractors and vendors in a manner set forth by the Department. Thereafter, the Contractor shall have an affirmative obligation to continue to provide such evidence of compliance on an ongoing basis and no later than 7 days after certification with the Registry of Motor Vehicles of any additional vehicles operated under this Contract by the Contractor and its subcontractors and vendors.

Non-compliance with respect to a vehicle that is subject to 540 CMR 4.00 may subject the Contractor to statutory fines as established in M.G.L. c. 90, § 7 and/or contractual remedies up to and including termination of the Contract.

SUBSECTION 8.14 UTILITY COORDINATION, DOCUMENTATION, AND MONITORING RESPONSIBILITIES

A. GENERAL

In accordance with the provisions of Section 8.00 Prosecution and Progress, utility coordination is a critical aspect to this Contract. This section defines the responsibility of the Contractor and MassDOT, with regard to the initial utility relocation plan and changes that occur as the prosecution of the Work progresses. The Engineer, with assistance from the Contractor shall coordinate with Utility companies that are impacted by the Contractor's operations. To support this effort, the Contractor shall provide routine and accurate schedule updates, provide notification of delays, and provide documentation of the steps taken to resolve any conflicts for the temporary and/or permanent relocations of the impacted utilities. The Contractor shall provide copies to the Engineer of the Contractor communication with the Utility companies, including but not limited to:

- Providing advanced notice, for all utility-related meetings initiated by the Contractor.
- Providing meeting minutes for all utility-related meetings that the Contractor attends.
- Providing all test pit records.
- Request for Early Utility work requirements of this section (see below).
- Notification letters for any proposed changes to Utility start dates and/or sequencing.
- Written notification to the Engineer of all apparent utility delays within seven (7) Calendar Days after a recognized delay to actual work in the field – either caused by a Utility or the Contractor.
- Any communication, initiated by the Contractor, associated with additional Right-of-Way needs in support of utility work.
- Submission of completed Utility Completion Forms.

B. PROJECT UTILITY COORDINATION (PUC) FORM

The utility schedule and sequence information provided in the Project Utility Coordination Form (if applicable) is the best available information at the time of the bid and has been considered in setting the contract duration. The Contractor shall use all of this information in developing the bid price and the Baseline Schedule Submission, inclusive of the individual utility durations sequencing requirements, and any work that has been noted as potentially concurrent utility installations.

C. INITIATION OF UTILITY WORK

The Engineer will issue all initial notice-to-proceed dates to each Utility company based on either the:

1) Contractor's accepted Baseline Schedule
2) An approved Early Utility Request in the form of an Early Utility sub-net schedule (in accordance with the requirements of this Subsection)
3) An approved Proposal Schedule

C.1 - BASELINE SCHEDULE – UTILITY BASIS

The Contractor shall provide a Baseline Schedule submission in accordance with the requirements of Subsection 8.02 and inclusive of all of the information provided in the PUC Form that has been issued in the Contract documents. This is to include the utility durations, sequencing of work, allowable concurrent work, and all applicable considerations that have been depicted on the PUC Form.

SUBSECTION 8.14 (Continued)

C.2 – EARLY UTILITY REQUEST – (aka SUBNET SCHEDULE) PRIOR TO THE BASELINE

All early utility work is defined as any anticipated/required utility relocations that need to occur prior to the Baseline Schedule acceptance. In all cases of proposed early utility relocation, the Contractor shall present all known information at the pre-construction conference in the form of a 'sub-net' schedule showing when each early utility activity needs to be issued a notice-to-proceed. The Contractor shall provide advance notification of this intent to request early utility work in writing at or prior to the Pre-Construction meeting. Prior to officially requesting approval for early utility work, the Contractor shall also coordinate with MassDOT and all utility companies (private, state or municipal) which may be impacted by the Contract. If this request is acceptable to the Utilities and to MassDOT, the Engineer will issue a notice-to-proceed to the affected Utilities, based on these accepted dates.

C.3 – PROPOSAL SCHEDULE - CHANGES TO THE PUC FORM

If the Contractor intends to submit a schedule (in accordance with MassDOT Standard Specifications, Division I, Subsection 8.02) that contains durations or sequencing that vary from those provided in the Project Utility Coordination (PUC) Form, the Contactor must submit this as an intended change, in the form of a Proposal Schedule and in accordance with MassDOT Standard Specifications, Division I, Subsection 8.02. These proposed changes are subject to the approval of the Engineer and the impacted utilities, in the form of this Proposal Schedule and a proposed revision to the PUC form. The Contractor shall not proceed with any changes of this type without written authorization from the Engineer, that references the approved Proposal Schedule and PUC form changes. The submission of the Baseline Schedule should not include any of these types of proposed utility changes and should not delay the submission of the Baseline Schedule. As a prerequisite to the Proposal Schedule submission, and in advance of the utility notification(s) period, the Contractor shall coordinate the proposed utility changes with the Engineer and the utility companies, to develop a mutually agreed upon schedule, prior to the start of construction.

D. UTILITY DELAYS

The Contractor shall notify the Engineer upon becoming aware that a Utility owner is not advancing the work in accordance with the approved utility schedule. Such notice shall be provided to the Engineer no later than seven (7) calendar days after the occurrence of the event that the Contractor believes to be a utility delay. After such notice, the Engineer and the Contractor shall continue to diligently seek the Utility Owner's cooperation in performing their scope of Work.

In order to demonstrate that a critical path delay has been caused by a third-party Utility, the Contractor must demonstrate, through the requirements of the monthly Progress Schedule submissions and the supporting contract records associated with Subsection 8.02, 8.10 and 8.14, that the delays were beyond the control of the Contractor.

SUBSECTION 8.14 (Continued)

All documentation provided in this section is subject to the review and verification of the Engineer and, if required, the Utility Owner. In accordance with MassDOT Specifications, Division I, Subsection 8.10, a Time Extension will be granted for a delay caused by a Utility, only if the actual duration of the utility work is in excess of that shown on the Project Utility Coordination Form, and only if;

1) proper Notification of Delay was provided to MassDOT in accordance with the time requirements that are specified in this Section
2) the utility delay is a critical path impact to the Baseline Schedule (or most recently approved Progress Schedule)

E. LOCATION OF UTILITIES

The locations of existing utilities are shown on the Contract drawings as an approximation only. The Contractor shall perform a pre-construction utility survey, including any required test pits, to determine the location of all known utilities no later than thirty (30) calendar days before commencing physical site work in the affected area.

F. POST UTILITY SURVEY – NOTIFICATION

Following completion of a utility survey of existing locations, the Contractor will be responsible to notify the Engineer of any known conflicts associated with the actual location of utilities prior to the start of the work. The Engineer and the Contractor will coordinate with any utility whose assets are to be affected by the Work of this Contract. A partial list of utility contact information is provided in the Project Utility Coordination Form.

G. MEETINGS AND COOPERATION WITH UTILITY OWNERS

The Contractor shall notify the Engineer in advance of any meeting they initiate with a Utility Owner's representative to allow MassDOT to participate in the meeting if needed.

Prior to the Pre-Construction Meeting, the Contractor should meet with all Utility Owners who will be required to perform utility relocations within the first 6 months of the project, to update the affected utilities of the Project Utility Coordination Form and all other applicable Contract requirements that impact the Utilities. The Contractor shall copy the Engineer on any correspondence between the Utility Owner and the Contractor.

H. FORCE ACCOUNT / UTILITY MONITORING REQUIREMENTS

The Engineer will be responsible for recording daily Utility work force reports. The start, suspension, re-start, and completion dates of each of the Utilities, within each phase of the utility relocation work, will be monitored and agreed to by the Engineer and the Contractor as the work progresses.

I. ACCESS AND INSPECTION

The Contractor shall be responsible for allowing Utility owners access to their own utilities to perform the relocations and/or inspections. The Contractor shall schedule their work accordingly so as not to delay or prevent each utility from maintaining their relocation schedule.

COMPLIANCE WITH THE NATIONAL DEFENSE AUTHORIZATION ACT

(Supplementing Subsection 7.01)

On all projects, the "Prohibition on Certain Telecommunications and Video Surveillance Services or Equipment" Regulation (2 CFR 200.216) prohibits the Contractor from using or furnishing the following telecommunications equipment or services:

- Telecommunications equipment produced by Huawei Technologies Company or ZTE Corporation (or any subsidiary or affiliate of such entities).
- For the purpose of public safety, security of government facilities, physical security surveillance of critical infrastructure, and other national security purposes, video surveillance and telecommunications equipment produced by Hytera Communications Corporation, Hangzhou Hikvision Digital Technology Company, or Dahua Technology Company (or any subsidiary or affiliate of such entities).
- Telecommunications or video surveillance services provided by such entities or using such equipment.
- Telecommunications or video surveillance equipment or services produced or provided by an entity that the Secretary of Defense, in consultation with the Director of the National Intelligence or the Director of the Federal Bureau of Investigation, reasonably believes to be an entity owned or controlled by, or otherwise connected to, the government of a covered foreign country.

This prohibition applies to all products manufactured by the aforementioned companies, including any individual components or parts.

By submitting a bid on a project, the Contractor certifies that all work will be in compliance with the terms of 2 CFR 200.216. The Contractor shall submit a COC indicating compliance with the above provisions for all telecommunications equipment or services included in the Contract.

Payment for the item in which the materials are incorporated may be withheld until these COCs are received. Any cost involved in furnishing the certificate(s) shall be borne by the Contractor.

BIDDERS LIST

Pursuant to the provisions of 49 CFR Part 26.11 all official bidders will be required to report the names, addresses and telephone numbers of all firms that submitted bids or quotes in connection with this project. Failure to comply with a written request for this information within 15 business days may result in a recommendation to the Prequalification Committee that prequalification status be suspended until the information is received.

The Department will survey all firms that have submitted bids or quotes during the previous year prior to setting the annual goal and shall request that each firm report its age and gross receipts for the year.

BUILD AMERICA BUY AMERICA PREFERENCE

On Federally-aid projects the Buy America (23.CFR § 635.410) and Build America, Buy America Act. requires the following,

(1) all iron and steel used in the project are produced in the United States--this means all manufacturing processes, from the initial melting stage through the application of coatings, must occur in the United States. Foreign steel and iron can be used if the cost of the materials does not exceed 0.1% of the total Contract cost or $2,500, whichever is greater. The action of applying a coating to a covered material (i.e., steel and iron) is deemed a manufacturing process subject to Buy America. Coating includes epoxy coating, galvanizing, painting and any other coating that protects or enhances the value of a material subject to requirements of Build America, Buy America. Steel used for temporary support of excavation, including H piles, soldier piles, and sheeting when the steel is required to be left in place is subject to requirements of Build America, Buy America. Temporary steel, shall remain in place when it falls within the influence zone of the soil supporting any structure or railroad tracks.

(2) all manufactured products used in the project are produced in the United States—this means the manufactured product was manufactured in the United States and

(3) all construction materials are manufactured in the United States—this means that all manufacturing processes for the construction material occurred in the United States. "Construction materials" includes an article, material, or supply—other than an item of primarily iron or steel; a manufactured product; cement and cementitious materials; aggregates such as stone, sand, or gravel; or aggregate binding agents or additives—that is or consists primarily of:

- non-ferrous metals,
- plastic and polymer-based products (including polyvinylchloride, composite building materials, and polymers used in fiber optic cables),
- glass (including optic glass),
- lumber; or
- drywall.

The Buy America preference only applies to articles, materials, and supplies that are consumed in, incorporated into, or affixed to an infrastructure project. As such, it does not apply to tools, equipment, and supplies, such as temporary scaffolding, brought to the construction site and removed at or before the completion of the infrastructure project. Nor does a Buy America preference apply to equipment and furnishings, such as movable chairs, desks, and portable computer equipment, that are used at or within the finished infrastructure project but are not an integral part of the structure or permanently affixed to the infrastructure project.

All articles, materials, and supplies should be classified as an iron or steel product, a manufactured product, or another product as specified by law or in 2 CFR part 184 (such other products specified by law or in 2 CFR part 184 include "excluded materials" and "construction materials"); an article, material, or supply must not be considered to fall into multiple categories.

NOTE: The requirements for manufactured products indicated in paragraph (2) above are not in effect for this contract.

MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION FILE NUMBER SIGN

This project is subject to Massachusetts General Laws, Chapter 131, Section 40 as amended. Signs shall be in accordance with the latest MassDOT Construction Standards. All costs for the manufacture, erection, maintenance, moving, and removal of the signs shall be absorbed by the contractor with no additional compensation other than the contract unit prices.

For this project the Massachusetts Department of Environmental Protection File Number is 055-0939.

ENVIRONMENTAL PERMITTING

If field conditions and/or Contractor-proposed erection, demolition, storage, or other procedures not originally allowed by existing environmental permits require work to occur in or otherwise impact water or wetland resource areas, the Contractor is advised that no associated work can occur until all required environmental permits have been either amended or obtained allowing such work. The Contractor must notify the District 4 Highway Director and Resident Engineer in writing at least 60 days prior to desired commencement of the proposed activity. All environmental submittals, including any contact with Local, State, or Federal environmental agencies, must be coordinated with the District 4 Environmental Engineer. The Contractor is expected to fully cooperate with requests for information and provide same in a timely manner. The Contractor is further advised that the Department will not entertain a delay claim due to the time required to modify or obtain the environmental permits.

NORTHERN LONG-EARED BAT AND TRICOLORED BAT PROTECTION

The northern long-eared bat (*Myotis septentrionalis*; NLEB) and tricolored bat (*Perimyotis subflavus*; TCB) are listed as federally endangered or proposed endangered, respectfully, under the Endangered Species Act (ESA). The U.S. Fish and Wildlife Service (USFWS) developed this guidance to address ESA compliance and promote conservation of NLEB and TCB. This project has been consulted with the USFWS through the Federal Highway Administration (FHWA), Federal Railroad Administration (FRA), and Federal Transit Administration (FTA) Programmatic Biological Opinion for Transportation Projects in the Range of the Indiana Bat and Northern Long-Eared Bat revised February 5, 2018 and amended March 31, 2023.

On July 27- August 1, 2022, Stantec, on behalf of MassDOT Highway Division Environmental Services, conducted a northern long-eared bat summer presence/absence survey using acoustic detection methods, in accordance with the 2022 survey guidelines. The survey confirmed the presence of NLEB and/or TCB, and as stated within the survey guidelines, the survey is valid for five years. If additional stressor producing work is proposed by the Contractor past this date, additional review is required by the MassDOT Highway Division's Environmental Services Section, and additional review and restrictions may be required by the USFWS.

NORTHERN LONG-EARED BAT AND TRICOLORED BAT PROTECTION (Continued)

The project is eligible for a May Affect, Not Likely to Adversely Affect (NLAA) determination, with Avoidance and Minimizations Measures (AMMs), in accordance with the FHWA, FRA and FTA Range-wide Programmatic Consultation for Indiana Bat and Northern Long-eared Bat. On behalf of FHWA, the lead federal agency for Section 7 consultation, MassDOT submitted a Programmatic Consultation for Transportation Projects affecting NLEB or Indiana Bat to the USFWS through the Information for Planning and Consultation (IPaC) webpage and generated a NLAA documentation letter (see **Document A00844**). Therefore, the project has completed Section 7 consultation through the ESA.

In advance of the uplisting of the TCB to endangered under the ESA, the following Avoidance and Minimization Measures (AMMs) must be strictly adhered to in order to protect NLEB and TCB and to be in compliance with the ESA. Contact MassDOT Environmental Services - Wildlife Unit Supervisor for questions about project limits, restrictions, or conservation measures.

General AMM

- The Contractor shall ensure all personnel working in on the project site are aware of all environmental commitments related to NLEB and TCB, including all applicable AMMs. NLEB and TCB information (https://www.fws.gov/midwest/endangered/mammals/nleb/ and https://www.fws.gov/species/tricolored-bat-perimyotis-subflavus) shall be made available to all personnel.

Lighting AMMs

- Direct temporary lighting away from suitable habitat during the active season: **April 1 to October 31.**

- When installing new or replacing existing permanent lights, use downward-facing, full cut-off lens lights (with same intensity or less for replacement lighting); or for those transportation agencies using the BUG system developed by the Illuminating Engineering Society, be as close to 0 for all three ratings with a priority of "uplight" of 0 and "backlight" as low as practicable.

Tree Removal AMMs

- *If additional cutting is proposed by the Contractor that is outside the scope of this contract, additional review is required by the MassDOT Highway Division's Environmental Services Section, and additional review and restrictions may be required by the USFWS.*

- Ensure tree removal is limited to that specified in project plans and ensure that contractors understand clearing limits and how they are marked in the field (e.g., install bright colored flagging/fencing prior to any tree clearing to ensure contractors stay within clearing limits).

- No tree cutting shall be conducted during the active season: **April 1 to October 31.**

NORTHERN LONG-EARED BAT AND TRICOLORED BAT PROTECTION (Continued)

- No tree cutting shall be conducted during the active season: **April 1 to October 31**, or if cutting inside of this timeframe is required, tree removal is limited to 10 or fewer trees per project at any time of year within 100 feet of existing road/rail surface and outside of documented roosting/foraging habitat or travel corridors; and a visual emergence survey must be conducted by *MassDOT Highway Division's Environmental Services Section or appointed representative* with no bats observed.

- Do not remove **documented** or NLEB and/or TCB roosts that are still suitable for roosting, or trees within 0.25 miles of roosts, or **documented** foraging habitat any time of year.

- The Contractor shall ensure all personnel working in on the project site are aware of all environmental commitments related to NLEB and/or TCB, including the **TOY** restriction. If this restriction needs to be waived at any location(s) the Resident Engineer shall send a locus map of the proposed work to MassDOT Highway Division's Environmental Services Section for review and a determination if the restriction can be waived.

RiKelly@simon.com

MATERIAL OPTIONS

The Contractor shall inform the Engineer of his option prior to the installation of the material. Once the option is designated, all material for the option item(s) shall remain the same throughout the job.

OPTIONS

Item Number	Item Description	Unit
234.12	12 Inch Drainage Pipe-Option	Foot
234.15	15 Inch Drainage Pipe-Option	Foot
234.18	18 Inch Drainage Pipe-Option	Foot
234.36	36 Inch Drainage Pipe-Option	Foot

Pipe Options

Reinforced Concrete Pipe
Corrugated Plastic (Polyethylene) Pipe
Corrugated Plastic (Polypropylene) Pipe

EMERALD ASH BORER ADVISORY

To the extent possible, all trees and brush shall be disposed on site, typically chipped and spread in place. When trees or brush must be removed, such as in urban, or otherwise populated areas, Contractor shall identify proposed location for disposal, and provide written notification to the Engineer for approval. Disposal shall be in city or town of project, or at minimum, within county, of construction operations.

EQUIVALENT SINGLE AXLE LOADS (ESALS)

The estimated traffic level to be used for SUPERPAVE HMA mixture designs for this contract, expressed in Equivalent Single Axle Loads (ESALs) for the design travel lane over a 20-year period, is 3.3 Million 18-kip (80-kn) ESALs.

CONTAMINATED SOIL

Soil to be removed from the project area shall not be assumed to be uncontaminated and must be evaluated prior to off-site management for potential contamination with hazardous materials. No soil may be disposed of off-site without proper assessment by the contractor and approval from the Resident Engineer (RE), District Environmental Engineer (DEE), or the project designee.

2026 FIFA WORLD CUP – BOSTON, MASSACHUSETTS

The 2026 FIFA World Cup will be held at Gillette Stadium in Foxborough and related events will be held throughout the region. Matches and Fan Fest activities are scheduled from June 11, 2026 through July 19, 2026. MassDOT will impose work restrictions as necessary to minimize traffic impacts during FIFA events when the Contractor's operations could impact vehicular traffic, particularly on interstate highways and major arterials throughout the region and local roads near the event site. No additional compensation will be allowed for work restrictions except as determined under Subsection 8.10

VALUE ENGINEERING CHANGE PROPOSAL

This Subsection defines the conditions and requirements which apply to Value Engineering Change Proposals ("VECPs"). The purpose of this provision is to encourage the Contractor to propose changes in certain project requirements that will maintain the project's functional requirements at a savings in contract time, contract price, or both. The net savings obtained by using a VECP that meets the conditions and requirements set forth here will be shared by the Contractor and MassDOT.

VECP's under this provison are to be initiated, developed and submitted to MassDOT by the Contractor. The VECP must show the contemplated changes to the Drawings, Specifications and other requirements in the Contract. When a VECP submitted pursuant to this section is fully accepted by MassDOT, the VECP will be implemented by the Contractor and paid using the current cost and resource loaded schedule. Contractor shall demonstrate that the VECP is equal to, or better than, the original design or material; that there is an interest in public safety within the VECP; that there is a life-cycle cost benefit; and/or that end users will benefit from the shortened schedule. VECPs shall be consistent with the MassHighway/MassDOT Standard Specifications for Highways and Bridges and other applicable reference documents and directives. Any proposed deviation from these documents will need to be clearly identified in the VECP Proposal Documents, and must be approved by MassDOT's Chief Engineer before accepting this VECP.

A. In order to be considered for MassDOT review each VECP shall:

1. Be clearly labeled pursuant to this Subsection;

2. Yield a net savings at least two hundred and fifty thousand (250,000.00) Dollars and/or a net saving of contract completion duration of at least three (3) months;

3. The proposed changes to contract items must:

    a. maintain the specified items' required functions (service life, reliability);

    b. meet applicable safety regulations and codes;

    c. material substitutions must be in accordance with DOT prequalified/preapproved products and must be tested in accordance with standard material specs/testing methods (and considering all relevant environmental, load, and other relevant factors);

    d. show economy of operation, ease of maintenance, ease of construction, and necessary standardized features and appearance; and

4. Shall not require an extension of Contract Time or Contract Milestones, with the exception of cases when there are anticipated significant cost saving.

VALUE ENGINEERING CHANGE PROPOSAL (Continued)

The thresholds above are considered to be a general guideline. MassDOT will consider VECPs outside of these thresholds if a significant benefit is demonstrated. Additionally, notwithstanding this VECP process, MassDOT will consider minor revisions in the form of a Contract Modification.

Further, any VECP submitted shall be in sufficient detail to clearly define the proposed change. The Contractor's failure to provide information of the type, detail and in a format to facilitate the MassDOT's review, may be grounds for rejection of the VECP. Additionally, the Contractor will not be entitled to any equitable adjustment or increased Time, due to any aspect of any of the proposed VECP including permitting, right of way, utility coordination or delayed responses by MassDOT. If, after the progression of the work associated with the executed Contract Modification for the VECP, any additional costs are realized by the Contractor or any of the sub-consultants, sub-contractors, or suppliers, the Contractor shall be obligated to pay for any and all costs.

B. The following initial items shall be provided by the Contractor for MassDOT's review. *Items 1-6 need to be submitted prior to the start of MassDOT's review of the VECP and item 7 is an important consideration for the pricing of the VECP and the timeline of the proposed VECP schedule.*

1. ***VECP Description***: A description of the difference between the existing and the proposed Contract requirements, and the comparative advantages and disadvantages of each;

2. ***VECP Change Listing***: A listing of the Contract requirements that will need to be changed, modified, or reviewed as well as the proposed Contract document changes in the Instructions to Bidders, Contract, Standard Specifications, General Requirements and Special Provisions required by the VECP.

3. ***Construction Schedule Update*****:** Any changes in the Contract Time(s) or Contract Milestone(s), that will result from acceptance of the VECP, shall be accompanied by a contemporaneous schedule analysis *(i.e, the Contractor's baseline schedule submission, all past/required monthly schedule updates, a detailed assessment of all past delays, and a resource loaded Crticial Path Method schedule as specified in Section 8.0 / Subsection 8.02 of this Contract)* of the projected Work that remains including the proposed VECP related schedule changes *(inclusive of the timeline to review accept the VECP and the timeline for implementing the design changes)* in the remaining work. This shall be submitted in the form of a Proposal Schedule until the VECP has been formally accepted. Note: All of this information is to be updated, recertified, and formally accepted by MassDOT before final acceptance of this this VECP is issued.

VALUE ENGINEERING CHANGE PROPOSAL (Continued)

4. ***Date for MassDOT's Acceptance***: A statement that clearly justifies the date by which the VECP must be accepted to obtain the maximum price reduction, noting any effect upon the Contract Time(s) and/or Contract Milestone(s). This statement must include a narrative that demonstrates the most recent construction schedule has been utilized to justify that proposed acceptance date *(e.g. "in order to start to fabricate critical materials, authorization must be provided to work on the shop drawings by no later than [date]").* The Contractor should allow for at least sixty (60) to ninety (90) days for acceptance by MassDOT once all of the VECP documentation has been provided. Acceptance shall mean that MassDOT has received a finalized and executed contract modification. However, this is a proposed Contract change.

   The Contractor is fully obligated to progress the Work of the original Contract and MassDOT is not liable for any delays or costs that may occur in the review phase of any VECP proposal.

5. ***Cost and Savings Estimates***: A detailed estimate of the anticipated net savings, calculated as follows:

   a. ***Original Scope:*** Isolate the cost of performing the original contract construction activities, in accordance with the original Contract Documents, as originally bid by the Contractor, that are anticipated to be superseded by the VECP. *This cost is to include any original contract scope that is anticipated to be altered or eliminated by the VECP such as, shop drawing preparation, inspection work, testing, maintenance of traffic, or any other original contract costs, that have yet to have been performed at the time of this VECP submission.*

   b. ***New VECP Scope:*** Calculate the cost of performing the comparable construction activities associated with the VECP.

   c. ***Contractor's Engineer & Inspection***: Calculate the cost of engineering, inspection, and design work by the Contractor's Engineer/Designer. This should be a realistic estimate of the costs of any required engineering, design and review work by the Contractor's Engineer.

   d. ***MassDOT's Costs:*** MassDOT's estimate of costs to perform engineering/design reviews, cost estimate reviews, schedule reviews, and any other administrative costs to review and recommend implementation of the proposed VECP. *(including all anticipated increased costs to MassDOT on other Contracts and all anticipated follow-on increased costs to MassDOT, if any)* as provided by MassDOT. MassDOT's estimated costs must be included the VECP calculation and will be provided by MassDOT in support of the VECP evaluation process.

   e. ***Other Costs:*** Estimated costs associated with any revisions to other project related costs, such as Environmental Permits or Right of Way acquisitions, including other agency or municipality costs, as provided by MassDOT.

VALUE ENGINEERING CHANGE PROPOSAL (Continued)

Net Savings:
The net savings to be split between MassDOT and the Contractor shall be calculated using the items above as follows: a - (b+c+d+e) = net savings

6. *The Contractor shall also provide:*

   a. A proposed Change Order, which explains and justifies any required Equitable Adjustment in the Contract Price.

   b. The Contractor's actual costs expended for developing the VECP as of the date of the VECP submission;

7. ***Design Changes and Drawings*:** The costs that are outlined above should be inclusive of the following design and engineering responsibilities.

   a. Design changes shall be prepared and stamped by the Contractor's professional designer and/or engineer. In addition, in the development of the VECP; the Contractor is responsible for anticipating and managing all aspects associated with any VECP design work that must be performed by a licensed Engineer.

   b. The Contractor's engineer must analyze and stamp all components of any aspect of the project that has been redesigned, changed, or altered as a result of this VECP.

   c. The Contractor's engineer shall provide all calculations and supporting design/engineering documentation that was utilized to develop the changes and stamped drawings. These will be used by MassDOT's Designer-of-Record to review the VECP changes. The Contractor is limited to selecting only those engineer's that have been pre-qualified by MassDOT's A&E Board.

   d. MassDOT's Designer-of-Record will review and respond to all completed design submissions related to this VECP within thirty (30) calendar days, unless determined to be a non-critical path item.

   e. MassDOT will be responsible for estimating and managing MassDOT's Designer-of-Record during the VECP review and implementation. Should any significant conflicts arise, between the Contractor's Engineer and MassDOT's Designer-of-Record, the DOT and the Contractor will work expeditiously to resolve the conflict. Should this type of conflict continue for greater than five (5) days, the Contractor is to bear all financial and time related impacts of such delay and must seek to resolve the design conflict, in an acceptable manner to MassDOT. The resolution of this conflict will be funded at the Contractor's expense – exclusive of the net saving that was agreed to at the execution of the contract modification for this VECP.

   f. The Contractor's Engineer may also be required to inspect the construction work. The Contractor is to include such anticipated inspection costs in the initial VECP.

VALUE ENGINEERING CHANGE PROPOSAL (Continued)

g. MassDOT's Designer of Record will remain the Designer-of-Record for the entire Project. Any costs incurred in the use of MassDOT's Designer-of-Record by MassDOT or Contractor associated with the review of a VECP are to be included in the calculated net savings.

C. Approval of the VECP shall not occur until a Contract Modification, incorporating the VECP, is issued by MassDOT and properly executed by the Contractor. MassDOT may accept or reject part or all of any VECP at any time prior to an executed Contract Modification for the applicable VECP. The decision of MassDOT, concerning acceptance or rejection of any VECP, shall be final and shall not be subject to dispute resolution.

It is expected that several weeks may go by before the final VECP documentation has been executed with a Contract Modification. Therefore, MassDOT intends to make certain that the initial cost estimate information has not changed before entering into a Contract Modification. As the VECP evaluation process is finalized, and prior to the signed Contract Modification for the VECP, the Contractor and MassDOT must re-certify the current status of the originally proposed cost and/or schedule savings.

Until a contract modification is issued and schedule and cost/savings re-certification is complete and accepted by MassDOT, the Contractor shall remain obligated to perform the Work in accordance with the terms and conditions of the original Contract Documents.

Upon completion of the work associated with the VECP, MassDOT may require verification that the VECP savings has been achieved.

D. VECPs will be processed (distributed, reviewed, commented upon, accepted or rejected) expeditiously (pursuant to M.G.L. c. 30, § 39R); however, as this is an elective modification to the contract, MassDOT shall not be liable for any delay or cost in the review and acceptance of the VECP. During the review of the VECP, the Contractor remains obligated to progress the original Contract scope, and schedule, as planned; until a Contract Modification, accepting the Contractor re-certified VECP, has been executed by MassDOT.

The Contractor has the right to withdraw part, or all of any VECP, prior to acceptance by MassDOT. Such withdrawal shall be made in writing to the Engineer. The Contractor shall state the period of time, from the date of the initial VECP submittal, that the VECP shall remain valid and feasible. Revision of this validity and feasibility period shall be allowed only by mutual agreement of the Contractor and the Engineer in writing.

If the Contractor desires to withdraw the proposal prior to the expiration of this period for non-technical reason, MassDOT reserves the right to recover all actual costs that have been incurred to MassDOT.

VALUE ENGINEERING CHANGE PROPOSAL (Continued)

If the Contractor withdraws the VEC Proposal, MassDOT reserves the right to proceed with the VECP or any portion of the VECP as a normal change and the Contractor waives any right it may have had to share in net savings thereunder.

For purposes of this provision, expiration of the time established by the Contractor for approval shall be considered as withdrawal by the Contractor if MassDOT requests an extension of that time and the Contractor does not provide a written extension.

E. With regard to unknown conditions or sub-surface work, in general, the expectation is that the Contractor and MassDOT will strive to gain enough knowledge about the risks in order to provide a forward-priced Change Proposal. Therefore, any costs to fully evaluate the proposal, such as additional borings and/or test pits, must be considered in the cost evaluation of whether the VECP is worth pursuing. However, if it is impractical to gather conclusive exploratory information, before the VECP is executed, MassDOT may consider provisions in the VECP that clearly identifies the risk sharing (cost and time) related specifically to the unknown/sub-surface conditions. If these VECP provisions are acceptable to MassDOT they are to include supplemental language to provide a determination of the final savings/cost, and time impacts, no later than 45 days after the sub-surface work is completed. All other aspects of the VECP, unrelated to these Provisions, will be binding upon execution of the VECP.

NOTIFICATION OF FUNDING SOURCES FOR WORK TO BE PAID BY OTHERS

This contract has an agreement with the ***City of Peabody;*** whereas when the construction costs for the contract scope exceed the total participating contract bid price by more than ten percent (10%), the ***City*** shall be responsible for the amount over 110% of the total participating contract bid price.

SECTION 722
CONSTRUCTION SCHEDULING
DESCRIPTION

722.20 General

The Contractor's approach to prosecution of the Work shall be disclosed to the Department by submission of a Critical Path Method (CPM) schedule and a cost/resource loaded Construction Schedule as defined by the schedule type set forth below. These requirements are in addition to any requirements imposed in other sections.

This section establishes the requirement for scheduling submissions. There are four schedule types identified as types A, B, C and D.

All schedules shall be prepared and submitted in accordance with this specification and the instructions contained in the Construction Schedule Toolkit located on the MassDOT-Highway Division website at https://www.mass.gov/info-details/massdot-highway-contractors-schedule-toolkit.

Type A –

- Schedule Planning Session
- Baseline CPM Schedule
- Monthly Update CPM Schedule
- Short-term Construction Schedule
- Contract Schedule Update Meeting
  - Cost-loaded & Resource Loaded CPM
- Resources Graphic Reporting
- Cash Flow Projections from the CPM
- Cash Flow Charts
- Monthly Projected Spending Report (PSR)
- Contractor-furnished CPM software and computer

Type B –

- Schedule Planning Session
  - Baseline CPM Schedule
  - Monthly Update CPM Schedule
- Short-term Construction Schedule
- Contract Schedule Update Meeting
- Cost-loaded & Resource Loaded CPM
- Monthly Projected Spending Report (PSR)
- Contractor-furnished CPM software and computer

Type C –

- Schedule Planning Session
- Baseline CPM Schedule
- Monthly Update CPM Schedule
- Short-term Construction Schedule
- Contract Schedule Update Meeting
  - Monthly Projected Spending Report (PSR)
- Contractor-furnished CPM software and computer

SECTION 722 (Continued)

Type D -

- Bar chart schedule updated monthly or at the request of the Engineer
- Short-term Construction Schedule
- Monthly Projected Spending Report (PSR)

EQUIPMENT, PERSONNEL

722.40 General

A. **Software Requirements**

The Contractor shall use Primavera P6 computer scheduling software.

In addition to the requirements of Section 740 – Engineer's Field Office and Equipment, the Contractor shall provide to the Department one (1) copy of the scheduling software, one (1) software license and one (1) computer capable of running the scheduling software for the duration of the Contract. This computer and software shall be installed in the Engineer's Field Office. The computer and software shall be maintained and serviced at no additional cost to the Department.

B. Scheduler Requirements

The Scheduler shall be approved by the Engineer.

For Type A, B and C Schedules the name of the Contractor's Project Scheduler together with his/her qualifications shall be submitted to the Department for approval by the Engineer within seven (7) Calendar Days after NTP. The Project Scheduler shall have a minimum of five (5) years of project CPM scheduling experience, three (3) years of which shall be on projects of similar scope and value as the project for which the Project Scheduler is being proposed. References shall be provided from past projects that can attest to the capabilities of the Project Scheduler.

SCHEDULING METHODS

722.60 General

A. **Schedule Planning Session**

The Contractor shall conduct a schedule planning session prior to submission of the Baseline Schedule. This session will be attended by the Department and its consultants. During this session, the Contractor shall present its planned approach to the project including, but not limited to:

1. the Work to be performed by the Contractor and its subcontractors;
2. the planned construction sequence and phasing; planned crew sizes;
3. summary of equipment types, sizes, and numbers to be used for each work activity;
4. all early work related to third party utilities;
5. identification of the most critical submittals and projected submission timelines;
6. estimated durations of major work activities;
7. the anticipated Critical Path of the project and a summary of the activities on that Critical Path;
8. a summary of the most difficult schedule challenges the Contractor is anticipating and how it plans to manage and control those challenges;

SECTION 722 (Continued)

9. a summary of the anticipated quarterly cash flow over the life of the project.

This will be an interactive session and the Contractor shall answer all questions that the Department and its consultants may have. The Contractor shall provide a written summary of the information presented and discussed during the session to the Engineer. The Contractor's Baseline Schedule and accompanying Schedule Narrative shall incorporate the information discussed at this Schedule Planning Session.

B. **Schedule Reviews by the Department**

1. Baseline Schedule Reviews
   The Engineer will respond to the Baseline Schedule Submission within thirty (30) Calendar Days of receipt providing comments, questions and/or disposition that either accepts the schedule or requires revision and resubmittal. Rejected Baseline Schedules shall be resubmitted within fifteen (15) Calendar Days after receipt of the Engineer's comments.
2. Contract Progress Schedule / Monthly Update Reviews / Recovery Schedules
   The Engineer will respond to each submittal within twenty-one (21) Calendar Days. Rejected schedules shall be resubmitted by the Contractor within five (5) Calendar Days after receipt of the Engineer's comments.

The Engineer's review comments shall not be construed as direction to change the Contractor's means and methods. The review and acceptance of the CPM schedule does not relieve the Contractor of the responsibility for accomplishing the work within the contract required completion dates. Omissions and errors in the accepted CPM schedule shall not excuse performance less than that required by the Contract.

722.61 Schedule Content and Preparation Requirements

All schedules shall be prepared and submitted in accordance with the instructions contained in the Construction Schedule Toolkit located on the MassDOT-Highway Division website at:
https://www.mass.gov/info-details/massdot-highway-contractors-schedule-toolkit
and the following:

A. **LOGIC**

The schedules shall divide the Work into activities with appropriate logic ties to show:

1. conformance with the requirements of this Section and Division I, Subsection 8.02 - Schedule of Operations
2. the Contractor's overall approach to the planning, scheduling, and execution of the Work
3. conformance with any additional sequences of Work required by the Contract Documents, including, but not limited to, Subsection 8.03 - Prosecution of Work and Subsection 8.06 – Limitations of Operations.

SECTION 722 (Continued)

B. **ACTIVITIES**

The schedule shall clearly define the progression of the Work from the Notice to Proceed (NTP) to Contractor Field Completion (CFC) by using separate activities, or including attributes within appropriate activities, to address each of the following:

1. Notice to Proceed
2. Work Breakdown Structure
3. The Critical Path is clearly defined and organized.
4. Float shall be clearly identified.
5. Detailed activities to satisfy permit requirements.
6. Subcontractor approvals at fifteen (15) Calendar Days from submittal to response
7. The preparation and submission of shop drawings, procedures, and other required submittals, with a planned duration that is to be demonstrated to the Engineer as reasonable.
8. The review and return of shop drawings, procedures, and other required submittals, approved or with comments, the duration of which shall be thirty (30) Calendar Days, unless otherwise specified or as approved by the Engineer.
9. Procurement of fabricated materials and equipment with long lead times, including time for review and approval of submittals required before procuring and fabricating.
10. Each component of the Work defined by specific activities.
11. Right-of-Way (ROW) takings that have been identified in the Contract.
12. Early Utility Relocation (by others) that has been identified in the Contract.
13. Interfaces with adjacent work, utility companies, other public agencies, sensitive abutters, and/or any other third-party work affecting the Contract.
14. Utility work to be performed in accordance with the Project Utility Coordination (PUC) Form as provided in Section 8.14 - Utilities Coordination, Documentation and Monitoring Responsibilities
15. Access Restraints – restrictions on access to areas of the Work that are defined by the Department in the bid package, in Subsection 8.06 – Limitations of Operations or elsewhere in the Contract
16. Limitations of Work – time of year restrictions and any other limitations identified in the contract
17. Traffic work zone set-up and removal, night work and phasing
18. Material Certifications
19. Milestones listed in Subsection 8.03 - Prosecution of Work or elsewhere in the Contract Documents
20. For Type A and B Contracts only: All items to be paid for, including all Unit Price and Lump Sum pay items, shall be identified by activity. This shall include all non-construction activities such as engineering work; purchase of permanent materials and equipment, purchase of structural steel stock, equipment procurement, equipment delivery to the site or storage location and the representative amount of overhead/indirect costs that was included in the Contractor's Bid Prices.

SECTION 722 (Continued)

21. Contractor's request for validation of FBU (ready to open to traffic)
22. Full Beneficial Use (FBU) Contract Milestone per the following requirements: The majority of contract Work has been completed and the asset(s) has been opened for full multi-modal transportation use, except for limited contract work items that do not materially impair or hinder the intended public use of the transportation facility. All anticipated lane takings have been completed, except for minor, short term work items and as defined in Subsection 8.03 - Prosecution of Work
23. The Department's confirmation of completed work to allow for FBU.
24. Contractor's request for validation of Substantial Completion
25. Department generated punch list of twenty-one (21) Calendar Days
26. Substantial Completion Contract Milestone as defined in the standard specifications.
27. Punch list Completion Period of at least thirty (30) Calendar Days per the requirements of Subsections 5.11 - Final Acceptance, 7.15 - Claims Against Contractors for Payment of Labor, Materials and Other Purposes
28. Contractor confirmation that all punchlist work and documentation has been completed.
29. Physical Completion of the Work Contract Milestone per the requirements of Subsections 5.11 - Final Acceptance and 8.03 - Prosecution of Work
30. Documentation Completion per the requirements of Subsections 5.11 - Final Acceptance and 8.03 - Prosecution of Work
31. Contractor Field Completion Contract Milestone (which can also be considered the completion date) per the following requirements: All physical contract Work is complete including punchlist. The Contractor has fully de-mobilized from field operations and as defined in Subsection 5.11

C. **EARLY AND LATE DATES**

Early Dates shall be based on proceeding with the Work or a designated part of the Work exactly on the date when the corresponding Contract Time commences. Late Dates shall be based on completing the Work or a designated part of the Work exactly on the corresponding Contract Time, even if the Contractor anticipates early completion.

D. **DURATIONS**

Activity durations shall be in Work Days. Planned Original Durations shall be established with consideration of resources and production rates that correspond to the Contractor's Bid Price. Within all of the Department-required schedules, the Contractor shall plan the Work using durations for all physical construction activities of no less than one (1) Work Day and no greater than fourteen (14) Work Days, unless approved by the Engineer as part of the Baseline Schedule Review.

SECTION 722 (Continued)

Should there be an activity with a duration that is determined by the Engineer to be unreasonable, the Contractor will be asked to provide a basis of the duration using bid documents, historic production rates for similar work, or other form of validation that is acceptable to the Engineer. Should the Contractor and the Engineer be unable to agree on reasonable activity durations, the Engineer will, at a minimum, note the disagreement in the Baseline Schedule Review along with a duration the Engineer considers reasonable and the basis for that duration. A schedule that contains a substantial number of activities with durations that are deemed unreasonable by the Engineer will not be accepted.

E. **MATERIALS ON HAND**

The Contractor shall identify in the Baseline Schedule all items of permanent materials (Materials On Hand) for which the Contractor intends to request payment prior to the incorporation of such items into the Work.

F. **ACTIVITY DESCRIPTIONS**

The Contractor shall use activity descriptions in all schedules that clearly describe the work to be performed using a combination of words, structure numbers, station numbers, bid item numbers, work breakdown structure (WBS) and/or elevations in a concise and compact label.

G. **ACTIVITY IDENTIFICATION NUMBERS**

The Contractor shall use the activity identification numbering system specified in the MassDOT Highway Division Contractor Construction Schedule Toolkit.

H. **ACTIVITY CODES**

The Contractor shall use the activity codes specified in the MassDOT Highway Division Contractor Construction Schedule Toolkit.

I. **CALENDARS**

Different calendars may be created and assigned to all activities or to individual activities. Calendars define the available hours of work in each Calendar Day, holidays and general or project-specific non-Work Days such as Fish Migration Periods, time-of-year (TOY) restrictions and/or area roadway restrictions. All calendars shall extend two years beyond the current project completion date.

Project Special Provisions identify specific calendar restrictions some examples of special calendars include, but are not limited to:

- Winter Shutdown Period, specific work is required by separate special provision to be performed during the winter. See Special Provision 8.03 (if applicable)
- Peak traffic hours on heavily traveled roadways. This shall be from 6:30 am to 9:30 am and from 3:30 pm to 7:00 pm, unless specified differently elsewhere in the Contract.
- Special requirements by sensitive abutters, railroads, utilities and/or other state agencies as defined in the Contract.
- Planting seasons for trees, shrubs and grasses and wetlands mitigation work.

SECTION 722 (Continued)

- Cape Cod and the Islands Summer Roadway Work Restrictions: A general restriction against highway and bridge construction is enforced between Memorial Day and Labor Day, unless otherwise directed by the Engineer. Cape Ann Summer Roadway Work Restrictions: While there are no general restrictions for Cape Ann as there are for Cape Cod and the Islands, project-specific restrictions may be enforced.
- Turtle and/or Fish Migration Periods and/or other in-water work restrictions: Refer to the Project Special Provisions for specific restrictions.
- Working over Waterways Restricted Periods.
- Night-time paving and striping operations, traffic, and temperature restrictions.
- Utility Restrictions shall be as specified within the Contract.

J. **FLOAT**

For the calculation of float in the CPM schedule, the setting for *Retained Logic* is required for all schedule submissions, starting with the Baseline Schedule Submission. Should the Contractor have a reason to propose that an alternative calculation setting such as *Progress Override* be used, the Contractor shall obtain the Engineer's approval prior to modifying to this setting.

K. **COST AND RESOURCE LOADING (Types A and B only)**

For all Type A and B Schedules, the Contractor shall provide a cost and resource-loaded schedule with an accurate allocation of the costs and resources necessary to complete the Work. The costs and resources shall be assigned to all schedule activities in order to enable the Contractor to efficiently execute the Contract requirements and the Engineer to validate the original plan, monitor progress, provide cash flow projections, and analyze delays.

1. Each schedule activity shall have an assigned cost that accurately represents the value of the Work. Each schedule activity shall have its resources assigned to it by craft and the anticipated hours to accomplish the work. Each schedule activity's equipment resources shall be assigned to it by equipment type and hours operated. Front-loading or other unbalancing of the cost distribution will not be permitted.
2. The sum of the cost of all schedule activities shall be equal to the Contractor's Bid Price.
3. Indicating the labor hours per individual, per day, by craft and equipment hours/day will be acceptable.
4. The Engineer reserves the right to use the cost-loading as a means to resolve changes, disputes, time entitlement evaluations, increases or decreases in the scope of Work, unit price renegotiations and/or claims.
5. For all Type A and B Schedules, all subnets, fragnets, Proposal Schedules, and Recovery Schedules shall be cost and resource- loaded to help to quickly validate and monitor the duration of the Work to be performed.
6. For Type A Schedules, cost-loading of the schedule will also be used for cash flow projection purposes.
7. The cost-loading of each activity shall indicate the portion of the cost for that activity that is applicable to a specific bid item (cost account.) The total cost for each cost account must equal the bid item price.

SECTION 722 (Continued)

L. **NOT TO BE USED IN THE CONTRACTOR'S CPM SCHEDULE**

1. Milestones or constraint dates not specified in the Contract.
2. Scheduled work not required for the accomplishment of a Contract Milestone
3. Use of activity durations, logic ties and/or sequences deemed unreasonable by the Engineer.
4. Delayed starts of follow-on trades.
5. Float suppression techniques.
6. Leads such as leads, lags, SS, SF, & FF relationships without the expressed permission of the Department.

722.62 Submittal Requirements

All schedules shall be prepared and submitted in accordance with the requirements listed below.

Each monthly Contract Progress Schedule submittal shall be uniquely identified.

Each Submission shall, at a minimum, include the following:

a. Narrative
b. Schedule submittals shall be signed by the Scheduler
c. Schedule Printout - All Activities
d. Schedule Printout - Critical Path Layout
e. Schedule Printout - Remaining Work
f. Schedule Printout - Top 3 Float Path
g. Work Breakdown Structure (WBS) Summary
h. Project Spending Report (PSR) in Portable Document Format (.PDF)
i. Project Spending Report (PSR) in Microsoft Excel spreadsheet (.XLS)
j. Oracle Primavera P6 Schedule File (.XER)

All digital file submittals will be labeled with the following information.

- Contract Number
- Project Number
- Project locations (i.e., town(s))
- Brief description
- Submittal description (i.e., UP07)
- Data Date (MM-DD-YY)
- File Description (i.e., Critical Path)

Example: C110464 (P606309) - Orange Route 2 over 202 – UP23 (07-15-22) - Critical Path

A. **Narratives**

A written narrative shall be submitted with every schedule submittal. The narrative shall:

1. itemize and describe the flow of work for all activities on the Critical Path in a format that includes any changes made to the schedule since the previous Contract Progress Schedule / Monthly Update or the Baseline Schedule, whichever is most recent.
2. provide a description of any specification requirements that are not being followed. Identify those that are improvements and those that are not considered to be meeting the requirements.

SECTION 722 (Continued)

3. provide all references to any Notice of Delay that has been issued, within the time period of the Contract Progress Schedule Update, by letter to the Engineer. Note that any Notice of Delay that is not issued by letter will not be recognized by the Engineer. See Subsection 722.64.A – Notice of Delay.
4. provide a description of each third-party utility's planned vs. actual progress and note any that are trending late or are late per the durations and commitments as provided in the PUC Form; provide a description of the five (5) most important responses needed from the Department and the need date for the responses in order to maintain the current Schedule of Record.
5. provide a description of all critical issues that are not within the control of the Contractor or the Department (third party) and any impact they had or may have on the Critical Path.
6. provide a description of any possible considerations to improve the probability of completing the project early or on time.
7. compare Early and Late Dates for activities on the Critical Path and describe reasons for changes in the top three (3) most critical paths.
8. describe the Contractor's plan, approach, methodologies, and resources to be employed for completing the various operations and elements of the Work for the top three (3) most critical paths. For update schedules, describe and propose changes to those plans and verify that a Proposal Schedule is not required.
9. describe, in general, the need for shifts that are not 5 days/week, 8 hours/day, the holidays that are inserted into each calendar and a tabulation of each calendar that has been used in the schedule.
10. describe any out-of-sequence logic and provide an explanation of why each out-of-sequence activity does not require a correction, if one has not been provided, and an adequate demonstration that these changes represent the basis of how these activities will be built, including considerations for resources, dependencies, and previously approved production rates.
11. identify any possible duration increases resulting from actual or anticipated unit price item quantity overruns as compared to the baseline duration, with a corresponding suggestion to mitigate any possible delays to the Critical Path. If the delay is anticipated to impact the Critical Path, refer to Subsections 4.06 – Increased or Decreased Contract Quantities and 8.10 – Determination and Extension of Contract Time for Completion and submit a letter to the Engineer notifying of a potential delay.
12. include a schedule log consisting of the name of the schedule, the data date and the date submitted.
13. include and describe any notifications, communications and coordination meetings with third-parties such as utility companies that occurred from the last update including personnel names, job titles and contact information, date of meeting(s)/correspondence(s), topics discussed, and reasons the third party provided for deviations from the PUC form.

SECTION 722 (Continued)

B. **CPM Bar Charts**

One (1) timescaled bar chart containing all activities shall be prepared and submitted using a scale that yields readable plots and that meets the requirements of Subsection 722.61 – Schedule Content and Preparation Requirements Activities shall be linked by logic ties and shown on their Early Dates. Critical Paths shall be highlighted, and Total Float shall be shown for all activities.

A second timescaled bar chart shall also be prepared containing only the Critical Path or, if the Critical Path is not the longest path, the Longest Path using a scale that yields readable plots and that meets the requirements of Subsection 722.61 – Schedule Content and Preparation Requirements. Activities shall be linked by logic ties and shown on their Early Dates. Total Float shall be shown for all activities.

C. Detailed Activity Schedule Comparisons

A Detailed Activity Schedule Comparison (DASC) is a simple reporting tool in the format of a graphical report that will provide Resident Engineers with immediate, timely and up-to-date information. The DASC consists of an updated bar chart that overlays the current time period's bar chart onto the previous time period's bar chart for an easily read comparison of progress during the present and previous reporting periods.

D. Activity Cost Report and Monthly Cash Flow Projections (Type A only)

With each Contractor Quantity Estimate (CQE), the Contractor shall submit an Activity Cost Report and Cash Flow Projection that includes all activities grouped by Contract Bid Item.

The Activity Cost Report shall be generated from the Schedule of Record and shall be the basis of the Monthly Cash Flow Projection. Within each contract Bid Item, activities shall be sequenced by ascending activity identification number and shall show:

1. activity ID and description,
2. forecast start and finish dates for each activity and,
3. when submitted as a revised schedule, actual start, and finish dates for each completed activity.
4. any variance to the estimated contract quantity shall be shown.

E. Resource Graphs (Type A only)

Monthly and cumulative resource graphs for the remaining Contract period using the Early Dates and Late Dates in the Contract Progress Schedule shall be included as part of each schedule submittal.

SECTION 722 (Continued)

F. Projected Spending Reports

A Projected Spending Report (PSR) shall be prepared and submitted monthly. The PSR shall indicate the monthly spending (cash flow) projection for each month from NTP to Contractor Field Completion (CFC). Each month's actual spending shall be calculated using all CQEs paid during that month. The Projected Spending Report (PSR) shall be depicted in a tabular format and provided in both an .XLS and .PDF.

722.63. Progress Schedule Requirements

A. Baseline Schedule

The Baseline Schedule shall be due thirty (30) Calendar Days after Notice to Proceed (NTP). The Baseline Schedule shall only reflect the Work awarded to the Contractor and shall not include any additional work involving Extra Work Orders or any other type of alleged delay. The Baseline Schedule shall be prepared and submitted in accordance with Subsections 722.61 - Schedule Content and Preparation Requirements and 722.62 - Submittal Requirements. Once the Baseline Schedule has been accepted by the Engineer, with or without comments, it shall represent the as-planned schedule for the Work and become the Contract Progress Schedule of Record until such time as the schedule is updated or revised under Subsections 722.63.C - Contract Progress Schedules / Monthly Updates, 722.64.C - Recovery Schedules and 722.64.D - Proposal Schedules.

The Cost and Resource-Loading information (Types A and B only) shall be provided by the Contractor within forty-five (45) Calendar Days after NTP.

The Engineer's review comments on the Baseline Schedule and the Contractor's responses to them will be maintained for the duration of the Contract and will be used by the Engineer to monitor the Contractor's work progress by comparing it to the Contract Progress Schedule / Monthly Update.

B. Interim Progress-Only Schedule Submissions

The first monthly update of the Contract Progress Schedule/Monthly Update is due within seventy (70) Calendar Days after Notice to Proceed (NTP.) The Baseline Schedule review period ends at sixty (60) Calendar Days after NTP, see Subsection 722.60.B - Schedule Reviews by the Department. If the Baseline Schedule has not been accepted within sixty (60) Calendar Days after NTP, an Interim Progress-Only Schedule shall be due within seventy (70) Calendar Days after NTP. The purpose of the Interim Progress-Only Schedule is to document the actual progress of all activities, including non-construction activities, from NTP until the Baseline Schedule is accepted.

SECTION 722 (Continued)

C. Contract Progress Schedules / Monthly Updates

The first Contract Progress Schedule shall be submitted by the Contractor no later than seventy (70) Calendar Days after NTP. The data date for this first Progress Schedule shall be two months (approximately sixty (60) Calendar Days) after NTP. Subsequent Progress Schedules shall be submitted monthly.

Each Contract Progress Schedule shall reflect progress up to the data date. Updated progress shall be limited to asbuilt sequencing and asbuilt dates for completed and inprogress activities. Asbuilt data shall include actual start dates, remaining Work Days and actual finish dates for each activity, but shall not change any activity descriptions, the Original Durations, or the Original Resources (as planned at the time of bid), without the acceptance of the Engineer. If any activities have been completed out-of-sequence, the Contractor shall propose new logic ties for affected in-progress and future activities that accurately reflect the previously approved sequencing. Alternatively, the Contractor may submit to the Engineer for approval an explanation of why an out-of-sequence activity does not require a correction and an adequate demonstration that the changes accurately represent how the activities will be built, including considerations for resources, dependencies, and previously approved production rates. Once approved by the Engineer, the Contractor may incorporate the changes in the next Contract Progress Schedule/Monthly Update with the affected activities clearly identified and explained in the Schedule Narrative.

No revisions to logic ties, sequence, description, or duration of future activities; or planned resource costs shall be made without prior approval by the Engineer.

Any proposed logic changes for in-progress or future activities shall be submitted to the Engineer for approval before being incorporated into a Contract Progress Schedule. The logic changes must be submitted using a Proposal Schedule or a schedule fragnet submission. Once approved by the Engineer, the Contractor may incorporate the logic in the next Contract Progress Schedule/Monthly Update with the affected activities clearly identified and explained in the Schedule Narrative.

For any proposed changes to the original sequence, description or duration of future activities, the Contractor shall submit to the Engineer for approval an explanation of how the proposed description or duration change reflects how the activity will be progressed, including considerations for resources and previously approved production rates. Any description or duration change that does not accurately reflect how the activity will be progressed will not be approved by the Engineer. Once approved by the Engineer, the Contractor may incorporate the changes in the next Contract Progress Schedule/Monthly Update with the affected activities clearly identified and explained in the Schedule Narrative.

Contract Progress Schedules that extend performance beyond the Contract Time or beyond any Contract Milestone shall not be approved by the Engineer. The Contractor shall submit a Recovery Schedule, or a Time Entitlement Analysis, if any Contract Progress Schedule/Monthly Update indicates a failure to meet the Contract Dates.

SECTION 722 (Continued)

D. Short-Term Construction Schedule

The Contractor shall provide a Short-Term Construction Schedule that details daily work activities, including any multiple shift work that the Contractor intends to conduct, in a spreadsheet format. The daily activities shall directly correspond to the Contract Progress Schedule activities, with a matching reference to the activity identification number in the Contract Progress Schedule and may be at a greater level of detail. The Short-Term Construction Schedule shall be submitted every two weeks. It shall display all work for a thirty-five (35) Calendar Day period consisting of completed work for the two (2) week period prior and all planned work for the following three (3) week period. The initial submission shall be provided no later than thirty (30) Calendar Days after NTP or as required by the Engineer.

The Contractor shall be prepared to discuss the Short-Term Construction Schedule, in detail, with the Engineer in order to coordinate field inspection staff requirements, the schedule of work affecting abutters and any corresponding work with affected utilities. Short-Term Construction Schedules shall be prepared and submitted in accordance with Subsections 722.61 - Schedule Content and Preparation Requirements and 722.62 - Submittal Requirements.

722.64 Impacted Schedule Requirements

A. Notice of Delay

The Contractor shall notify the Engineer in writing, with copies to the District and State Construction Engineers, within fifteen (15) of the start of any delays to the Critical Path that are caused by actions or inactions that were not within the control of the Contractor. Delay notifications that are not provided in a letter to the Engineer, such as a delay notification in the schedule narrative, will not be recognized as contractual notice in the determination of any Time Extension related to the impacts to the work associated with this specific alleged delay. Should such a delay continue for more than one (1) week, the Contractor shall note it in the Schedule Narrative until the delay is no longer impacting the Critical Path for the completion of the Contract Milestones. The Engineer will evaluate the alleged delay and its impact and will respond to the Contractor within ten (10) Calendar Days after receipt of a notice of delay.

B. Time Entitlement Analysis

A Time Entitlement Analysis (TEA) shall consist of a descriptive narrative, prepared in accordance with Subsection 722.62.A - Narratives, and an as-built CPM schedule, which may be in the form of a schedule fragnet that has been developed from the project's Contract Progress Schedule of Record, and illustrates the impact of a delay to the Critical Path, Contract Milestones and/or Contract Completion Date as required in Subsection 8.10 - Determination and Extension of Contract Time for Completion. TEAs shall also be used to determine the schedule impact of proposed Extra Work Orders (EWO) as also required in Subsection 8.10.

TEAs shall be prepared and submitted in accordance with the requirements of Subsections 722.61 - Schedule Content and Preparation Requirements and 722.62 - Submittal Requirements and shall be based on the Contract Progress Schedule of Record applicable at the start of the delay or impact from an EWO. A TEA fragnet must start with a specific new activity describing the work contained in either a Notice of Delay previously submitted to the Department per Subsection 722.64.A - Notice of Delay or an EWO.

SECTION 722 (Continued)

TEAs shall be submitted:

1. as part of any Extra Work Order that may impact Contract Time,
2. with a request for a Time Extension,
3. within fifteen (15) Calendar Days after a request for a TEA by the Engineer for any other reason.

A TEA shall be submitted to the Engineer before any Time Extension is granted to the Contractor. Time Extensions will not be granted unless the TEA accurately reflects an evaluation of all past delays and the actual events that occurred that impacted the Critical Path. The TEA must also demonstrate a plan for the efficient completion of all of the remaining work through an optimized CPM Schedule. The analysis shall include all delays, including Contractor-caused delays, and shall be subdivided into timeframes and causes of delays.

TEAs shall incorporate any proposed activities, logic ties, resource considerations, and activity costs required to demonstrate the schedule impacts most efficiently in addition to detailing all impacts to existing activities, logic ties, the Critical Path, Contract Milestones, and the Contract Completion Date. In addition, TEAs shall accurately reflect any changes made to activities, logic ties, restraints, and activity costs, necessitated by an Extra Work Order or other schedule impact, for the completion of the remaining work. The Contractor shall provide TEAs that demonstrate that all delays have been mitigated to the fullest extent possible without requiring an Equitable Adjustment to the original bid basis.

All TEAs shall clearly indicate any overtime hours, additional shifts and the resources that are proposed to be incorporated in the schedule. The Engineer shall have final discretion over the use of overtime hours and additional shifts. The Engineer shall have the right to require that overtime hours and/or additional shifts be used to minimize the duration of Time Extensions if it is determined to be in the best interest of the Department to do so.

When accepted, the changes included in a TEA shall be incorporated into the next Contract Progress Schedule per the requirements of Subsection 722.63.C - Contract Progress Schedules / Monthly Updates. During the review of any TEA, all Contract Progress Schedules shall continue to be submitted as required.

The Engineer may request that the Contractor prepare a Proposal Schedule or a Recovery Schedule to further mitigate any delays that are shown in the accepted TEA or Contract Progress Schedule.

C. Recovery Schedules

The Contractor shall promptly report to the Engineer all schedule delays during the prosecution of the Work. Contract Progress Schedules that predict performance extended beyond the Contract Time or beyond any Contract Milestone shall not be approved as the schedule of record. This requirement is critical to the Department's ability to make informed decisions regarding Contract Time and costs.

The Contractor shall submit a Recovery Schedule within fifteen (15) Calendar Days of a Contract Progress Schedule submission that shows failure to meet the Contract Dates unless a recovery schedule is waived by the Department. Waiving the recovery schedule does not relieve the contractor of the responsibility for the delay. The Department may revoke the waiver of a Recovery Schedule, at which time a Recovery Schedule shall be submitted within fifteen (15) Calendar Days of the Contractor being notified.

Changes represented in accepted Recovery Schedules shall be incorporated into the next Contract Progress Schedule.

SECTION 722 (Continued)

D. Proposal Schedules

A Proposal Schedule is an alternative schedule used to evaluate proposed changes to the Contract scope or significant alternatives to previously approved approaches to complete the Work, which may include changes to activity durations, logic, and sequence. For Types A and B Schedules, the Proposal Schedule shall be cost and resource loaded.

A Proposal Schedule may be requested by the Department at any time or may be offered by the Contractor. The Engineer may request that the Contractor prepare a Proposal Schedule to further mitigate any delays that are shown in an accepted TEA or Contract Progress Schedule.

The Contractor shall submit the Proposal Schedule within thirty (30) Calendar Days of a request from the Department.

The Proposal Schedule shall not be considered a Schedule of Record until the logic, durations, narrative, and basis of the Proposal Schedule have been accepted by the Engineer. If the Proposal Schedule took the form of a fragnet, it must be incorporated into the Contract Progress Schedule of Record showing the current progress of all other activities and the impacts/results of the changes made by the Proposal Schedule before the Proposal Schedule is accepted by the Department.

Proposal Schedules shall clearly indicate any proposed acceleration including overtime hours, additional shifts, and the resources that are proposed to be incorporated in the schedule. The Engineer shall have final discretion over the use of overtime hours and additional shifts. Proposal Schedules that contain a cost element shall be submitted with a separate Cost Proposal.

Changes represented in the accepted Proposal Schedules shall be incorporated into the next Contract Progress Schedule. During the review of any Proposal Schedule, all Contract Progress Schedules shall continue to be required every month.

E. Disputes

All schedules shall be submitted, reviewed, dispositioned, and accepted in the timely manner specified herein so as to provide the greatest possible benefit to the execution of this Contract.

The Contractor may dispute a decision by the Engineer by filing a claim notice within seven (7) days after the Contractor's request for additional time has been denied or if the Contractor does not accept the number of days granted in a time extension. The Contractor's claim notice shall include a revised time entitlement analysis that sufficiently explains the basis of the time-related claim. Failure to submit the required time entitlement analysis with the claim notice shall result in denial of the Contractor's claim. A determination on the Contractor’s claim shall be in accordance with Subsection 7.16 Claims of Contractor for Compensation. Pending resolution of any dispute, the last schedule accepted by the Engineer will remain the Contract Schedule of Record.

SECTION 722 (Continued)

722.65 Schedule Type D Requirements

This section is to detail the requirements for Type D Schedules and is separate from the requirements listed above. These schedules are intended for a project in which a more formal schedule would not be practical.

Schedules for Type D projects shall be submitted for each work assignment. The Schedule Type D shall be submitted electronically in .XLS and .PDF format and meet the following requirements.

The schedule requirements for work assignments that are anticipated to last three weeks or less shall conform to the requirements for Short-term Construction Schedules below.

Work assignments that are anticipated to last longer than three weeks shall submit a bar chart baseline and provided update schedules upon request of the engineer as required under Bar Chart Schedule below in addition to meeting the Short-term Construction schedule requirements.

A. **Bar Chart Schedule**

A Bar Chart that shall include the following:

- Work Assignment start date.
- Activities to identify.
  - Major work operations broken down to be no longer than 14 days.
  - Procurement of fabricated materials and equipment with long lead times, including time for review and approval of submittals required before procuring and fabricating.
  - The preparation and submission of shop drawings, procedures, and other required submittals, with a planned duration that is to be demonstrated to the Engineer as reasonable.
  - The review and return of shop drawings, procedures, and other required submittals, approved or with comments, the duration of which shall be shown as thirty (30) Calendar Days,
  - Detailed activities to satisfy permit requirements.
  - Subcontractor approvals at fifteen (15) Calendar Days from submittal to response
  - Project Close out activities including a 21-calendar day creation of a punchlist activity and 30 calendar day minimum completion of punchlist activity.
- Interfaces with adjacent work, utility companies, other public agencies, sensitive abutters, and/or any other third-party work affecting the Contract.
- Access Restraints – restrictions on access to areas of the Work
- Traffic work zone set-up and removal, night work and phasing
- Contract Milestones including Full beneficial Use, Substantial Completion and Contractor Field Completion

The Bar Char Schedule shall be provided at the beginning of the project and updated with each work order created for the project.

SECTION 722 (Continued)

B. **Short-Term Construction Schedule**

The Contractor shall provide a Short-Term Construction Schedule that details daily work activities, including any multiple shift work that the Contractor intends to conduct, in a spreadsheet format. The daily activities shall directly correspond to the Contract Progress Schedule activities, with a matching reference to the activity identification number in the Contract Progress Schedule and may be at a greater level of detail. See schedule toolkit for suggested format.

The Short-Term Construction Schedule shall be submitted every two weeks. It shall display all work for a thirty-five (35) Calendar Day period consisting of completed work on the assignment for the two week period prior and all planned work for the following three week period. The initial submission shall be provided no later than thirty (30) Calendar Days after NTP or as required by the Engineer.

The Contractor shall be prepared to discuss the Short-Term Construction Schedule, in detail, with the Engineer in order to coordinate field inspection staff requirements, the schedule of work affecting abutters and any corresponding work with affected utilities.

C. **Project Spending Report (PSR)**

A Projected Spending Report (PSR) shall be prepared and submitted monthly. The PSR shall be for all active work assignments, broken down by work assignment. The PSR shall indicate the monthly spending (cash flow) projection for each month from NTP to Contractor Field Completion (CFC). Each month's actual spending shall be calculated using all CQEs paid during that month. The Projected Spending Report (PSR) shall be depicted in a tabular format and provided in both an .XLS and .PDF

SECTION 722 (Continued)

COMPENSATION

722.80 Method of Measurement

Schedule of Operations (Type A, B and C)

The project bid documents specify the fixed-price amounts to be paid to the Contractor for the Project Schedule requirements contained herein. Each bidder shall include this fixed price bid item amounts in their bid. Failure to do so may be grounds for the rejection of the bid.

This fixed price amount is for payment purposes only and is separate from what the Department considers to be the Contractor's General Condition costs. If the Contractor deems it necessary to include additional costs to provide all of the requirements of this section, these additional costs shall be included in the Contractor's overall bid price.

All required schedule-related work, including, but not limited to computers, computer software, the planning and coordination with utilities, training, schedule preparation and schedule submittals will be paid for under the fixed price amount.

Twenty percent (20%) of this pay item will be paid upon the Engineer's acceptance of the Contractor's Baseline Schedule, prepared and submitted in accordance with Subsection 722.63.A.

The remaining eighty percent (80%) of this pay item will be paid in equal monthly installments distributed across the Contract Duration from Notice to Proceed (NTP) to Contractor Field Completion (CFC), less the 2 months required for the submittal and review of the Baseline Schedule in accordance with the following formula:

$$\text{Monthly Payment} = \frac{\text{Remaining Fixed Price amount (80\% of the Item Cost.)}}{\text{Contract Duration in whole months} - 2 \text{ months}}$$

The Schedule of Operations pay item will be adjusted to pay for only the actual quantity of schedules that have been submitted in accordance with this section.

Should there be a Time Extension granted to the Contractor, the Engineer may provide an Equitable Adjustment for additional Contract Progress Schedule Updates at intervals directed by the Engineer. The monthly payment will be the basis for this Equitable Adjustment.

Schedule of Operations (Type D)

For projects assigned with Type D schedule requirements, all scheduling work shall be considered incidental to the project with no separate payment under this section.

SECTION 722 (Continued)

722.81 Basis of Payment

The timely and accurate submission of the Baseline Schedule is critical to the Contract and the Department's ability to make informed decisions. Only payments under Item 740 - Engineer's Field Office and Item 748 – Mobilization will be made until the Baseline Schedule is accepted by the Engineer.

All required schedule-related work, including, but not limited to computers, computer software, the planning and coordination with utilities, training, schedule preparation and schedule submittals (including monthly progress schedules, short-term schedules, project spending reports, TEAs, recovery schedules or impacted schedules) shall be included in this work.

No payment for any other pay item will be processed beyond seventy-five (75) Calendar Days from Notice to Proceed (NTP) until the Baseline Schedule is accepted by the Engineer. Until the Engineer's acceptance of the Baseline Schedule, the combined total of all payments made to the Contractor will be limited to an amount no greater than the total price for Item 748 - Mobilization or 3% of the contract price, whichever is less.

All Contract Progress Schedule Updates submitted later than ten (10) Calendar Days after the CQE (Contract Quantity Estimate) completion date, or greater than forty (40) Calendar Days from the Data Date of the previous submission, will be deemed to be no longer useful and will not qualify for payment. The late submission of Impacted schedules, including TEAs, recovery schedules and proposal schedules will result in the forfeiture of the monthly payment for the month in which they were due and subsequent months until the submission is made. Late submission of missed submittals will not result in recovery of the previously forfeited portion of the Schedule of Operations Fixed Price Payment Item.

Failure to submit schedules as and when required may result in the forfeiture of that portion of the Schedule of Operations Fixed Price Payment and/or the withholding of the full or partial CQE payments by the Engineer.

Failure to submit schedules that are acceptable to the Engineer may result in the forfeiture of that portion of the Schedule of Operations Fixed Price Payment and/or the withholding of the full or partial CQE payments by the Engineer.

The Schedule of Operations pay item will be adjusted to pay for only the actual quantity of schedules that have been submitted in accordance with this section.

The Contractor's failure or refusal to comply with the requirements of this Section shall be reasonable evidence that the Contractor is not prosecuting the Work with due diligence and may result in the Engineer withholding of full or partial payments of all work performed.

722.82 Payment Items

722.1	SCHEDULE OF OPERATIONS (TYPE A) - FIXED PRICE $_____	LUMP SUM
722.2	SCHEDULE OF OPERATIONS (TYPE B) - FIXED PRICE $_____	LUMP SUM
722.3	SCHEDULE OF OPERATIONS (TYPE C) - FIXED PRICE $_____	LUMP SUM

ITEM 102.3 HERBICIDE TREATMENT OF INVASIVE PLANTS HOUR

This work must be performed by persons who meet the qualifications below and are approved by the Landscape Design Section.

Work under this item consists of herbicide treatment of invasive plants currently existing within the project limits and as directed. An Invasive Plant Management Strategy (IPMS) shall be submitted to the Engineer for review and approval and the IPMS shall be implemented on-site. The IPMS shall be written and submitted per Item 102.33 Invasive Plant Management Strategy and shall be measured and paid for under that Item.

Work under this item shall be coordinated with work and schedule for Selective Clearing, Clearing and Grubbing, Mowing, Tree Removal, Planting, and Wetland Mitigation items.

Payment is per hour on-site and shall be compensation for a minimum crew of 2 licensed applicators, 2 back-pack sprayers and mist-blowers, a properly equipped spray truck with spray hoses, and a tank with sufficient capacity for a full day of work. If there is only one applicator, hourly payment shall be adjusted to 50 percent of the unit price.

Date and time stamped photos indicating start and stop time of work must be submitted if requested.

This item is not intended for manual removal of plants.

Management of plants determined to have been introduced to the site via imported loam, compost, mulch, plants, equipment, or other construction activities will be the Contractor's responsibility and at the Contractor's expense.

Herbicide shall be applied during daytime hours only.

Measures to prevent the introduction of invasive plant species to the site and to address introduction due to construction-related activities shall be covered under the Standard Specifications, Division I - Subsections 7.01(D) Plant Pest Control and 7.13 Protection and Restoration of Property as amended in these Special Provisions.

Plant species targeted for management under this item shall be as determined in the field per the site walk and as specified in the IPMS.

The definition of invasive plant species shall be as described by Massachusetts Invasive Plant Advisory Group (MIPAG): "non-native species that have spread into native or minimally managed plant systems in Massachusetts, causing economic or environmental harm by developing self-sustaining populations and becoming dominant and/or disruptive to those systems."

ITEM 102.3 (Continued)

Control of invasive plants shall begin immediately with the initiation of construction activities and prior to any clearing or site disturbance. Treatment areas shall include stockpile locations and may, upon approval of the Engineer, extend outside the project limit. Treatment shall be done each consecutive year for the duration of the contract unless specified otherwise in the IMPS or unless directed otherwise by the MassDOT invasive species contact. Work shall be done during the growing season from May – October unless otherwise specified in the IPMS.

Areas identified for vegetation control measures shall be as shown on the plans and as determined in the field by the Engineer and a MassDOT Landscape Architect. Contact at MassDOT Landscape Design Section may be contacted at: Maxwell.R.McNulty@dot.state.ma.us.

QUALIFICATIONS

The applicators shall submit and meet the qualifications outlined below. A list of contractors specializing in invasive management and approved by MassDOT Landscape Design Section is available on the following website: https://www.mass.gov/lists/landscape-design-and-roadside-maintenance under Invasive Plant Management.

Requirements

1. Company must provide proof of qualifications by providing the following:
    a. Narrative describing company, its expertise and experience with invasive plant control.
    b. Demonstrate experience with herbicide treatment as part of restorations and in sensitive areas.
    c. Describe company's technical qualifications and past performance.

2. Company must meet licensing requirements:
    a. All crew applicators must have a Massachusetts Commercial Applicator License (CORE).
    b. At least one or more applicator must have a ROW certification, if required for work.
    c. Company must provide name(s) of applicator(s) and Applicator License/Certification number for all contractor crew leaders working on the project.
    d. Company must provide documentation of any warnings, penalties or fines received in the last three (3) years.

3. Company must provide proof of experience with invasive plant control and include following:
    a. At least five (5) references from prior invasive plant control work completed in last five (5) years. Provide contact information including address, phone number and email.
    b. Provide a summary of each of these projects including nature of the problem, specific invasive vegetation treated, dates and period of treatment, methodologies used, and summary of success or not in terms of meeting performance objectives. Include summary of equipment used.
    c. Photo documentation of these projects.
    d. GPS coordinates of project locations, if available.

ITEM 102.3 (Continued)

4. Crew leader must have expertise with invasive plant control and provide the following:
   a. Have held Core license for at least five (5) years.
   b. Resume listing five (5) or more years of experience applying pesticides with the company or with another company specializing in vegetation management.

SUBMITTALS

No work shall begin without approval of the submittals.

Submittals include the following items:

Invasive Plant Management Strategy (IPMS)

At least thirty (30) days prior to proposed treatment the IPMS shall be submitted for approval by the Engineer and MassDOT Landscape Architect. All chemicals, methods and work done under this item shall be consistent with the IPMS. The IPMS shall be as described under Item 102.33.

Herbicide Use Report

Within two (2) weeks after each application, the Contractor shall provide to the Engineer and the MassDOT Landscape Architect a completed and signed MassDOT Herbicide Use Report.

Photo Documentation

Digital photos with date and time of herbicide application work, showing start time and completion time, are required and must be submitted for measurement of payment upon request.

MATERIALS

All proposed herbicides shall be as approved in the IPMS. Herbicides shall be labeled for the method of treatment and shall meet all federal, state and local regulation requirements. Application rates will depend on herbicide proposed and shall be per the manufacturer's label for specific application.

METHODS

All methods used shall be as approved in the IPMS which shall be determined during the Initial Site Walk as described under Item 102.33 Invasive Plant Management Strategy.

The Contractor shall be responsible for marking delineated areas and plants to be preserved, removed, or otherwise treated. Fencing or other materials needed for marking and delineating protected areas shall be incidental to this item.

The Contractor shall notify the Engineer a minimum of 3 days prior to date of expected herbicide application. Applicators shall notify the Engineer upon arriving on-site and upon leaving the site.

ITEM 102.3 (Continued)

Herbicide Applications

All herbicide application shall conform to Massachusetts Pesticide Laws and Regulations per the Massachusetts Department of Agricultural Resources (MDAR) Pesticide Bureau.

Mixing, applying and/or disposing of herbicides shall always be in accordance with instructions on their labels and all applicable federal, state, and local regulations. Mixing shall not occur within sensitive areas, wetlands, or buffer zones.

Contractor shall not spray 2 hours prior to precipitation, during rain, or during windy conditions. The Contractor shall be responsible for monitoring weather conditions and adjusting the work schedule as appropriate for the herbicide and application method to be used.

Targeted vegetation shall be identified and marked prior to treatment. Plants treated by foliar spray, injection or glove application or other methods that leave standing vegetation, as opposed to cut-stump application, shall remain clearly marked for identification through the contract period.

Desirable vegetation shall be protected from both spray and other physical damage.

Contractor is responsible for any damage to vegetation not designated for removal or treatment. Vegetation damaged shall be restored. Cost of replacement plants and/or restoration shall be borne by the Contractor.

Contractor shall ensure that the public does not enter a work area while herbicide application or spraying is underway.

Disposal Of Invasive Plant Material

All material to be cleared shall become the property of the Contractor. The satisfactory disposal of all cleared plant material (seeds, roots, woody vegetation, associated soils, etc.) shall be the Contractor's responsibility.

The Contractor shall take measures to prevent viable plant material from leading to further infestations (seeds, roots, woody material, etc.) while stockpiled, in transit, or at final disposal locations. All precautions shall be taken to avoid contamination of natural landscapes with invasive plants or invasive plant material.

Chipping, shredding, or on-site burning of plant material must be approved by the Engineer and included in the IMPS.

For plant material taken to an incinerating facility per the IPMS, a receipt from that facility shall be submitted to the Engineer as proof of disposal.

ITEM 102.3 (Continued)

Where feasible, it is preferable to dispose of plants on-site or to bury them on-site with on-going monitoring for re-sprouting. Disposal locations and methods must be approved and included in the IPMS. Site work such as grading and seeding to stabilize and restore disposal area shall be incidental to this item.

The Contractor shall be responsible for treating or otherwise managing areas of re-growth due to improper disposal. Treatment shall be at the Contractor's expense.

Follow-Up Treatment

Plants and areas shall be re-treated as necessary and as appropriate to the time of year. Treatment shall be for the duration of the contract and per the IPMS.

MEASURE OF SUCCESS

The expectation is a minimum of 85-95 percent control achieved after the first treatment, depending on plants targeted and extent of population, and based on the expectations laid out in the IPMS. The expectation for the contract duration is 95-100% eradication by the end of the treatment period, unless otherwise specified in the IPMS.

METHOD OF MEASUREMENT

Item 102.3 will be measured for payment by the Hour of verified crew time spent on the project doing herbicide application as and where specified herein and in the IPMS. A crew shall be defined as a minimum of two licensed applicators each equipped with (at minimum) back-pack sprayer and mist blower. The crew shall also have a properly equipped spray truck with hoses and a tank with sufficient capacity for a full day of work.

BASIS OF PAYMENT

Item 102.3 will be paid at the contract unit price per Hour, which price shall include all labor, materials, equipment, tools, and all incidentals required to complete the work.

Payment will be based upon verified time spent on the project doing herbicide application as and where specified in the IPMS and upon receipt and approval of submittals. Payment will not include travel time to and from the Contractor's place of business and nor time for investigative field trips.

If there is only one applicator, hourly payment shall be adjusted to 50 percent of the unit price.

The Invasive Plant Management Strategy will be paid for under Item 102.33.

ITEM 102.33 INVASIVE PLANT MANAGEMENT STRATEGY HOUR

This item consists of providing an Invasive Plant Management Strategy (IPMS) for the control of invasive plants currently existing on the project site and/or as directed and shall be coordinated with Item 102.3 Herbicide Treatment of Invasive Plants. Unless otherwise approved, the IPMS shall be submitted in the form of the MassDOT Invasive Plant Management Strategy Report Form.

The IPMS shall be submitted for review and approval by the MassDOT Landscape Design Section or their representative, and the IPMS shall be implemented on-site.

The Invasive Plant Management Strategy Report Form is available online at https://www.mass.gov/lists/landscape-design-and-roadside-maintenance under Invasive Plant Management.

Herbicide treatment for invasive plants shall be as described under Item 102.3 Herbicide Treatment of Invasive Plants and shall be compensated per that Item.

Work under this item shall be coordinated with work and schedule for Selective Clearing, Clearing and Grubbing, Mowing, Tree Removal, Planting, and Wetland Mitigation as relevant to the project.

Individual attending the site walk and determining the Invasive Plant Management Strategy must demonstrate expertise with vegetation management and invasive plant control and submit qualifications as described below.

QUALIFICATIONS

Individual shall be from the same company as that providing services for Item 102.3 Herbicide Treatment of Invasive Plants and shall submit the following, if not submitted under Item 102.3:

- Submit copy of current Core license.
- Submit a resume listing five (5) or more years of experience managing invasive plants with a company specializing in vegetation management.
- References shall be submitted if requested.

SUBMITTALS

Task Summary & Reports

For measurement of payment, the contractor shall submit the total sum and a breakdown of hours for the tasks performed. At a minimum, the tasks shall include the Initial Site Walk, submittal of an approved IPMS, and if requested to accommodate project or site changes, a Follow-up Site Inspection and accompanying IPMS Amendment.

Interim Site Monitoring Reports and/or a Final Report shall be submitted if requested by the MassDOT Landscape Design contact. The MassDOT Landscape Design contact must be notified to attend the site inspection walk when an Interim or Final Report has been requested.

ITEM 102.33 (Continued)

Invasive Plant Management Strategy (IPMS)

At least thirty (30) days prior to construction activities and/or any proposed treatment, the contractor shall submit the IPMS for approval by the Engineer and MassDOT Landscape Architect. All chemicals and methods proposed shall be consistent with applicable Massachusetts Wetlands Protection Act Order of Conditions.

The IPMS shall be completed in coordination with the Prime Contractor and the Engineer and shall include the following as appropriate and applicable to the project and to the IPMS Report Form questions and Guidance:

I. Project Information
- a. Company writing the IPMS and performing the herbicide application.
- b. Date of site walk
- c. Attendees at site walk
- d. Expected end date of contract and expected last treatment (month/season)

II. Brief Description of Conditions
- a. Provide a free-hand sketch on construction plans or aerial image showing species, location, and as relevant, show or note extent of population as relevant to Strategy (i.e., population extends off ROW preventing eradication, small population and eradication deemed feasible within contract schedule, etc.).

III. Coordination with Roadway Contractor regarding other work
- a. Tree Work: Note coordination to be implemented with tree removal, clearing, and clearing and grubbing as applicable to the project.
- b. Wetland Mitigation - Include management proposed for wetland mitigation areas in the IPMS, if and as required.
- c. Planting: If there will be planting in areas proposed for treatment, propose treatment and schedule to avoid herbicide damage to plants.
- d. Mowing: If coordination is required with state mowers, note need in IPMS.

IV. Soil Management
- a. Provide specifics on how soil with invasive plant roots (in particular) or seeds will be handled (i.e., separate stockpiles, plant material will be buried on-site, re-used on-site, disposed off-site and if so, where?).
- b. Show stockpile locations on plan and include treatment schedule.
- c. Note measures that will be implemented to avoid spread through equipment, including how and where equipment will be cleaned.

V. Invasive Plant Treatment & Management
- a. Proposed chemical and methods of treatment for each species or area.
- b. Time of treatment based on target plant species.
- c. Submit product label including application methods and rates (entire MSDS information need not be submitted if available online).
- d. Proposed performance metrics or measure of treatment success if different from that specified under Item 102.3.
- e. Method for disposing invasive plant material. This includes material that may result in spread (i.e., seeds, roots) and material that has been treated and/or is not viable (foliage, dead wood, etc.). Methods may include grinding in place, stockpiling and treating, and incinerating offsite.

ITEM 102.33 (Continued)

f. Expected follow-up treatment for duration of contract.

VI. Monitoring Schedule if requested by MassDOT.

Note: The IPMS is critical for identifying pre-construction conditions as well as strategies for minimizing import or spread of invasive plants. Failure to provide an approved IPMS may jeopardize this item, in which case, the contractor will be responsible for management of invasive plants found on-site at no cost to the contract.

Photo Documentation

Digital photos of site conditions, typical species, and extent of infestation must be provided with the IPMS and with any follow-up monitoring or reporting. Photos of follow-up monitoring and reporting must be date and time stamped for acceptance.

METHODS

Initial Site Walk

Prior to any construction activities and soil disturbance, the Contractor shall walk the site with the Engineer and the MassDOT Landscape Architect to determine the IPMS. During the site walk the Contractor shall identify limits of work and, as necessary, mark locations of areas designated for treatment and individual plants targeted for treatment or removal. The Contractor shall be responsible for marking delineated areas and plants to be preserved, removed, or otherwise treated. Fencing or other materials needed for marking and delineating protected areas shall be incidental to this item.

IPMS Follow-up Amendment

The IPMS may be amended to address additional concerns or adjust to conditions if required by the MassDOT Landscape Architect. The amended IPMS shall be submitted to the Engineer and MassDOT Landscape Architect for approval at least fourteen (14) days prior to any proposed treatment.

Interim Site Monitoring Inspection Reports

If required by the MassDOT Landscape Architect and Engineer, Interim Site Monitoring and an accompanying report shall be conducted. Interim Reports must include time and date stamped photos showing treated locations and species.

Final Inspection

A final inspection and report documenting the status of the invasive control may be required for regulatory purposes or for instances where control will be continued by others. The report shall include photo documentation of pre-construction (existing) and post-treatment conditions, notations on a plan or aerial image of area treated, summary of treatment performed, and control achieved. Final reports submittal must include time and date stamped photos.

ITEM 102.33 (Continued)

METHOD OF MEASUREMENT

Item 102.33 will be measured for payment by the Hour. The basis for measurement shall be per the completion of tasks as approved under the Task Summary submittal and acceptance of submittals and photos described above.

BASIS OF PAYMENT

Item 102.33 will be paid at the contract unit price per Hour, which price shall include all labor, materials, equipment, tools, and all incidentals required to complete the work. Payment shall not include travel time to and from the Contractor's place of business.

ITEM 102.511 TREE PROTECTION -ARMORING AND PRUNING EACH

The work under this item shall conform to the relevant provisions of Subsection 771 of the Standard Specifications and the following:

Tree protection – armoring and pruning shall be used for instances where construction activity (the use of heavy equipment), comes within proximity to potentially damage tree trunk(s) or limbs.

The work shall include the furnishing and installing of temporary tree trunk protection, minor limb pruning, or removal of lower tree limbs to prevent injury to the tree from construction equipment and activities; as shown on the Drawings; and/or as required by the Engineer.

REFERENCES

If requested, the Contractor shall provide to the Engineer one copy of the latest edition of the American National Standards Institute (ANSI) A300 Standard Practices for Tree, Shrub, and Other Woody Plant Maintenance: Part 1-Pruning and Part 5-Construction Management Standard. Provision of reference shall be incidental to this item.

MATERIALS

Trunk armoring shall be such that it prevents damage to the trunk from construction equipment. Material used for trunk armoring or mounting shall be such that installation and removal shall not damage the trunk.

Acceptable trunk armoring materials shall include two by four (2x4) wood cladding, mounted with wire or metal strapping, or when duration of construction activities is less than three months, slotted corrugated plastic pipe, mounted with duct tape. Eight (8) once untreated burlap shall be used to wrap the tree trunk prior to installation of cladding.

Alternative armoring methods or materials may be acceptable if approved by the Engineer.

The height of tree trunk cladding shall be measured from the base of the tree (including root flare) to the bottom of the first branch, or to a height of eight (8) feet, or as may be required by the Engineer.

METHODS OF WORK

Prior to construction activities, the Engineer, Contractor, and the Arborist (if item is included in the contract), shall review trees noted on the Drawings to be protected. Final decision and selection of trees to be armored and/or pruned shall be per the Engineer.

Care shall be taken to avoid damage to the bark during installation and removal of armoring. Trunk armoring shall be maintained such that it is effective for as long as required or replaced when materials are found to be damaged or ineffective, as determined by the Engineer. Replacement, if required, shall be incidental to the work. Armoring shall be removed immediately upon completion of work activities adjacent to the protected tree(s).

ITEM 102.511 (Continued)

Pruning of limbs shall conform to the techniques and standards of the most recent ANSI A300 standards.

DAMAGES OR LOSS

If trees designated for protection under this item are damaged, including root damage from unapproved trespassing onto the root zone, the Contractor shall, at his own expense, secure the services of an Arborist, described in Item 102.55. The Arborist shall be approved by MassDOT.

If, based on the recommendation of the Arborist, the Engineer determines that damages can be remedied by corrective measures, such as repairing trunk or limb injury; soil compaction remediation; pruning; soil injection fertilization; and/or watering; the damage shall be repaired as soon as possible, within the appropriate season for such work and according to industry standards.

If, based on the recommendation of the Arborist, the Engineer determines that damages are irreparable, or that the damages are such that the tree is sufficiently compromised to pose a future safety hazard, the tree shall be removed. Tree removal shall include cleanup of all wood, grinding of the stump to a depth sufficient to plant a replacement tree or plant, removal of all chips from the stump site, and filling the resulting hole with topsoil. Such tree removal(s), grinding, debris removal, and topsoil filling, shall be at the Contractor's expense.

Tree removal from improper or inadequate tree protection shall result in the Engineer assessing the Contractor monetary damages consistent with industry standards for assessed value and/or replacement.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 102.511 will be measured and paid at the contract unit price per EACH tree to be armored and pruned. This will include full compensation for all labor, equipment, materials, and incidentals for the satisfactory completion of the work and the subsequent removal and satisfactory disposal of the protective materials upon completion of the contract or as required by the Engineer.

Payment for work under this item will be scheduled as follows:

- 40% of the value shall be paid upon installation of trunk armoring and completion of pruning work, if required.
- 60% of the value shall be paid at the end of construction operations that would potentially damage the tree and after protection materials have been removed and properly disposed of by the Contractor. In the event of repairable damages, payment shall be made after the completion of remediation measures.

No separate payment will be made for costs of remedial actions, including Arborist services, tree removal, but all costs in connection therewith shall be included in the Contract unit price bid.

Tree damages assessed, due to lack of or improper tree and plant protective measures being taken, shall be deducted from the contract price of the work.

ITEM 102.521 TREE AND PLANT PROTECTION FENCE FOOT

The work under this Item shall conform to the relevant provisions of Subsections 644 and 771 of the Standard Specifications and the following:

Work under this item shall consist of furnishing, installing, and maintaining tree and plant protection fence(s) in a vertical and taut position; removing and resetting fencing as may be required; and final removal of protection fence(s) at the completion of construction activities, or as otherwise required by the Engineer.

The purpose of the fencing is to signify a construction work-free zone and physical barrier, thereby preventing damage to tree roots, tree trunks, soil, and all other vegetation within this delineated Tree and Plant Protection Zone (TPPZ), as shown on the Drawings, as required by the Engineer, and as described herein.

Protection shall be for the duration of the construction activities unless otherwise required by the Engineer.

MATERIALS

Tree and plant protection fence(s) shall provide a minimum forty-eight (48) inch tall barrier, that remains vertical and taut. The Fence shall be orange plastic safety fence (recommended where high visibility is necessary), or wooden snow fencing, or other approved material. Posts and anchoring materials shall be incidental to the work.

Per requirements of the Engineer, additional posts, deeper post depths, and/or additional attachments shall be used if the fabric or fence sags, leans or otherwise is not providing visible or physical protection to the TPPZ.

REFERENCES

If requested, the Contractor shall provide to the Engineer one copy of the American National Standards Institute (ANSI) A300 Standard Practices for Tree, Shrub, and Other Woody Plant Maintenance Part 1, Pruning and Part 5, Construction Management Standard. Provision of reference shall be incidental to this item.

ESTABLISHMENT OF THE TPPZ

Fencing shall be used to delineate and establish the TPPZ, adjacent to construction areas, staging areas, stockpile areas, as shown on the Drawings, and/or as required by the Engineer.

Fencing shall be located as close to the work zone limit and as far from tree trunk(s) and plants as possible to maximize the area to be protected. Fence shall run parallel and adjacent to construction activity to create a barrier between the work zone and the root zone or designated limit of plants and soils to be protected.

ITEM 102.521 (Continued)

When construction activities surround (or have the potential to surround) trees or plants to be protected, a circular enclosure shall be used. In these instances, the TPPZ limit shall be the drip line of each tree or as close as possible to the drip line, and/or as shown on the Drawings. The drip line is defined as the outermost limit of tree canopy.

The Contractor shall not engage in any construction activity within the TPPZ without the approval of the Engineer. Activities may including operating, moving, or storing equipment, supplies, or materials; and locating temporary facilities, including trailers or portable toilets, Accessing or traversing the TPPZ shall not be permitted.

METHOD OF WORK

TPPZ fencing shall be installed prior to any construction work or staging activities. Fence(s) shall be repositioned where and as necessary for optimum tree and plant protection. Repositioning shall be incidental to this item. TPPZ fencing shall not be moved without prior approval by the Engineer.

The TPPZ shall be protected at all times from compaction of the soil; damage of any kind to trunks, bark, branches, leaves, and roots of all plants; and contamination of the soil with construction materials, debris, silt, fuels, oils, and any chemicals substance.

After construction activities are completed, or when required by the Engineer, fencing, stakes, and other anchoring materials, if any, shall be removed and disposed off-site by the Contractor.

REQUIRED WORK WITHIN THE TPPZ

In the event that grading, trenching, utility work, or storage is unavoidable within the TPPZ, the Engineer shall be notified. Measures may be required for tree protection and preservations, including air spading; the use of six (6) inch depth of wood chips or approved matting for root protection; pruning of branches; and/or trunk protection. These protection measures shall be paid under applicable contract items.

Landscaping work specified within the TPPZ shall be accomplished by hand tools. Where handwork is not feasible, with permission of the Engineer, work shall be conducted with the smallest mechanized equipment necessary.

TREE AND PLANT INJURY OR LOSS

If the TPPZ is encroached by construction activity without approval, at the discretion of the Engineer, the Contractor may be required to provide a more durable barrier (e.g., Jersey Barriers, chain link fence (if not already in use) to secure the area. Costs of furnishing and installing additional or more durable barrier(s) shall be borne by the Contractor.

In such cases of encroachment, soils shall be considered compacted and tree root injury will be assumed. Action shall be taken as specified below.

ITEM 102.521 (Continued)

In the event that trees designated for protection under this item are injured, including root injury from unapproved trespassing onto the root zone, the Contractor shall, at his own expense, secure the services of an Arborist, described under Item 102.55. The Arborist shall be approved by MassDOT.

In the event of spills, compaction or injury, the Contractor shall take corrective action immediately using methods approved by the Engineer, in coordination with the Arborist.

If, based on the recommendations of the Arborist, the Engineer determines that injuries can be remedied by corrective measures, such as repairing trunk or limb injury, soil compaction remediation, pruning, and/or watering; the injury shall be repaired as soon as possible, within the appropriate season for such work, and according to industry standards.

If, based on the recommendations of the Arborist, the Engineer determines that injuries are irreparable, or that the injuries are such that the tree is sufficiently compromised to pose a future safety hazard, the tree shall be removed. Tree removal shall include cleanup of all wood, grinding of the stump to a depth sufficient to plant a replacement tree or plant, removal of all chips from the stump site, and filling the resulting hole with topsoil. Such tree removal(s), grinding, debris removal, and filling, shall be at the Contractor's expense.

Tree removal from improper or inadequate protection of the TPPZ shall result in the Engineer assessing the Contractor monetary damages consistent with industry standards for assessed value and/or replacement.

Shrubs removals from improper or inadequate protection of the TPPZ shall be replaced with plants of similar species and equal size or the largest size plants reasonably available. The Engineer shall approve the size, quality, and quantity of the replacement plant(s). Each replacement shall include a minimum of one year of watering and establishment care, specified under Subsection 771.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Tree and Plant Protection Fence will be measured by the FOOT, complete in place, by the length along the top of the fence.

Tree and plant protection fence will be paid for under the contract unit price per FOOT, complete in place and shall include all materials, labor, and equipment required to furnish, install, anchor, maintain, and remove the fence upon completion, as described herein. Posts, temporary footings, anchoring and removal upon completion, shall be incidental to this item.

No separate payment will be made for costs of remedial actions, including addition of more durable barriers, Arborist services, tree or plant removal, shrub replacement and establishment, but all costs in connection therewith shall be included in the Contract unit price bid.

Tree damages assessed, due to lack of or improper tree and plant protective measures being taken, shall be deducted from the contract price of the work.

ITEM 102.521 (Continued)

Payment for work under this item will be scheduled as follows:

- Forty (40) percent of the value payment will be made upon installation of fencing.

- Sixty (60) percent of the value payment will be made when fencing materials have been maintained to function as specified, for the intended duration, and removed and disposed off-site at the completion of protection measure requirement.

ITEM 152.71 PEASTONE DIAPHRAGM LUMP SUM

The work under this Item shall conform to the relevant provisions of Subsections 150, 200, M2, and M9 of the Standard Specifications and the following.

The work under this Item includes furnishing and installation of a 2-foot wide by 6-inch deep peastone (M2.01.6) diaphragm adjacent to the proposed infiltration trench. The Contractor shall place peastone approved by the Engineer at the location shown on the plans.

MATERIALS

Peastone shall meet the following gradation requirements.

Sieve Size	Percent Passing by Weight
½ inch	100
3/8 inch	85-100
No. 4	20-50
No. 8	0-15
No. 16	0-5

Non-Woven Geotextile filter fabric shall meet MassDOT M 9.50.0 and Application Code 1 for subsurface drainage shall be installed along all sides of the peastone diaphragm.

BASIS OF PAYMENT

Item 152.71 will be paid for at the Contract Lump Sum price, which price shall include, furnishing, installation, excavation, peastone, filter fabric, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 180.01 ENVIRONMENTAL HEALTH AND SAFETY PROGRAM LUMP SUM

The work shall consist of ensuring the health and safety of the Contractor's employees and subcontracting personnel, the Engineer, their representatives, the environment, and public welfare from any on-site chemical contamination present in air, soil, water and sediment.

The Contractor shall prepare and implement a site-specific Environmental Health and Safety Plan (EHASP) which has been approved and stamped by a Certified Industrial Hygienist (CIH) and includes the preparer's name and work experience. The EHASP shall include appropriate components required by OSHA Standard 29 CFR 1910.120(b) and the Massachusetts Contingency plan (MCP) 310 CMR 40.0018 and must comply with all applicable state and federal laws, regulations, standards and guidelines, and provide a degree of protection and training appropriate for implementation on the project. The EHASP shall be a dynamic document with provision for change to reflect new information, new practices or procedures, changing site environmental conditions or other situations which may affect site workers and the public. The EHASP shall be developed and implemented independently from the standard construction HASP required to work on all MassDOT construction projects.

Health and safety procedures provided by the Contractor shall comply with all the appropriate regulations that address employee working conditions, including but not limited to standards established by OSHA and National Institute for Occupational Safety and Health (NIOSH). Equipment used for the purpose of health and safety shall be approved by and meet pertinent standards and specifications of the appropriate regulatory agencies.

A copy of the most up-to-date version of the EHASP shall be maintained on-site at all times by the Contractor. The on-site copy shall contain the signature of the Engineer and each on-site employee of the MassDOT, Contractor, and Subcontractors involved with on-site activities. The employee's signature on the EHASP shall be deemed prima facie evidence that the employee has read and understands the plan. Updated copies of signature sheets shall be submitted to the Engineer.

The EHASP shall specify a Contractor Site Safety and Health Officer responsible for implementation of the EHASP and to oversee all construction activities, including handling, storage, sampling and transport, which require contact with or exposure to potentially hazardous materials.

The level of protection, required to ensure the health and safety of on-site personnel will be stipulated in the EHASP. The Site Safety and Health Officer shall implement the EHASP based on changing site and weather conditions, type of operation or activity, chemical compounds identified on-site, concentration of the chemicals, air monitoring data, physical state of the hazardous materials, potential duration of exposure to hazardous materials, dexterity required to perform work, decontamination procedures, necessary personnel and type of equipment to be utilized.

ITEM 180.01 (Continued)

During implementation of the EHASP, a daily log shall be kept by the Site Safety and Health Officer and a copy shall be provided weekly to the Engineer. This log shall be used to record a description of the weather conditions, levels of personal protection being employed, screening data and any other information relevant to on-site environmental safety conditions. The Site Safety and Health Officer shall sign and date the daily log.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Preparation and implementation of the Environmental Health and Safety Program, including the monitoring, protection and storage of all contaminated materials, as well as subsequent modifications to the EHASP, will be measured and paid for at the Lump Sum Bid Price.

Payment of 50% of the Environmental Health and Safety Program contract price will be made upon the initial acceptance of the EHASP by the Engineer. Payment of the remaining 50% of the Environmental Health and Safety Program contract price will be made upon completion of the work. The bid price shall include preparation and implementation of the EHASP as well as the cost for its enforcement by the Site Safety and Health Officer along with any necessary revisions and updates. The work of implementing the Environmental Health and Safety Program includes work involving, but not limited to, the monitoring, protection, and storage of all contaminated materials.

ITEM 180.02 PERSONAL PROTECTION LEVEL C UPGRADE HOUR

The work shall consist of providing appropriate personal protective equipment (PPE) for all personnel in an area either containing or suspected of containing a hazardous environment.

Contingencies for upgrading the level of protection for on-site workers will be identified in the EHASP and the Contractor shall have the capability to implement the personal protection upgrade in a timely manner. The protective equipment and its use shall be in compliance with the EHASP and all appropriate regulations and/or standards for employee working conditions.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Personal Protection Level C Upgrade will be measured and paid only upon upgrade to Level C and will be at the contract unit price, per hour, per worker, required in Level C personal protection. No payment will be made to the Contractor to provide Level D PPE.

ITEM 180.03 LICENSED SITE PROFESSIONAL SERVICES HOUR

Within limited areas of the project site, media (i.e. soils, sediments, surface water and/or groundwater) requiring evaluation and/or management under the Massachusetts Contingency Plan (MCP) may be encountered. A Licensed Site Professional (LSP) shall be required to provide the services necessary to comply with the requirements of the MCP. These services may include a site walk, field screening, sampling, analysis and characterization of potentially contaminated media, preparation and implementation of Immediate Response Action (IRA) Plans, Utility-Related Abatement Measure (URAM) and Release Abatement Measure (RAM) Plans, Imminent Hazard Evaluations, status reports, transmittal forms, release notification forms, risk assessments, completion statements, and related documents required pursuant to the MCP. LSP services shall also be necessary to temporarily move material generated on the project to an off-site storage location.

The name and qualifications of the LSP and all environmental technicians to be assigned to the project shall be submitted to the Engineer for approval at least four weeks prior to initial site activities. The LSP shall have a current, valid license issued by the Massachusetts Board of Registration of Hazardous Waste Site Cleanup Professionals. The LSP shall have significant experience in the oversight of MCP activities at active construction sites. Qualification packages for the LSP and each technician shall include a resume, all recent work assignments with responsibilities identified (previous 5 years), and applicable training and certifications. A list of all Notices of Noncompliance, Notice of Audit Findings and Enforcement Orders issued by the Massachusetts Department of Environmental Protection (DEP) shall be submitted for all work assignments listed for the LSP and environmental technicians. Upon approval of the LSP Qualifications, the LSP will be designated as the LSP of Record unless MassDOT designates in writing otherwise. The LSP of Record will serve as the primary point of contact for all hazardous material matters on the project.

The LSP shall evaluate soil and/or sediment with discoloration, odor, elevated field screening results, presence of petroleum liquid or sheen on the groundwater surface, or any abnormal gas or materials in the ground which are known or suspected to be oil or hazardous materials. Excavated soil and sediment which is suspected of petroleum contamination shall be field screened using the jar headspace procedures according to established DEP Guidance. All field screening equipment must be pre-approved by the Engineer. The LSP shall ensure proper on-site calibration of all field screening instrumentation.

The Engineer shall be contacted immediately when observations or any field screening results verify contamination requiring further analysis, and/or enhanced management of suspect media. Any enhanced management of contaminated soil to ensure proper stockpiling and storage is incidental to the LSP Services item. The LSP shall evaluate the need for confirmatory sampling prior to backfill in areas where contaminated material has been excavated and disposed off-site for compliance with applicable regulatory requirements. The Engineer shall approve the locations of the testing sites prior to the sampling.

ITEM 180.03 (Continued)

Contaminated media shall be handled in accordance with all applicable state and federal statutes, regulations, and policies. The LSP shall adequately evaluate contaminated media for compliance with the requirements of the MCP and Department Policies.

The Contractor and the LSP shall be aware of the reporting requirements for releases of oil and/or other hazardous material (OHM) as set forth in federal and state laws and regulations and both shall be held responsible for performing the work in accordance with all applicable Federal and State laws and regulations. The LSP shall maintain written records in a clear and concise tabular format which tracks the excavation, stockpiling, analysis and reuse/disposal of all known/suspect contaminated media. These records shall be up-to-date and submitted to the Engineer on a bi-weekly basis. The LSP shall review and summarize the laboratory data from any analyses performed on contaminated media in a tabular format and compare the results to applicable reporting thresholds. A report shall be delivered to the Engineer outlining the material sampling methods, laboratory analysis results, evaluation of applicable regulatory exemptions, reporting obligations, and proposed course of action. The laboratory report together with Chain of Custody forms for all analytical results shall be submitted to the Engineer within 14 days after completion of such analyses.

The LSP and Contractor shall be held responsible for the submission of all MCP-related documents to the Engineer at least 14 days in advance of any timeframe specified in the MCP and for the timely submission of data and tracking information as noted within this Item. All documents prepared under this Item must be reviewed and signed by the approved LSP. The Contractor and LSP shall be responsible for all fines, damages, and enforcement requirements imposed by applicable regulatory agencies for failure to meet regulatory and contract timeframes. No compensation will be provided for such fines, damages, and enforcement actions.

The Contractor and the LSP shall be aware of the reporting requirements for releases of oil and/or other hazardous material (OHM) as set forth in federal and state laws and regulations and shall both be held responsible for performing the work in accordance with all applicable Federal and State laws and regulations.

If the Contractor causes a release of OHM, the Contractor shall be responsible for assessing and remediating the release in accordance with all pertinent State and Federal regulations, including securing the services of a LSP, at his own expense.

The LSP shall coordinate all activities involving both MassDOT and the DEP through the Engineer. Any notification of release shall be approved by the Engineer before submittal to the DEP, except if an imminent hazard condition exists as defined in 309 CMR 4.03(4)(b).

ITEM 180.03 (Continued)

LABORATORY TESTING IN SUPPORT OF LSP SERVICES

Laboratory testing provides for analytical testing in support of LSP services related to maintaining MCP compliance, such as delineating the extent and type of contamination present. Sampling and testing for disposal purposes are not included and are incidental to Items 181.11-181.14.

In order to maintain compliance with the MCP and Department Policies or other regulatory requirements, the LSP shall request approval from the Engineer to obtain samples from various locations and depths within the project area and to perform laboratory analyses on those samples. No sampling shall be conducted without prior approval from the Engineer. The samples shall be delivered to a DEP-certified laboratory using proper chain-of-custody documentation for analyses which, depending upon site conditions and suspected and/or identified contaminants of concern, may include, but are not limited to, metals, polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, polycyclic aromatic hydrocarbons (PAHs), extractable petroleum hydrocarbons (EPHs) and volatile petroleum hydrocarbons (VPHs). Subsequent testing, depending upon initial results, may be required for Toxicity Characteristic Leaching Procedure (TCLP) analyses (EPA Method 1311) for metals.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

LSP Services for work under this item will be measured per person, per hour of service provided by LSP, Environmental Technicians and other approved personnel. Travel time shall not be included in the billable hours.

The quantity and type of laboratory tests must be approved by the Engineer beforehand. The Contractor will be reimbursed upon satisfactory written evidence of payment. The Contractor may be required to obtain cost estimates from three DEP certified laboratories for the Engineer to choose the service provider.

LSP Services will be paid at the Contractor bid price for each hour, or fraction thereof, spent to perform the work as described above. The bid price shall be a blended rate that includes the cost of the LSP, environmental technicians and other personnel, the performance of all work tasks and field screening, including required equipment, materials and instrumentation, and production of all documentation described above. All requests for payment must be accompanied by the following information: the names of the personnel associated with the work charged under LSP Services, dates and hours worked, work conducted, including, where appropriate, locations as identified on the construction plans, and a copy of the field diary for the dates submitted.

ITEM 180.03 (Continued)

Laboratory testing will be reimbursed upon receipt of paid invoices for testing approved by the Engineer.

This item is for LSP work for compliance with the MCP and Department Policies. LSP hours and any laboratory testing related to off-site disposal of excess soil and sediment is incidental to Items 181.11-181.14 (including, but not limited to, disposal characterization, disposal package preparation, landfill acceptance, shipment paperwork preparation, field screening, and tracking). LSP hours for groundwater management (including characterization, obtaining off-site discharge permits, compliance testing, etc.) is incidental to Item 183.1.

ITEM 181.11	**DISPOSAL OF UNREGULATED SOIL**	**TON**
ITEM 181.12	**DISPOSAL OF REGULATED SOIL - IN-STATE FACILITY**	**TON**
ITEM 181.13	**DISPOSAL OF REGULATED SOIL - OUT-OF-STATE FACILITY**	**TON**
ITEM 181.14	**DISPOSAL OF HAZARDOUS WASTE**	**TON**

The work under these Items shall include the transportation and disposal of contaminated material excavated, or excavated and stockpiled. It shall also include the cost of any additional laboratory analyses required by a particular disposal facility beyond the standard disposal test set.

Excavation of existing subsurface materials may include the excavation of contaminated soils. The Contractor shall be responsible for the proper coordination of characterization, transport and disposal, recycling or reuse of contaminated soils. Disposal, recycling or reuse will be referred to as "disposal" for the purposes of this specification. However, regardless of the use of the term herein, there will be no compensation under these items for reuse within the project limits. The Contractor will be responsible for coordinating the activities necessary for characterization, transport and disposal of contaminated soils. Such coordination will include the Engineer and his/her designee overseeing management of contaminated materials. Contaminated soils must be disposed of in a manner appropriate for the soil classification as described below and in accordance with the applicable laws of local, state and federal authorities. The Contractor shall be responsible for identifying disposal facility (ies) licensed to accept the class of contaminated soils to be managed and assure that the facility can accept the anticipated volume of soil contemplated by the project. The Contractor shall be responsible for hiring a Licensed Site Professional (LSP) and all ancillary professional services including laboratories as needed for this work. The Contractor will be responsible for obtaining all permits, approvals, manifests, waste profiles, Bills of Lading, etc. subject to the approval of the Engineer prior to the removal of the contaminated soil from the site. The Contractor and LSP shall prepare and submit to the Engineer for approval all documents required under the Massachusetts Contingency Plan (MCP) and related laws and environmental regulations to conduct characterization, transport, and disposal of contaminated materials.

CLASSES OF CONTAMINATED SOILS

The Contractor and its LSP shall determine if soil excavated or soil to be excavated is unregulated soil or contaminated soil as defined in this section. Such materials shall be given a designation for purposes of reuse or disposal based on the criteria of the MCP. Soils and sediments which are not suitable for reuse will be given a designation for purposes of off-site disposal based on the characterization data and disposal facility license requirements. The Classes of Contaminated Soils are defined as follows:

ITEMS 181.11 through 181.14 (Continued)

UNREGULATED SOIL consists of soil, fill and dredged material with measured levels of oil and hazardous material (OHM) contamination at concentrations below the applicable Reportable Concentrations (RCs) presented in the MCP. Unregulated soil consists of material which may be reused (or otherwise disposed) as fill within the Commonwealth of Massachusetts subject to the non-degradation criteria of the MCP (310 CMR 40.0032(3), in a restricted manner, such that they are sent to a location with equal or higher concentrations of similar contaminants. Disposal areas include licensed disposal facilities, approved industrial settings in areas which will be capped or covered with pavement or loamed and seeded, and for purposes of this project should be reused as fill within the project site construction corridor whenever possible. The material cannot be placed in residential and/or environmentally sensitive (e.g. wetlands) areas. Under no circumstances shall contaminated soils be placed in an uncontaminated or less contaminated area (including the area above the groundwater table if this area shows no sign of contamination).

The Contractor shall submit to MassDOT the proposed disposal location for unregulated soils for approval. If such a disposal location is not a licensed disposal facility, the Contractor shall submit to the Engineer analytical data to characterize the disposal area sufficiently to verify that the unregulated material generated within the MassDOT construction project limits is equal to or less than the contaminant levels at the disposal site and meets the non-degradation requirements of the MCP. In addition, the Contractor shall provide written confirmation from the owner of the proposed disposal location that they have been provided with the analytical data for both the materials to be disposed as well as the disposal site characterization and that s/he agrees to accept this material. A Material Shipping Record or Bill of Lading, as appropriate, shall be used to track the off-site disposal of unregulated soil and a copy, signed by the disposal facility or property owner, shall be provided to the Engineer in order to document legal disposal of the unregulated material.

The cost of on-site disposal of unregulated soil within the project area will be considered incidental to the item of work to which it pertains.

ITEMS 181.11 through 181.14 (Continued)

REGULATED SOIL consists of materials containing measurable levels of OHM that are equal to or exceed the applicable Reportable Concentrations for the site as defined by the MCP, 310 CMR 40.0000. Regulated soil which meets the MCP reuse criteria of the applicable soil/groundwater category for this project area may be reused on site provided that it meets the appropriate geotechnical criteria established by the Engineer. Regulated Soil may be reused (as daily or intermediate cover or pre-cap contouring material) or disposed (as buried waste) at lined landfills within the Commonwealth of Massachusetts or at an unlined landfill that is approved by the Massachusetts Department of Environmental Protection (DEP) for accepting such material, in accordance with DEP Policy #COMM-97-001, or at a similar out-of-state facility. It should be noted that soils which exceed the levels and criteria for disposal at in-state landfills, as outlined in COMM-97-001, may be shipped to an in-state landfill, but require approval from the DEP Division of Solid Waste Management and receiving facility. An additional management alternative for this material is recycling into asphalt. Regulated Soils may also be recycled at a DEP approved recycling facility possessing a Class A recycling permit subject to acceptance by the facility and compliance with DEP Policy #BWSC-94-400. Regulated Soil removed from the site for disposal or treatment must be removed via an LSP approved Bill of Lading, Manifest or applicable material tracking form. This type of facility shall be approved/permitted by the State in which it operates to accept the class of contaminated soil in accordance with all applicable local, state and federal regulations.

HAZARDOUS WASTE consists of materials which must be disposed of at a facility permitted and operated in full compliance with Federal Regulation 40 CFR 260-265, Massachusetts Regulation 310 CMR 30.000, Toxic Substances Control Act (TSCA) regulations, or the equivalent regulations of other states, and all other applicable local, state, and federal regulations. All excavated materials classified as hazardous waste shall be disposed of at an out-of-state permitted facility. This facility shall be a RCRA hazardous waste or TSCA facility, or RCRA hazardous waste incinerator. This type of facility shall be approved/permitted by the State in which it operates to accept hazardous waste in accordance with all applicable local, state and federal regulations and shall be permitted to accept all contamination which may be present in the soil excavate. The Contractor shall ensure that, when needed, the facility can accept TSCA waste materials i.e. polychlorinated biphenyls (PCBs). Hazardous waste must be removed from the site for disposal or treatment via an LSP approved Manifest.

MONITORING/SAMPLING/TESTING REQUIREMENTS

The Contractor shall be responsible for monitoring, sampling and testing during and following excavation of contaminated soils to determine the specific class of contaminated material. Monitoring, sampling and testing frequency and techniques should be performed in accordance with Item 180.03 – LSP Services. Additional sampling and analysis may be necessary to meet the requirements of the disposal facility license. The cost of such additional sampling and analysis shall be included in the bid cost for the applicable disposal items. The Contractor shall obtain sufficient information to demonstrate that the contaminated soil meets the disposal criteria set by the receiving facility that will accept the material.

ITEMS 181.11 through 181.14 (Continued)

No excavated material will be permanently placed on-site or removed for off-site disposal until the results of chemical analyses have been received and the materials have been properly classified. The Contractor shall submit to the Engineer results of field and laboratory chemical analyses tests within seven days after their completion, accompanied by the classification of the material determined by the Contractor, and the intended disposition of the material. The Contractor shall submit to the Engineer for review all plans and documents relevant to LSP services, including but not limited to, all documents that must be submitted to the DEP.

WASTE TRACKING:

Copies of the fully executed Weight Slips/Bills of Lading/ Manifests/Material Shipping Records or other material tracking form received by the Contractor from each disposal facility and for each load disposed of at that facility, shall be submitted to Engineer and the Contractor's LSP within three days of receipt by the Contractor. The Contractor is responsible for preparing and submitting such documents for review and signature by the LSP or other appropriate person with signatory authority, three days in advance of transporting soil off-site. The Contractor shall furnish a form attached to each manifest or other material tracking form for all material removed off-site, certifying that the material was delivered to the site approved for the class of material. If the proposed disposition of the material is for reuse within the project construction corridor, the Contractor shall cooperate with MassDOT to obtain a suitable representative sample(s) of the material to establish its structural characteristics in order to meet the applicable structural requirements as fill for the project.

All material transported off-site shall be loaded by the Contractor into properly licensed and permitted vehicles and transported directly to the selected disposal or recycling facility and be accompanied by the applicable shipping paper. At a minimum, truck bodies must be structurally sound with sealed tail gates, and trucks shall be lined and loads covered with a liner, which shall be placed to form a continuous waterproof tarpaulin to protect the load from wind and rain.

DECONTAMINATION OF EQUIPMENT

Tools and equipment which are to be taken from and reused off site shall be decontaminated in accordance with applicable local, state and federal regulations. This requirement shall include, but not be limited to, all tools, heavy machinery and excavating and hauling equipment used during excavation, stockpiling and handling of contaminated material. Decontamination of equipment is considered incidental to the applicable excavation item.

ITEMS 181.11 through 181.14 (Continued)

REGULATORY REQUIREMENTS

The Contractor shall be responsible for adhering to regulations, specifications and recognized standard practices related to contaminated material handling during excavation and disposal activities. MassDOT shall not be responsible at any time for the Contractor's violation of pertinent State or Federal regulations or endangerment of laborers and others. The Contractor shall comply with all rules, regulations, laws, permits and ordinances of all authorities having jurisdiction including, but not limited to, Massachusetts DEP, the U.S. Environmental Protection Agency (EPA), Federal Department of Transportation (DOT), Massachusetts Water Resources Authority (MWRA), the Commonwealth of Massachusetts and other applicable local, state and federal agencies governing the disposal of contaminated soils.

All labor, materials, equipment and services necessary to make the work comply with such regulations shall be provided by the Contractor without additional cost to MassDOT. Whenever there is a conflict or overlap within the regulations, the most stringent provisions shall apply. The Contractor shall reimburse MassDOT for all costs it incurs, including damages and/or fines, as a result of the Contractor's failure to adhere to the regulations, specifications, recognized standard practices, etc., that relate to contaminated material handling, transportation and disposal.

SUBMITTALS

I. Summary of Sampling Results, Classification of Material and Proposed Disposal Option.

The following information, presented in tabular format, must be submitted to the Engineer for review and approval prior to any reuse on-site or disposal off-site. This requirement is on-going throughout the project duration. At least two weeks prior to the start of any excavation activity, the Contractor shall submit a tracking template to be used to present the information as stipulated below. Excavation will not begin until the format is acceptable to MassDOT.

Characterization Reports will be submitted for all soil, sediment, debris and groundwater characterized through the sampling and analysis program. Each report will include a site plan which identifies the sampling locations represented in the Report. The Construction Plan sheets may be used as a baseplan to record this information.

The Sampling Results will be presented in tabular format. Each sample will be identified by appropriate identification matching the sample identification shown on the Chain of Custody Record. The sample must also be identified by location (e.g. grid number or stockpile number). For each sample, the following information must be listed: the classification (unregulated, regulated, etc.), proposed disposal option for the stockpile or unit of material represented, and, all analytical results.

ITEMS 181.11 through 181.14 (Continued)

Each Characterization Report will include the laboratory analytical report and Chain of Custody Record for the samples included in the Report.

II. Stockpiling, Transport, and Disposal.

At least two weeks prior to the start of any excavation activity, the Contractor shall submit, in writing, the following for review and shall not begin excavation activity until the entire submittal is acceptable to MassDOT.

Excavation and Stockpiling Protocol:
Provide a written description of the management protocols for performing excavation and stockpiling and/or direct loading for transport, referencing the locations and methods of excavating and stockpiling excavated material.

Disposal and Recycling Facilities:

1. Provide the name, address, applicable licenses and approved waste profile for disposal and/or recycling location(s) where contaminated soil will be disposed. Present information substantiating the suitability of proposed sites to receive classifications of materials intended to be disposed there, including the ability of the facility to accept anticipated volumes of material.

2. Provide a summary of the history of compliance actions for each disposal/recycling facility proposed to be used by the Contractor. The compliance history shall include a comprehensive list of any state or federal citations, notices of non-compliance, consent decrees or violations relative to the management of waste (including remediation waste) at the facility. Material should not be sent to facilities which are actively considered by the DEP, USEPA or other responsible agency to be in violation of federal, state or local hazardous waste or hazardous material regulations. MassDOT reserves the right to reject any facility on the basis of poor compliance history.

Transportation:
The name, address, applicable license and insurance certificates of the licensed hauler(s) and equipment and handling methods to be used in excavation, segregation, transport, disposal or recycling.

III. Material Tracking and Analytical Documentation for Reuse/Disposal.

The following documents are required for all excavation, reuse and disposal operations and shall be in the format described. At least two weeks prior to the start of any excavation or demolition activity, the Contractor shall submit the tracking templates required to present the information as stipulated below. Excavation or demolition will not begin until the format is acceptable to MassDOT.

ITEMS 181.11 through 181.14 (Continued)

All soils, sediments and demolition debris must be tracked from the point of excavation to stockpiling to onsite treatment/processing operations to off-site disposal or onsite reuse as applicable.

Demolition Debris:
Demolition debris must be tracked if the debris is stockpiled at a location other than the point of origin or if treatment or material processing is conducted. Identification of locations will be based on the station-offset of the location. The tracking table will identify date and point of generation, any field screening such as PID or dust monitoring, visual observations/comments, quantity, and stockpile ID/processing operation location. For each unit of material tracked, the table will also track reuse of the material on-site, providing reuse date, location of reuse as defined by start and end station, width of reuse location by offset, the fill elevation range, quantity, and finish grade for said location. For demolition debris which is not reused on site, the table will also track disposal of the material as defined by disposal date, quantity and disposal facility. The table must provide a reference to any analytical data generated for the material.

Soil/Sediment:
Soil excavation will be identified based on the station-offset of the excavation location limits. The tracking table will identify date and point of generation, any field screening such as PID or dust monitoring, visual observations, quantity, and stockpile number/location. For each unit of material tracked, the table will also track reuse of the material on-site and disposal of the material off-site using the same categories identified for demolition debris above.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Disposal of contaminated soil shall be measured for payment by the Ton of actual and verified weight of contaminated materials removed and disposed of. The quantities will be determined only by weight slips issued by and signed by the disposal facility. The most cost-effective, legal disposal method shall be used. The work of the LSP for disposal under all of these items shall be incidental to the work with no additional compensation.

ITEM 181.11 Measurement for Disposal of Unregulated Soil shall be under the Contract Unit Price by the weight, in tons, of contaminated materials removed from the site and transported to and disposed of at an approved location or licensed facility, and includes any and all costs for approvals, permits, fees and taxes, additional testing/characterization required by the facility beyond the standard disposal test set, decontamination procedures, transportation and disposal.

ITEM 181.12 Measurement for Disposal of Regulated Soil – In-State Facility shall be under the Contract Unit Price by the weight in tons of contaminated materials removed from the site and transported to and disposed of at an approved in-state facility, and includes any and all costs for approvals, permits, fees and taxes, testing/characterization required by the facility beyond the standard disposal test set, decontamination procedures, transportation and disposal.

ITEMS 181.11 through 181.14 (Continued)

ITEM 181.13 Measurement for Disposal of Regulated Soil - Out-of-State Facility shall be under the Contract Unit Price by the weight in tons of contaminated materials removed from the site and transported to and disposed of at an approved out-of-state facility, and includes any and all costs for approvals, permits, fees and taxes, testing/characterization required by the facility beyond the standard disposal test set, decontamination procedures, transportation and disposal.

ITEM 181.14 Measurement for Disposal of Hazardous Waste shall be under the Contract Unit Price by the weight in tons of hazardous waste removed from the site and transported to and disposed of at the licensed hazardous waste facility, and includes any and all costs for approvals, permits, fees and taxes, testing/characterization required by the facility beyond the standard disposal test set, decontamination procedures, transportation and disposal.

ITEM 182.1 INSPECTION AND TESTING FOR ASBESTOS LUMP SUM

The work shall include the inspecting and testing of all materials suspected of containing asbestos. When any demolition is required to enable the inspection and testing of the suspected material it will be considered incidental to this Item and the Contractor must perform all asbestos handling and testing in accordance with the regulations stated below.

Dust suppression in the form of light water sprays, foams, dust suppressants and calcium chloride will be implemented as required to control dusting during any disturbance of asbestos suspected material. Alternatively, intrusive activities may be reduced or curtailed under high wind or heavy rain conditions, which in the opinion of the Health and Safety Plan (HASP) may pose a safety hazard to the workers.

The Contractor shall employ the services of a Massachusetts licensed "Asbestos Inspector" to inspect the material to determine whether or not "ITEM 182.2 REMOVAL OF ASBESTOS" is required. Should the asbestos inspector determine laboratory testing is required, a state certified laboratory shall be used to perform all necessary tests.

REGULATIONS

U.S. Department of Labor, Occupational Safety and Health Administration, (OSHA) including but not limited to:

29 CFR 1910 Section 1001 and 29 CFR 1926 Section 58 Occupational exposure to Asbestos, Tremolite, Anthophyllite and Actinolite, Final Rule

ITEM 182.1 (Continued)

U.S. Department of Transportation 49 CFR 172 and 173

Massachusetts Department of Labor Standards Regulations, (DLS) including but not limited to:

454 CMR 28.00 Removal, Containment and Encapsulation of Asbestos

Massachusetts Department of Environmental Protection (DEP) including but not limited to (supplementing subsection 7.01):

310 CMR 7.00, Section 7.09 Odor and Dust, Section 7.10 Noise, Section 7.15 Air Pollution Control Regulations
310 CMR 18.00 and 19.00 Solid Waste Regulations

Massachusetts Division of Industrial Safety 45 CMR 10.00

Local Requirements including but not limited to those of Health Departments, Fire Departments and Inspection Services Departments

Wherever there is a conflict or overlap of the above references, the most stringent provision shall apply.

BASIS OF PAYMENT

Item 182.1 will be paid for at the Contract unit price per Lump Sum, which price shall include all labor, materials, tools, equipment, and all incidental costs required to complete the work as described and as required by the Engineer.

No separate payment will be made for the protection of general public, private property, the proper inspecting and testing of the material, but all costs in connection therewith shall be included in the Contract unit price bid.

ITEM 184.1 DISPOSAL OF TREATED WOOD PRODUCTS TON

Work under this item shall include the transportation and disposal of all treated existing wood product as directed by the Engineer.

The timber components of the existing structure are suspected to be treated with creosote, pentachlorophenol and/or CCA. This item shall include all costs for sampling, laboratory testing, loading, transportation and disposal of the treated wood. The Contractor is required to submit disposal manifests to the Engineer prior to the completion of the project. All aspects of this Item are to be completed in accordance with state and federal regulations.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Measurement and payment will be by the weight, in tons, of treated timber transported and accepted at a licensed facility. The work shall be considered full compensation for all labor, tools, equipment, materials, testing, loading, transportation, approvals, and permits necessary for the completion of the work.

ITEM 201.7 CATCH BASIN – DOUBLE GRATE EACH

The work to be done under this Item shall conform to the relevant provisions of Subsection 201 of the Standard Specifications, and the following:

The work under this Item shall include furnishing and installation of double grate catch basins as shown on the details and required by the Engineer.

CONSTRUCTION METHODS

Catch Basin – Double Grate shall have an inside diameter of 5 feet.

Catch Basins – Double Grate shall be precast concrete structures with a 4 foot sump.

Catch Basins – Double Grate shall be installed as shown on the details.

METHOD OF MEASUREMENT

Item 201.7 will be measured for payment by the Each catch basin – double grate furnished and installed, complete in place.

BASIS OF PAYMENT

Item 201.7 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, all excavation, all labor, materials, tools, equipment and incidental costs required to complete the work.

Catch Basin hoods shall be paid for under Item 224.12 – 12 Inch Hood.

Crushed stone for bedding shall be paid for under Item 156. Crushed Stone.

Frame and grates shall be paid for under Item 222. Frame and Grate – MassDOT Bar Type.

ITEM 203. SPECIAL MANHOLE EACH

The work under this Item shall conform to the relevant provisions of Subsections 201, 901, M4, and M8 of the Standard Specifications, and as follows:

The work under this Item includes furnishing and installing a special manhole at the location shown on the plans.

CONSTRUCTION METHODS

Drain manholes shall be precast concrete conforming to the latest ASTM Specifications for precast reinforced concrete sections (ASTM C478). Concrete shall have a minimum compressive strength of 4,000 psi. Reinforcing steel shall conform to the latest ASTM A185 Specifications. The manhole shall be capable of supporting an HS-20 load.

The joints of precast manhole sections shall be sealed with either a round rubber "O"-ring gasket or a flexible joint sealant. The "O"-ring shall conform to ASTM C443.

The cone sections of manholes shall be replaced with flat tops sections, when approved by the Engineer, at no additional cost.

The manhole shall be placed on a bedding of 12 inches of crushed stone when required by the engineer.

The manhole casting shall be a standard frame and cover. The cover shall be marked "DRAIN".

All castings located within the pavement area shall not be set to finished grade until after the binder course has been placed. Adjustment to grade for frame and cover shall be made using courses of brick conforming to ASTM C32, Grade 55, or by use of precast concrete rings conforming to ASTM C478, which will be paid for under Item 203.

All frames shall be set in a concrete collar conforming to Construction Standard Details, Drawing No. E 202.9.0 prior to placement of the top course pavement. The cost of the concrete collar shall be included in the unit price bid for this item.

METHOD OF MEASUREMENT

Item 203. will be measured for payment by the Each special manhole furnished and installed, complete in place.

BASIS OF PAYMENT

Item 203. will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, concrete collar, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

Crush stone for bedding shall be paid for under Item 156. Crushed Stone.

ITEM 220.8 SANITARY STRUCTURE REMODELED EACH

Work under this Item shall conform to the relevant provisions of Subsections 201 and 220 of the Standard Specifications and the following:

CONSTRUCTION METHODS

When the line or grade or both the line and grade of the structure changes by more than 6 in. the structure shall be remodeled. The sloped masonry and the vertical masonry shall be removed to such depths as directed by the Engineer and new masonry shall be constructed to conform to the proposed design and in conformity with the requirements of the applicable parts of Subsection 201: Basins, Manholes and Inlets. All associated work shall conform to the City of Peabody's requirements.

Frames and grates (or covers) determined to be unsatisfactory for reuse shall become the property of the Contractor and shall be removed and discarded. All frames and covers designated to be discarded shall be carefully removed, transported and discarded in accordance with all applicable regulations. The new masonry construction, replacing of castings, highly early strength concrete collars, backfilling around structures and other incidental work shall be as specified in Subsection 201: Basins, Manholes and Inlets. This work will be paid for under Item 220.8.

METHOD OF MEASUREMENT

Item 220.8 will be measured for payment by the Each sanitary structure remodeled, complete in place and approved by the Engineer.

BASIS OF PAYMENT

Item 220.8 will be paid for at the Contract unit price per Each, which price shall include remodeling, all labor, materials, equipment and all incidental costs required to complete the work.

ITEM 223.1 FRAME AND GRATE (OR COVER) REMOVED AND STACKED EACH

The work under this Item shall conform to the relevant provisions of Subsection 201 of the Standard Specifications and the following:

CONSTRUCTION METHODS

The existing frames and grates or covers from existing structures shown on the Plans to be abandoned, removed, or changed in type, shall be removed and stacked unless, in the judgment of the Engineer, they are unsuitable for salvage. Unsuitable frames, grates and covers shall become the property of the Contractor and shall be legally disposed of off the site at no additional cost to the Owner. New frames, grates, and covers shall be furnished and installed for new structures and change in type structures, and paid for under their respective items.

Existing frames and grates or covers owned by the Municipality shall be removed, transported, unloaded, and stacked at the Municipality's Department of Public Works Yard (50 Farm Ave, Peabody, MA 01960) as required by the Engineer.

METHOD OF MEASUREMENT

Item 223.1 will be measured for payment by the Each frame and grate (or cover) removed and stacked.

BASIS OF PAYMENT

Item 223.1 will be paid for at the Contract unit price per Each, which price shall include removal, stacking, disposal of unsuitable frames and grates or covers, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 228. CLOSED CIRCUIT TV INSPECTIONS OF SEWER LINE LUMP SUM

Work under this Item shall consist of furnishing all labor, materials, accessories, equipment, tools, transportation and services for performing all operations required to professionally execute the internal inspection of sewer line at for the following locations:

- Proposed boardwalk construction from Station 351+/- to Station 355+50+/-
- Proposed 16-inch diameter ductile iron pipe at Station 358+50+/- (near Endicott Street).

It shall be the sole responsibility of the Contractor to obtain information concerning depths of flow, manhole depths, air quality in the sewer, accessibility of manholes, and other safety considerations and to incorporate the necessary provisions into the overall lump sum prices to complete the specified work under the conditions existing in the sewer to be inspected.

The existing sewer line within the for the defined locations shall be inspected using Closed Circuit TV (CCTV) at the beginning of the project, prior to any major work activities or large equipment mobilizing on site. A CCTV inspection of the existing sewer line for the same limits shall also be performed at the end of construction to confirm its condition has not changed over the course of the project.

The Contractor shall submit a plan for the pre, and post CCTV inspection of the existing sewer line for the limits described in this special provision to the Engineer for review and approval before the work can commence.

System Description

The Contractor shall perform Closed Circuit TV (CCTV) inspection of the Lowell Branch Interceptor as specified herein. The 42” sewer passes through the project area, running adjacent to the proposed bikepath between Northshore Road and Endicott Street. The Contractor shall anticipate that inspections of the sewer shall be required along the section of sewer in proximity to the proposed bikepath bridge over Proctor Brook, which is approximately 300 feet long. These inspections will occur before and after the proposed Work.

Qualifications:

Work shall be performed by Contractor with a minimum of ten (10) years’ experience in Closed Circuit TV inspection of sewers with diameters in excess of 24 inches.

Procedures and Equipment

One basic method of internal pipe inspection shall be made available by the Contractor for this project; remote inspection.

1. Special industrial grade color inspection cameras, contained in waterproof housings, and mounted on floating skids or rafts.

ITEM 228. (Continued)

All cameras used shall be color units specifically designed or modified for use in sewer inspection work. The cameras shall be operable in 100% humidity conditions. The camera lens shall have not less than a 65-degree viewing angle and shall have either automatic or remote focus and iris controls. Camera lighting shall be sufficient for use with color inspection cameras. In all cases, the complete video system (camera, lens, lighting, cables, monitors and recorders) shall be capable of providing a picture quality acceptable to the Engineer, and if unsatisfactory, equipment shall be removed, and re-inspection shall be performed with more suitable equipment.

No payment will be made for unsatisfactory inspections.

Remote pipe inspections

Remote pipe inspections, using either electric or manually operated winches to pull the inspection camera through the sewer line, shall be performed in the sewer.

The camera shall be pulled through the sewer line in either direction at a speed not greater than 30 feet per minute, stopping as necessary to permit proper documentation of the sewer's condition. If, during the inspection operations the inspection camera will not pass through the entire manhole section, the Contractor shall reset his equipment so that the inspection can begin at the opposite manhole. If again, the camera fails to pass through the entire manhole section, the inspection shall be considered complete and no additional inspection work will be required.

The camera used in remote pipe inspections shall in addition to requirements described above, be equipped with a rotating head capable of 90-degree rotation from horizontal and minimum 180-degree rotation about its centerline. The camera lens shall be capable of a minimum 140 degree viewing angle with automatic or remote focus and iris controls. Focal distance shall be adjustable through average of 6 inches to infinity.

In instances where manual or remote power winches are used to pull the camera through the sewer (i.e., where the recording technician does not directly control the winch), constant two-way communication shall be set up between the two manholes of the line being inspected to permit the recording technician to communicate clearly with the crew member controlling the camera's movement.

Execution

The Contractor shall perform an inspection prior to work beginning in the area adjacent to the sewer interceptor line between Warren Street Extension and Endicott Street. This inspection will record to the condition of the line prior to construction.

After the bikepath has been constructed within this area, the Contractor shall perform a post construction inspection of the sewer main to confirm the condition of the pipe.

Accurate and continuous footage readings shall be superimposed on the video recording for each line inspected by remote inspection methods. Also shown shall be the date of inspection and a three-digit manhole number designation for each manhole on the line section inspected.

ITEM 228. (Continued)

Lines scheduled for inspection shall be inspected in their existing condition. The Contractor shall be responsible for having the necessary camera skids, floats, and rafts available to allow for inspection of these lines in a manner acceptable to the Engineer under live flow conditions.

The following general criteria shall be followed:

1. The inspections shall occur at off-peak hours, between midnight and 4am. No inspections shall be performed where flow depths exceed 50% of pipe diameter without prior approval of the Engineer.

2. The maximum flow depth for remote or manual inspection work is 33% of the pipe diameter. The Contractor may be required to perform inspections during off-peak hours (night inspections) if specifically requested by the Owner to achieve this maximum flow standard.

The Contractor shall submit a listing of actual measured flow depths and times of measurement at a sufficient number of locations to indicate the flow depths that could be expected during inspection work. A minimum of one flow depth measurement shall be provided for each line section at no additional cost to MassDOT. Additional off-peak flow measurements (i.e., night flow measurements) may be requested by the Engineer at various locations also at no additional cost to the MassDOT.

A kick-off meeting shall be scheduled with the Engineer, MassDOT and the City of Peabody prior to beginning any internal pipe inspection work to review the Contractor's proposed schedule, procedures and inspection methods. At that time, the Contractor shall have available the necessary flow depth data described in above as well as the overall listing of proposed inspection methods.

Documentation and Reports

Video recordings shall include an audio track recorded by the inspection technician during the actual inspection work describing the parameters of the line being inspected (i.e., location, depth, diameter, pipe type), as well as describing connections, defects and unusual conditions observed during the inspection. All videotapes shall be of the 120 minute minimum DVD-R, DVD-RW, or DVD+R high quality color and each shall be professionally labeled showing the MWRA’s name, the lines recorded on the tape, and the name of the Contractor.

ITEM 228. (Continued)

Printed inspection reports shall be prepared by the Contractor for each sewer line inspected during the actual field inspection activities. These field logs shall then be reviewed by the Contractor's technical staff, along with reviewing the associated video record, as a means of insuring that no defects or entries are omitted or incorrect, and as a means of gaining a second opinion as to the condition of each sewer line. Edited field logs shall then be reprinted or typed for use in the final project reports. Detailed, one-page summaries shall also be prepared for each line section inspected, during the data review, presenting the synopsis of the general line condition and the relative severity of observed defects. These summaries shall also be included in all field report copies immediately before each associated inspected report to further assist the Engineer in understanding and using the results of the inspection project. Direct submittal of copies of the field technician's field logs, without this secondary review and summary pages, shall not be acceptable.

The 35 mm photographs taken during manual, walk-through inspections shall be properly mounted and labeled on 8.5 x 11 inch paper for inclusion in the final project reports. One copy of the final reports shall contain the original 35 mm photos, on fully laminated pages, and the remaining requested copies shall contain copies of these photo pages, The photo pages shall be presented immediately following the inspection report for the line section in which they were taken.

Photographs taken from the video monitor for remote TV inspections shall be properly mounted and labeled on 8.5 x 11 inch paper for inclusion in the final project reports. One copy of the final reports shall contain the original photos, on fully laminated pages, and the remaining requested copies shall contain copies of these photo pages, The photo pages shall be presented immediately following the inspection report for the line section in which they were taken. The Engineer and MassDOT desire photos of all significant defects observed during remote inspection work; however, it is understood that it may not be possible to obtain clear still photos from the monitor for inspections in lines where manual inspections are not performed.

Original DVDs for the project shall be forwarded to the Engineer with final report submittals. Additional copies of the DVDs, if requested, shall be made by the Contractor on professional tape duplication equipment.

BASIS OF PAYMENT

Item 228. will be paid for at the Contract Lump Sum price, which price shall include media, recordings, inspections of pipe access locations, inspections to evaluate sewer conditions, worker safety measures, cameras, lighting, photographs, inspection logs and reports, traffic control measures, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 238.36 36 INCH DUCTILE IRON PIPE FOOT

The work under this Item shall conform to the relevant provisions of Subsection 230 of the Standard Specifications, and the following:

CONSTRUCTION METHODS

The pipe shall be one continuous pipe segment and located so that no bell end is located beneath the paved bikeway surface. The pipe shall be bedded and backfilled as shown on the design plans.

METHOD OF MEASUREMENT

Item 238.36 will be measured for payment according to the provisions of Subsection 230.80 of the Standard Specifications.

BASIS OF PAYMENT

Item 238.36 will be paid for according to the provisions of Subsection 230.81 of the Standard Specifications.

ITEM 285. INFILTRATION TRENCH FOOT

The work under this Item shall conform to the relevant provisions of Subsections 150, 200, M2, and M9 of the Standard Specifications, and the following.

The infiltration trench shall meet M2.01.0 of the Standard Specifications for 2" to 5" Crushed Stone.

CONSTRUCTION METHODS

The Work shall include the full depth excavation and subsequent installation of an infiltration trench system consisting of: three (3) foot crushed stone layer by four (4) foot wide as shown on the plans. Crushed Stone shall meet the following gradation requirements:

Sieve Size	Percent Passing by Weight
5 inch	90-100
4 inch	80-100
3 inch	40-60
2 inch	0-20

Non-Woven Geotextile filter fabric that meets MassDOT M 9.50.0 and Application Code 1 for subsurface drainage shall be installed along all sides and ends (not the bottom) of the infiltration trench system. The 6-inch sand filter layer shall meet Section 150 of the MassDOT Standard Specifications and the requirements of MassDOT M 1.04.1.

METHOD OF MEASUREMENT

Item 285. will be measured for payment by the Linear Foot of infiltration trench installed, complete in place.

BASIS OF PAYMENT

Item 285. will be paid for at the Contract unit price per Linear Foot, which price shall include excavation, disposal of excavated material, installation, crushed stone, filter fabric, sand filter, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 431.1 HIGH EARLY STRENGTH CEMENT CONCRETE BASE COURSE CUBIC YARD

The work under this Item shall conform to the relevant provisions of Subsection 430 of the MassDOT Standard Specifications and the following:

The work under this Item shall include furnishing and placing high early strength cement concrete base course at the locations and dimensions, including any encasement of conduits, shown on the plans, and as required by the Engineer.

METHOD OF MEASUREMENT

Item 431.1 will be measured for payment by the Cubic Yard of high early strength cement concrete base course furnished and placed, complete in place.

BASIS OF PAYMENT

Item 431.1 will be paid for at the Contract unit price per Cubic Yard, which price shall include furnishing, placement, all labor, tools, equipment, materials, and all incidental costs required to complete the work.

ITEM 506.2 GRANITE TRANSITION TYPE VB – SPLAYED END EACH

The work under this Item shall conform to the relevant provisions of Subsection 501 of the Standard Specifications, and the following:

The work under this Item shall include furnishing and installing Granite Transition Type VB– Splayed Ends as shown on the Contract Drawings.

MATERIALS

Materials shall meet Materials Specification for VB curb and be in accordance with sections M9.04.0, M9.04.01, and M9.04.02 of the Standard Specifications. Curb shall be as shown on the Plans. Standard length shall be 6 feet.

CONSTRUCTION METHODS

Granite Transition Type VB– Splayed End shall be installed at the final grades as shown on the Plans.

METHOD OF MEASUREMENT

Item 506.2 will be measured for payment by the Each Granite Transition Type VB– Splayed End furnished and installed, complete in place.

BASIS OF PAYMENT

Item 506.2 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 655. CEDAR RAIL FENCE FOOT

The work under this Item shall conform to the relevant provisions of Subsection 644 of the Standard Specifications, and the following:

The work under this Item shall include furnishing and installing cedar rail fence consisting of cedar wood posts and cedar wood rails as shown on the Contract Drawings.

SUBMITTALS

The Contractor shall provide the following submittals:

Shop Drawings for the cedar rail fence showing complete construction detailing.

Manufacturer's product literature: Submit manufacturer's material descriptions.

MATERIALS

Posts and rails shall be made of No. 1 western red cedar. Both ends shall be cut square. Posts will be shown as on the drawings and incidental to the cost of the fence.

Included under this item is all the hardware, galvanized steel screws, etc., necessary to attach the 4-inch x 6-inch rail to the 6-inch x 6-inch fence post.

The cedar wood rail and cedar wood fence shall be pressure-treated with Chromated Copper Arsenate (CCA) chemical preservative. Pressure-treated rails shall be 4-inch x 6-inch. Fence post shall be set at maximum intervals of 8-feet and set so the top of the post is 42 inches from proposed ground level.

CONSTRUCTION METHODS

Cedar rail fence posts shall be set plumb, backfilled with gravel borrow, as required, and compacted to the lines and grades given. End and corner posts shall be backfilled with 4000, 1.5, 565 cement concrete in lieu of gravel borrow.

The Contractor shall embed each post the minimum depth required as shown in the plans. Longer post may be required at transition areas or where field conditions warrant.

Where solid rock or boulder is encountered without an overburden soil, posts shall be set at a minimum depth of 18-inches in the solid rock. The posts shall be cut before installation to lengths, which will give the required length of post above ground.

After the post is set and plumped, the hole shall be with 4000 psi, 1.5 inch , 565 cement concrete in lieu of gravel borrow.

When loose rock or small boulders are encountered, the post shall be set to the full depth as shown in the Drawings after removing the rock and small boulders.

ITEM 655. (Continued)

This item includes all associated incidental work necessary to install the item, including gravel borrow and cement concrete.

METHOD OF MEASUREMENT

Item 655. will be measured for payment according to the provisions of Subsection 644.80.

BASIS OF PAYMENT

Item 655. will be paid for according to the provisions of Subsection 644.81.

ITEM 657. TEMPORARY FENCE FOOT
ITEM 657.5 TEMPORARY FENCE REMOVED AND RESET FOOT

The work under these Items shall conform to the relevant provisions of Subsections 644 and 665 of the Standard Specifications, and the following:

The work under these Items shall include furnishing, installing, removing, resetting and final removal of temporary fence as required by the Engineer.

MATERIALS

Temporary fence for pedestrian protection shall be a minimum of 6 feet in height and shall be any type specified in Subsection 644. All end, corner and intermediate posts shall be driven into the ground and properly supported as outlined in Subsection 644.

CONSTRUCTION METHODS

The Contractor shall furnish and install all end, corner and intermediate brace posts and all other incidental materials, labor and equipment required for the installation, including concrete foundations if required, relocation and final removal from the site. Material need not be new, but shall not be deteriorated, nor in any way jeopardize the protection purposes intended. All fencing shall meet the approval of the Engineer.

The Contractor shall be responsible for maintenance of the temporary fence and shall be responsible and cognizant that it remains secure at all times. Fence fabric shall be placed on the face of the post away from the work area. The top edge of the fabric shall be finished with a "knuckled" selvage.

During construction it will be necessary to remove and reset the temporary fence at different locations to accommodate the stage construction.

Upon completion of the work, or as required by the Engineer, the fencing and supports shall be removed and disposed off-site by the Contractor at no additional cost.

METHOD OF MEASUREMENT

Item 657. will be measured for payment by the Foot of temporary fence furnished and installed, complete in place.

Item 657.5 will be measured for payment by the Foot of temporary fence removed and reset, complete in place.

ITEMS 657. and 657.5 (Continued)

BASIS OF PAYMENT

Item 657. Will be paid for at the Contract unit price per Foot, which price shall include furnishing, installation, final removal and disposal, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

Twenty (20) percent of the total bid price for Item 657. will be held and paid upon final removal of the temporary fence.

Item 657.5 will be paid for at the Contract unit price per Foot, which price shall include removal, resetting, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 665.2 CHAIN LINK FENCE REMOVED AND DISCARDED FOOT

Work under this Item shall conform to the relevant provisions of Subsection 665 of the Standard Specifications, and the following:

CONSTRUCTION METHODS

The Contractor shall remove the existing link fence, gates, posts, bracing, hardware and footings and legally dispose of all material away from the site.

METHOD OF MEASUREMENT

Item 665.2 will be measured for payment by the Foot of chain link fence removed and discarded.

Measurement will be made by the length from outside of end post to end post of fence removed, measured in its original location before removing.

BASIS OF PAYMENT

Item 665.2 will be paid for at the Contract unit price per Foot, which price shall include removal, disposal, all labor, materials, equipment, and all incidental costs required to complete this work.

ITEM 673. ACCESS ROAD GATE EACH

The work under this Item shall conform to the relevant provisions of Subsection 644 and 901 of the Standard Specifications, and the following:

This work under this Item shall consist of furnishing and installing a galvanized steel access road gate at the location indicated in the Contract Documents and as directed by the Engineer.

MATERIALS

The Roadway Gate shall meet the requirements of Subsection 644 and other related provisions in the Standard Specifications. Galvanized Steel shall be Grade B, Fy = 33,000 ksi. Footings shall conform to the requirements in Subsection 901 in the Standard Specifications for 4000 psi, 1.5 inch, 565 Cement Concrete. Reinforcing steel shall be Grade 60 Reinforcing Level 1.

CONSTRUCTION METHODS

The access road gate shall be installed across the access road at the locations shown on the plans and as directed by the Engineer. The gate shall be installed after embankment work is substantially complete and the Contractor no longer needs to use the access road.

The gate shall be installed to open away from Warren Street Extension.

METHOD OF MEASUREMENT

Item 673. will be measured for payment by the Each access road gate furnished and installed, complete in place.

BASIS OF PAYMENT

Item 673. will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, foundation including cement concrete and reinforcing steel, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 697.1 **SILT SACK** **EACH**

Work under this item shall conform to the relevant provisions of Subsections 227 and 670 of the Standard Specifications, and the following:

The work under this item includes the furnishing, installation, maintenance and removal of a reusable fabric sack to be installed in drainage structures for the protection of wetlands and other resource areas and the prevention of silt and sediment from the construction site from entering the storm water collection system. Devices shall be ACF Environmental (800)-448-3636; Reed & Graham, Inc. Geosynthetics (888)-381-0800; The BMP Store (800)-644-9223; or approved equal.

CONSTRUCTION

Silt sacks shall be installed in retained existing and proposed catch basins and drop inlets within the project limits and as required by the Resident Engineer.

The silt sack shall be as manufactured to fit the opening of the drainage structure under regular flow conditions, and shall be mounted under the grate. The insert shall be secured from the surface such that the grate can be removed without the insert discharging into the structure. The filter material shall be installed and maintained in accordance with the manufacturer's written literature and as directed by the Engineer.

Silt sacks shall remain in place until the placement of the pavement overlay or top course and the graded areas have become permanently stabilized by vegetative growth. All materials used for the filter fabric will become the property of the Contractor and shall be removed from the site.

The Contractor shall inspect the condition of silt sacks after each rainstorm and during major rain events. Silt sacks shall be cleaned periodically to remove and disposed of accumulated debris as required. Silt sacks, which become damaged during construction operations, shall be repaired or replaced immediately at no additional cost to the Department.

When emptying the silt sack, the contractor shall take all due care to prevent sediment from entering the structure. Any silt or other debris found in the drainage system at the end of construction shall be removed at the Contractors expense. The silt and sediment from the silt sack shall be legally disposed of offsite. Under no condition shall silt and sediment from the insert be deposited on site and used in construction.

All curb openings shall be blocked to prevent stormwater from bypassing the device.

All debris accumulated in silt sacks shall be handled and disposed of as specified in Section 227 of the Standard Specifications

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Silt sacks will be measured and paid at the Contract unit price per each, complete in place, which price shall include all labor, materials, equipment and incidental costs required to complete the work. No separate payment will be made for removal and disposal of the sediment from the insert, but all costs in connection therewith shall be included in the Contract unit price bid.

ITEM 697.2 FLOATING SILT FENCE FOOT

The work under this Item shall conform to the relevant provisions of Subsections 670 of the Standard Specifications, and the following:

The work under this Item shall include installation, maintenance and removal of a temporary floating silt fence to prevent any sediment disturbed during construction from reaching adjacent waterways and further dispersing. The fence shall be installed within the waterway, approximately 50 feet downstream of the bridge or culvert.

MATERIALS

Floating silt fence shall be made of a woven polypropylene with a minimum 200 lb. tensile strength. The Contractor shall submit to the Engineer, for review and approval, product specifications and technical data provided by the manufacturer, prior to installation. The fence shall be continuously weighted at the bottom to maintain a vertical submerged position. Anchors shall be placed at both ends of the curtain and at intermediate locations, as necessary, to hold the fence securely in place. The fence shall be installed to withstand the forces of the flow of the waterway.

CONSTRUCTION METHODS

Floating silt fence shall be installed before construction begins and earth is disturbed. Silt fences shall be inspected and approved by the Peabody Conservation Commission Agent after installation and prior to commencement of further construction activities. The Contractor shall inspect silt fence at least weekly to ensure continuous effectiveness. Fence shall be maintained for effective performance at all times. If any fence becomes damaged or dislodged, construction activities shall be halted until all deficiencies are corrected by the Contractor with no additional compensation. The floating silt fence shall be removed after all construction activities are completed and in such a way that no collected sediment is dispersed into Waterways

METHOD OF MEASUREMENT

Item 697.2 will be measured for payment by the Foot of floating silt fence furnished, installed, maintained, and removed.

BASIS OF PAYMENT

Item 697.2 will be paid for at the Contract unit price per Foot, which price shall include furnishing, installation, maintenance, final removal, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 698.3 GEOTEXTILE FABRIC FOR SEPARATION SQUARE YARD

This work shall consist of furnishing and installing geotextile fabric in close conformity with the lines and grades shown on the plan or established by the Engineer. Geotextile fabric for separation shall be used for separation of soil from dumped riprap embankment and stone for pipe ends.

MATERIALS

Geotextile fabric shall conform to the requirements AASHTO M 288 for the intended application in accordance with Subsection M9.50.0, and shall be one of those included on the Department's Qualified Construction Materials List.

CONSTRUCTION METHODS

The geotextile fabric shall be installed in accordance with the manufacturer's instructions. The stone shall be placed on top of the fabric in a careful manner so as to not disturb or puncture the Fabric.

For seams, which are sewn in the field, the Contractor shall provide at least a 6 foot length of sewn seam for sampling by the Engineer before the geotextile is installed. The seams sewn for sampling shall be sewn using the same equipment and procedures as will be used for the production seams. If seams are sewn in both the machine and cross machine direction, samples of seams from both directions shall be provided. The Contractor shall submit the seam assembly description along with the sample of the seam. This description shall include the seam type, stitch type, sewing thread, and stitch density.

The geotextile shall be placed in intimate contact with the soil without wrinkles or folds, and it shall be anchored on a smooth graded surface approved by the Engineer. The geotextile shall be placed in such a manner that placement of the overlaying materials will not excessively stretch so as to tear the geotextile.

The geotextile shall be placed so that the machine direction is horizontal and runs along the slope. Adjacent geotextile sheets shall be jointed by either sewing or overlapping. Overlapped seams at roll ends shall be a minimum of 1 foot except if placed under water. In such instances the overlap shall be a minimum of 3 feet. Overlaps of adjacent rolls shall be a minimum of 1 foot in all instances.

Care shall be taken during installation so as to avoid damage to the geotextile as a result of the installation process. Should the geotextile be damaged during installation, a geotextile patch shall be placed over the damaged area extending 3 feet beyond the limits of damage.

The riprap placement shall begin at the toe of the slope and proceed up the slope. Placement shall take place so as to avoid stretching and subsequent tearing of the geotextile. No stone material shall be dropped from a height exceeding 2 feet.

ITEM 698.3 (Continued)

Field monitoring shall be performed to verify that the dumped riprap placement does not damage the geotextile. Any geotextile damaged during this placement shall be replaced as directed by the Engineer, at the Contractor's expense.

The Contractor shall remove all excess material from the site.

METHOD OF MEASUREMENT

Item 698.3 will be measured for payment by the Square Yard of geotextile fabric for separation furnished and installed, complete in place.

Geotextile fabric will be measured per square yard on the surface of the fabric in a horizontal plane after installation. Geotextile fabric placed outside the specified limits will not be measured and the Contractor may be required to remove and dispose of the excess material without cost to the Owner. Overlapped material will not be included in the measurement.

BASIS OF PAYMENT

Item 698.3 will be paid for at the Contract unit price per Square Yard, which price will include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 698.4 GEOTEXTILE FABRIC FOR PERMANENT EROSION CONTROL SQUARE YARD

This work shall consist of furnishing and installing geotextile fabric in close conformity with the lines and grades shown on the plan or established by the Engineer. Geotextile fabric shall be used for erosion control under the riprap embankment.

MATERIALS

Geotextile fabric shall conform to the requirements AASHTO M 288 for the intended application in accordance with Subsection M9.50.0 of the Standard Specifications and shall be one of those included on the Department's Qualified Construction Materials List.

CONSTRUCTION METHODS

The geotextile fabric shall be installed in accordance with the manufacturer's instructions. The stone shall be placed on top of the fabric in a careful manner to not disturb or puncture the Fabric.

For seams, which are sewn in the field, the Contractor shall provide at least a 6 foot length of sewn seam for sampling by the Engineer before the geotextile is installed. The seams sewn for sampling shall be sewn using the same equipment and procedures as will be used for the production seams. If seams are sewn in both the machine and cross machine direction, samples of seams from both directions shall be provided. The Contractor shall submit the seam assembly description along with the sample of the seam. This description shall include the seam type, stitch type, sewing thread, and stitch density.

The geotextile shall be placed in intimate contact with the soil without wrinkles or folds, and it shall be anchored on a smooth graded surface approved by the Engineer. The geotextile shall be placed in such a manner that placement of the overlaying materials will not excessively stretch so as to tear the geotextile.

The geotextile shall be placed so that the machine direction is horizontal and runs along the slope. Adjacent geotextile sheets shall be jointed by either sewing or overlapping. Overlapped seams at roll ends shall be a minimum of 1 foot except if placed under water. In such instances the overlap shall be a minimum of 3 feet. Overlaps of adjacent rolls shall be a minimum of 1 foot in all instances.

Care shall be taken during installation to avoid damage to the geotextile as a result of the installation process. Should the geotextile be damaged during installation, a geotextile patch shall be placed over the damaged area extending 3 feet beyond the limits of damage.

The riprap placement shall begin at the toe of the slope and proceed up the slope. Placement shall take place so as to avoid stretching and subsequent tearing of the geotextile. No stone material shall be dropped from a height exceeding 2 feet.
Field monitoring shall be performed to verify that the dumped riprap placement does not damage the geotextile. Any geotextile damaged during this placement shall be replaced as directed by the Engineer, at the Contractor's expense.

ITEM 698.4 (Continued)

The Contractor shall remove all excess material from the site.

METHOD OF MEASUREMENT

Item 698.4 will be measured for payment by the Square Yard of geotextile fabric for separation furnished and installed, complete in place.

Geotextile fabric will be measured per square yard on the surface of the fabric in a horizontal plane after installation. Geotextile fabric placed outside the specified limits will not be measured and the Contractor may be required to remove and dispose of the excess material without cost to the Owner. Overlapped material will not be included in the measurement.

BASIS OF PAYMENT

Item 698.4 will be paid for at the Contract unit price per Square Yard, which price will include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 701.3 CEMENT CONCRETE REINFORCED PAVEMENT SQUARE YARD

The work under this Item shall conform to the relevant provisions of Subsections 701, M8.01.0, and M8.01.2 of the Standard Specifications, and the following:

The work to be done under this item consists of constructing a cement concrete reinforced pavement at the trailheads.

SUBMITTALS

The Contractor shall submit joint layout plan for the cement concrete reinforced sidewalk at the trailheads as per the drawing.

CONSTRUCTION METHODS

Concrete at the trailheads shall be 6" depth concrete with welded wire mesh. The concrete shall be 8" depth at the expansion joints.

The Contractor shall place 6"x6" -, 1.4x1.4 welded wire mesh in the sidewalk at the trailheads as shown on the plans.

Dowels with an expansion sleeve shall be placed at the expansion joints as shown on the plans.

METHOD OF MEASUREMENT

Item 701.3 will be measured for payment by the Square Yard of cement concrete reinforced pavement furnished and placed, complete in place.

BASIS OF PAYMENT

Item 701.3 will be paid for at the Contract unit price per Square Yard, which price shall include furnishing, placement, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

The cost of furnishing and installing the welded wire mesh, dowels and expansion sleeves is included in the cost of this item.

ITEM 704.2 STONE DUST FOR SHOULDERS TON

The work under this Item shall conform to the relevant provisions of Subsection 150 of the Standard Specification, and the following:

The work under this Item shall include the furnishing and placing of stone dust for shoulders as shown on the Drawings and as required by the Engineer.

MATERIALS

Stone dust shall be crushed stone or gravel fines conforming to the following gradation:

- 100% passing 3/8"
- 50-70% passing 1/4"
- 50-60% passing #4 sieve
- 35-40% passing #16 sieve
- 25% passing #100 sieve

Color shall be dark gray. Submit stone dust sample for approval by Engineer.

CONSTRUCTION METHODS

Place, grade, and compact the stone dust over the gravel borrow subbase to produce the minimum required thickness with a firm, uniform surface at the lines and grades shown on the Plans and as required by the Engineer.

Compaction shall be in accordance with Subsections 150.60 and 150.62. All depressions shall be filled and material in high spots removed until the surface is smooth and compacted satisfactorily

METHOD OF MEASUREMENT

Item 704.2 will be measured for payment by the Ton of stone dust for shoulders furnished and placed, complete in place.

BASIS OF PAYMENT

Item 704.2 will be paid for at the Contract unit price per Ton, which price shall include furnishing, placement, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

Gravel borrow will be paid for under Item 151, “Gravel Borrow.”

ITEM 706.9 TEXTURED DECORATIVE PAVEMENT SQUARE YARD

The work under this Item includes furnishing and installing imprinted aggregate reinforced preformed thermoplastic pavement that replicate brick in a relief surface pattern in hot mix asphalt pavement areas. The work also includes pavement sawcutting, pavement removal and disposal to the limits of proposed imprint areas, pavement surface preparation in the areas to receive the imprint, and protecting the surface until accepted and open to traffic.

Unless otherwise authorized by the Engineer upon the Contractor's assurance that quality will not be compromised, it is assumed that the finish pavement course will be completed prior to the work of this item. Pavement removal refers to sawcutting and removal of that portion of the finished pavement required to install the imprint material.

A 3 foot by 3 foot "mock up" shall be constructed for review and approval by the City and the Engineer. Cost for constructing the "mock up" shall be included in the unit bid price for this item.

MATERIAL

Manufacturer: The preformed thermoplastic pavement manufacturer must be ISO 900 1:2008 certified for design, development and manufacturing of preformed thermoplastic, and provide proof of current certification.

Preformed thermoplastic material: The material shall consist of a resilient, aggregate reinforced preformed thermoplastic product which contains a minimum of thirty percent (30%) intermixed anti-skid/anti-slip elements and where the top surface contains anti-skid/anti-slip elements. These anti-skid/anti-slip elements must have a minimum hardness of 6 (Mohs scale).

The material shall be supplied in panels typically measuring 2ft x 2ft.

The preformed material must be resistant to the detrimental effects of motor fuels, antifreeze, lubricants, hydraulic fluids, etc.

Preformed thermoplastic material shall be composed of an ester-modified rosin impervious to degradation by motor fuels, lubricants, etc. in conjunction with aggregates, pigments, binders, and anti-skid/anti-slip elements. Pigments and anti-skid/anti-slip elements shall be uniformly distributed throughout the material. The material shall conform to AASHTO designation M249, with the exception of the relevant differences due to the material being supplied in a preformed state, being non-reflective, and potentially being of a color different from white or yellow. The preformed thermoplastic material shall be capable of application at ambient and road temperatures down to 45°F (7°C) without any preheating of the pavement to a specific temperature.

Pigments: The pigment system must not contain heavy metals nor any carcinogen, as defined in 29 CFR 1910.1200 in amounts exceeding permissible limits as specified in relevant Federal Regulations.

ITEM 706.9 (Continued)

Skid Resistance: The surface of the material shall contain factory applied anti-skid/anti-slip elements with a minimum hardness of 6 (Mohs scale). Upon application the material shall provide a minimum skid resistance value of 60 BPN when tested according to ASTM E 303.
Slip Resistance: The surface of the material shall contain factory applied anti-skid/anti-slip elements with a minimum hardness of 6 (Mohs scale). Upon application the material shall provide a minimum static friction of' coefficient of 0.6 when tested according to ASTM C 1028 (wet and dry), and a minimum static coefficient of friction of 0.6 when tested according to ASTM D 2047.

Thickness: The material must be supplied at a minimum thickness of 150 mil (3.8mm).

Environmental Resistance: The material must be resistant to deterioration due to exposure to sunlight, water, salt or adverse weather conditions and impervious to oil and gasoline.

Storage Life: The material may be stored for 12 months, if stored indoors and protected from the elements.

Packaging: The preformed thermoplastic material shall be packaged in cardboard cartons with a plastic sheet between each layer of preformed thermoplastic. The cartons in which packed shall be non-returnable and shall not exceed 25 in. in length and 25 in. in width. The cartons shall be labeled for ease of identification. The weight of the individual carton must not exceed seventy (70) pounds. A protective film around the carton must be applied in order to protect the material from rain or premature aging.

CONSTRUCTION METHODS

Preformed thermoplastic pavement shall only be applied to a stable, high quality asphalt pavement substrate over a stable base that is free of defects. The asphalt pavement substrate surface shall be dry and free from all foreign matter, including but not limited to dirt, dust, deicing materials, and chemical residue.

The area of preformed thermoplastic pavement application shall be sawcut to neat straight lines and the asphalt pavement removed to a uniform depth having a smooth surface approved by the manufacturer's representative prior to application of the material.

ITEM 706.9 (Continued)

The material shall be applied to the asphalt pavement substrate using reciprocating infrared heating equipment. A two-part epoxy sealer shall be applied to the substrate prior to preformed thermoplastic application to ensure proper adhesion and to provide reinforcement for larger volumes of material. A specialized sealer dispensing gun specific to the application shall be used to dispense the required two-part epoxy sealer onto the substrate. Immediately following sealer application, panels of aggregate reinforced preformed thermoplastic shall be positioned properly on the asphalt substrate with the aggregate side facing up. The preformed thermoplastic shall then be heated to the required melting temperature. Additional anti-skid/anti-slip aggregate conforming to the properties of the preformed material aggregate shall be applied to the preformed thermoplastic surface as needed following the melting process to achieve added friction properties and a uniform surface appearance or if the factory applied anti-skid/anti-slip elements embed too deeply into the surface of the molten thermoplastic material during the heating process. The additional aggregate shall be applied by spray by means of an air powered spray hopper.

As the material is cooling, it shall be imprinted with a stamping template made from 3/8 inch flexible wire rope in the required design using a vibratory plate compactor to create crisp, clean lines which define the pattern. A hand held finishing tool shall be used that enables the applicator to complete the imprinting of the thermoplastic in areas which may be inaccessible to the stamping template.

The reciprocating infrared heating equipment shall be of a design specifically to elevate the temperature of the preformed thermoplastic material and asphalt pavement without adversely affecting it. The primary heating unit shall employ a bank of propane-fired infrared heaters, mounted on a track device that allows the heater bank to reciprocate back and forth over a designated area, thereby allowing the operator to monitor the temperature of the preformed thermoplastic at all times during the pavement heating process.

A smaller, mobile infrared heater designed specifically to heat areas such as borders and narrow areas that are inaccessible to the primary heaters shall be utilized as necessary for the work. This secondary heater also allows the operator to monitor the temperature of the preformed thermoplastic at all times during the heating process.

An approved hand-held propane heat torch shall be used to heat isolated areas of the preformed thermoplastic if required and approved by the Engineer.

A vibratory plate compactor (700-900 lb.) shall be used for pressing the 3/8 inch wire rope stamping templates into the thermoplastic to create the specified pattern in both the thermoplastic and asphalt substrate.

The color shall be Colonial Red and the surface pattern shall be a running bond brick pattern.

Any residue resulting from this work shall be removed and disposed of in a proper manner. The completed work area is to be left in a neat and clean condition.

ITEM 706.9 (Continued)

Special care must be exercised by the Contractor during the operation of work to save from harm and injury, any structure, public or private, situated above or below the surface and lying within the project limits. If during the execution of the work, the Contractor, through willfulness or carelessness, permits or causes any damage, the cost of satisfactory repair or replacement shall be the responsibility of the Contractor.

Manufacturer Certified Applicator Requirement: The preformed thermoplastic material shall be applied only by an approved certified applicator. The applicator shall provide proof of current certification by the manufacturer before commencing work. The certified applicator shall follow the manufacturer's current published application procedures.

METHOD OF MEASUREMENT

Item 706.9 will be measured for payment by the Square Yard of textured decorative pavement furnished and installed, complete in place and accepted by the Engineer.

BASIS OF PAYMENT

Item 706.9 will be paid for at the Contract unit bid price per Square Yard, which price shall include furnishing, installation, all labor, material, tools, equipment, and all incidental costs required to complete the work.

No separate payment will be made for sawcutting, existing pavement removal or “mock-up” but all costs in connection therewith shall be included in the contract unit price bid for this item.

ITEM 707.17 BENCH EACH

Work under this item includes furnishing and installing benches as shown on the drawings and as specified herein.

MATERIALS

The bench shall be comprised of supports manufactured from 3/8" x 4 1/2" ASTM A36 carbon steel flat bar and 3" x 3" x 1/4" wall ASTM A500 steel tubing. Seat slats shall be manufactured from 3" x 4" nominal HDPE recycled plastic slats. Integral armrests shall be manufactured from 1/4" x 2" ASTM A36 carbon steel flat bar. Anchoring shall be Stainless steel expansion anchors (1/2" x 3 3/4"). provided.

Finish shall be black polyester powder coating over zinc rich primer. Zinc-rich epoxy primer to an average of 4-5 mils. TGIC-polyester powder top coat shall be an AVERAGE of 4-5 mils. Submit color chart for approval.

Benches shall be model number 88-60PL S-1 surface mount with armrests as manufactured by DuMor, Inc. P.O. Box 142, Mifflintown, PA 17059-0142 (1-800-598-4018) www.dumor.com , model number PRS-10 as manufactured by Victor Stanley, 2103 Brickhouse Road Dunkirk, MD 20754, or Covington Collect 6 foot bench with back and recycled plastic slats surface mount as manufactured by Wabash Valley, DFW International Commerce Park 2580 Esters Road Suite 100 DFW Airport, TX 75261 or approved equal.

Cement concrete for bench pad shall be 4000 psi conforming to Section M 4.02.00 of the Standard Specifications.

Contractor shall submit shop drawings and color samples for approval by the Engineer, including anchoring device, prior to ordering.

CONSTRUCTION METHODS

The Contractor shall assemble and install benches as per manufacture's recommendations.

Anchors shall be long enough to penetrate through the concrete and be securely anchored with epoxy cement in the concrete sidewalk or concrete base course.

Contractor shall protect benches from damage until final acceptance. Touch-up, repair or replace damaged products before substantial completion. Damaged items will not be accepted, as determined by the Engineer.

ITEM 707.17 (Continued)

METHOD OF MEASUREMENT

Item 707.17 will be measured for payment by the Each bench furnished and installed, complete in place.

BASIS OF PAYMENT

Item 707.17 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 707.2 TRASH RECEPTACLE EACH

The work under this item shall consist of furnishing and installing trash receptacles as shown on the plans and as specified herein.

The Contractor shall provide product data and shop drawings for approval by the Engineer.

MATERIALS

Trash receptacle shall be the size and configuration shown on the drawing. Trash receptacle shall be model 84-32 FTO manufactured by DuMor, Inc., P. O. Box 142; Mifflintown, PA 17059-0142; Tel: 717-436-2106; www.dumor.com or model number RB-36 as manufactured by Victory Stanley, Inc. P.O. Drawer 330 Dunkirk, MD 20754, Tel. 301-855-8300; www.victorstanley.com, model Carnival 32 Gallon with no door as manufactured by Thomas Steele 1080 Uniek Dr, Waunakee WI 53597 Tel. 608-849-1080 or approved equal.

The trash receptacle shall be 32 gallon capacity with a detachable cover of spun 14-gauge steel coated with a vinyl-coated cable and plastic liner. All welds shall be continuous and ground smooth. Color shall be black.

Fasteners shall be stainless steel.

CONSTRUCTION METHODS

The Contractor shall install according to the manufacture's recommendations and as shown on the drawings.

Trash receptacles shall be installed with expansion anchor bolts that extend a minimum of 2 inches into the concrete pavement. Locations shall be as shown on the plans and as approved by the Engineer. Anchor bolts and nuts shall be stainless steel. Contractor shall coordinate the size of the anchor bolts with the openings in the trash receptacles. Each trash receptacle shall have four anchor bolts.

Trash receptacles shall be installed plumb, as approved by the Engineer.

Contractor shall protect trash receptacles from damage until final acceptance. Touch-up, repair or replace damaged products before substantial completion. Damaged items will not be accepted, as determined by the Engineer.

METHOD OF MEASUREMENT

Item 707.2 will be measured for payment by the Each trash receptacle furnished and installed, complete in place.

BASIS OF PAYMENT

Item 707.2 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 707.8 STEEL BOLLARD EACH

The work under this item shall consist of furnishing and installing bollards at the locations and to the dimensions shown on the plans in accordance with these specifications and/or as required by the Engineer. All materials shall be in accordance with the applicable sections of the Standard Specifications.

The work shall include the installation of 24" diameter concrete foundations and 6 ½" O.D. / 6" I.D., schedule 40 steel bollards filled with cement concrete. Steel Bollards shall be steel ASTM Grade B and, in accordance with the plan and detail, have yellow PVC color with white retroreflective bands. Paint shall conform to the requirements under section M7.00.0.

All bollards shall be installed plumb in a concrete foundation as detailed.

The Contractor shall submit shop drawing(s) of steel bollards, installation method, and associated foundations to be approved by MassDOT.

METHOD OF MEASUREMENT

Item 707.8 will be measured for payment by the Each steel bollard furnished and installed, complete in place.

BASIS OF PAYMENT

Item 707.8 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 707.9 BICYCLE RACK EACH

The work will consist of the furnishing and installation of steel bicycle racks in accordance with these specifications and at specific locations shown on the plans or established by the Engineer.

MATERIALS

The bike racks shall be manufactured by shall be U Rack U238-IG-P, 22" width, 34" height, with in ground mounting as manufactured by Madrax division of Garber Manufacturing 1080 Uniek Dr, Waunakee WI 53597, Heavy Duty Hoop Rack inground mount as manufactured by Dero of 5522 Lakeland Ave. Minneapolis, MN 55429 or Heavy Duty Hoop Rack HRHD-in ground Mount as manufactured Belson 627 Amersale Drive Naperville, IL 60563 or approved equal.

U shaped bicycle rack shall be constructed of 2 3/8" OD x 0.154 thick wall, ASTM A53, Schedule 40 steel pipe. Finish shall be electrostatically applied super TGIC (Triglycidyl isocyanurate) polyester powder coat. Finish shall be factory applied. Color shall be black.
Bicycle parking racks are to carry a one year manufacturer's limited warranty against defects in materials and workmanship.

Grout shall be pourable exterior anchoring hydraulic cement per item on MassDOT QCML.

Gravel Borrow	M1.03.0 (Type B)
Cement Concrete (Air-Entrained 4000 psi, ¾", 610)	M4.02.00

CONSTRUCTION METHODS

The Contractor shall consult the manufacturer in order to install the bicycle rack properly and shall provide a representative who is thoroughly familiar with the installation process. The Contractor shall install the bicycle racks level, plumb and true.

Engineer shall approve the locations of the bicycle racks prior to installation of the footings.

The Contractor shall protect bicycle rack finishes on exposed surfaces from damage by applying a temporary protective covering or wrapping before shipping. Materials shall be stored in compliance with the manufacturer's directions to prevent deterioration from moisture, heat, cold, direct sunlight, or other causes.

Each end of the bicycle rack shall be installed on a concrete footing as shown on the drawings as per manufacturer's recommendations Top of footing shall be set below the finished paving course. The spacing of each rack shall be a minimum of 3feet on center or as recommended by the manufacturer or as deemed reasonable by the Owner in order to fit within the available site conditions.

The Contractor shall inspect the bike rack after installation is completed and remove spots, dirt, and debris from all components. The Contractor shall repair damaged finishes to match the original finish or replace the damaged component.

ITEM 707.9 (Continued)

METHOD OF MEASUREMENT

Item 707.9 will be measured for payment by the Each bicycle rack furnished and installed, complete in place.

BASIS OF PAYMENT

Item 707.9 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 740. ENGINEER'S FIELD OFFICE AND EQUIPMENT (TYPE A) MONTH

The work under this Item shall conform to the relevant provisions of Subsection 740 of the Standard Specifications and the following:

Two computer systems and printer system meeting minimum requirements set forth below including installation, maintenance, power, paper, disks, and other supplies shall be provided at the Resident Engineer's Office:

All equipment shall be UL approved and Energy Star compliant.

The Computer System shall meet the following minimum criteria or better:

Processor:	Intel, 3.5 GHz
System Memory (RAM):	12 GB
Hard Drive:	500 GB
Optical Drive:	DVD-RW/DVD+RW/CD-RW/CD+RW
Graphics Card:	8 GB
Network Adapter:	10/100 Mbit/s
USB Ports:	6 USB 3.0 ports
Keyboard:	Generic
Mouse:	Optical mouse with scroll, MS-Mouse compliant
Video/Audio	the computer system shall be capable of allow video calling and recording:
Video camera	shall be High Definition 1080p widescreen capable video calling and recording with built in microphone. The microphone system shall capture natural audio while filtering out background noise.
Audio	shall be stereo multimedia speaker system delivering premium sound.
OS:	Latest Windows Professional with all security updates
Web Browser:	Latest Internet Explorer with all security updates
Applications:	Latest MS Office Professional with all security updates Latest Adobe Acrobat Professional with all security updates Latest Autodesk AutoCAD LT Antivirus software with all current security updates maintained through the life of the contract.
Monitors:	Two 27" LED with Full HD resolution. Max. resolution 1920 x 1080
Flash drives:	2 (two) - 128GB USB 3.0
Internet access:	High Speed (min. 24 mbps) internet access with wireless router.

ITEM 740. (Continued)

The Multifunction Printer System shall meet the following minimum criteria or better:

Color laser printer, fax, scanner, email and copier all in one with the following minimum capabilities:

- Estimated volume 8,000 pages per month
- LCD touch panel display
- 50 page reversing automatic document feeder (RADF)
- Reduction/enlargement capability
- Ability to copy and print 11" x 17" paper size
- email and network pc connectivity
- Microsoft and Apple compatibility
- ability to overwrite latent images on hard drive
- 600 x 600 dpi capability
- 30 pages per minute print speed (color),
- 4 Paper Trays Standard (not including the bypass tray)
- Automatic duplexing
- Finisher with staple functions
- Standard Ethernet. Print Controller
- Scan documents to PDF, PC and USB
- ability to print with authenticated access protection

The Contractor shall supply a maintenance contract for next day service, and all supplies (toner, staples, paper) necessary to meet estimated monthly usage.

The Engineer's Field Office and the equipment included herein including the computer system, and printer shall remain the property of the Contractor at the completion of the project. Disks, flash drives, and card readers with cards shall become the property of the Department.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Compensation for this work will be made at the contract unit price per month which price includes full compensation for all services and equipment, and incidentals necessary to provide equipment, maintenance, insurance as specified and as directed by the Engineer.

ITEM 751.7 COMPOST BLANKET CUBIC YARD

The work under this Item shall conform to the relevant provisions of Subsection 751 and M1.06.0 Compost of the Standard Specifications and the following:

Work shall consist of furnishing and pneumatically applying compost as a thin mulch blanket (1/2- 1 inch depth) over prepared soil to provide temporary soil stabilization and organic matter for plant growth.

SUBMITTALS AND MATERIALS

No materials shall be delivered until the required submittals have been approved by the Engineer. Delivered materials shall match the approved samples. Approval of test results does not constitute final acceptance.

Contractor shall submit to the Engineer samples and certified test results no sooner than 60 days prior to application of compost. Vender certification that material delivered meets the test results shall be submitted if requested.

Compost shall meet the requirements for M1.06.0: Compost, Type 2, as referenced in the MassDOT– Highway Division Standard Specifications for Highways and Bridges, Division III: Materials Specifications, latest edition.

The Engineer shall approve the Contractor's equipment for application.

CONSTRUCTION METHODS

Application of compost material shall not begin until the Engineer has approved the site and soil conditions. Soil preparation shall be as specified under the applicable item for soil placement or for seeding. The Contractor shall notify the Engineer when areas are ready for inspection and application of compost.

Compost blanket shall be pneumatically applied (blown on) to a minimum depth of one half to one inch. Where shown on the plans or when directed by the Engineer depth may be increased to provide berms for sediment control or to otherwise prevent slope erosion.

When compost blanket is proposed with seeding, seed shall be broadcast and shall occur in conjunction with compost blanket, as specified under the relevant item for seeding.

When compost blanket is proposed for areas with planting, compost (and seed if applicable) shall be applied after planting. If compost and seed occur prior to planting, areas shall be regraded and compost and seed reapplied to the satisfaction of the Engineer and at the Contractor’s expense.

ITEM 751.7 (Continued)

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 751.7 will be measured and paid for at the Contract unit price per Cubic Yard which price shall include all labor, materials, equipment, and all incidental costs required to complete the work of pneumatically applying compost.

Surface preparation of substrate receiving compost blanket shall be compensated under the applicable item for placement of loam, sand, ordinary borrow, wetland soil, topsoil rehandled and spread, tilled existing soil, or other specified substrate.

Seeding, if utilized, will be compensated for under the appropriate seeding items.

ITEM 755.35 INLAND WETLAND REPLICATION AREA LUMP SUM

The work under this item shall conform to the relevant provisions of Subsections 120, 770, 771 of the Standard Specifications and the following:

Work under this item shall include furnishing material and the construction and maintenance of inland wetland replication areas as shown on the drawings and as required by the Engineer. Inland Wetland Replication Area shall hereafter be referred to as Replication Area. All work shall be in coordination with an approved Wetland Specialist as specified under that item.

Wetland Restoration work shall be as specified and compensated under that item. Construction of tidal wetlands shall be as specified under the appropriate item for tidal wetland mitigation.

The Replication Area shall be constructed prior to wetland impacts unless otherwise approved by the Engineer, specified herein, or specified in permit conditions and approvals. Construction schedule shall be appropriate to planting and seeding season (see below). Changes to this schedule will require written approval from the Engineer.

DESCRIPTION OF WORK

Construction of the Replication Area shall be completed as shown on the drawings at the following location(s):

Area/s A at Road: ***Gilmore Terrace*** Area = ***2,500*** sf.

Replication Area shall be constructed to meet the requirements of all associated permits and certifications, including relevant performance standards of the Massachusetts Wetlands Protection Act (MGL C. 131, s40), Section 401 Water Quality Certification, and Section 404, U.S. Army Corps of Engineers Permit.

The Contractor is responsible for protection and preservation of natural areas adjacent to the Replication Area both within and outside the project limits and for the duration of the Contract; including but not limited to damage to soils or vegetation due to erosion, sedimentation, compaction, trampling, vehicles, storage of materials, or other negligence shall be repaired to the satisfaction of the Engineer and at the Contractor's expense.

The Wetland Specialist overseeing the Wetland Replication construction work shall not be from the same company as that which is performing planting, seeding, or participating in any aspect of the Wetland Replication construction.

SUBMITTALS - DOCUMENTS

Request for Conditional Acceptance: As specified below, a letter requesting Conditional Acceptance of the work and the site conditions shall be submitted to the Engineer.

Request for Certificate of Compliance (Partial or Full): As specified below, shall be submitted to the Engineer for distribution to appropriate regulatory agencies.

ITEM 755.35 (Continued)

Request for Final Acceptance: As specified below, a letter requesting Final Acceptance of the work and the site conditions shall be submitted to the Engineer.

Monitoring Reports: Reports shall be submitted to the Engineer as specified below. Reports shall be compensated under Item 755.75 and 755.76.

SUBMITTALS - MATERIAL

Soil and Amendments

No soil, compost, or other soil amendment imported to the work site shall contain seeds, roots, stems, or other viable parts of invasive plants or other noxious plants.

At least sixty (60) days prior to installation and prior to ordering, the Contractor shall submit for approval sources of soil, compost, and amendments. Submittal shall include the supplier and location of the source. Off-site sources shall be identified and available for inspection by the Wetland Specialist prior to transport of material to the site to verify that they are likely to be free of invasive plant species, including all viable plant parts.

Samples of tested and approved wetland soil and soil amendments for soil texture, organic carbon content or other routine soil analysis parameters (e.g., pH, Cation Exchange Capacity, Percent Base Saturation) and Soil Organic Matter Analysis will be required if requested by the Engineer. The grab samples shall be collected by the Contractor or Wetland Specialist from multiple representative locations in the wetland topsoil mix following the "Umass Soil and Plant Tissue Testing Laboratory Sampling and Collection Protocols" (or equivalent certification paperwork provided by the soil supplier). The lab analysis shall be provided to the Engineer along with written certification from the Contractor or Wetland Specialist that the wetland topsoil was collected per the referenced protocol and meets the desired specification. The analysis and written certification of same shall be provided to the Engineer prior to placing the wetland topsoil in the Replication Area.

Seed Mix

Certificate of Materials from the supplier shall be submitted 30 days prior to seeding and must be approved prior to ordering materials. Seed species listed on the certificate shall include ecotype region (i.e., *Asclepias incarnata*, PA Ecotype).

Seed tag from the bag of seed used shall be submitted to the Engineer at the time of seeding. Seed tag shall include ecotype region and species, guaranteed percentages of purity, weed content and germination of the seed, and the net weight. Seed tag shall match the Certificate of Materials, include the name of the supplier, and date material was sent.

Bill of lading or notarized Certificate of Compliance from the Supplier serving as proof of purchase shall be submitted if requested by the Engineer. Document shall include date of sale, quantity, lot number, and address of Supplier. This shall match the seed tag. Notary shall not work for either the contractor or seed supplier.

ITEM 755.35 (Continued)

Plant Certification

Plant Certification shall be per the applicable requirements of Subsection 771, PLANTING TREES, SHRUBS AND GROUNDCOVER, of the Standard Specifications. The nursery source shall certify the provenance or origin of all plants.

MATERIALS

Sediment Control Barrier and Erosion Prevention Measures

Sediment control barriers shall be per Item 767.121.

Erosion prevention measures for disturbed areas adjacent to the Replication Area shall include but not necessarily be limited to compost blankets, jute mesh, seeding, and/or combinations thereof as approved by the Engineer.

Sediment controls and erosion prevention devices and measures shall be compensated under the respective items.

Wetland Soil

Soil appropriate for the Replication Area may be either hydric soil excavated from the impacted wetland, a manufactured mix of compost and on-site borrow, or a combination thereof, as approved by the Engineer.

Hydric soil from the impacted wetland area may be spread on the surface of the constructed Replication Area as an inoculant or can be placed in a bulk fashion in a roughly 1:1 ratio of area and depth. Soil shall be handled such that the original soil structure is preserved and shall not be compacted, screened, or otherwise processed.

Hydric soil from the impacted wetland that is infested with invasive plant species identified on the Massachusetts Invasive Plant Advisory Group (MIPAG) shall not be used in the Replication Area unless approved by the Wetland Specialist and Engineer. To the extent possible, infested soil shall be disposed of within the project limits in an upland area outside of regulated areas and as approved by the Invasive Plant Management Strategy item (if in the contract) or by the Engineer.

A manufactured mix suitable for wetlands shall consist of on-site borrow from the proposed Replication Area (if approved by the Wetland Specialist and Engineer) thoroughly mixed with compost to achieve a target organic carbon content of 10-12% (up to 21% percent organic matter) by dry weight. The organic material used for mixing shall be well or partially decomposed. Clean leaf compost is the preferred soil amendment to achieve these standards though other materials may be used if approved by the Wetland Specialist and Engineer. Note that “clean” refers both to a negligible amount (<1%) of physical contaminants such as plastic and to the lack of chemical contaminants that might pose a hazard to plants or animals. Off-site borrow may be used for mixing if approved in advance by the Engineer.

ITEM 755.35 (Continued)

No soil or soil amendment shall be brought on site without approval of the material source by the Wetland Specialist and the Engineer. Soils used in the replacement area shall be free of rocks greater than 4 inches in diameter.

Plants

Plant material shall conform to the applicable requirements of Section 771, PLANTING TREES, SHRUBS AND GROUNDCOVER, of the latest edition of the Standard Specifications and as amended below.

Plants shall be native species, not cultivars. To the extent possible, plants shall originate from the applicable EPA Level III Ecoregion.

Plant species and sizes to be included in the Replication Area shall be as specified on the plans. Requests for substitutions shall be submitted in writing to the Engineer for review by the Wetland Specialist, MassDOT Landscape Architect, and, if required, the relevant regulatory agency at least thirty (30) days prior to planting. All proposed substitutes shall be in conformance with the requirements herein and suitable for the site conditions.

Transplanting and plant material collected from the wild is prohibited unless approved in writing by the Engineer. Plants shall be selected from certified nurseries that have been inspected by state and/or federal agencies.

Seed Mix

Seeding shall conform to the Standard Specifications Section M6, ROADSIDE DEVELOPMENT MATERIALS.

ITEM 755.35 (Continued)

Wetland Seed mix shall be:

Mix 765.554 **Wetland – Seasonally Flooded Mix** **LB**

	Botanical Name	Common Name	% PLSBy Weight
Grass			
	Elymus riparius	Riverbank Wild Rye	20.00%
	Andropogon gerardii NY Eco	Big Bluestem NY Eco	12.00%

		6.60%
Seeding Rate: 15.0 lbs PLS/Acre		**100.00%**

Fertilizers shall not be used.

ITEM 755.35 (Continued)

Water

The Contractor shall provide water and all equipment required at no extra cost. Water shall be suitable for irrigation and free from ingredients harmful to plants and wildlife. Water from the adjacent water bodies or waterways shall not be utilized. It is the Contractor's responsibility to correct injury or damage due to the lack of water, too much water, or use of contaminated water.

Mulch/Compost Blanket for Seeding

Hydromulch shall be per the manufacturer's recommendations and shall be wood fiber or straw mulch only. Mulch shall be incidental to seeding.

Compost Blanket may be used in lieu of mulch for seeding. Compost Blanket shall meet the material and submittal requirements of that Item and shall be applied as specified below. Compost Blanket shall be compensated under that item.

CONSTRUCTION METHODS & SEQUENCE

SITE PROTECTION MEASURES

Minimizing Damage

The Contractor shall plan and execute operations in a manner minimizing the amount of excavated and exposed fill or other foreign materials that could be washed or otherwise carried into Replication Area and nearby resource areas.

Construction of and access to the Replication Area shall minimize damage to existing vegetation and soils as specified herein. Damage to soils or vegetation shall be repaired to the satisfaction of the Engineer and at the Contractor's expense. If required for soil remediation, tilling and the addition of compost shall be at the Contractor's expense.

Wetland topsoil shall be deposited and graded in the Replication Area in a manner that minimizes travel and subsequent compaction of the subgrade (including any specified pit and mound topography) to the extent practicable, including use of track mounted excavators as appropriate. Should soils be compacted, they shall be loosened by a method such as disking, spring-tooth harrowing and/or rototilling. The Contractor shall use boards, timber or composite mats, or other approved materials as necessary, to protect existing and/or new wetlands from compaction due to heavy foot traffic or if equipment is required to travel over wetland soil. All labor and materials required for protection and preservation of site shall be incidental to this item.

ITEM 755.35 (Continued)

Stockpiling of Soil

Stockpiling of soil, including hydric soil for replication, shall be at least 100 feet from the edge of the bordering and isolated vegetated wetlands and inland banks, unless approved otherwise by the Engineer. Stockpiled soils shall be securely stabilized and contained. Any areas of exposed soil or stockpiles within and adjacent to the Replication Area that will remain inactive for more than 7 calendar days shall be sown with a mix of rapid germinating annual grasses (e.g., annual rye) covered with a layer of straw mulch applied at a rate of 90 pounds per 1,000 square feet. As necessary, the mulch shall be anchored with a tacking coat (non-tar) applied by a hydro seeder or other method recommended by the Wetland Specialist in consultation with the Engineer. In the event that there is excess borrow, it shall be disposed of under Excavation, Item 120.

Sediment Barriers

Placement: Sediment barriers shall be installed along the downslope perimeter of the Replication Area beginning and ending in the surrounding upland so that no excavated material or disturbed soil can enter adjacent wetlands or waters. Where construction work is immediately upgradient of the wetland, barriers shall be located so as to protect the Replication Area until slopes are stabilized. Sediment barriers shall be in place and approved by the Engineer prior to excavation work. No work shall take place outside the barriers.

Maintenance: The Contractor shall ensure that all sediment barriers function as intended and at all times per the specifications of those respective items.

Existing Trees to Remain

Tree protection shall be per the relevant specifications and as shown on the plans or as required by the Engineer. To protect root systems of existing trees to remain, the limits of the Replication Area may be adjusted, but, the total area of replication required by the permits shall not be reduced. Access route may be adjusted as required.

Trees to be retained as snags (upright dead or dying trees left for wildlife habitat) within or adjacent to the Replication Area shall be as shown on the plans or as directed by the Wetland Specialist or Landscape Architect during the initial site walk. Trees to remain as snags shall be clearly marked prior to clearing. Trees that pose a potential fall hazard (i.e., are near a roadway) should have limbs and trunk cut such that the tree does not pose a fall hazard.

Coarse woody debris in the form of cut trees, stumps, logs, and brush shall be incorporated as shown on the plans or as directed by the Wetland Specialist or Landscape Architect. On site material shall be selected and marked by the Wetland Specialist, retained on the project site, and placed as specified below under Placement of Coarse Woody Debris.

All trees, stumps, or brush not specified to remain shall be removed and shall not be stockpiled in the wetland resource areas while awaiting disposal.

Work shall be coordinated with Clearing or Tree Removal Item and compensated under that Item.

ITEM 755.35 (Continued)

PRE-WETLAND CONSTRUCTION SITE WALK

Delineating the Replication Area and Access Route. The Contractor shall stake out the Replication Area boundaries and the intended access route and set grade stakes for approval by the Wetland Specialist and Engineer. Following staking and demarcation of areas, the Engineer and Wetland Specialist shall approve or modify as necessary the limits of work, the access route, final location and configuration of replication, grade stake elevations, proposed location of sediment barriers, and review proposed construction methods.

As part of the delineation and approval process, the Wetland Specialist shall mark trees to be converted to snags, select course woody debris to be retained for re-use, and select rocks or other elements to be used for habitat features.

Invasive Plants: As part of the initial site walk, the wetland to be impacted and the proposed replication site shall be inspected for the presence of invasive plants. If invasive plants are found they shall be addressed as described herein under Invasive Plants.

SOIL WORK

Final grades in the Replication Area shall meet the target elevations as shown on the Plans or as adjusted by the Wetland Specialist to achieve the desired hydrology and micro-habitat. If adjustments are required, a Request for Information (RFI) shall be submitted to the Engineer for approval. Adjustments shall be documented and included in the As-Built plans (if required) and/or other applicable required documents.

Excavation & Grading

When required by permits, the Wetland Specialist shall notify MADEP and the ACOE (as applicable) at least 72 hours prior to excavation.

Soil in the proposed wetland areas that must be removed for grades to conform to the proposed elevations shall be stripped and disposed of, or, if suitable for reuse, be stockpiled in an approved location. Stockpiled soils shall be kept wet and not allowed to dry out. Procedures for maintaining appropriate moisture levels shall be documented by the Wetland Specialist and provided to the Engineer and the Contractor.

Replication area shall be excavated as shown on the drawings. Where replication area is adjacent to existing reference wetland, finish grade of replication shall generally match existing grades and micro-topography, notwithstanding any deviations that are necessary to achieve the desired hydrology and habitat in the Replication Area.

Prior to placement of backfill, scarify subgrade to a depth of 4 to 6 inches.

ITEM 755.35 (Continued)

Placement of Wetland Soil

Following excavation, scarification, and grading of sub-grade, and after the sub-grade elevations are approved by the Wetland Specialist, suitable soil previously removed or an evenly mixed organic/mineral soil created on-site shall be spread to the design depth and thickness over the proposed wetland areas as shown on the plans and as directed by the Wetland Specialist.

Vehicles used to transport soil from offsite shall be washed or cleaned with air pressure to prevent exotic or invasive seeds or root fragments from contaminating the Replication Area.

Final Grading

The finished grade of the Replication Area shall be at an elevation that will provide an unrestricted hydrologic connection between the Replication Area and adjacent resource areas. The hydrologic connection should be in keeping with restoring the intended function of the replacement wetland relative to the impacted reference wetland. The Contractor shall verify that this elevation is not at a level that could negatively alter the hydrology of an adjacent wetland. Microtopography in the form of hummocks, pits and mounds shall be as shown on the plans or as adjusted by the Wetland Specialist. Final elevations and grading of wetland soil shall be approved by the Wetland Specialist and the Engineer.

To avoid compaction once soil has been placed, no heavy equipment shall travel across placed soil and no work shall occur in wet or moist soil. Soil that is compacted due to construction activities shall be replaced with soil as specified herein and at the Contractor's expense.

Installation of Monitoring Wells in Replication Area

For a constructed Replication Area over 1,000 square feet, a representative number of monitoring wells shall be installed in locations as shown on the Plans. Monitoring wells shall include data loggers. For purposes of this specification, a data logger refers to a battery powered device that records groundwater level. Data shall be collected by the Wetland Specialist and submitted with Monitoring Reports and as required by applicable permits. Wells shall be installed immediately following completion of construction of the Wetland Replication Area. Wells shall be installed in accordance with USDA/NRCS technical report entitled: "Sprecher, S.W. 2008. Installing monitoring wells in soils (Version 1.0). National Soil Survey Center, Natural Resources Conservation Service, USDA, Lincoln, NE." or equivalent methodology approved by Engineer.

ITEM 755.35 (Continued)

RESTORING VEGETATION

Placement of Coarse Woody Material

If specified within this Contract or if directed by the Wetland Specialist or Landscape Architect during the initial site walk, woody debris shall be placed in the Replication Area and/or adjacent upland buffer. Material shall be placed as shown on the plans or as directed following placement of wetland soil and prior to application of compost and/or seed. Woody material shall cover a minimum of 5-20 percent of the Replication Area, depending on whether it is a meadow or woodland wetland and how much wood is available from construction clearing. Where trees are cut for construction purposes, logs of a minimum length of 8 feet must comprise a minimum of 50% of the woody material left on site. Brush shall be included along with logs and stumps as directed. Woody material shall be placed in a deliberate and naturalistic manner.

Planting

Following placement of wetland soil and approval of final grade and conditions, Replication Area shall be planted. Planting shall conform to SECTION 771 PLANTING TREES, SHRUBS AND GROUNDCOVER of the Division I Standard Specifications and as amended below.

Planting Season shall be May 15-June 15 and September 1-November 1 unless otherwise specified in applicable permit conditions.

Prior to planting, the Wetland Specialist shall approve the condition of the plant material and the method of installation and shall oversee the planting work. Replication Area shall be planted in the dry. Plants shall be placed according to the planting details and within the range of target elevations and at the spacing shown on the Plans or, if spacing is not indicated on the Plans, at the direction of the Wetland Specialist. Unless otherwise noted on the Plans, final plant locations shall be determined on site and located with regard to expected hydrology, plant growth characteristics, habitat desired, and water protection.

Plant material shall be installed as soon as possible after delivery. Plants stored on-site prior to installation shall be stored in the shade and watered twice daily up until time of installation. Plants showing signs of stress or compromised health may be rejected by the Engineer or Wetland Specialist and shall be replaced at the Contractor’s expense.

Plant material shall be furnished and installed as indicated including all labor, materials, plants, equipment, incidentals, re-setting of plants (frost heaves, etc), irrigation, re-planting and clean up. If previously approved species are not available at the time of planting, the Wetland Specialist may propose substitutions relative to species, size, and quantities for review and approval by the MassDOT Landscape Architect. Upon approval by MassDOT, substitutions shall be approved by the regulating authority, if and as necessary. Provisions shall be made for a growth warranty of at least two (2) calendar years from the date of Conditional Acceptance as described below or as required by permits.

ITEM 755.35 (Continued)

Seeding

Following placement of wetland soil and planting,the Replication Area shall be seeded using one of the following methods:

- Broadcast by hand or with a hand-held spreader followed by application of straw mulch. If necessary, seed shall be lightly raked to insure good seed-to-soil contact.
- Hydro-seeded with hydro mulch per the Standard Specifications and per the manufacturer's directions.
- Hand broadcast seed with Compost Blanket pneumatically applied at the same time to ensure light cover of soil topdressing over seed.

If spring conditions are drier than usual, supplemental watering may be required. If sowing during the summer months, supplemental watering will likely be required until germination.

If required, seeding limits for different seed mixes shall be determined by the Wetland Specialist.

PLANT ESTABLISHMENT AND INVASIVE MANAGEMENT

Plants shall be watered as necessary to maintain healthy establishment. Plants that fail by September 1 after spring planting or by May 15 after fall planting shall be replaced within the immediate or next planting period and at the Contractor's expense.

Seeding that fails to established according to the conditions of acceptance below shall be over-seeded as required by the Engineer. Washouts and channels shall be repaired and stabilized prior to overseeding. Excessive weed growth shall be pulled out by the roots or, with approval from the Engineer, cut prior to over-seeding. Soil repair and weed control are incidental to this item.

Invasive Plants: Corrective measures shall be taken to remove or treat invasive plant species in the Replication Areas. Invasive plants shall include those listed as invasive by Massachusetts Invasive Plant Advisory Group (MIPAG) and the US Army Corp of Engineer's New England District's Compensatory Mitigation Guidance

The strategy for chemical and/or manual removal shall be as directed by the Wetland Specialist, shall continue for the duration of the monitoring period, and shall be incidental to this item.

CONDITIONAL ACCEPTANCE OF WORK

Conditional Acceptance shall indicate approval of the wetland construction work and agreement that work has been done according to plan or modified as approved.

Upon completion of construction, the Contractor shall submit a Request for Conditional Acceptance that includes a brief narrative from the Wetland Specialist demonstrating that the wetland replication construction work was done according to plans (or how modified) and meets required permit conditions. The narrative shall include, photo-documentation of pre-construction conditions as well as soil work, planting, and seeding. Seed tags shall be submitted as part of the Request for Conditional Acceptance.

ITEM 755.35 (Continued)

Upon receipt of a Request for Conditional Acceptance, the Engineer, the Wetland Specialist, and regulatory representative (if required) shall assess the Replication Area and surrounding areas. At a minimum, the following conditions shall be included in the narrative and reviewed as part of the on-site assessment of whether:

- The final finished target elevations have been met and maintained relative to the approved plans and reference wetland. Areas that are too high or too low should be identified along with suggested corrective measures.
- Hydrology meets performance standards.
- Specified seed mix has been seeded. If inspected 30 or more days after seeding, seeded species in the wetland and adjacent upland shall show signs of good germination and healthy growth.
- Planted woody and herbaceous species meet specifications and are establishing well.
- Soils are stabilized and there is no sediment in the wetland and no channeling of slopes.
- There are no invasive plants visible in the replication area.

Upon approval that the work meets the above conditions, MassDOT will issue a letter of Conditional Acceptance. If the Wetland Replication work is not approved, MassDOT will issue a rejection letter requiring corrective actions. The Wetland Specialist shall recommend corrective actions. Work not approved shall be addressed by the Contractor at no extra cost.

Wetland Specialist shall be compensated under Item 755.75.

Erosion of adjacent slopes or the flow of sediments into the wetland between Conditional and Final Acceptance shall be immediately addressed by the Contractor.

REQUEST FOR CERTIFICATE OF COMPLIANCE

If required, a request for a Certificate of Compliance (Partial or Full) pursuant to the Massachusetts Wetlands Protection Act regulations shall be prepared and submitted to MassDOT within 30 days following Conditional Acceptance.

The Request for Certificate of Compliance shall include the following:

- A brief narrative of the work on company letterhead signed by the Wetland Specialist. Narrative shall be prepared as a MS Word document and shall include substantive explanation that demonstrates compliance with EACH relevant permit condition. Narrative shall note variations from the originally permitted design.
- As-built Drawings signed by the Contractor's PE registered in the Commonwealth of Massachusetts. As-built drawings shall show hydrologic conditions, status of plantings and seeding, and shall include a narrative and minimum of 4 photographs documenting site conditions. Plans should note variations from the originally permitted design.

ITEM 755.35 (Continued)

When required, drawings shall meet the Army Corp of Engineer's New England District's Compensatory Replication Guidance, including: scale in the range of 1"=20' to 1" = 100', contours at 1' intervals, spot elevations for intermediate elevations, and polygons outlining each Replication Area, and, as applicable, plant community types. The As-built Drawings shall be provided to the Engineer electronically in Portable Document Format (PDF). If requested by the Engineer, the Drawings shall be provided in printed paper format (11" x 17" sheets, unless otherwise directed). Drawings must be scalable.

- Other documents as required.

FINAL ACCEPTANCE OF WORK

Following one full growing season, the Contractor shall submit a Request for Final Acceptance. Submittal shall include a brief narrative of conditions. Upon receiving the Request, the Engineer, Contractor, Wetland Specialist and regulatory representative (if required) shall assess the Replication Area. Final Acceptance will initiate the start of the Wetland Monitoring Period.

The following conditions shall be inspected and approved for acceptance and payment.

- Hydrology is functioning as intended.
- The desired seeded species are establishing well and cover at least 95 percent of the Replication Area, excluding areas of open water areas or planned bare soil.
- No sediments have entered the wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- All planted species are living and establishing well.
- There are no visible invasive plants.
- Silt fence and non-biodegradable sediment barrier materials have been removed.

If the mitigation work does not meet the above condition and is not approved, MassDOT will issue a rejection letter requiring corrective action. The Wetland Specialist shall recommend corrective actions. Work not approved will be addressed by the Contractor at no extra cost.

Wetland Specialist shall be compensated under Item 755.75.

MONITORING REPORTS FOR REGULATORY COMPLIANCE

Post wetland construction Monitoring Reports shall be completed and submitted by the Wetland Specialist as specified and compensated under Item 755.76 Wetland Monitoring Reports.

ITEM 755.35 (Continued)

Generally, the following conditions shall be met upon each inspection:

- Hydrology is functioning as intended.
- The desired seeded species are establishing well and cover 95 percent of the area, excluding areas of open water areas or planned bare soil.
- No sediments have entered into wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- All planted species (if included) are living and establishing well.
- There are no visible invasive plants.

If, at the end of the required monitoring period, the requirements have not been met and success of the wetland replication area has not been achieved as determined by the Monitoring Reports, the Contractor shall provide corrective measures. All costs associated with corrective measures and plant replacement shall be incidental to this item with no additional compensation.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 755.35 will be paid for at the Contract unit price per Lump Sum, which price shall include all labor, materials, equipment, submittals, maintenance, all required soil, site preparation, grading, wetland seeding, planting, mulching, watering, monitoring wells, registered surveyor, as-built plans, Request for Certificate of Compliance, and all incidental costs necessary to complete the work as required.

Payment shall be as follows:

- 60% upon Conditional Acceptance.
- 20% after receipt and acceptance of Certificate of Compliance by the Engineer and once all permit construction requirements have been met and approved.
- 20% upon Final Acceptance.

Excavation will be paid under Item 120.
Compost Blanket will be paid under Item 751.7
Sediment Control Barrier will be paid under Item 767.121
Wetland Specialist will be paid under Item 755.75
Wetland Monitoring Reports for follow-up monitoring will be paid under Item 755.76

ITEM 755.45 WETLAND RESTORATION SQUARE YARD

The work under this item shall conform to the relevant provisions of Subsections 120, 751, 765, 767, and 771 of the Standard Specifications and the following:

The work under this item shall include all labor and furnishing of materials to complete the work specified herein to protect and restore existing inland wetland areas that will be temporarily impacted as shown on the drawings and as required by the Engineer.

Inland Wetland Replication work shall be as specified and compensated under that item. Tidal wetland mitigation shall be as specified under the appropriate item for tidal wetlands.

Restoration Area shall be constructed to meet the requirements of all associated permits and certifications, including relevant performance standards of the Massachusetts Wetlands Protection Act (MGL C. 131, s40), Section 401 Water Quality Certification, and Section 404, U.S. Army Corps of Engineers General Permit.

All work shall be in coordination with an approved Wetland Specialist. Wetland Specialist qualifications and requirements shall be per Item 755.75, Wetland Specialist.

SUBMITTALS – DOCUMENTS

Request for Conditional Acceptance: As specified below, a letter requesting Conditional Acceptance of the work and the site conditions shall be submitted to the Engineer.

Request for Final Acceptance: As specified below, a letter requesting Final Acceptance of the work and the site conditions shall be submitted to the Engineer.

Request for Certificate of Compliance (Partial or Full): If applicable, request for a Certificate of Compliance shall be submitted to the Engineer for distribution to appropriate regulatory agencies as specified below.

Monitoring Reports: Reports shall be submitted to the Engineer as specified below. Reports shall be compensated under Item 755.76 Wetland Monitoring Reports.

ASSOCIATED ITEMS AND MATERIALS

Timber Mat shall be as specified under that Item 767.91.

CONSTRUCTION METHODS & SEQUENCE

Site Protection Prior to Impacts

Prior to any land work, as part of the initial site-walk, the Wetland Specialist shall photo-document the site and provide a summary report of existing conditions as outlined under Item 755.75 Wetland Specialist.

Where and as required vegetation shall be cut flush and area surveyed to establish pre-construction elevations.

ITEM 755.45 (Continued)

Following the cutting and surveying, timber matting shall be placed as required to protect soil and vegetation from compaction, contamination, and/or other damages. Timber mats shall be placed as specified under the respective items and the Engineer shall approval placement.

Restoration Upon Completion of Construction Work

Sediment Barriers

If required for sediment control during Restoration work (i.e, tilling is required to restore soil), sediment barriers shall be installed along the downslope perimeter of the Restoration Area beginning and ending in the surrounding upland so that no disturbed soil can enter adjacent wetlands or waters. Sediment barriers shall be in place and approved by the Engineer prior to any soil disturbance. No work shall take place outside the barriers.

Removal of Fill and Grading

Timber mats shall be removed and disposed of as specified under the respective items.

If required, grades shall be restored to pre-construction elevations as shown in the baseline survey or as required by the Engineer and Wetland Specialist to restore hydrologic functions. Final elevations shall be approved by the Engineer prior to soil preparation and seeding. Grading shall be incidental to this item.

CONDITIONAL ACCEPTANCE OF WORK

Conditional Acceptance shall indicate approval of the wetland restoration work and agreement that work has been done according to plan or modified as approved.

Upon completion of construction, the Contractor shall submit a Request for Conditional Acceptance that includes a brief narrative from the Wetland Specialist (if applicable to project) demonstrating that the wetland restoration work was done according to plans (or how modified) and meets required permit conditions (if applicable). The narrative shall include, photo-documentation of pre-construction conditions as well as soil work, planting, and seeding. Seed tags shall be submitted as part of the Request for Conditional Acceptance.

Upon receipt of a Request for Conditional Acceptance, the Engineer, the Wetland Specialist, and regulatory representative (if required) shall assess the Restoration Area and the surrounding areas. At a minimum, the following conditions shall be included in the narrative and reviewed as part of the on-site assessment of whether:

ITEM 755.45 (Continued)

- The target elevations have been restored per the survey or adjusted per the Engineer. Areas that are too high or too low should be identified along with suggested corrective measures.
- Soil compaction has been mitigated.
- Soils are stabilized and there is no sediment in the wetland and no channeling of slopes.
- Hydrology meets performance standards and has been adequately restored.
- There are no invasive plants visible in the restored wetland area.
- Silt fence and non-biodegradable sediment barrier materials have been removed.

Upon approval that the work meets the above conditions, MassDOT will issue a letter of Conditional Acceptance. If the Wetland Restoration work is not approved, MassDOT will issue a rejection letter requiring corrective actions. Work not approved shall be addressed by the Contractor at no extra cost.

Erosion of adjacent slopes or the flow of sediments into the wetland between Conditional and Final Acceptance shall be immediately addressed by the Contractor.

FINAL ACCEPTANCE OF WORK

Following one full growing season, the Contractor shall submit a Request for Final Acceptance. Submittal shall include a brief narrative of conditions. Upon receiving the Request, the Engineer, Wetland Specialist and regulatory representative (if required) shall assess the Restoration Area. Final Acceptance will initiate the start of the Monitoring Period (if required).

The following conditions shall be inspected and approved for acceptance and payment:

- Hydrology is functioning as intended.
- No sediments have entered the wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- There are no visible invasive plants.

If the restoration work is not approved, MassDOT will issue a rejection letter requiring corrective action. All costs associated with corrective measures and plant replacement shall be incidental to this item with no additional compensation. Work not approved shall be addressed by the Contractor at no extra cost.

MONITORING REPORTS FOR REGULATORY COMPLIANCE

Post wetland construction Monitoring Reports shall be completed and submitted by the Wetland Specialist as specified and compensated under Item 755.76 Wetland Monitoring Reports.

ITEM 755.45 (Continued)

Generally, the following conditions shall be met upon each inspection:

- Hydrology is functioning as intended, relative to the preexisting condition of the restored wetland.
- No sediments have entered into wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- There are no visible invasive plants.

If, at the end of the required monitoring period, the requirements have not been met and success of the wetland replication area has not been achieved as determined by the Monitoring Reports, the Contractor shall provide corrective measures. All costs associated with corrective measures and plant replacement shall be incidental to this item with no additional compensation.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 755.45 will be paid for at the Contract unit price per Square Yard, which price shall include all labor, materials, compost and amendments, seed, mulch, equipment, submittals, maintenance, grading, and incidental costs necessary to complete the work as required.

Payment shall be as follows:

- 50% upon completion of removal of timber mats and any grading or soil modifications
- 25% upon Conditional Acceptance
- 25% upon Final Acceptance or approval of the Engineer

Sediment Control Barrier will be paid under Item 767.121
Timber Mat will be paid under Item 767.91
Wetland Specialist will be paid under Item 755.75
Wetland Monitoring Reports for follow-up monitoring will be paid under Item 755.76

ITEM 755.75 WETLAND SPECIALIST HOUR

Work under this Item shall be for services of a Wetland Scientist, Wetland Ecologist, Restoration Ecologist, or other professional with similar qualifications hereafter referred to as the "Wetland Specialist."

"Wetland Mitigation" shall be used herein for applicable wetland work. For this project, applicable wetland work is fo*r:* **Item 755.35 Inland Wetland Replication Area and Item 755.45 Wetland Restoration.**

The Wetland Specialist shall demonstrate knowledge and expertise to coordinate and oversee all work associated with the Wetland Mitigation as defined herein, as shown on the Plans, as required by permits, and as specified under the relevant Wetland Mitigation items.

Regulatory monitoring reports following Final Acceptance of the Wetland Mitigation shall be per Item 755.76, Wetland Monitoring Reports.

For all onsite work, the Wetland Specialist shall sign in and sign out with the Engineer.

The Wetland Specialist shall not be from the same company as the company responsible for planting, seeding, and/or maintaining the wetland.

QUALIFICATIONS

The Wetland Specialist shall have a minimum of five (5) years of experience with construction and monitoring of wetland mitigation areas similar in size, type, and complexity to the Contract mitigation. When required by permits, at least ten (10) years of experience may be required. The Wetland Specialist shall be thoroughly versed in the Commonwealth of Massachusetts Wetlands Protection Act (MGL C.131, s.40), U.S. Army Corps of Engineers New England District Compensatory Mitigation Guidance, and all other relevant regulations of the Massachusetts Department of Environmental Protection and the U.S. Army Corps of Engineers New England District.

SUBMITTALS - QUALIFICATION

Within sixty (60) days following the Notice to Proceed, the Contractor shall provide proof of qualifications for the Wetland Specialist to the Engineer for approval. Submittals shall include, but not be limited to, the following:

- Resume of the individual on-site implementing the Wetland Specialist work. If the Wetland Specialist changes over the course of the project, the new individual shall submit resume and qualifications for approval 30 days prior to doing any work on-site.
- Resume of any personnel working on-site in place of the Wetland Specialist. Individual shall be approved prior to work on-site.
- Narrative describing the company, its expertise, technical qualifications and experience with wetland construction.
- At least three (3) references from prior work of a similar nature completed in the last five (5) years and by the individuals who will perform the work. Provide contact information for each reference including address, phone number and email.

ITEM 755.75 (Continued)

- A summary of each reference project including nature of the work, project size, dates, and period of construction and monitoring, methodologies used, and summary of success (or not) in terms of meeting performance objectives. Summary shall include a minimum of one before and one after photo for each project.

SUBMITTALS – DOCUMENTATION AND REPORTS

Wetland Construction Oversight

Wetland Specialist shall provide documentation of pre-existing conditions and wetland construction as specified below and as part of fulfilling the Scope of Work described below. Documentation shall include photos that are clear and legible. Photos are incidental to this item.

- ***Site Walk Prior to Disturbance and Construction of Wetlands:*** Provide brief assessment with photos, including documentation of the existing wetlands to be impacted (both permanent and temporary), proposed wetland replication area, and reference/model wetland areas (typically an adjacent undisturbed wetland or the existing wetland to be impacted). Photos of existing wetlands that will be temporarily impacted shall include a view from at least 3 angles.
- ***Excavation and Grading:*** Documentation shall include minimum of two photos of the excavated wetland and two photos after final grading prior to planting and seeding. For restoration areas, photos shall show soil preparation (i.e, tilling and grading), if applicable.
- ***Approval of Subgrades****:* The Wetland Specialist shall inspect the sub-grade of the Replication Area to ensure that proper hydrology is likely to be established and shall provide the Engineer with written confirmation and photographs upon completion of subgrade excavation work. Written confirmation shall include recommended field adjustments, based on field observations, to achieve the desired hydrology and designed wetland system.
- ***Planting and Seeding:*** Provide assessment and photos of vegetation upon completion of planting and seeding work.
- ***Data logger output from Monitoring Wells*** shall be submitted with reports, if applicable and requested.

Wetland construction documentation and reports shall be submitted with Request for Conditional Acceptance and for the Order of Conditions, Water Quality Certifications, and other regulatory permits as required.

Requests for Acceptance of Work & Regulatory Compliance

The Wetland Specialist shall submit the following documents if and as specified herein and under Item the relevant Wetland Mitigation items:

- Request for Conditional Acceptance.
- Request for Certificate of Compliance (Partial or Full) when applicable.
- Request for Final Acceptance.

ITEM 755.75 (Continued)

SCOPE OF WORK

In the event of discrepancies with the applicable permits, the Wetland Specialist shall submit a Request for Information (RFI) to the Engineer.

General

The Wetland Specialist shall be responsible for the following:

- Review and have a comprehensive knowledge of the environmental permits relevant to the specific mitigation work being done so as to ensure compliance throughout the duration of the contract.
- Identify and inform the Contractor and Engineer of unique site conditions which may require adjustments to the schedule, design, or construction methods. For example, wildlife nesting, illegal dumping, or rare species.
- Identify and inform the Contractor and Engineer of any sediment or erosion control problems observed within mitigation areas.
- Advise so as to avoid impacts to adjacent areas and regulated wetland resources.
- Participate in necessary meetings as required by permits and when requested by the Engineer.

Inspections & Construction Oversight

The Wetland Specialist shall be responsible for, but not limited to, the following:

- Pre-Construction Site Walk
    - Following surveying, flagging, and staking of all relevant boundaries and elevations by the Contractor, the Wetland Specialist shall walk the site with the Engineer and the Contractor to review existing and proposed conditions, recommend changes if necessary, and approve the following: location and boundaries of the Mitigation Area, target elevations and grades, location of tree protection associated with the Mitigation Area, and final layout and limits of clearing for access route.
    - Select and mark snags, logs, and woody material to be retained for placement in the Wetland Mitigation, as appropriate.
    - Note invasive plants in and adjacent to Wetland Mitigation.
    - Provide summary report if and as specified under Wetland Mitigation items.
- Excavation, Soil Placement, Grading for Replication Areas
    - Approve excavated depth and grading for appropriate wetland hydrology, subsoil preparation, and finished grade of placed wetland soil.
    - Adjust grades as required and approve microtopography. If grades need to be adjusted, submit an RFI to the Engineer.
    - If requested by the Engineer, the Wetland Specialist shall inspect stockpiled wetland soil for moisture content and signs of undesirable weeds.
- Soil Protection and Restoration Measures for Restoration Areas
    - Review and approve methods of soil protection and restoration if required.
    - Confirm decompaction will adequately restore appropriate wetland hydrology. If decompaction measures need to be adjusted, submit an RFI to the Engineer.

ITEM 755.75 (Continued)

- Re-vegetation of Mitigation Area
    - Placement of woody material to be re-used.
    - Verify seed used complies with specifications and site conditions, determine limits for wetland seeding based on elevations, approve seeding and mulching methods, and collect seed tags to submit with Request for Conditional Acceptance.
    - Review planting methods (if applicable) prior to installation and oversee layout of wetland plants.

Conditional Acceptance

Upon completion of construction of the wetland, as part of the Request for Conditional Acceptance, the Wetland Specialist shall provide a brief narrative demonstrating that the wetland construction work was done according to plans (or how modified) and meets the conditions required for acceptance as specified under the Wetland Mitigation items. Submittal shall include a report and photo documention of pre-construction conditions, construction work, seeding, planting, and other work as specified under the Wetland Mitigation items. Photos of completed Wetland Restoration areas shall include the same views as the pre-construction reference photos.

Upon receipt of a Request for Conditional Acceptance, the Engineer, the Wetland Specialist and regulatory representative (if required) shall assess the Wetland Mitigation and surrounding area to ensure that it meets the conditions specified under the Wetland Mitigation items.

Upon approval, MassDOT will issue a letter of Conditional Acceptance. If the Wetland Mitigation work is not approved, MassDOT will issue a rejection letter requiring corrective action. The Wetland Specialist shall recommend corrective actions.

Request for Certificate of Compliance

If required, a Request for Certificate of Compliance shall be prepared and submitted to the Engineer immediately following Conditional Acceptance. Request shall be as specified under the relevant Wetland Mitigation items.

Request for Final Acceptance

Following one full growing season, the Wetland Specialist shall provide a brief narrative of the status of the Wetland Mitigation to be submitted with the Request for Final Acceptance.

Upon receipt of the Request, the Engineer, the Wetland Specialist and regulatory representative (if required) shall assess the Wetland Mitigation and surrounding area to ensure that it meets the conditions specified under the relevant Wetland Mitigation items.

If the Wetland Mitigation is not approved, MassDOT will issue a rejection letter requiring corrective action. The Wetland Specialist shall recommend corrective actions.

ITEM 755.75 (Continued)

METHOD OF MEASUREMENT

Item 755.75 Wetland Specialist shall be measured per hour for on-site service provided by the Wetland Specialist.

Work shall include all inspections, photos, submittals, and associated tasks for construction and restoration oversight, narratives for Conditional and Final Acceptance, Request for Certificate of Compliance (Partial or Full) if required, documentation required for permits, and all other work specified above. Payment shall not include travel time or time spent off-site on reports. Decimal Pay Limits will be 0.25 hours.

BASIS OF PAYMENT

Item 755.75 Wetland Specialist shall be paid at the Contractor bid price for each hour, or fraction thereof, spent on-site to perform the work as described above. Reports and photo documentation are required for payment.

Post wetland construction reports shall be per Item 755.76, Wetland Monitoring Reports.

ITEM 755.76 WETLANDS MONITORING REPORTS LUMP SUM

Work under this item shall be for the submittal of Wetland Monitoring Reports following the completion of wetland construction and shall include all inspections, photos, and other work required to complete those reports as specified herein.

"Wetland Mitigation" shall be used herein for applicable wetland work, whether Wetland Replication (creation of a new wetland) and/or Wetland Restoration (restoration after temporary impacts).

The Contractor shall retain the services of a Wetland Scientist, Wetland Ecologist, Restoration Ecologist, or other professional with similar qualifications, hereafter referred to as the "Wetland Specialist," to complete the Wetland Monitoring reports. Wetland Specialist shall meet requirements specified under Item 755.75 Wetland Specialist.

All on-site Wetland Specialist services required to complete the construction and revegetation of the wetland replication, including preparation and submission of monitoring reports during construction, shall be per Item 755.75 Wetland Specialist.

SCOPE OF WORK

Post-Construction Wetland Monitoring Reports

Final Acceptance of the wetland construction work as specified under Items 755.35 and 755.45 shall initiate the beginning of the Monitoring Period.

Inspections and reports shall be performed to ensure compliance with mitigation requirements defined under the relevant Wetland Mitigation items and with all applicable environmental permits. Monitoring reports shall cover the following:

- Identification of all plant species present
- Percent cover for each plant species and overall percent surface area cover by indigenous wetland plant species for replication area and upland
- Description of the viability, health, and vigor of installed plants as well as volunteer plant species within the replication areas
- Description of remedial measures taken to ensure criteria are met
- Depth to apparent water table and/or depth of surface inundation, both as measured from the soil surface and data loggers, as appropriate.
- A conclusion regarding the success of the wetland mitigation area relative to the performance standards at 310 CMR 10.55(4)(b) (unless varied), the design plans, and performance criteria established by MADEP in the variance conditions (when applicable), and the reference wetland.
- Recommendation for a corrective plan of action if needed.

ITEM 755.76 (Continued)

Reports shall be submitted to the Engineer as a digital copy in Portable Document Format (PDF) unless otherwise requested. Hard copies shall be provided as requested by the Engineer. All reports shall be marked with the applicable permit numbers and identifying information as required in the permits. Reports shall include photo documentation of the wetland/s being monitored and shall include a minimum of 3 views from different orientations. Views shall be labeled.

Spring Reports, when required, shall be submitted to the Engineer by July 1 for dispersal to the appropriate permitting agencies.

End of Year Reports (which may serve as the Fall Report) shall be based on inspections that occur prior to October 15th. Reports shall be submitted to the Engineer no later than November 1 of each year.

Monitoring Reports shall be as follows for ***2*** years:

- *MassDEP: 1 Report - (1 end of year).*
- *ACOE: #1 Report (1 end of year).*

Conservation Commission: 4 Reports (1 spring and 1 end of year for two years).

BASIS OF PAYMENT

Item 755.76 Wetland Monitoring Reports and associated inspections shall be at the Contract unit price per Lump Sum and shall include all labor, materials, equipment, and all incidental costs required to complete the work. Lump Sum will be paid in equal installments of the Lump Sum divided by the number of reports submitted. Payment shall be upon submittal and acceptance of each report, based on the following schedule:

- Year 1 = ***one spring and one end of year report***
- Year 2 = ***one spring and one end of year report***

ITEM 756. NPDES STORM WATER POLLUTION PREVENTION PLAN LUMP SUM

This Item addresses the preparation and implementation of a Storm Water Pollution Prevention Plan required by the National Pollutant Discharge Elimination System (NPDES) and applicable Construction General Permit (CGP) issued by the U.S. Environmental Protection Agency (EPA).

Pursuant to the Federal Clean Water Act, construction activities which disturb one acre or more are required to apply to the EPA for coverage under the NPDES General Permit for Storm Water Discharges from Construction Activities. The Contractor shall be fully responsible for compliance with the most recently issued CGP and any subsequent revisions. Should a fine or damages be assessed against it, or MassDOT, as a result of a local, state, or federal enforcement action due to non-compliance with the CGP, the Contractor shall take full responsibility.

The NPDES CGP requires the submission of a Notice of Intent (NOI) to the EPA prior to the start of construction (defined as any activity which disturbs land, including clearing and grubbing). There is a fourteen (14) day review period commencing from the date on which EPA enters the Notice into their database. Based on the review of the NOI, EPA may require additional information, including but not limited to, the submission of the Storm Water Pollution Prevention Plan (SWPPP) for review. Work may not commence on the project until final authorization has been granted by EPA. Any additional time required by EPA for review of submittals will not constitute a basis for claim of delay.

In addition, if the project discharges to an Outstanding Resource Water, vernal pool, or is within a coastal ACEC as identified by the Massachusetts Department of Environmental Protection (DEP), a separate notification to DEP is required. DEP may also require submission of the Storm Water Pollution Prevention Plan for review and approval. Filing fees associated with the notification to DEP and, if required, the SWPPP filing to DEP shall be paid by the Contractor.

The CGP also requires the preparation and implementation of a SWPPP in accordance with the afore-mentioned statutes and regulations. The Plan will include the CGP conditions and detailed descriptions of controls of erosion and sedimentation to be implemented during construction. The contractor shall prepare the SWPPP and update it as necessary. The Contractor shall submit the Plan to the Engineer for approval at least four (4) weeks prior to any site activities. It is the responsibility of the Contractor to comply with the CGP conditions and the conditions of any state Wetlands Protection Act Order, Water Quality Certification, Corps of Engineers Section 404 Permit and other environmental permits applicable to the project and to include in the SWPPP the methods and means necessary to comply with applicable conditions of said permits.

It is the responsibility of the Contractor to complete the SWPPP in accordance with the EPA CGP, provide all information required, and obtain any and all certifications as required by the CGP. Any amendments to the SWPPP required by site conditions, schedule changes, revised work, regulations, construction methodologies, and the like are the responsibility of the Contractor. Amendments will require the approval of the Engineer prior to implementation.

ITEM 756. (Continued)

In addition to the CGP requirements for inspections, MassDOT requires inspection of all erosion controls and site conditions on a weekly basis. Inspections are also required at portions of sites that discharge to sediment or nutrient impaired or high quality waters per the CGP when each incidence of rainfall exceeding 0.25 inches in twenty-four hours or after snowmelt discharge from a storm event that produces 3.25 inches or more of snow within twenty-four hours occurs. The CGP requires that inspections be performed by a qualified individual as outlined in the CGP. MassDOT requires proof of completion of a 4 hour minimum sedimentation and erosion control training class current to the latest CGP. This individual can be, but not limited to, someone that is either a certified inspector, certified professional, or certified storm water inspector. The documentation shall be included as an appendix in the SWPPP. The inspector's qualifications shall be submitted to the Engineer for approval prior to beginning any work. This individual shall be on-site during construction to perform these inspections. In addition, if the Engineer determines at any time that the inspector's performance is inadequate, the Contractor shall provide an alternate inspector. Written weekly inspection forms, storm event inspection forms, and Monthly Summary Reports must be completed and provided to the Engineer. Monthly Summary Reports must include a summary of construction activities undertaken during the reporting period, general site conditions, erosion control maintenance and corrective actions taken, the anticipated schedule of construction activities for the next reporting period, any SWPPP amendments, and representative photographs.

The Contractor is responsible for preparation of the Plan, all SWPPP certifications, inspections, reports and any and all corrective actions necessary to comply with the provisions of the CGP. The Standard Specifications require adequate erosion control for the duration of the Contract. All control measures must be properly selected, installed, and maintained in accordance with manufacturer specifications and good engineering practices. If periodic inspections or other information indicates a control has been used inappropriately or is no longer adequate, it is the responsibility of the Contractor to replace or modify the control for site conditions at no additional cost to the Department. Contractor must maintain all control measures and other protective measures in effective operating conditions and shall consider replacement of erosion controls for each construction season.

The work under this item shall also include the preparation, submission and implementation of a Flood Contingency Plan. The plan shall address the potential need for the temporary relocation of construction and auxiliary equipment situated within the 1% annual chance of flooding zone to designated upland locations above the Base Flood Elevation during flood events. The Flood Contingency Plan shall address any additional MassDEP-required information requirements, as applicable. The Flood Contingency Plan shall be submitted to the Engineer for review and approval at the same time as the SWPPP.

ITEM 756. (Continued)

This Item addresses acceptable completion of the SWPPP, any revisions/amendments required during construction, preparation of monthly reports and Flood Contingency Plan. In addition, any erosion controls beyond those specified in bid items which are selected by the

Contractor to facilitate and/or address the Contractor's schedule, methods and prosecution of the work shall be considered incidental to this item.

The CGP provides specific requirements for temporary and final stabilization. This shall be incorporated into the project schedule. The permit defines specific deadline requirements for Initial Stabilization ("immediately", i.e., no later than the end of the next work day following the day when earth-disturbing activities have temporarily or permanently ceased) and for Complete Stabilization Activities (no later than 14 calendar days after the initiation of stabilization). Stabilization criteria for vegetative and non-vegetative measures are provided in the CGP.

The CGP requires the submission of a Notice of Termination (NOT) from all operators when final stabilization has been achieved, as well as removal and proper disposal of all construction materials, waste and waste handling devices, removal of all equipment and construction vehicles, removal of all temporary stormwater controls, etc. Approval of final stabilization by the Engineer and confirmation of submission of the NOT will be required prior to submission of the Resident Engineer's Final Estimate. The permittee shall use EPA's website to prepare and submit the NOT.

BASIS OF PAYMENT

Item 756 will be paid for at the Contract unit price Lump Sum, which price shall include all labor, materials, equipment, SWPPP & Flood Contingency Plan preparation, revisions/addenda during construction, monthly reports, filing fees, and all incidental costs required to complete the work.

Payment of 50% of the Lump Sum price of this item will be made upon acceptance of the NPDES Stormwater Pollution Prevention Plan & Flood Contingency Plan.

Payment of 40% of the Lump Sum price of this item will be will be paid in equal monthly installments distributed across the time remaining in the accepted baseline schedule until substantial completion.

The remaining 10% of the Lump Sum price of this Item will be paid following accepted submission of a Notice of Termination (NOT) when final stabilization has been achieved.

ITEM 765.451 NATIVE SEED – PART SHADE ROADSIDE MIX POUND

Work under this item shall consist of furnishing the mix(es) specified below in the required quantity.

SUBMITTALS

1) Pre-Verification of Seed Availability. Within 30 days after the Notice to Proceed, the Contractor shall submit to the Engineer the supplier's verification of availability of seed species in the required quantities and for the anticipated date of seeding. Verification shall be on the supplier's letterhead and notarized by the supplier's notary. Species not expected to be available should be noted and substitutions recommended.

2) Final Verification of Seed Availability. No earlier than 21 days prior to ordering, the Contractor shall submit to the Engineer the supplier's verification of availability of seed species and in the required quantities. Verification shall be on the supplier's letterhead and notarized by the supplier's notary. A copy of this submittal shall be forwarded to the MassDOT Landscape Design Section. Substitutions or changes in the mix at this time must be approved by MassDOT Landscape Design Section.

3) Seed Worksheet provided herein shall be submitted to the Engineer prior to ordering seed to determine the number of pounds of Pure Live Seed required.

4) Seed Tags. The contractor shall submit original seed tags from each bag of seed used on the project or ensure that each tag is photo documented by the Engineer while on the unopened bag.

   Number of tags submitted must correspond to number of bags delivered.

   Species listed on the seed tag shall match the Final Verification of Seed Availability (Submittal #2) unless approved otherwise. Tag must include: variety and species name; lot number; purity; percentage of inert matter; percentage of weeds, noxious seeds, and other crop seeds; germination, dormant or hard seed; total viability; origin of seed; germination test date, net weight, and name and address of seller. The origin of seed must be listed on the seed tag for all species in the mix to provide verification of original (generation 0) seed source. The smallest known geographic area (township, county, ecotype region, etc.) shall be listed. Ecotypes and cultivars shall be as close to Massachusetts as possible and appropriate to the site conditions.

   A copy of this submittal shall be forwarded to the MassDOT Landscape Design Section.

5) Verification of Seed Delivery. Prior to payment, contractor shall submit the Seed Delivery Verification form contained within the contract or the Supplier's Verification on company letterhead or a bill of lading. Supplier verification must include all information requested on the Verification form within this contract. The bill of lading must include variety and species name, lot number, net weight shipped, date of sale, invoice, project or seeding location, and name and address of Supplier. All information must be filled in and complete for acceptance. Information must match the seed tags and quantity of seed used on the job. A copy of this submittal shall be forwarded to the MassDOT Landscape Design Section

ITEM 765.451 (Continued)

6) Seed Sample. If requested or if seed is from a previously opened bag, the contractor may be asked to submit to the Engineer a sample of seed from the seed bag (1-2 cups) at the time of seeding.

SEEDING SEASON

The appropriate seeding seasons are:

Spring: April 1 - May 15
Fall: October 1 - December 1 for dormant seeding

PERMANENT SEED MIX(ES)

Calculating Pure Live Seed (PLS)

Quantities specified are PURE LIVE SEED. Greater quantities of ordered seed may be required to achieve actual specified seeding rates.

Pure Live Seed (PLS) is defined as a percentage calculated by multiplying the percent of pure seed by the percent of viable seed (total germination, hard seed, and dormant seed). For example:

If a seed label indicates 90% purity, 78% germination, 10% hard seed, and 2% dormancy, it is calculated to be 90% x [78 + 10 + 2]% = 81% PLS.

Therefore, each pound of PLS would need 1 pound / 0.81 = 1.2 pounds of seed with a 90% purity and 90% total germination

ITEM 765.451 (Continued)

Seed Mix(es) shall be as specified below. Ecotypes and cultivars shall be as close to Massachusetts as possible and appropriate to the site conditions.

765.451 Part Shade Roadside Mix

	Botanical Name	Common Name	% PLS by Weight
Grass			
	Festuca rubra	Creeping Red Fescue	25.70%
	Elymus virginicus	Virginia Wild Rye	24.00%
	Schizachyrium scoparium	Little Blue Stem	22.50%
	Panicum virgatum	Switch Grass	10.00%
	Panicum clandestinum 'Tioga'	Deer Tongue 'Tioga'	7.00%
	Carex vulpinoidea	Fox Sedge	2.00%
	Agrostis perennans	Upland Bentgrass	2.00%
	Juncus effusus	Soft Rush	0.20%
			93.40%
Herb/Forb			
	Chamaecrista fasciculata	Partridge Pea	3.00%
	Penstemon digitalis	Beard-tongue	1.00%
	Zizia aurea	Golden Alexanders	0.30%
	Desmodium canadense	Showy Tick Trefoil	0.30%
	Solidago bicolor	White Goldenrod	0.20%
	Solidago caesia	Woodland Goldenrod	0.20%
	Rudbeckia hirta-VT ecotype	Black-eyed Susan-VT	0.20%
	Aster novae-angliae	New England Aster	0.20%
	Solidago odora	Licorice Scented	0.20%
	Aster divaricatus	White Wood Aster	0.20%
	Heliopsis helianthoides	Ox-Eye Sunflower	0.20%
	Pycnanthemum tenuifolium	Slender Mountain Mint	0.20%
	Monarda fistulosa	Wild Bergamot	0.10%
	Eupatorium perfoliatum	Boneset	0.10%
	Aster lateriflorus	Calico Aster	0.10%
	Oenothera fruticosa var.	Sundrops	0.10%
			6.60%
			100.00%

Seeding Rate: 15.0 lbs

Seeding Rate:
Species ecotype shall be as native to New England region as possible. Apply this mix at 20 lbs PLS/acre.

ITEM 765.451 (Continued)

FOR USE WITH SLOPES: Add 30 lbs/acre of a cover crop. For a cover crop use either grain oats (1 Jan to 31 July) or grain rye (1 Aug to 31 Dec).

Application Rate

Wetland riparian mix: 20 lbs/acre PLS. In addition, apply 30 pounds of cover crop (grain oats or grain rye) as appropriate to the season.

Any species substitutions shall be with a species having similar characteristics and function. Substitutions must be approved by MassDOT Landscape Design Section per the documentation submittal process.

50% Increase Adjustment for Field Conditions

Seeding under the following conditions requires a 50% increase in the permanent mix at the time of construction:

- Seeding out of season
  OR
- Seeding after Compost Blanket has been applied (unless already increased for out of season).

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Wetland riparian mix will be measured for payment by the pound of Pure Live Seed delivered and complete in place.

Wetland riparian mix will be paid at the contract unit price per pound of Pure Live Seed delivered upon approval of all Seed Submittal Documentation. Overseeding required to correct poor germination or establishment shall be incidental to the item.

Cover crop not included as part of the permanent mix composition will be paid for under Item 765.21, Annual Cover Crop.

Application and care of native seed mix will be paid for separately under Item 765.635 Native Seeding and Establishment.

ITEM 765.635 NATIVE SEEDING AND ESTABLISHMENT SQUARE YARD

Work shall conform to the relevant provisions of Subsections 765 and 767 of the Standard Specifications and the following:

The work under this item shall consist of seeding, mowing, and other care to establish a stand of grass in the areas shown on the plans or as required by the Engineer. For the purposes of these specifications, the term "grass" shall apply to all the forbs, grasses, sedges, and rushes included in the materials.

QUALIFICATIONS

Seeding shall be done by a company having a minimum of five years of experience with native seed establishment. Prior to beginning work, the seeding Contractor shall furnish proof of qualifications to the Engineer for approval. Proof of qualifications shall include providing documentation (photos and contacts) to demonstrate knowledge and expertise with native seeding and establishment and proof of having completed successful native seeding projects.

SEEDING SEASON

Seeding seasons for native mixes is April 1 - May 15 and October 1 - December 1 for dormant seeding. Written approval must be obtained for seeding outside the seeding season and, if approved, the permanent seed rate shall be increased by 50%.

Seeding season for cover crops shall be grain oats January 1 – July 31 and grain rye August 1 – December 1.

MATERIAL AND SUBMITTALS

Seed Mixes and Submittals shall be per the item(s) for permanent and annual (cover crop) seed mixes.

Compost Blanket, if used, shall meet the material and submittal requirements for that item.

Hydromulch shall be wood fiber or straw applied per the Standard Specifications and at the rates specified below and per the manufacturer.

A certified statement shall be furnished, prior to start of work, to the Engineer by the Contractor as to the number of pounds of hydromulch, tackifier, and seed, per 100 gallons of water and as applicable to products used. This statement should also specify the number of square yards of seeding that can be covered with the solution specified above.

Fertilizer

No fertilizers shall be applied.

ITEM 765.635 (Continued)

Water

Water, including hose and all other watering equipment required for the work, shall be furnished by the Contractor to the site at no additional cost. Water shall be suitable for irrigation and free from ingredients harmful to plant life. All plants injured or work damaged due to the lack of water or the use of too much water shall be the Contractor's responsibility to correct.

SEEDING

Hand broadcast method shall be used for all areas smaller than half an acre and when specified on the plans for areas over half an acre.

Seeding shall occur within 72 hours of placement of loam and final grading or the Contractor shall propose a reasonable, alternative schedule that shall be approved by the Engineer.

Surface Preparation

No seeding or soil preparation shall be done if soils are muddy or dry and compacted. Bare soils shall be raked to remove large stiff clods, lumps, brush, roots, stumps, litter and other foreign matter. Ruts and depressions shall be filled with additional loam or compost and the soil shall be re-graded to a relatively smooth finish corresponding to the required grades.

When seeding over existing or compacted soil or soil that has sat bare for more than 30 days, surface will be prepared by tilling or raking to a minimum depth of 2 inches prior to seeding and prior to Compost Blanket application (when applied).

Surface preparation shall be compensated for under for loam placement or topsoil rehandled and spread as appropriate to the project.

Jute or coir mesh, when specified in the contract, shall be placed after seeding and per the Standard Specifications and the manufacturer’s instruction.

Surface preparation shall be approved by the Engineer prior to seeding.

Seeding over Various Substrates

Loam: Seeding shall occur within 72 hours of loam placement to prevent loss of topsoil. Seed shall be manually broadcast for areas less than half an acre (each area, not cumulative area) and when specified on the plans. Broadcasting shall be immediately followed by hydromulching as specified below. When not specified on the plans, larger areas may be hydroseeded as specified below.

Compost Blanket: Compost Blanket shall be applied as specified under that item. Seed should be hand broadcast at the same time as compost application to ensure a thin cover of compost over seed.

ITEM 765.635 (Continued)

When seeding is done after application of Compost Blanket the rate shall be increased by 50%. If the Compost Blanket is applied after December 1, seed shall be broadcast or hydroseeding over the compost in the Spring and the rate increased by 50% specified under Seed Application.

Compost Mulch over Modified Rock: Compost Mulch and seed shall be applied as specified under that item. No hydromulch is required.

Cover Crop

Cover crop shall be used when seeding out of season, when specified with the permanent native seed mix under that item, and as required to prevent erosion until the permanent seed establishes.
A cover crop should not be used with a steep slope mix or other permanent mix which already contains either cereal rye or oats in the composition of the mix. A cover crop is not necessary for wetland seeding and is not typically necessary for soil stabilization when seeding in conjunction with a compost blanket application.

Seed Application

All seed shall be mulched as specified herein.

Seed application shall be by broadcast seeding or by hydroseeding as described below.

Broadcast Seeding

Seed shall be broadcast spread using a cyclone or whirlwind seeder or hand broadcast. Small or light-seeded species such as bluestem may be mixed with approved filler to achieve an even distribution. Seed shall not be broadcast when wind velocities are greater than 15 mph.

Broadcast seeding shall be undertaken in two separate passes at ninety degrees to each other. One-half the seeding rate shall be applied in each direction (horizontally and vertically). To ensure seed to soil contact with broadcasting of seed, seeding shall be followed by rolling or tracking with equipment approved by the Engineer.

Broadcast seed shall be mulched with weed-free straw mulch unless seeding is done as part of Compost Blanket in which case it shall be as specified above under seeding with Compost Blanket application. Hydromulching shall be as specified under Hydromulching.

Hydroseeding and Hydromulching

Hydroseed and mulching shall be per the manufacturer's directions and as follows.

Hydroseeding shall only be used for sites over half an acre in size or with permission of the Engineer.

ITEM 765.635 (Continued)

Tank and hoses shall be cleaned from all previous hydroseeding and hydromulching projects. Seed shall be mixed into the slurry immediately before application and slurry applied within 30 minutes after seeds have been placed in the tank. Once seed has been placed in the tank, tank shall be agitated only enough to mix the seeds and keep slurry from separating.

A 2-step process shall be used for seeding in conjunction with hydromulch. Seed shall be applied with 500 lbs/acre of hydromulch in the first pass. A second pass with 1,000 lbs/ acre of hydromulch shall be applied in a second pass. Each pass shall be applied in a different direction.

Once the seed has been added to the tank mixture a one-hour time limit is set for spreading the mixture on the soil. Once the one hour has passed the excess mixture must be discarded.

For broadcast seeding, hydromulch shall be applied immediately following seeding at a rate of 1,000 lbs/acre. Tank shall be cleaned from any previous hydroseeding.

CARE DURING GERMINATION AND ESTABLISHMENT

Contractor shall care for seeded areas as necessary for successful germination. Care will include watering and weed control as necessary to achieve establishment of the specified seeded species after one growing season as specified below.

The contractor shall maintain the stand of grasses to ensure healthy growth of the seeded species. Work shall include mowing or weed-whacking for weed control, watering if necessary, and removal of invasive plants.

Watering shall be sufficient to achieve soil moisture to a depth of 2 inches or more and such moisture is uniform. Method of watering shall not erode or damage soil or grassed surfaces.

General Weed Control: Unless otherwise directed, mowing shall be as specified under Mowing for Weed Control for seed establishment. Weeds shall be mowed prior to weeds setting seed (by the end of July unless otherwise approved).

Control of Invasive and Aggressive Weeds: Invasive and aggressive weeds, including but not limited to mugwort, ragweed, knapweed, foxtail, crabgrass, and chicory must be cut or treated prior to going to seed. Herbicide treatment must be coordinated with MassDOT. Undesired species (such as chicory) introduced due to use of incorrect seed mix shall be removed at the Contractor's expense.

MOWING FOR WEED CONTROL

Mowing for weed control shall be completed after weeds have sprouted and show leaf and bud growth, but prior to setting seed, generally between July 7th and August 1st, unless directed otherwise by the MassDOT Landscape Architect and the Engineer.

ITEM 765.635 (Continued)

Mowing height shall be as needed for weed control, generally to a height of 8 inches and not below 4 inches, unless directed otherwise. Mowing shall be with a brush hog mower or string trimmer other approved equipment. Conventional lawn mowers which cannot achieve the appropriate cut shall not be used.

Contractor shall give 48-hour notice prior to mowing work. Mowing shall only occur in dry sunny weather. Litter pickup should occur prior to mowing in all areas. If required, cut grass shall be raked and removed. Litter pickup and raking and removal of grass shall be incidental to the work.

Mowing equipment shall be approved by the Engineer prior to work.

OVER-SEEDING

Areas of bare ground greater than 2-3 feet in diameter shall be over-seeded with the specified mix during the appropriate season for seeding. Where required for overseeding mowing shall be as close to the soil as possible. Soil that is compacted shall be raked or otherwise roughened prior to over-seeding.

Over-seeding rates and methods shall those specified above under Materials and Methods. Following over-seeding, soil shall be lightly tamped to ensure seed to soil contact and areas shall be mulched with straw mulch and watered with a fine mist to moisten soil to a depth of at least 2 inches.

Over-seeding, mulch, watering, and all work for over-seeding shall be incidental.

DETERMINING SATISFACTORY GRASS ESTABLISHMENT

A well-established stand of the specified seeded species as determined by the Engineer and the MassDOT Landscape Architect will be required for Final Acceptance. The expectation is that an acceptable number and variety of the desired permanent seeded species (not the cover crop) will be visible. Generally:

- A minimum of 75% coverage by the specified permanent seeded species after one growing season. Of that percentage, generally, depending on the mix species:
    - At least 3 types of the permanent seeded grass species shall be visible.
    - At least 3 species of wildflowers shall be visible.
- There will be no significant gaps or bare soil (generally 2-3 feet in diameter or greater).
- There will be no more than 25% coverage by weed species.
- All soil shall be stabilized and there shall be no channeling or erosion.
- There will be no invasive or aggressive species within the stand at the time of acceptance.
- There shall be no evidence of seed from non-native mixes (i.e., clover) due to failure to clean the hydroseeding tank or using incorrect mix.

Invasive and aggressive weeds (such as mugwort, ragweed, knapweed, and chicory) must be cut or treated prior to going to seed for Interim Acceptance. Herbicide treatment must be coordinated with MassDOT.

ITEM 765.635 (Continued)

A warm-season grass mix with perennials will not have uniform growth. A uniform stand of grass may indicate use of an incorrect mix.

ACCEPTANCE OF SEEDING AND ESTABLISHMENT WORK

Conditional Acceptance shall be based on proper application of seed as specified herein.

Interim Acceptance of Care. Seeding will be inspected by mid-July to assess germination and Establishment conditions as described above. When necessary for Interim Acceptance, areas shall be mowed prior to weed species producing seed and as specified above under Weed Control. ***Areas requiring weed control that are not mowed prior to weed seed dispersal will not be approved for Interim Acceptance.*** Seeding that shows good germination and is determined by the Engineer and Landscape Architect to not require weed control at time of inspection shall be accepted for Interim Acceptance payment.

Final Acceptance of Establishment shall be given upon satisfactory Establishment as described above.

If the seeded area fails to meet the requirements of Establishment by the end of the growing season, contractor shall propose and implement remediations and site shall be inspected during the following growing season after July 1st. All remediation shall be at the contractor's expense.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Native Seeding and Establishment will be measured for payment by the square yard, complete in place.

Native Seeding and Establishment will be paid at the Contract unit price by the square yard upon Conditional, Interim, and Final Acceptances as described above. This price shall include all submittals, seeding, rolling to ensure seed-to-soil contact, weed control other than mowing, water, over-seeding, labor, materials, equipment, and all incidental costs required to complete the work of establishing a satisfactory stand of grass.

Native seed and cover crop mixes shall be compensated under the respective items.

Site preparation, including raking, tilling, removal of debris and stones, and other work to the prepare site for seeding shall be compensated under loam placement or topsoil rehandled and spread as relevant to the project. If used, Compost Blanket shall be compensated under the respective item.

Mowing for weed control will be incidental to this item.

Schedule of payment shall be as follows:

30% upon Conditional Acceptance

20% upon Interim Acceptance of Care, except this amount will be reduced to zero and final payment will be reduced accordingly when areas requiring weed control are not mowed as specified in the Interim Acceptance criteria.

50% upon Final Acceptance of Establishment

ITEM 767.121 SEDIMENT CONTROL BARRIER FOOT

The work under this item shall conform to the relevant provisions of Subsections 670, 751 and 767 of the Standard Specifications and shall include the furnishing and placement of a sediment control barrier. Sediment control barrier shall be installed prior to disturbing upslope soil.

The purpose of the sediment control barrier is to slow runoff velocity and filter suspended sediments from storm water flow. Sediment barrier may be used to contain stockpile sediments, to break slope length, and to slow or prevent upgradient water or water off road surfaces from flowing into a work zone. Contractor shall be responsible for ensuring that barriers fulfill the intent of adequately controlling siltation and runoff.

Twelve-inch diameter (after installation) compost filter tubes with biodegradable natural fabric (i.e., cotton, jute, burlap) are intended to be the primary sedimentation control barrier. Photo-biodegradable fabric shall not be used.

For small areas of disturbance with minimal slope and slope length, the Engineer may approve the following sediment control methods:

- 9-inch compost filter tubes
- Straw bales which shall be trenched

No straw wattles may be used. Additional compost filter tubes (adding depth or height) shall be used at specific locations of concentrated flow such as at gully points, steep slopes, or identified failure points in the sediment capture line.

When required by permits, additional sediment barrier shall be stored on-site for emergency use and replacement for the duration of the contract.

Where shown on the plans or when required by permits, sedimentation fence shall be used in addition to compost filter tubes and straw bales and shall be compensated under that item.

Sediment control barriers shall be installed in the approximate location as shown on the plans and as required so that no excavated or disturbed soil can enter mitigation areas or adjacent wetlands or waterways. If necessary to accommodate field conditions and to maximize effectiveness, barrier locations may be shifted with approval from the Engineer. Barriers shall be in place prior to excavation work. No work shall take place outside the barriers.

MATERIALS AND CONSTRUCTION

Prior to initial placement of barriers, the Contractor and the Engineer shall review locations specified on the plans and adjust placement to ensure that the placement will provide maximum effectiveness.

Barriers shall be staked, trenched, and/or wedged as specified herein and according to the Manufacturer’s instructions. Barriers shall be securely in contact with existing soil such that there is no flow beneath the barrier.

ITEM 767.121 (Continued)

Compost Filter Tube

Compost material inside the filter tube shall meet M1.06.0, except for the following: no peat, manure or bio-solids shall be used; no kiln-dried wood or construction debris shall be allowed; material shall pass through a 2-inch sieve; and the C:N ratio shall be disregarded.

Outer tube fabric shall be made of 100% biodegradable materials (i.e., cotton, hemp or jute) and shall have a knitted mesh with openings that allow for sufficient water flow and effective sediment capture.

Tubes shall be tamped, but not trenched, to ensure good contact with soil. When reinforcement is necessary, tubes shall be stacked as shown on the detail plans.

Straw Bales

Straw bales shall be used if shown on the plans or when specified by Orders of Condition or other permit requirements.

Bales should be placed in a single row, lengthwise on the contour, with ends of adjacent bales tightly abutting one another. All bales should be either wire-bound or string-tied. Straw bales should be installed so that bindings are oriented around the sides (rather than along the tops and bottoms) of the bales in order to prevent deterioration of the bindings.

The barrier should be entrenched and backfilled. A trench should be excavated the width of a bale and the length of the proposed barrier to a minimum depth of 4 inches. The trench must be deep enough to remove all grass and other material which might allow underflow. After the bales are staked and chinked (filled by wedging), the excavated soil should be backfilled against the barrier. Backfill soil should conform to the ground level on the downhill side and should be built up to 4 inches against the uphill side of the barrier.

Each bale should be securely anchored by at least 2 stakes or re-bars driven through the bale. The first stake in each bale should be driven toward the previously laid bale to force the bales together. Stakes or re-bars should be driven deep enough into the ground to securely anchor the bales. For safety reasons, stakes should not extend above the bales but should be driven in flush with the top of the bale.

The gaps between the bales should be chinked (filled by wedging) with straw to prevent water from escaping between the bales. Loose straw scattered over the area immediately uphill from a straw bale barrier tends to increase barrier efficiency. Wedging must be done carefully in order not to separate the bales.

When used in a swale, the barrier should be extended to such a length that the bottoms of the end bales are higher in elevation than the top of the lowest middle bale to assure that sediment-laden runoff will flow either through or over the barrier but not around it.
Sedimentation Fence

ITEM 767.121 (Continued)

Materials and Installation shall be per Section 670.40 and 670.60 of the Standard Specifications and the following:

Sedimentation fence shall only be used if shown on the plans or when specified by Orders of Condition or other permit requirements.

When used with compost filter tubes, the tube shall be placed on a minimum of 8 inches of folded fabric on the upslope side of the fence. Fabric does not need to be trenched.

When used with straw bales, an 8-inch deep and 4-inch wide trench or V-trench shall be dug on the upslope side of the fence line. One foot of fabric shall be placed in the bottom of the trench followed by backfilling with compacted earth or gravel. Stakes shall be on the down slope side of the trench and shall be spaced such that the fence remains vertical and effective.

Width of fabric shall be sufficient to provide a 36-inch high barrier after fabric is folded or trenched. Sagging fabric will require additional staking or other anchoring.

MAINTENANCE

Maintenance of the sediment control barrier shall be per Section 670.60 of the Standard Specifications or per the Stormwater Pollution Prevention Plan (SWPPP), whichever is more restrictive.

The contractor shall inspect the sediment barrier in accordance with relevant permits. At a minimum, barriers shall be inspected at least once every 7 calendar days and after a rain event resulting in 0.25 inches or more of rainfall. Contractor shall be responsible for ensuring that an effective barrier is in place and working effectively for all phases of the Contract.

Barriers that decompose such that they no longer provide the function required shall be repaired or replaced as directed. If the resulting berm of compost within the fabric tube is sufficiently intact (despite fabric decay) and continues to provide effective water and sediment control, barrier does not necessarily require replacement.

DISMANTLING & REMOVING

Barriers shall be dismantled and/or removed, as required, when construction work is complete and upslope areas have been permanently stabilized and after receiving permission to do so from the Engineer.

Regardless of site context, nonbiodegradable material and components of the sediment barriers, including photo-biodegradable fabric, plastic netting, nylon twine, and sedimentation fence, shall be removed and disposed off-site by the Contractor.

ITEM 767.121 (Continued)

For naturalized areas, biodegradable, natural fabric and material may be left in place to decompose on-site. In urban, residential, or other locations where aesthetics is a concern, the following shall apply:

- Compost filter tube fabric shall be cut and removed, and compost shall be raked to blend evenly (as would be done with a soil amendment or mulch). No more than a 2-inch depth shall be left on soil substrate.
- Straw bales shall be removed and disposed off-site by the Contractor. Areas of trenching shall be raked smooth and disturbed soils stabilized with a seed mix matching adjacent seeding or existing grasses (i.e., lawn or native grass mix).
- Sedimentation fence, stakes, and other debris shall be removed and disposed off-site. Site shall be restored to a neat and clean condition.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 767.121 will be measured and paid for at the contract unit price per foot of sediment control barrier which price shall include all labor, equipment, materials, maintenance, dismantling, removal, restoration of soil, and all incidental costs required to complete the work.

Additional barrier, such as double or triple stacking of compost filter tubes, will be paid for per foot of tube installed.

Barriers that have been driven over or otherwise damage by construction activities shall be repaired or replaced as directed by the Engineer at the Contractors expense.

Sedimentation fence used in conjunction with compost filter will be measured and paid for separately under Standard Item 697., Sedimentation Fence.

ITEM 767.91 TIMBER MATTING SQUARE YARD

Work under this item shall conform to the plans and the relevant provisions of Subsection 767 of the Standard Specifications, and the following:

Timber Mats shall be used to support construction equipment when operating in wetlands. This item consists of furnishing, placing, maintaining, and removing Timber Matting as specified herein, as shown on the plans, and as required to protect existing soils during construction. Mats shall be within the area shown on the plans as necessary for construction access and staging. Existing soils shall be protected to the extent feasible.

At a minimum, material and methods shall follow Army Corp of Engineers Best Management Practices:
https://www.nae.usace.army.mil/Portals/74/docs/regulatory/StateGeneralPermits/MA/ConstructionMatBMPs.pdf

Relevant permit conditions and approvals shall also be followed.

MATERIALS & SUBMITTALS

Material and methods shall be submitted to the Engineer for approval. Submittal shall include a plan to show the proposed extent of matting, methods of preventing soil or other material from entering the wetland through gaps in the timber, procedure for inspections, method of removal and cleaning, and location of cleaning.

The timber construction mats shall be composed of heavy timbers joined together to form stable platforms installed over the surface of wetlands. Mats shall have all timber and rods intact.

Depending on site specific field conditions at the time of construction, multiple layers of Timber Mats and stringers may be necessary to support heavy equipment and to protect the underlying wetland.

As necessary, sediment control devices such as compost filter tubes shall be placed along edge of the Timber Mats to protect wetlands from sedimentation caused by construction vehicle traffic.

Mats shall be certified clean by the vendor prior to installation. The vendor shall submit proof of compliance. Clean is defined as being free of plant matter (stems, flowers, roots, etc.), soil, or other deleterious materials prior to being brought to the project site.

METHOD OF WORK

Prior to placement of mats, existing wetland limits and topography shall be assessed. Vegetation shall be cut flush. Care shall be taken to avoid removal of plant roots and to avoid soil disturbance.

ITEM 767.91 (Continued)

Mats shall be spread evenly and smoothly to ensure direct contact with the soil at all points and placed parallel to the drainage flow direction. To the extent possible, mats shall be placed along the travel area so that individual boards are perpendicular to the direction of traffic. There shall be no gaps between the mats. Mats shall be placed on either side of wetland area to rest on firm ground.

For situations where the Contractor determines that stones or boulders shall be removed or relocated within wetland areas in order to install safe and level structure work pads or access roads, the boulders shall be moved in a manner which does not result in significant soil disturbance (i.e., pushing with a bull-dozer is not allowed). When there is a significant number of boulders that shall be removed, the Contractor shall consult with the Engineer prior to undertaking the work.

The stockpiling of stone, drill spoils, and other unconsolidated material on construction mats shall be avoided unless determined necessary due to access and work pad constraints. Under this scenario, composite mats and/or other approved methods and materials shall be placed on top of the timber mats to prevent spoils from migrating through the gaps between timbers or spilling over the sides of the matting. The stockpiled spoil shall be removed from the work zone and properly disposed of in uplands approved by the Engineer or hauled off site for proper disposal. Material that falls into or otherwise enters the wetlands shall be removed by hand following removal of the mats.

Sediment controls and stone or wood chip ramps may be installed to promote a smooth transition to and minimize sediment tracking onto the timber mats. Geotextile may be added beneath stone or wood chip transitions to facilitate removal, as necessitated by site or permit conditions.

Mats shall be placed per the manufacturer's instruction. If requested by the Engineer, method of installation and final placement of mats shall be approved by the Wetland Specialist.

MAINTENANCE

Mats shall be monitored to assure that they are functioning correctly and shall be inspected for any defects or structural problems. Mats covered with soils or construction debris shall be cleaned and the materials removed and disposed of in an upland location. The material should not be scraped and shoveled into the resource area. Mats that become imbedded must be reset or layered to prevent mud from covering them or water passing over them. Worn timber or plywood used as a wearing surface shall be replaced as required and to the satisfaction of the Engineer.

REMOVAL OF MATS

Clean mats after use to remove any invasive plant species seed stock. Cleaning methods may include but are not limited to, shaking or dropping mats in a controlled manner with a piece of machinery to knock off attached soil and debris, spraying with water or air, sweeping, or exposing the mats to high temperatures. The location and method of cleaning shall be approved by the Engineer.

ITEM 767.91 (Continued)

Upon completion of construction, mats shall be removed. Matting should be removed by "backing" out of the site, removing mats one at a time.

If rutting or soil compaction following construction mat removal is observed, the area shall be returned to pre-existing conditions consistent with the surrounding area, by light hand raking or by back-blading with machinery. Deeper ruts shall be graded using available, loose soil from the work area.

Care shall be taken to inspect wetland crossings as each mat is removed to ensure any undesirable materials are properly removed and disposed of off- site.

If determined necessary by the Engineer, to enhance the functions of an altered wetland, a wetland seed mix shall be sown throughout the disturbed areas. In most instances, natural re-vegetation is an appropriate means to re-establish the wetland plant community in lieu of seeding.

Proper snow removal on construction mats shall avoid the formation of ice. To avoid the formation of ice, snow shall be removed from construction mats before applying sand. Prior to their removal from wetlands, sand shall be collected from the construction mats and disposed of in an upland area. A round street sweeping brush mounted on the front of a truck may be an effective way to remove snow from construction mats. Propane heaters may also be suitable solutions for snow removal and/or de-icing of swamp mats. Once construction mats are removed, wetlands shall be inspected for build-up of sand that may have fallen through swamp mats, therefore care shall be taken to inspect wetland crossings carefully as each mat is removed to ensure sand is properly removed and disposed of off-site.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Timber matting will be measured for payment by the square yard, complete in place, maintained and removed. Overlapped matting will not be measured for payment.

Timber matting will be paid for at the Contract unit price per square yard, which price shall include all labor, materials, equipment, sediment barriers specific to matting, geotextile, stone, wood chips, cutting of existing vegetation, and incidental costs required to complete the work of installation, maintenance, removal, and restoration of soil and vegetation, if required.

ITEM 772.035	**ARBORVITAE - EMERALD GREEN 4-5 FEET**	**EACH**
ITEM 772.334	**CEDAR - RED 3-4 FEET**	**EACH**

ITEM 796.753	**DAY LILY - HAPPY RETURNS - #1 CONT**	**EACH**
ITEM 796.757	**DAY LILY - ROSY RETURNS - #1 CONT**	**EACH**

The work under these items shall conform to the applicable requirements of Subsection 771 of the Standard Specifications, and the following:

Plant locations shown on the plans are schematic. Plants shall be located as directed by the MassDOT Landscape Architect or the Landscape Architect for the Designer of Record.

Tree trunk guards shall be supplied and installed at all deciduous trees. Tree trunk guards shall be expandable, made of corrugated plastic, 2 feet in length and a diameter that is a minimum of one-half inch larger than the caliper of the tree. Tree trunk guards shall not be tied or otherwise secured in a manner that does not allow for expanded tree trunk growth.

PLANTING

As shown in the Details, soil shall be carefully removed to expose the root flare of all B&B and container plants. Container plants shall be scored and girdled roots shall be teased out and pruned as necessary.

Plants planted incorrectly (too deep, girdled roots, root balls not scored) shall be deemed unacceptable for payment. The problem shall be remediated, and the plants re-planted to the satisfaction of the Landscape Architect. Plants with root systems that cannot be untangled or that require such severe pruning that the plant is compromised shall be rejected on site and replaced at the contractor’s expense.

Plants shall be watered prior to backfilling of planting pits and again after backfilling.

ITEMS 772.035 through 796.757 (Continued)

WATERING

Watering shall meet the requirements for the MassDOT Standard Specifications. In addition, a Watering Log (available online: Watering Log for MassDOT Plantings) shall be submitted to the Engineer at the end of each week or as requested by the Engineer. Watering and submitting of the weekly Watering Log shall commence immediately following planting and shall continue until the end of the plant warranty. The Engineer shall be notified prior to watering.

Failure to submit the watering log and/or notify the Engineer will result in deductions or non-payment for plants at the Interim and Final Acceptance inspections. This may include rejection of plants that have healthy foliage at the time of inspection but have been compromised (root system loss) due to lack of water during establishment.

ACCEPTANCE OF PLANTING AND PLANT ESTABLISHMENT

Inspections and acceptance of planting and plant establishment shall be as follows:

Conditional Acceptance

Following planting, the Contractor shall request an inspection for Conditional Acceptance of the plants and planting beds. The Engineer, the MassDOT Landscape Architect, and the Contractor shall inspect the plants, planting methods, and planting beds. Approval of plants and planting shall mark the beginning of the Plant Establishment Period and the one-year warranty period. Plants shall be watered and cared for as specified in the MassDOT Standard Specifications.

Interim Acceptance

Following Conditional Acceptance, plants and planting beds shall be cared for as specified in the standard specifications. Plants shall show healthy growth per the Standard Specifications. All weeds shall be removed (including roots) or, if approved by the Landscape Architect, weed-whacked. Watering log submissions shall be submitted and reviewed.

Plants that are dead or that fail to show healthy growth will not be approved for Interim Acceptance. As determined by the Engineer, those plants shall be immediately replaced, or shall be deducted from the contract and there shall be no further payments made.

Inspections for Interim Acceptance shall be conducted by the Contractor, the Engineer, and the MassDOT Landscape Architect and shall be according to the following schedule:

Spring Planting: Plants and planting beds shall be inspected following the first full growing season (June – August) after planting.

Fall Planting: Plants and planting beds shall be inspected the following spring (April– June) for Spring Interim Acceptance. Plants and planting beds shall be inspected again at the end of the growing season for Fall Interim Acceptance. This inspection shall take place between August 15 - September 10 or as otherwise determined by the Engineer, in order to allow for place replacements.

ITEMS 772.035 through 796.757 (Continued)

Final Acceptance: One year following Conditional Acceptance (end of the plant warranty period), plants shall be inspected by the Contractor, MassDOT Landscape Architect and the Engineer. Plants shall show healthy growth meeting the MassDOT Standard Specifications and planting beds shall be free of weeds. Formal planting beds shall be weed-free (no roots) and have a neat appearance.

No payment will be made for plants that are dead or that fail to show healthy growth.

PAYMENT SCHEDULE

Upon approval of plants at each inspection, payment shall be as follows:

Spring Planting:

- 40% upon Conditional Acceptance
- 40% upon Interim Acceptance which will include submission and approval of watering logs
- 20% upon Final Acceptance

Fall Planting:

- 35% upon Conditional Acceptance
- 10% upon Spring Interim Acceptance
- 35% upon Fall Interim Acceptance which will include submission and approval of watering logs
- 20% upon Final Acceptance

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

The quantity of trees, shrubs, vines, grasses and ground cover plants measured will be paid for at the contract unit prices per each for planting of the types, species and sizes called for in the bid schedule. The unit price per planting item shall include furnishing and delivering all plants, furnishing and delivering prepared backfill soil, mulch, fertilizer, excavation for plant pits, backfilling, planting, pruning, guying and staking, tree trunk guards, mulching, weeding, watering, cleanup, plant establishment work and care including replacements, and for all labor, equipment, tools and incidentals necessary to complete the work prescribed in this section.

Mulching will be paid for under Item 767.6 Aged Pine Bark Mulch.

ITEM 796.775 LIVE STAKES EACH

The work under this Item shall conform to the relevant provisions of Subsection 771 of the Standard Specifications, and the following:

GENERAL

Live stakes shall be planted as shown on the Plans and shall be planted only during dormancy, prior to any growth or blooms.

Live stakes are placed after rip rap. If schedule doesn't allow for installation immediately following rip rap installation, they shall be installed at the next live stake planting window.

Planting Season

Live stakes shall be planted November 1 to December 15; and February 15 to March 31. Stakes shall not be planted in frozen ground.

MATERIAL

A variety of plant species may be used, depending on availability. Mix shall be determined by the Landscape Architect and/or Wetland Specialist. Species shall be 1) native to Massachusetts; 2) appropriate for conditions; and 3) appropriate for use as a live stake. Species may include, but are not limited to:

Salix discolor (Pussy willow)
Salix nigra (Black willow)
Cornus sericea (Redosier dogwood)
Cornus amomum (Silky dogwood)
Viburnum dentatum (Arrowwood viburnum)
Sambucus canadensis (Elderberry)

Live stakes shall be a minimum of four feet in length and a minimum of three-quarter inch (3/4") in diameter. Stakes shall have been harvested locally, within the same physiographic ecoregion and plant hardiness zone. Stakes shall have side branches removed and bark shall be intact. Bottom ends shall be cut with a sharp blade at a 30 to 45-degree angle for insertion into the soil. Top ends of stakes shall be cut square. Stakes shall have at least two (2) bud scars near the top to facilitate branch development.

Stakes must be fresh when brought to site and shall be planted within two (2) weeks of arriving on site. If stored on site after arrival, the stakes shall be cool, moist, and shaded with the bottoms of the stakes soaked in water. Dried stakes shall be rejected. Stakes that have been stored in water shall have the bottom recut, as described above, prior to planting.

ITEM 796.775 (Continued)

CONSTRUCTION METHODS

Care shall be taken to ensure the correct end of the stake is planted in the ground (buds facing upward). One foot of the live stake should be installed into the ground. Prior to planting, pilot holes should be made with a metal bar or re-bar. A rubber mallet should be used to drive the stakes in the ground. Tops that are damaged during insertion shall be cut. Stakes that split during insertion shall be removed and replaced.

Stakes shall be planted at 90-degrees to the slope.

The layout of species shall be as shown on the plans. If not shown, stakes shall be in groupings of three to five plants of the same species (depending on the species used) or shall be as required by the Landscape Architect or Wetland Specialist. Spacing shall be as directed by the Landscape Architect and/or Wetland Specialist, otherwise spacing shall be no farther than four (4) feet apart, and if planted in double rows, stakes shall be in a staggered pattern.

All stakes shall be watered as required for healthy growth.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Measurement and payment shall be at the Contract unit price for each stake planted. At a minimum, stakes shall have firmly established roots for acceptance at the time of the one-year warranty period.

ITEM 797.2 INFORMATIONAL SIGN EACH

The work to be done under this item includes furnishing and installing of a double pedestal informational sign as detailed on the plans at the locations shown on the plans or as directed by the Engineer.

MATERIALS

Double pedestal informational sign shall have a frame dimension of 38"x 26" for exhibits size of 36"x 24" and shall be made of corten weathering steel and shall have powder coat with black texture finish.

Grout shall be pourable exterior anchoring hydraulic cement per item on MassDOT QCML.

Gravel Borrow	M1.03.0 (Type B)
Cement Concrete (Air-Entrained 4000 psi, ¾", 610)	M4.02.00

CONSTRUCTION METHODS

The Contractor shall consult the manufacturer's recommendations in order to install the informational sign properly. The Contractor shall install the informational sign level, plumb and true.

Engineer shall approve the locations of the informational sign prior to installation of the footings.

The Contractor shall protect informational sign finishes on exposed surfaces from damage by applying a temporary protective covering or wrapping before shipping. Materials shall be stored in compliance with the manufacturer's directions to prevent deterioration from moisture, heat, cold, direct sunlight, or other causes.

Each post of the informational sign shall be installed on a concrete footing as shown on the drawings as per manufacturer's recommendations. Top of footing shall be set below the finished paving course.

The Contractor shall inspect the informational sign after installation is completed and remove spots, dirt, and debris from all components. The Contractor shall repair damaged finishes to match the original finish or replace the damaged component.

METHOD OF MEASUREMENT

Item 797.2 will be measured for payment by the Each informational sign furnished and installed, complete in place.

BASIS OF PAYMENT

Item 797.2 will be paid for at the Contract unit price per Each which price shall include furnishing, installation, all labor, materials equipment, tools, and incidental costs required to complete the work.

ITEM 811.36 ELECTRIC MANHOLE ADJUSTED EACH

The work under this Item shall conform to the relevant provisions of Subsections 201, and 801 of the Standard Specifications, and the following:

The work to be done under this item is the adjustment of electric manholes on Essex Center Drive.

The Contractor shall coordinate the adjustment of these manholes with Sports Medicine North before commencing any work. The structures shall be adjusted to line and grade, with masonry removal and reconstruction conducted in conformity with the applicable requirements of Subsection 201: Basins, Manholes, and Inlets.

METHOD OF MEASUREMENT

Item 811.36 will be measured for payment according to the provisions of Subsection 801.80 of the Standard Specifications.

BASIS OF PAYMENT

Item 811.36 will be paid for according to the provisions of Subsection 801.81 of the Standard Specifications.

ITEM 815.13 RECTANGULAR RAPID FLASHING BEACON SYSTEM (SOLAR) EACH

The work under this Item shall conform to the relevant provisions of Section 800 of the Standard Specifications, the Plans, and the following:

Rectangular rapid flashing beacons (RRFBs) are intended to provide supplemental warning to approaching vehicles of the potential for pedestrians to be crossing in an adjacent crosswalk. The work shall include furnishing and installing a pair of solar-powered, pedestrian actuated, rectangular RRFB system at the locations indicated in the Plans. The final location for each assembly shall be determined and field verified by the City of Peabody and the engineer prior to installation.

MATERIALS

Each RRFB system shall, at a minimum, consist of the following items, which shall be included in the bid for each crossing depicted in the plans:

- (2) concrete foundations;
- (2) 15' traffic signal posts and pedestals
- (2) APS pushbutton systems;
- (4) dual rectangular yellow LED beacons in NEMA enclosures;
- (2) 9"x12" R10-25 (PUSH BUTTON TO TURN ON WARNING LIGHTS) signs;
- (4) 30"x30" W11-15 (BICYCLIST/PEDESTRIAN X-ING) signs;
- (2) 24"x12" W16-7PR and (2) 24"x12" W16-7PL (Diagonal Downward Arrow) signs;
- (2) solar panel arrays;
- (2) NEMA Type 3R or higher enclosures to house:
    - Electrical components, including wiring and solid-state circuit boards;
    - On-board user interface;
    - Battery and solar panels (at the solar-powered location indicated in the plan); and
    - Frequency hopping spread spectrum (or other alternate FCC approved) wireless activation unit with a minimum 150' range; and
- All mounting and supporting hardware and wiring necessary to complete a working system.

RRFB controller and LED beacons, APS pushbutton systems, and traffic signal posts and pedestals shall be listed on the Qualified Traffic Control Equipment List.

The light intensity of the LED beacons during daytime conditions shall meet the minimum specifications for Class 1 yellow peak luminous intensity in the Society of Automotive Engineers (SAE) Standard J595 (Directional Flashing Optical Warning Devices for Authorized Emergency, Maintenance, and Service Vehicles) dated January, 2005. An automatic signal dimming device shall be included to reduce the brilliance of the LED beacons during nighttime conditions.

All signs shall be MUTCD-compliant. R10-25 signs shall have a black border and legend on a white background. W11-15, W16-7PR, and W16-7PL signs shall have a black border and legend on a fluorescent yellow-green background. All sign sheeting materials shall be per Subsection 828.41.

ITEM 815.13 (Continued)

R10-25 signs may be integrated into the APS pushbutton system as a single unit or mounted separately on Type A aluminum.

W11-15, W16-7PR, and W16-7PL signs shall be Type A aluminum per Subsection 828.42.

Any proprietary software required for the programming and/or operation of the system shall be included at no additional cost.

Where necessary, the Contractor shall provide extension bracket mounted on the signal poles at no additional cost such that the pedestrian pushbutton detector shall be located within 10 inches from the wheelchair ramp level landing. The extension bracket including pushbutton and signs shall not encroach into level landing resulting level landing area smaller than 4 feet by 4 feet. The bracket extension shall provide the provision of mounting pushbutton and 9 inch by 12 inch sign required per ADA and MUTCD guidelines. The bracket extension shall be installed per manufacturer's recommendation and the length of the extension shall be field verified and adjusted as needed.

Solar Panels:

The solar panels shall be affixed to an aluminum plate and bracket, adjustable at an angle of 45° to 60° and each assembly shall be mounted on a 360° rotatable pole cap mount to facilitate adjustment for maximum solar collection and optimal battery strength. The solar panel assemblies shall be rated for 90 mph wind conditions.

The batteries shall conform to Battery Council International specifications and have a capacity allowing up to 30 days of autonomy without sunlight and varying with ambient temperature and number of activations. The batteries shall be rated for a minimum lifespan of 3 years. Batteries shall be replaceable independently of other components. The contractor is responsible for designing the solar panel and battery assembly for each post to provide the stated level of autonomy.

The solar panels and battery shall have a minimum operating temperature range of -40° to 122°F (-40° to 50°C).

The Contractor shall provide shop drawings and calculations to confirm solar panel sizing and battery/solar energy storage will meet the functional requirements of the system.

Functional Requirements:

The RRFB system shall remain dark until pedestrian actuation.

ITEM 815.13 (Continued)

Upon actuation, all LED beacons shall activate and flash in a rapidly flashing sequence. Each sequence shall last 800 milliseconds and there shall be 75 sequences per minute. The sequence shall be the same for each pair of LED beacons in an enclosure and shall be as follows:

1. The RRFB indication on the left-hand side shall be illuminated for approximately 50 milliseconds.
2. Both RRFB indications shall be dark for approximately 50 milliseconds.
3. The RRFB indication on the right-hand side shall be illuminated for approximately 50 milliseconds.
4. Both RRFB indications shall be dark for approximately 50 milliseconds.
5. The RRFB indication on the left-hand side shall be illuminated for approximately 50 milliseconds.
6. Both RRFB indications shall be dark for approximately 50 milliseconds.
7. The RRFB indication on the right-hand side shall be illuminated for approximately 50 milliseconds.
8. Both RRFB indications shall be dark for approximately 50 milliseconds.
9. Both RRFB indications shall be illuminated for approximately 50 milliseconds.
10. Both RRFB indications shall be dark for approximately 50 milliseconds.
11. Both RRFB indications shall be illuminated for approximately 50 milliseconds.
12. Both RRFB indications shall be dark for approximately 250 milliseconds.

The flash rate of each individual RRFB indication, as applied over the full flashing sequence, shall not be between 5 and 30 flashes per second.

The RRFB units shall operate in flashing sequence after pushbutton activation for the following locations and intervals:

- Crossing of Northshore Road: 11 seconds (for a 24-foot crossing at 3.5 feet per second plus 4 seconds).
- Crossing of Endicott Street: 13 seconds (for a 31-foot crossing at 3.5 feet per second plus 4 seconds).

All RRFBs within a system shall commence and cease operation simultaneously.

These settings shall be user-programmable through the on-board user interface. No-fee wireless (Wi-Fi, Bluetooth®, etc.) may be used as an alternative programming method.

Each APS pushbutton shall have a tactile arrow and locator tone. The tactile arrow shall be oriented to point in the direction of the crosswalk. The locator tone shall have a duration of 0.15 seconds or less and shall repeat at 1-second intervals. The locator tone shall be set 2 to 5 dBA above ambient sound, shall automatically adjust intensity, but cap at a maximum volume of 100 dBA. The tone shall be audible whenever the LED modules are not active.

Upon activation of the LED modules, a speech message shall state, "Yellow lights are flashing." This message shall be stated twice. No vibrotactile or percussive indications shall be used.

ITEM 815.13 (Continued)

CONSTRUCTION METHODS

No work shall commence until the shop drawings are approved.

The Contractor shall perform a pre-construction utility survey, including any required test pits, to determine the location of all known utilities no later than thirty (30) calendar days before commencing physical site work in the area affected by the proposed conduit and posts. The cost of the test pits and utility survey shall be considered incidental to the lump sum cost.

Both poles and both signal post pole bases (if applicable) shall be painted black

Foundation installations (where applicable) shall be per Subsection 801.62 and SD3-030 with foundation depth as indicated in the plans. The top of the foundation shall be ¼" to 1" proud of the sidewalk and chamfered at 45 degrees. Gaps between the sidewalk and foundation shall be no larger than ¼" and grouted with preformed joint filler. Foundations shall be cast in place.

Equipment grounding shall be per Subsections 813.61 and 813.62.

The Contractor shall diagnose and replace any part of the pedestrian activated warning system that is found to be defective in workmanship, material, or manner of functioning within six months of final acceptance by the Engineer. This requirement does not supersede the one-year warranty period on materials specified in Subsection 815.20.

Systems shall have a warranty of three (3) years with the warranty period beginning on the date the RRFB units are accepted by the City.

The Contractor shall furnish three (3) sets of maintenance and operation manuals. The equipment manuals shall contain schematic diagrams, complete installation/operation procedures, maintenance/troubleshooting procedures, and a list of replacement parts including names of vendors.

METHOD OF MEASUREMENT

Item 815.13 will be measured for payment by the Each rectangular rapid flashing beacon, as measured by the 2-Post Assembly System, furnished and installed, complete in place.

BASIS OF PAYMENT

Item 815.13 will be paid for at the Contract unit price per Each, which price shall include furnishing, installation, wiring, mounting equipment, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 820.11 HIGHWAY LIGHTING - UNDERPASS LUMP SUM

The work under this Item shall conform to the relevant provisions of Subsection 820 of the Standard Specifications, and the following:

The Lighting Assemblies shall be as generally described on the Drawings and as detailed in these Special Provisions. This work shall be done in accordance with the Standard Specifications and these Special Provisions, as detailed in the Drawings. The contractor shall furnish all supervision, materials, equipment, accessories, handling, shipping, and delivery to provide the specified Lighting Assemblies as detailed herein, complete with all appurtenances. All transportation, handling, shipping costs, manufacturer's storage, and other necessary costs shall be included.

This work shall include providing all labor, equipment, and materials to install the Lighting Assemblies, complete with lamps, drivers, wiring, grounding connections, and all other items necessary to provide a complete and operational system. This work shall be done in accordance with the Standard Specifications and these Special Provisions and as detailed on the Drawings.

SUBMITTALS

Submit detailed shop drawing submittals with all aspects and dimensions, as well as equipment and material specifications of the proposed pole, Luminaire, and appurtenances clearly detailed. Shop drawing submittal shall include point-by-point photometric calculations. Calculations shall be in maintained fc. Include light loss factors in the report. Point-by-point calculations shall utilize an IES standard grid. The manufacturer may contact the engineer to receive an Auto Cad .dwg file of the project area and pole layout to facilitate these calculations.

MATERIALS

Luminaire: Proposed Lighting shall be approved by the Engineer and in accordance with the following requirements:

1. Drawing Designation: SW-1
2. Qty: 4
3. Height: 6 1/2”
4. Width: 15 11/16”
5. Length: 14 17/64”
6. Weight: 17 lbs.
7. EPA Rating: N/A
8. Material: Die Cast Aluminum Housing and Heatsinks.
9. Vibration Rating: 1.5G.
10. Driver Enclosure: Thermally isolated from optics to allow for optimal thermal performance.
11. Optics: High efficiency injection-molded AccuLED Optics to be fully sealed to maintain IP rating.
12. BUG Rating: Luminaire to produce 0% total lumens above 90º (BUG Rating, U=0).
13. Fixture Connection: Gasketed and zinc plated rigid steel mounting attachment.

ITEM 820.11 (Continued)

14. Finish:
    a. Provide in TGIC polyester powder coat paint, 2.5mil nominal thickness, in Gray finish.
    b. Finish to be confirmed with owner prior to ordering.
15. Lamping: 44 watt LED
16. LEDs: ROHS compliant, 100% mercury and lead free.
17. Lumens: 4,851 lm
18. Minimum Efficacy: 110 (lm/w)
19. System Drive Current: 800 mA
20. Voltage: Universal Electronic, wired at 120v to 277v
21. CCT: 3,000K
22. CRI: Minimum of 80
23. Distribution: Type 3
24. BUG Rating: B1-U0-G1
25. Power Supply / Driver: Class 2 0-10V dimmable driver w/ IP66 minimum rating.
    a. Temp Range: -40deg Celsius to 40deg Celsius
    b. Surge Protection: 20kV UL Surge Protection Device integral to fixture.
26. Driver Location: Integral to fixture, mounted to heavy duty fabricated bracket to allow for ease of maintenance.
27. Life: Minimum L90 of 60,000 hours minimum with projected L70 at 205,000 hours.
28. Listing & Rating:
    a. Minimum IP66
    b. UL Wet Location (US/Canada)
    c. Vandal Rating: IK10
    d. Tested and in conformance w/ IESNA LM-79 & LM-80 test standards at 25-degree Celsius
    e. DesignLights Consortium™ Premium Classification qualified product.
    f. International Dark Sky Association listed.
29. Warranty: 5 Year
30. Wiring: Exterior and underground wiring in conduit and grounding conductors: 98% conductivity copper 600 volt insulation, XHHW, THHN/THWN, or THWN-2. Streetlight pole internal wiring: 98% conductivity copper 600 volt insulation, MTW, XHHW, THWN-2 or THHN/THWN.
31. Color code: All conductors shall have color-coded insulation to designate ground, neutral conductor and phases. Colored tape alone is not acceptable. Phases shall be black and red, receptacle branch circuit shall be black, neutral shall be white and ground shall be green.
32. Wire markers: Shall be plastic cable wrap type with marking tag for permanent tagging. Plastic tag shall have controller and circuit number written on it with permanent ink marking pen per tag manufacturer's directions. Panduit PLF1MA-C Marker Tie, or equivalent.
33. Splices and Junctions:
    a. All splices and junctions shall be made waterproof by a UL approved method. Conductor splice shall be made by UL listed compression type butt splice kit. Waterproofing method shall be by heat shrink, by sealant in waterproof splice cap, or by sealant in cold shrink.

ITEM 820.11 (Continued)

b. #10 AWG or Smaller, above grade: UL listed compression type connectors.
c. #8 A WG or Larger, above grade: UL listed mechanical compression connector.
d. Splices and junctions shall not be buried or installed in conduit.
e. Splices in junction boxes shall be UL listed hydraulic compression (12 tons minimum) type butt or two-wire stub splice with UL listed heat shrink waterproof splice cover.
f. End caps shall be used to seal and insulate the ends of 1/C wires. End caps shall be waterproof of thermally stabilized, modified polyolefin heat shrink material with mastic sealant inside UL listed 600 Volt, 90 degrees C.
g. Wet location splices and junctions shall be accomplished with UL listed heat shrink 600 Volt, 90 degrees C, waterproof splice kits. Raychem Series MCK, Type V or L or equivalent.

CONSTRUCTION METHODS

Install fixtures in strict accordance with the manufacturer's instructions.

Electrical conduit, junction boxes, and boxes to be installed in accordance with Section 800 of the MassDOT standard specifications.

Handle lighting fixtures carefully to prevent breakage, denting or scoring of fixtures' finishes. Do not install damaged lighting fixtures. Replace with undamaged units and return damaged units to equipment manufacturer. Install fixture, drivers and wiring complete.

Splices and junctions shall be made only in junction boxes. Perform no more splices than needed.

Install a tie wrap type permanent wire marker on each and every pair of conductors passing through every junction box (bundle circuit pairs together). Mark controller number, circuit letter and pole number on each tie wrap and designate home runs as encountered.

BASIS OF PAYMENT

Item 820.11 will be paid for at the Contract Lump Sum price, which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

Furnishing and installing all required wiring is included in the unit price of this item.

ITEM 832.91 EAST COAST GREENWAY STANDARD ROUTE SIGN EACH
ITEM 832.92 EAST COAST GREENWAY ARROW SIGN EACH

The work under these Items shall conform to the relevant provisions of Subsection 828 of the Standard Specifications, and the following:

The work under these Items shall include furnishing and installing East Coast Greenway signs at the locations designated on the plans and as required by the Engineer.

Signage for the East Coast Greenway must be ordered from the East Coast Greenway Alliance using the attached order form and map or plan of proposed sign locations per the Pavement Marking & Signing Plans.

METHOD OF MEASUREMENT

Items 832.91 and 832.92 will be measured for payment by the Each respective East Coast Greenway sign furnished and installed, complete in place.

BASIS OF PAYMENT

Items 832.91 and 832.92 will be paid for at the respective Contract unit prices per Each, which prices shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

Posts shall be paid under Item 847.1.

ITEM 847.1 SIGN SUP (N/GUIDE)+RTE MKR W/1 BRKWAY POST ASSEMBLY – STEEL EACH

The work under this Item shall conform to the relevant provisions of Subsection 840 of the Standard Specifications, and the following:

Where new signs and posts are installed in cement concrete surfaces, coring post holes, filling hole, and repairing/restoring sidewalk shall be considered incidental to this item.

METHOD OF MEASUREMENT

Item 847.1 will be measured for payment according to Subsection 840.80 of the Standard Specifications.

BASIS OF PAYMENT

Item 847.7 will be paid for according to Subsection 840.81 of the Standard Specifications and shall also include coring post holes, filling hole, and repairing/restoring the sidewalk.

ITEM 851.11 TEMPORARY PEDESTRIAN BARRICADE FOOT
ITEM 851.12 TEMPORARY PEDESTRIAN CURB RAMP EACH

Work under these items consist of furnishing, deploying, maintaining in proper operating conditions, and removing temporary pedestrian barricades and temporary pedestrian ramps as part of a Temporary Pedestrian Access Route (TPAR) in order to guide pedestrians around a fully- or partially-closed sidewalk. These devices are intended to prevent pedestrians from entering the work area and to prevent pedestrians from inadvertently entering the vehicle travel lane by providing visual and physical separation between each space.

MATERIALS

The Temporary Pedestrian Barricade shall have a continuous bottom rail or edge no more than two (2) inches above the ground and eight (8) inches in height (minimum) to accommodate cane users, have a smooth and continuous hand railing along the top edge no less than 32 inches above the ground and not obstruct or project into the pedestrian path of travel. Barricade walls shall be nearly vertical and generally within the same plane.

If exposed to traffic, Temporary Pedestrian Barricades shall be crashworthy.

The Temporary Pedestrian Curb Ramp shall provide a 48 inch minimum width, with a firm, stable, and non-slip surface. Protective edging with a two (2) inch minimum height shall be installed when the curb ramp or landing platform has a vertical drop of six (6) inches or greater.

The Temporary Pedestrian Curb Ramp walkway and landing area surface shall be of a solid, continuous, contrasting color abutting up to the existing sidewalk.

If a Temporary Pedestrian Curb Ramp leads to a crosswalk, a detectable warning pad must be used at the base of the ramp; if it leads to a protected path that does not conflict with vehicular traffic then a detectable pad shall not be used.

CONSTRUCTION METHODS

The Temporary Pedestrian Barricade shall be placed in an area that will provide pedestrians with a TPAR on a smooth, continuous hard surface for its entirety. The geometry and alignment of the facility shall meet the applicable requirements of the "Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities" and the Massachusetts Architectural Access Board.

The recommended width of the TPAR is 60 inches, but if constraints exist a minimum clear width of 48 inches shall be provided along its entirety. If a 60 inch width cannot be accommodated in full, a 60 inch by 60 inch passing space shall be provided every 200 feet or less along the TPAR.

Turning areas shall be 60 inches by 60 inches minimum.

Lateral joints between any surfaces shall not exceed 0.5 inches. Lateral edges may be vertical up to 0.25 inches high and shall be beveled at 1V:2H between 0.25 inches and 0.5 inches.

ITEMS 851.11 and 851.12 (Continued)

The TPAR shall be kept clear of debris, snow, and ice and the Temporary Pedestrian Barricades and Temporary Pedestrian Curb Ramps shall not obstruct drainage.

Removal and/or resetting of Temporary Pedestrian Barricades and Temporary Pedestrian Curb Ramps shall be considered incidental.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Payment for Temporary Pedestrian Barricades will be made at the contract price per foot installed in place, including all incidental items. This price shall include the cost of furnishing, installing, resetting, removal, and maintaining in good working condition.

Payment for Temporary Pedestrian Curb Ramps will be made at the contract price per each unit installed in place, including all incidental items. This price shall include the cost of furnishing, installing, resetting, removal, and maintaining in good working condition.

ITEM 874.2 TRAFFIC SIGN REMOVED AND RESET EACH

The work under this Item shall conform to the relevant provisions of Subsection 840 of the Standard Specifications and the following:

The work to be done consists of removing and resetting the existing street, warning, regulatory and miscellaneous signs and their supports to new locations as shown on the Plans or as required by the Engineer.

The Contractor shall replace at his own expense, all sign panels and supports that are damaged or lost either directly or indirectly as a result of his actions.

MATERIALS

Materials for traffic signs and miscellaneous signs removed and reset shall be the existing signs. If in the opinion of the Engineer, the existing sign panel is unsuitable for reuse, a new sign panel of a size and composition equal to the existing sign panel, shall be furnished, as required by the Engineer.

CONSTRUCTION METHOD

The sign shall be mounted in accordance with the Manual on Uniform Traffic Control Devices (MUTCD) and the 1990 Standard Drawings for Signs and Supports.

When the visibility of the relocated sign panels is obstructed by trees and other vegetation, the Contractor shall clear the obstruction for proper sight distance. All clearing shall be done within the roadway layout, as approved by the Engineer.

Sign panels to be removed and reset shall be cleaned before being reset.

Damage during removal or resetting to any sign panel designated for reuse by the Engineer shall be repaired or replaced by the Contractor at his own expense.

Any excavation made for removal of the existing sign or foundation and any resulting depression shall be backfilled with selected excavated material and the surface restored to match the adjacent materials.

The Contractor shall furnish and install all necessary mounting fixtures (nuts, bolts and other miscellaneous items) required to complete the work.

ITEM 874.2 (Continued)

METHOD OF MEASUREMENT

Item 874.2 will be measured for payment by the Each traffic sign removed and reset, complete in place.

BASIS OF PAYMENT

Item 874.2 will be paid for at the Contract unit price per Each, which price shall include removing, resetting, excavation, backfilling, mounting fixtures, all labor, materials, tools, equipment, and incidental costs required to complete the work.

If required by the Engineer, new sign posts for Traffic Signs shall be paid for separately under Item 847.1.

If required by the Engineer, new Traffic Sign panels shall be furnished, installed and paid for under Item 832.

The cost of any work or materials required, due to the Contractor's negligence, shall be borne by the Contractor.

ITEM 874.4 TRAFFIC SIGN REMOVED AND STACKED EACH

The work to be done under this item consists of dismantling, removing, and stacking existing warning and regulatory sign panels, guide signs, and posts (whether signs are present or not); including their supports and all mounting hardware, designated to be removed on the plans or as required by the Engineer.

CONSTRUCTION METHODS

Signs and attached hardware shall be carefully removed from their supports. The supports and existing foundations shall be completely removed and the holes backfilled with gravel borrow. The surface shall be patched with a material to match the existing ground or as required by the Engineer.

The Contractor shall backfill all holes resulting from removal of existing signs and their foundations with compacted gravel and restore the area to match the existing conditions of adjacent areas.

Sign panels, posts and foundations shall be disposed of offsite in a manner that meets all applicable local, state and federal requirements.

If signs are attached to existing light poles, utility poles or traffic poles, only the sign and attached hardware shall be removed and stacked.

Signs shall be stockpiled at the City of Peabody DPW at 50 Farm Avenue, Peabody 01960.

The existing signs shall not be removed and stacked without the prior approval of the Engineer.

METHOD OF MEASUREMENT

Item 874.4 will be measured for payment by the Each traffic sign removed and stacked, complete in place.

One unit shall include the sign panel, sign post(s), appurtenances, and foundation(s).

BASIS OF PAYMENT

Item 874.4 shall be paid for at the Contract unit price per Each which price shall include removing, stacking, backfilling, restoration of the removed sign area, all labor, materials, equipment and all incidental costs required to complete the work.

ITEM 916.01 PRECAST CONCRETE CULVERT NO. 1 (8' SPAN, 4' RISE) EACH
ITEM 916.02 PRECAST CONCRETE CULVERT NO. 2 (8' SPAN, 4' RISE) EACH

The work performed under this Item shall conform to the applicable provisions of Subsection 901 of the Standard Specifications and the following:

Work under this item shall include all materials, equipment and labor needed to construct the following:

- Precast concrete box culvert, cutoff walls, and headwalls;
- Precast concrete wingwalls and footings;
- Damproofing and weep holes;
- All items included hereinafter under Basis for Partial Payments.

PRECAST CONCRETE CULVERTS, CUTOFF WALLS, HEADWALLS AND WINGWALLS

A. General.

The work under this Heading consists of fabricating, transporting and installing precast concrete box culverts, and includes all necessary labor, materials, and equipment to complete the work as shown on the Plans. The work shall conform with the MassDOT Standard, Supplemental, and Interim Specifications and the requirements of the current AASHTO LRFD Bridge Construction Specifications, supplemented by the current relevant provisions of the latest edition of PCI MNL-116 (The Manual for Quality Control for Plants and Production of Precast and Prestressed Concrete Products), except as noted herein.

The manufacturer shall submit evidence at the request of the Engineer showing that he or she has successfully completed work of similar magnitude prior to being approved as the source of the material for this work. The manufacturing process shall be closely supervised by experienced plant personnel and records of plastic and concrete strength shall be kept and submitted to the Engineer for control.

QUALITY ASSURANCE

A. General.

Quality Assurance includes all the planned and systematic actions necessary to provide confidence that a product or facility will perform satisfactorily in service. It is an all-encompassing term that includes Quality Control (performed by the Fabricator) and Acceptance (performed by MassDOT). Quality Control is the system used by the Contractor and Fabricator to monitor and assess their production processes at the plant facility and installation activities at the project site to ensure that the final product will meet the specified level of quality. Acceptance includes all factors used by MassDOT to determine the corresponding value for the product. MassDOT Acceptance inspection at the plant facility is intended as a means of evaluation of compliance with contract requirements. Contractor and Fabricator Quality Control activities and MassDOT Acceptance activities shall remain independent from one another. MassDOT Acceptance activities shall not replace Fabricator Quality Control activities.

ITEMS 916.01 and 916.02 (Continued)

B. Fabricator Quality Control.

Quality Control shall be performed by the Fabricator to ensure that the product is fabricated in conformance with the specifications herein. The Fabricator shall maintain a Quality Control system to monitor, assess, and adjust placement and fabrication processes to ensure the Precast Concrete Bridge Element(s) meet the specified level of quality, through sufficient Quality Control sampling, testing, inspection, and corrective action (where required). The Fabricator's Quality Control system shall address all key activities during the placement and fabrication and shall be performed in conformance with the Fabricator's NPCA or PCI Certification. Quality Control documentation shall meet the requirements of the *Fabricator Quality Control – Documentation* section below. Upon request, Fabricator Quality Control documentation shall be provided to the MassDOT Plant Inspector.

1. Plant.

Prior to the fabrication of Precast Concrete Bridge Elements, the Fabricator's precast concrete plant shall obtain the following:

(a) Certification by the National Precast Concrete Association (NPCA) Plant Certification Program or Precast/Prestressed Concrete Institute (PCI) Plant Certification Program, for the applicable types of Precast Concrete Bridge Element(s) being fabricated
(b) MassDOT Prequalification
(c) MassDOT Mix Design Approval

All concrete for a given Precast Concrete Bridge Element shall be produced by a single company and plant, unless otherwise approved by the Engineer.

2. Personnel.

The Fabricator shall provide adequate training for all QC personnel in accordance with NPCA or PCI certification. There shall be sufficient personnel trained and certified to perform the tests listed under Subsection M4.02.13, Part D. At a minimum, the Fabricator's Quality Control Personnel shall maintain the following qualifications and certifications:

(a) QC Manager with an active NETTCP Field Technician or ACI Concrete Field Testing Technician – Grade I certification or higher, and a minimum of 4 years continuous experience in the manufacture of Precast Concrete Bridge Elements for state transportation departments. The QC Manager shall be on site while the batch plant is producing and placing concrete for MassDOT projects.
(b) A Technician/Inspector having the Precast/Prestressed Concrete Institute (PCI) Technician/Inspector Level I or NorthEast Transportation Training and Certification Program (NETTCP) Precast Concrete Inspector, or higher.

The Contractor shall submit to the Engineer a copy of the Fabricator's Quality Control Personnel required qualifications, as specified above.

ITEMS 916.01 and 916.02 (Continued)

3. Laboratory.

The Fabricator shall provide a room of sufficient size to house all equipment and to adequately perform all testing. The room shall have either a separate moisture storage room or curing box for concrete cylinders, and it shall be thermostatically controlled to maintain temperatures consistent with AASHTO T 23. It shall include a desk and file cabinet for proper record keeping, and have good lighting and ventilation. This room shall be kept for testing and quality control and not used for any other purpose. An additional desk and file cabinet shall be provided for exclusive use of the Engineer. No exception from these requirements will be allowed without the express written permission of the Engineer.

4. Testing Equipment.

At a minimum, the Fabricator's plant facility shall have the following testing equipment:

(a) Air Content Meter Type A or B: AASHTO T 152
(b) Air Content Meter Volumetric Method: AASHTO T 196 (Required for Lightweight Concrete)
(c) Slump Cone: AASHTO T 119
(d) Cylinder Molds AASHTO M 205
(e) Concrete Testing Machine: AASHTO T 22
(f) Screening Sieve: AASHTO T 27, AASHTO T 11
(g) Curing Box: AASHTO T 23
(h) Spread Test Base Plate for Self-Consolidating Concrete (SCC): ASTM C1611
(i) All other equipment prescribed by AASHTO and ASTM standards for the tests to be performed by the Fabricator as specified

5. Inspection.

Quality Control personnel shall monitor and inspect the fabrication of each Precast Concrete Bridge Element. Quality Control personnel shall report all inspection activities on Quality Control Inspection Reports and non-conformances on Non-Conformance Reports (NCRs) throughout the entire fabrication process, as speciefied herein.

6. Temperature Monitoring.

At a minimum, the Fabricator shall monitor, record, and report the temperatures of the form, ambient temperatures surrounding the concrete, and temperatures of the concrete continuously, without interruption as specified below:

(a) Prior to placement of concrete to verify that $T_i \geq 50°F$.
(b) Immediately after placement to verify that $T_i \geq 50°F$ is maintained.
(c) Throughout the entire duration of the curing cycle, at regular intervals not to exceed one hour until 100% Design Strength (f'_c) is attained and concrete has cooled to within 40°F of the ambient temperature surrounding the Precast Concrete Bridge Element.

ITEMS 916.01 and 916.02 (Continued)

At a minimum, the temperature measuring devices shall record and report the temperature of the concrete to the nearest 2°F. At least two temperature sensors (thermocouples) shall be positioned to record the maximum and minimum anticipated concrete temperatures. The anticipated minimum temperature shall be measured with one or more thermocouples at a distance no greater than 2 inches from the surface of the thinnest section. The anticipated maximum temperature shall be measured with one or more thermocouples at the center of the thickest section. Proposed temperature measurement locations shall be submitted to the Engineer for approval. Temperature recording devices shall be located within the curing enclosure and calibrated as required by PCI MNL-116 Section 4.18.4. Maximum heat increase and cool down rates shall comply with PCI MNL-116, Section 4.19. The Contractor shall furnish temperature logs recorded at a minimum frequency of once per hour to the Inspector as required, with each post-pour QC inspection report.

7. Sampling and Testing.

At a minimum, the Fabricator shall perform random Quality Control sampling and testing as specified in *Table 1: Quality Control Sampling and Testing*. The Fabricator shall perform additional Quality Control sampling and testing on concrete that has been retempered with admixtures or hold-back water during fabrication. Test Specimens shall conform to the requirements of Section M4.02.13 of the MassDOT Standard and Supplemental Specifications and AASHTO R 60, with the exception of the Stripping (80% f'_c) set of cylinders. Stripping (80 % f'_c) cylinders shall be cured in the same location and environment as the Precast Bridge Elements they represent. If approved by the Engineer, compressive strength cylinder match curing equipment, that maintains the same concrete conditions that the corresponding Precast Bridge Element is exposed to, may be utilized in lieu of Stripping (80 % f'_c) field cured cylinders, with the use of thermocouples, controllers, and heaters

ITEMS 916.01 and 916.02 (Continued)

Table 1: Quality Control Sampling and Testing

Quality Characteristic	Test Method	Sample Size	Specification Limit	Lot Size [c]	Sublot Size [d]	Frequency	Point of Sampling
Slump (in.) [a]	AASHTO T 119	Per AASHTO	≤ 8 in. or as approved by the Engineer	Total Quantity of Concrete (cy) produced on a Contract, per Type of Element fabricated, per Mix Design	20 cy	One (1) per Sublot or fraction thereof	Point of Discharge
Air Content (%)	AASHTO T 152	Per AASHTO	5% ≤ % ≤ 8%				
Temperature (°F)	AASHTO T 309	Per AASHTO	50°F ≤ °F ≤ 90°F				
Compressive Strength (psi)	AASHTO T 22 AASHTO T 23	Stripping Cylinders: One (1) set of Three (3) 4 x 8 in.	≥ 80% f'c at Stripping				
		7-day Cylinders: One (1) set of Three (3) 4 x 8 in.	For Information at 7 days				
		28-day Cylinders: One (1) set of Three (3) 4 x 8 in.	≥ 100% f'c at 28 days				
		56-day Cylinders: One (1) set of Three (3) 4 x 8 in.	≥ 100% f'c at 56 days [b]				

Notes:

(a) Self-consolidating concrete (SCC) shall meet the requirements of M4.02.17.

(b) 56-day Compressive Strength test specimens shall require testing only when 28-day Compressive Strength test specimens have failed to meet Design Strength (f'_c).

(c) Lot shall be defined as a specific quantity of material from a single source, produced or placed by the same controlled process.

(d) Sublot shall be defined as an equal division or part of a Lot from which a sample of material is obtained in order to assess the Quality Characteristics of the Lot.

8. Certificate of Compliance.

The Fabricator shall provide a Certificate of Compliance in accordance with Standard Specifications, Division I, Section 6.01, stating that QC test cylinders have achieved the design strength, f'_c. A Certificate of Compliance shall accompany each shipment and shall be presented to the MassDOT Resident Engineer or designee upon delivery to the site.

ITEMS 916.01 and 916.02 (Continued)

9. Documentation.

At a minimum, the Fabricator shall maintain a filing system for the following QC records and documentation. All QC records and documentation shall be made available to MassDOT upon the request of the Department.

(a) Current MassDOT Approved Mix Design Sheet(s) and Approval Letter(s)
(b) PCI or NPCA Certification
(c) Current Qualifications and Certifications for QC Manager(s) and QC Technician(s)
(d) Most current set of Approved Shop Drawings
(e) Approved Placement, Finishing and Curing Plan
(f) Approved Dunnage Plan
(g) Fabricator Certificate of Compliance for each fabricated Precast Concrete Bridge Element
(h) Admixture Manufacturer's Certification of Compliance for each approved Admixture
(i) Completed QC Inspection Report for each fabricated Precast Concrete Bridge Element
(j) Identification Number for each fabricated Precast Concrete Bridge Element
(k) Time and date of casting of each fabricated Precast Concrete Bridge Element
(l) Date of stripping of each fabricated Precast Concrete Bridge Element
(m) Batch Ticket Printout reporting the quantity of concrete produced for each batch of concrete produced
(n) Concrete temperature records for each Precast Concrete Bridge Element fabricated
(o) QC Test Report Forms for each sublot of concrete produced
(p) Non-Conformance Reports (NCRs)
(q) Documentation of Repairs (if applicable)

C. Acceptance.

MassDOT will perform Acceptance inspection, sampling, and testing during fabrication and installation, to evaluate the quality and degree of compliance of the fabricated Precast Concrete Bridge Element to MassDOT specifications. Additionally, MassDOT Inspectors will monitor the Fabricator's Quality Control activities to ensure the Fabricator is properly administering Quality Control in conformance with the Fabricator's NPCA or PCI Certification. Acceptance inspection and test results not meeting MassDOT specifications will result in Non-conformance Reports (NCR) being issued by MassDOT to the Fabricator or Contractor for corrective action. Final Acceptance for the fabricated Precast Concrete Bridge Elements shall be determined by MassDOT.

1. Inspection.

A MassDOT MassDOT Inspector will be assigned to perform Acceptance activities during fabrication, which includes the inspection of the materials, work procedures, and Precast Concrete Bridge Elements. At least seven (7) days prior to the scheduled start of fabrication, the Fabricator shall contact the MassDOT Research and Materials Section (RMS) to provide notice of the scheduled fabrication start date. The Fabricator shall complete the following activites prior to notifying MassDOT RMS of the scheduled start date:

(a) Receive approval for all submitted Fabricator cement concrete mix designs from the MassDOT Research and Materials Section for the current year, as specified under the *Mix Design* section and *Table 3: Trial Batch Sampling Testing for New Mix Designs*. Self-consolidating concrete shall meet the requirements of M4.02.17.

ITEMS 916.01 and 916.02 (Continued)

(b) Receive approval for the submitted Fabricator Placement, Finishing, and Curing Plan from the MassDOT Research and Materials Section, as specified under the *Placement, Finishing, and Curing Plan* section.
(c) Receive Engineer of Record approved shop drawings from the MassDOT Research and Materials Section as specified under the *Shop Drawings* section.
(d) Participate in the pre-production meeting, as described under the *Pre-Production Meeting* section (if required).

Prior to the start of fabrication, the Fabricator shall review the fabrication schedule with the MassDOT Inspector. Fabrication shall only proceed when:

(a) The QC Inspector and MassDOT Inspector are present to inspect the Precast Concrete Bridge Element(s) being fabricated.
(b) The QC Manager is present at the Fabricator's plant.

The Fabricator shall grant access to all required areas of the Fabricator's plant to the MassDOT Inspector, during the hours of fabrication. Fabrication without MassDOT Inspector access to required areas is prohibited, and will result in the rejection of the fabricated Precast Concrete Bridge Element(s).

Additionally, the MassDOT Inspector will monitor the adequacy of the Fabricator's Quality Control activities. MassDOT Inspector Acceptance activities performed at the Fabricator's plant shall remain independent from the Fabricator, and does not replace the Fabricator's required Quality Control activities.

2. Sampling and Testing.

At a minimum, the MassDOT Inspector will perform random Acceptance sampling and testing for each Sublot of concrete produced as specified in *Table 2: Acceptance Sampling and Testing.* The MassDOT Inspector will also perform Acceptance sampling and testing on concrete that has been retempered with admixtures or hold-back water during production. Test Specimens will conform to the requirements of Section M4.02.13 of the MassDOT Standard and Supplemental Specifications and AASHTO R 60

ITEMS 916.01 and 916.02 (Continued)

Table 2: Acceptance Sampling and Testing

Quality Characteristic	Test Method	Sample Size	Specification Limit	Lot Size [c]	Sublot Size [d]	Frequency	Point of Sampling
Slump (in.) [a]	AASHTO T 119	Per AASHTO	≤ 8 in. or as approved by the Engineer	Total Quantity of Concrete (cy) produced on a Contract, per Type of Element fabricated, per Mix Design	20 cy	One (1) per Sublot or fraction thereof	Point of Discharge
Air Content (%)	AASHTO T 152	Per AASHTO	5% ≤ % ≤ 8%				
Temperature (°F)	AASHTO T 309	Per AASHTO	50°F ≤ °F ≤ 90°F				
Compressive Strength (psi)	AASHTO T 22 AASHTO T 23	7-day Cylinders: One (1) set of Three (3) 4 x 8 in.	For Information at 7 days				
		28-day Cylinders: One (1) set of Three (3) 4 x 8 in.	≥ 100% f'$_c$ at 28 days				
		56-day Cylinders: One (1) set of Three (3) 4 x 8 in.	≥ 100% f'$_c$ at 56 days [b]				

Notes:

(a) Self-consolidating concrete (SCC) shall meet the requirements of M4.02.17.

(b) 56-day Compressive Strength test specimens shall require testing only when 28-day Compressive Strength test specimens have failed to meet Design Strength (f'$_c$).

(c) Lot shall be defined as a specific quantity of material from a single source, produced or placed by the same controlled process.

(d) Sublot shall be defined as an equal division or part of a Lot from which a sample of material is obtained in order to assess the Quality Characteristics of the Lot.

ITEMS 916.01 and 916.02 (Continued)

MATERIALS

A. Materials.
Materials shall meet the following specifications (if applicable):

Stone for Pipe Ends	M2.02.3
Crushed Stone	M2.01.3
General	M4.00.00
Portland Cement	M4.01.0
Blended Hydraulic Cements	M4.01.1
Fly Ash	M4.01.2
Cement Concrete	M4.02.00
Cement	M4.02.01
Cement Mortar	M4.02.15
Aggregates	M4.02.02
Lightweight Aggregates	M4.02.03
Water	M4.02.04
Cement Concrete Additives	M4.02.05
Proportioning	M4.02.06
Mixing and Delivery	M4.02.10
Test Specimens	M4.02.13
Mortar for Filling Keyways	M4.04.0
Slag	AASHTO M 302
High Performance Cement Concrete	M4.06.1
Self-Consolidating Concrete (SCC)	M4.02.17
Controlled Density Fill – Non-Excavatable	M4.08.0
Reinforcing Bars	M8.01.0
Epoxy Coated Reinforcing Bars	M8.01.7
Galvanized Reinforcing Bars	M8.01.8
Welded Wire Reinforcement	M8.01.2
Mechanical Reinforcing Bar Splicer	M8.01.9
Lifting Devices	PCI MNL-116
Corrugated Metal Pipe	AASHTO M 36
Geotextile Fabric	M9.50.0

The payment for Natural Streambed Material, Stone for Pipe Ends, Crushed Stone and Geotextile Fabric shall be paid under their respective items.

The precast box culverts shall be reinforced concrete and shall be manufactured in accordance with ASTM C76 standard specifications for reinforced concrete culvert. The culvert shall be designed to support an HS-20 (32,000 lbs.) truck axle load and dead load from earth cover over the top of the culvert as shown on the plans, and shall conform to all applicable 2017 AASHTO LRFD Bridge Design Specifications with current interim Specifications .

ITEMS 916.01 and 916.02 (Continued)

The Contractor shall submit shop drawings and structural calculations stamped by an Engineer registered in the Commonwealth of Massachusetts for approval as specified in Section 5.02 of the Standard Specifications. The shop drawings shall show the size and location of all inserts and openings as shown on the Plans.
Existing utility locations shall be verified in the field prior to starting this work. The Contractor shall provide the Engineer with a plan showing existing utility locations and elevations prior to undertaking this work.

The Contractor shall dig test pits to verify the dimensions of the existing culvert prior to ordering the material. All costs shall be incidental and be paid for under the EACH price.

1. Cement Concrete Mix Design.

The cement concrete shall be comprised of specified proportions of water and MassDOT approved aggregates, cement, supplementary cementitious materials (SCMs), and admixtures to form a homogenous composition. Cement concrete for Precast Concrete Bridge Elements shall meet the requirements of M4.06.1 High Performance Cement Concrete, with the exception that the "Total Cementitious Content" specified shall be considered the "Maximum Allowable Cementitious Content". When used, self-consolidating concrete (SCC) shall meet the requirements of M4.02.17.

Prior to production of cement concrete, the Fabricator shall report and submit all proposed mix design formulations and its constituent materials onto the MassDOT Cement Concrete Mix Design Sheet to the MassDOT Research and Materials Section for review and approval. All mix design yields shall be designed for 1.0 cubic yards of concrete, with an allowable tolerance of +/- 1.0 %. All liquids incorporated into the proposed mix design(s) shall include both water and admixtures in the liquid mass calculation.

During production of cement concrete, the Fabricator shall not alter the previously approved mix design formulation or its constituent materials. Proposed alterations in source, type, batch quantity, or gradation to any of the constituent materials of the previously approved mix design formulation shall require a new MassDOT Mix Design Sheet submission to the MassDOT Research and materials Section for review and approval. Fabrication shall not occur without prior MassDOT mix design approval.

The Fabricator shall notify MassDOT RMS to schedule trial batch testing for the new mix design(s). Trial batch testing shall meet the following requirements:

(a) Performed by a qualified laboratory and/or AASHTO accredited laboratory.
(b) Performed and/or sampled in the presence of a MassDOT Inspector.
(c) Meet the requirements as specified in *Table 3: Trial Batch Sampling Testing for New Mix Designs*. Self-consolidating concrete (SCC) shall meet M4.02.17.

Failure to perform all of the required trial batch testing or provide MassDOT RMS trial batch test results within the Specification Limits (as specified in Table 3) will result in the disqualification of the Fabricator's proposed mix design(s).

ITEMS 916.01 and 916.02 (Continued)

Table 3: Trial Batch Sampling and Testing for New Mix Designs

Quality Characteristic	Test Method	Sample Size	Specification Limit	Performed By
Slump [(a)]	AASHTO T 119	Per AASHTO	Max. 8 inches or as approved by the Engineer	Quality Control
Air Content (AC)	AASHTO T 152	Per AASHTO	$5\% \leq AC \leq 8\%$	Quality Control
Temperature (°F)	AASHTO T 309	Per AASHTO	$50°F \leq °F \leq 90°F$	Quality Control
Compressive Strength [(b)]	AASHTO T 22 AASHTO T 23	28-day Cylinders: One (1) set of Three (3) 4 x 8 in.	Lab Mixed $f'_{cr} = 1.3\ f'_c$ at 28 days	MassDOT
			Batch Mixed $f'_{cr} = 1.2\ f'_c$ at 28 days	
Alkali-Silica Reaction (ASR) [(d)]	ASTM C 1567	Per ASTM	M4.02.00	Quality Control
Resistance to Chloride Ion Penetration Chloride Ion Penetration [(e)]	AASHTO T 358 [(f)]	28-day Cylinders: One (1) set of Three (3) 4 x 8 in.	Resistivity ≥ 21 kΩ-cm at 28 days	MassDOT
Freeze/Thaw Durability [(c)]	AASHTO T 161 (Procedure A)	Per AASHTO	Relative Dynamic Modulus of Elasticity after 300 cycles ≥ 80%	Quality Control

Notes:

(a) Self-consolidating concrete (SCC) shall meet the requirements of M4.02.17.
(b) Trial batch compressive strength testing shall be performed by MassDOT. Laboratory mixed trial batch compressive strength results shall achieve 130% Design Strength (f'_c). Batch-mixed trial batch compressive results shall achieve 120% f'_c. Acceptance will be based on compressive strength testing performed by MassDOT.
(c) If an AASHTO accredited laboratory is preparing the trial batch test specimens, MassDOT Acceptance presence is not required. If the Fabricator is preparing the trial batch test specimens, MassDOT Acceptance presence is required during trial batch test specimen preparation.
(d) Alkali Silica Reaction (ASR) testing shall meet the requirements of M4.02.00. Independent laboratories performing ASR testing shall be listed on the MassDOT Quality Construction Materials List (QCML).
(e) Calcium nitrite shall be removed from mix designs containing the admixture and replaced by an equivalent quantity of water when preparing Chloride Ion Penetration resistance trial batch test specimens.
(f) The Wenner probe tip spacing "a" shall be 1.5.

ITEMS 916.01 and 916.02 (Continued)

2. Vertical Adjustment Assembly.

Vertical Adjustment Assembly details and material requirements shall be as shown on the plans. Alternate devices may be used provided that they are adjustable and can support the anticipated loads. The design of the leveling devices, with necessary calculations, shall be submitted to the Engineer of Record for approval.

3. Grout.

Grout used for shear keys, vertical adjustment assembly voids, and hand holes shall be in accordance with M4.04.0.

4. Reinforcement.

All reinforcing steel shall be coated Grade 60 unless otherwise noted on the plans. Mechanical reinforcing bar splicers shall be epoxy coated.

5. Threaded Inserts.

Threaded inserts are permissible to facilitate forming the keyway pours. Threaded inserts shall be hot dip galvanized or made of stainless steel. The number of threaded inserts shall be minimized, and the inserts shall not come in contact with the reinforcing steel.

6. Corrugated Metal Pipe.

Corrugated Metal Pipe to be used for forming voids as specified on the plans shall be fabricated from steel and shall have a protective metallic coating of zinc (galvanizing).

CONSTRUCTION METHODS – PLANT FABRICATION

A. Shop Drawings.

Prior to performing any work under this Section, the Contractor shall receive approval for all shop drawings for the Precast Concrete Bridge Element being worked on and any special Contract requirements, provided that a complete shop drawing package is provided. The Contractor shall not order materials or begin work before receiving approved shop drawings. MassDOT will reject Precast Concrete Bridge Elements that deviate from the approved drawings or are fabricated prior to receiving written approval of the shop drawings. The Contractor shall bear full responsibility and costs for all materials ordered or work performed prior to the approval of the shop drawings or written authorization from MassDOT.

Contractor shall submit scaled shop drawings to the Engineer of Record for review and approval. Upon approval, the Engineer of Record will forward two (2) sets of scaled, full size (minimum 24x36") paper copies of the Approved (or Approved As Noted) shop drawings to the MassDOT Director of Research and Materials. Calculations are not to be included in any submittal to the Research and Materials Section. An approval stamp shall appear on every shop drawing sheet. Wet-stamping or wet-signing is not required, provided that the stamp and reviewer name are legible. The Fabricator's name and address shall appear on each sheet.

Resubmittal of "Approved as Noted" shop drawings is not necessary for minor revisions, provided that the correction can be clearly understood and is unambiguous without possibility of misinterpretation. Shop drawings with questions or comments that require a response and/or additional information from the Fabricator must be resubmitted.

ITEMS 916.01 and 916.02 (Continued)

Detailed shop drawings shall be prepared in accordance with the relevant provisions of Subsection 5.02 and shall, at a minimum, contain the following:

(a) Number and type and/or piece mark of the precast concrete bridge element including overall length, width and height.
(b) Skew angle.
(c) Location, size and geometry of all steel reinforcement, including mechanical reinforcing bar splicers to be used for connecting Precast Concrete Bridge Elements together in the field.
(d) Location and details of all inserts, anchors, Vertical Adjustment Assemblies, and any other items required to be cast into the Precast Concrete Bridge Elements (whether detailed on the plans by the Engineer of Record or provided for the Contractor's convenience). Precast Concrete Bridge Elements shall not be fired or drilled into for attachment purposes. All hardware shall be galvanized except as noted.
(e) Locations and details of the lifting devices, including supporting calculations, type and amount of any additional reinforcing required for lifting. The Fabricator shall design all lifting devices based on the no cracking criteria in Chapter 8 of the PCI Design Handbook (7^{th} edition).
(f) The minimum compressive strength required prior to handling the precast concrete bridge element.

The shop drawings shall not include procedures for placement, finishing, and curing of concrete. These details shall be included in the Placement, Finishing and Curing Plan that is to be submitted to MassDOT Research and Materials Section as described under *Placement, Finishing, and Curing Plan*.

B. Fabrication.

All Precast Concrete Bridge Elements shall be fabricated in accordance with the latest edition of PCI MNL-116 as modified herein.

C. Placement, Finishing and Curing Plan.

At least 30 days prior to start of fabrication, the Contractor shall submit the Fabricator's proposed Placement, Finishing and Curing Plan to the Engineer for approval by MassDOT Research and Materials Section. This shall be an independent submittal, separate from the fabrication shop drawings. The Placement, Finishing and Curing Plan shall include the following:

(a) Method of Mixing
(b) Method of Placement
(c) Method of Consolidation
(d) Method of Finishing
(e) Method of Initial Curing
(f) Method of Intermediate Curing
(g) Method of Final Curing
(h) Moisture Retention Materials and Equipment (water spray equipment, saturated covers, sheet materials, liquid membrane-forming compounds, accelerated curing equipment, etc.)

ITEMS 916.01 and 916.02 (Continued)

(i) Cylinder Curing Methods, Location, and Environmental Control (temperature, humidity, etc.)
(j) Temperature Monitoring, Recording, and Reporting

D. Dunnage Plan Shop Drawings.

At least 30 days prior to the start of fabrication, the Contractor shall submit proposed Dunnage Plan Shop Drawings to the Engineer of Record for review and approval. This shall be an independent submittal, separate from the fabrication shop drawings. Upon approval, the Engineer of Record will forward two (2) sets of scaled, full size (minimum 24"x36") paper copies of the Approved (or Approved As Noted) Dunnage Plan to the MassDOT Director of Research and Materials. Calculations are not to be included in any submittal to the Research and Materials Section. The Dunnage Plan shall include the following:

(a) Proposed layout of the Precast Concrete Bridge Elements for storage in yard and during shipping
(b) Support and blocking point locations
(c) Support and blocking materials

E. Box Culverts.

The Contractor shall submit design computations for the box culvert, rigid frame or arch bridge elements to the Engineer for review and approval. The computations shall be prepared in accordance with the latest AASHTO LRFD Bridge Design Specifications, the 2013 Part 2 & 2020 Interim Update Part 1 MassDOT LRFD Bridge Design Manual, and the Plans using English units and HS-20 live loading. The design computations shall consider all Strength, Extreme Event and Service Limit States as are appropriate for each stage of fabrication, shipment, construction, and for the final in-service condition. Design computations and shop drawings shall be prepared and stamped by a Professional Engineer licensed to practice in the Commonwealth of Massachusetts. The shop drawings shall be prepared and submitted in accordance with the section, Drawings, above.

The culvert dimensions provided on the plans are shown to establish the size of the proposed opening. The width and thickness of each culvert unit may vary depending upon the manufacturer's specifications provided that the opening size is maintained. The Contractor shall be responsible for modifying the dimensions of the culvert elements to compensate for elastic shortening, shrinkage, grade corrections, and other phenomena that make in-process fabricating dimensions different from those shown on the drawings. Approval of the shop drawings shall not relieve the Contractor from responsibility for the correctness of the dimensions shown.

1. Joints.

The precast reinforced concrete box culvert shall be produced with grout-filled keyways per the details on the plans, the manufacturer's recommendations, and as approved by the Engineer. The ends shall be manufactured such that when the sections are laid together they will make a continuous line of culverts with a smooth interior surface free of appreciable irregularities, and in compliance with the permissible variations.

ITEMS 916.01 and 916.02 (Continued)

2. Marking.

The following information shall be clearly marked on the interior of each culvert by indentation, waterproof paint, or other approved means:

(a) Culvert span and rise
(b) Date of manufacture and lot number
(c) Name and trademark of the manufacturer

F. Pre-Production Meeting.

The Contractor shall notify the MassDOT Research and Materials Section to determine if a pre-production meeting will be required to review the specification, shop drawings, curing plan, schedule, and discuss any specific requirements. The meeting shall be held prior to scheduling a MassDOT Inspector (refer to Section *Quality Assurance – Precast Concrete, C. Acceptance, A. Inspection*), and at least seven (7) days prior to the scheduled casting of any Precast Concrete Bridge Element or control section. The Contractor shall schedule the meeting, which shall include representatives of the Fabricator and MassDOT.

G. Reinforcement.

The reinforcing bars shall be installed in accordance with Section 901.62 of the Supplemental Specifications, including tolerances for cover and horizontal spacing of bars. Components of mechanical reinforcing bar splicers shall be set with the tolerances shown on the plans. The reinforcing bars and mechanical reinforcing bar splicers shall be assembled into a rigid cage that will maintain its shape in the form and which will not allow individual reinforcing bars to move during the placement of concrete. This cage shall be secured in the form so that the clearances to all faces of the concrete, as shown on the plans, shall be maintained.

Where reinforcing bars are to protrude from one Precast Concrete Bridge Element in order to mate with reinforcing bar splicers in a second precast concrete element, the fabricator shall set the reinforcing bars and the reinforcing bar splicers with a template in order to ensure proper fit up within the tolerances specified on the plans.

H. Tolerances.

Fabrication shall comply with tolerances specified on the plans. Tolerances for steel reinforcement placement shall be in accordance with 901.62. In the absence of specifications on the plans, tolerances shall comply with the latest version of the PCI MNL 135, Precast Tolerance Manual.

ITEMS 916.01 and 916.02 (Continued)

I. Forms.

Concrete shall be cast in rigidly constructed forms, which will maintain the Precast Concrete Bridge Elements within specified tolerances to the shapes, lines and dimensions shown on the approved fabrication drawings. Forms shall be constructed from flat, smooth, non-absorbent material and shall be sufficiently tight to prevent the leakage of the plastic concrete. When wood forms are used, all faces in contact with the concrete shall be laminated or coated with a non-absorbent material. All worn or damaged forms, which cause irregularities on the concrete surface or damage to the concrete during form removal, shall be repaired or replaced before being reused. Any defects or damage of more than "Category 2, Minor Defects" made to the concrete, due to form work, stripping or handling, shall be subject to repair or rejection, as defined in the *Repairs and Replacement* section. If threaded inserts are cast into the elements for support of formwork, the inserts shall be recessed a minimum of 1 inch and shall be plugged after use with a grout of the same color as that of the precast cement concrete.

J. Mixing of Concrete.

The concrete shall be proportioned and mixed in conformance with the Fabricator's MassDOT approved mix design and M4.02.10 Mixing and Delivery Fabrication shall not occur without prior MassDOT mix design approval. The Fabricator shall provide copies of batch tickets to the MassDOT Plant Inspector. The MassDOT Plant Inspector will verify if the batch ticket quantities are within the tolerances of the Fabricator's MassDOT approved mix design.

K. Placement of Concrete.

Prior to the placement of concrete, the temperature of the forms shall be greater than or equal to 50°F. Quality Control inspection shall be performed by the Fabricator as specified in the *Fabricator Quality Control* section. Placement of the concrete shall not proceed until the MassDOT Plant Inspector is present to perform inspection and begin monitoring Fabricator Quality Control inspection activities, and is in compliance with specifications. The MassDOT Plant Inspector shall inspect and accept the placement of the reinforcing steel prior to the placement of concrete into the forms. The Fabricator shall verify all materials and equipment required for protecting and curing the concrete are readily available and meet the requirements of the *Final Curing Methods* section below. All items encased in the concrete shall be accurately placed in the position shown on the Plans and firmly held during the placing and setting of the concrete. Clearance from the forms shall be maintained by supports, spacers, or hangers and shall be of approved shape and dimension.

During placement, the concrete shall maintain a concrete temperature range between 50°F and 90°F. The Fabricator shall minimize the time to concrete placement (measured from start of mixing to completion of placement). In no event shall time to placement exceed 90 minutes. The Fabricator shall perform additional Quality Control sampling and testing on concrete that has been retempered with admixtures or hold-back water during the placement of the concrete as specified in the *Fabricator Quality Control* section above. Delays or shutdowns of over 30 minutes shall not be allowed during the continuous filling of individual forms.

ITEMS 916.01 and 916.02 (Continued)

L. Consolidation of Concrete.

Suitable means shall be used for placing concrete to prevent segregation or displacement of reinforcing steel or forms. The concrete shall be thoroughly consolidated by external or internal vibrators or a combination of both. Vibrators shall not be used to move concrete within the forms. Vibrators shall be used as specified in 901.63C and as directed by the Engineer. Concrete shall be placed and consolidated in a way that minimizes the presence of surface voids or bug holes on the formed surfaces. When used, self-consolidating concrete (SCC) shall meet the requirements of M4.02.17.

M. Finishing of Concrete.

The finish of the Precast Concrete Bridge Elements shall be as indicated on the plans. Where Precast Concrete Bridge Elements have keyways for grout or closure pours, the surfaces of these shear keys shall be abrasive blasted prior to shipment. The Fabricator may utilize a surface retarder with water blast, sandblast, or a combination of both to achieve the desired keyway finish. At a minimum, the profile of the keyway surfaces shall be similar to that of 60 grit sand paper. The exposed reinforcing steel in the precast slab shall be protected from damage during the cleaning of the keyways. Damaged epoxy coating of steel reinforcement shall be repaired, and the reinforcing steel shall be cleaned as directed by the Engineer.

The Fabricator shall permanently mark each precast concrete bridge element with its type and/or piece mark, date of casting, and supplier identification either by stamp markings in fresh concrete, waterproof paint, or other approved means on a surface that will not be exposed after assembly.

N. Exposed Surfaces of Precast Concrete Bridge Elements.

As soon as conditions permit, before the concrete has fully hardened, all dirt, laitance, and loose aggregate shall be removed from the exposed concrete surfaces. Contractor shall not allow foot traffic on the uncured concrete until it has reached sufficient strength to prevent damage.

O. Exposed Surfaces of Closure Pour Shear Keys.

The closure pour shear key cast in the sides of the beam flanges shall have an exposed aggregate finish. The closure pour reinforcing steel and its coating shall not be damaged by the process for creating the exposed aggregate surface. Fabricator may utilize a surface retarder with water blast, abrasive blast, or a combination of both to achieve the desired shear key finish. The abrasive blast shall use oil free compressed air. The profile of the shear key surfaces shall be similar to that of 60 grit sand paper.

P. Initial Curing Methods.

After the placement of concrete and prior to concrete finishing, the Fabricator shall initiate initial curing methods when the concrete surface begins to dry, to reduce moisture loss from the surface. Application of one or more of the following initial curing methods shall occur immediately after the bleed water sheen has disappeared.

ITEMS 916.01 and 916.02 (Continued)

1. Fogging.

Fogging nozzles shall atomize water into a fog-like mist. The fog spray shall be directed and remain visibly suspended above the concrete surface, to increase the humidity of the air and reduce the rate of evaporation. Water from fogging shall not be worked into the surface during finishing operations and shall be removed or allowed to evaporate prior to finishing.

2. Liquid-applied Evaporation Reducers

Evaporation reducers shall be sprayed onto the freshly placed concrete surface to produce an effective monomolecular film that reduces the risk of plastic-shrinkage cracking and rate of evaporation of the bleed water from the concrete surface. Evaporation reducers shall be applied in accordance with manufacturer's recommendations.

Q. Intermediate Curing Methods.

The Fabricator shall initiate intermediate curing methods if concrete finishing has taken place prior to the concrete reaching final set. The freshly finished concrete surface shall be protected from moisture loss, by the continuation of initial curing methods (fogging and evaporation reducers) until final curing methods are applied or by the use of liquid membrane-forming curing compounds (see *Liquid Membrane-Forming Compounds for Curing* section).

R. Final Curing Methods.

The Fabricator shall initiate and apply final curing methods to the concrete immediately after the following conditions are met:

(a) Completion of concrete finishing
(b) Final set of concrete
(c) Concrete has hardened sufficiently enough to prevent surface damage

During fabrication of Precast Concrete Bridge Elements, the Fabricator shall maintain the required concrete temperature ranges throughout the entire duration of the final curing method cycle as specified herein. Controlled and gradual termination of the final curing method shall occur after all specified conditions are met. The concrete temperature shall be reduced at a rate not to exceed 36°F per hour until the concrete temperature is within 20°F of the ambient temperature outside of the final curing method enclosure. The Fabricator shall maintain a minimum concrete temperature of 40°F until 100% f'c is attained (see *Handling and Storage* section below).

1. Water Spray Curing.

All exposed concrete surfaces shall remain moist with a continuous fine spray of water throughout the entire duration of the final curing method cycle (see *Table 4: Final Curing Method Cycle for Water Spray*).

ITEMS 916.01 and 916.02 (Continued)

Table 4: Final Curing Method Cycle for Water Spray

Sustained Concrete Temperature	Final Curing Method Cycle Duration	Compressive Strength
50°F ≤ °F ≤ 90°F	≥ Five (5) days	≥ 80% f'_c

2. Saturated Covers for Curing.

All exposed concrete surfaces shall remain moist with a continuous application of saturated covers throughout the entire duration of the final curing method cycle (see *Table 5: Final Curing Method Cycle for Saturated Covers*). Saturated covers shall be allowed to dry thoroughly before removal to provide uniform, slow drying of the concrete surface.

Table 5: Final Curing Method Cycle for Saturated Covers

Sustained Concrete Temperature	Final Curing Method Cycle Duration	Compressive Strength
50°F ≤ °F ≤ 90°F	≥ Three (3) days	≥ 80% f'_c

Saturated covers, such as burlap, cotton mats, and other coverings of absorbent materials shall meet the requirements of AASHTO M 182, Class 3. Saturated covers shall be in good condition, free from holes, tears, or other defects that would render it unsuitable for curing concrete. Saturated covers shall be dried to prevent mildew when storing. Prior to application, saturated covers shall be thoroughly rinsed in water and free of harmful substances that are deleterious or cause discoloration to the concrete. Saturated covers shall have sufficient thickness and proper positioning onto the concrete surface to maximize moisture retention.

Saturated covers shall contain a sufficient amount of moisture to prevent moisture loss from the surface of the concrete. Saturated covers shall be kept continuously moist so that a film of water remains on the concrete surface throughout the entire duration of the final curing method cycle. The Fabricator shall not permit the saturated covers to dry and absorb water from the concrete. Use of polyethylene film (see *Polyethylene Film* section) may be applied over the saturated cover to potentially decrease the need for continuous watering.

3. Sheet Materials for Curing.

All exposed concrete surfaces shall remain moist with a continuous application of curing sheet materials throughout the entire duration of the final curing method cycle (see *Table 6: Final Curing Method Cycle for Curing Sheet Materials*).

ITEMS 916.01 and 916.02 (Continued)

Table 6: Final Curing Method Cycle for Sheet Materials

Sustained Concrete Temperature	Final Curing Method Cycle Duration	Compressive Strength
50°F ≤ °F ≤ 90°F	≥ Three (3) days	≥ 80% f'_c

Sheet Materials used for curing, such as polyethylene film, white burlap-polyethylene sheeting, and reinforced paper shall meet the requirements of ASTM C171 and the specifications herein. Sheet materials shall inhibit moisture loss and reduce temperature rise in concrete exposed to radiation from the sun during the final curing method cycle. Adjoining covers shall overlap not less than 12 inches. All edges of the covers shall be secured to maintain a moist environment.

(a) Polyethylene Film.

Polyethylene film shall meet the requirements of ASTM C171, consist of a single sheet manufactured from polyethylene resins, be free of visible defects, and have a uniform appearance. Careful considerations shall be taken by the Fabricator to prevent the film from tearing during storage and application, so as to not disrupt the continuity of the film (polyethylene film reinforced with glass or other fibers is more durable and less likely to be torn). The Fabricator shall monitor the application of the film to prevent uneven spots from appearing (mottling) on the concrete surface, due to variations in temperature, moisture content, or both. The Fabricator shall prevent mottling from occurring on the concrete surface by applying additional water under the film or applying a combination of polyethylene film bonded to absorbent fabric to the concrete surface to retain and evenly distribute the moisture.

Immediately following final finishing, polyethylene film shall be placed over the surface of the fresh concrete surface, so as to not damage the surface of the concrete and shall be placed and weighted so that it remains in contact with the concrete throughout the entire duration of the final curing method cycle. The film shall extend beyond the edges of the concrete surface. The film shall be placed flat on the concrete surface, avoiding wrinkles, to minimize mottling. Edges of adjacent polyethylene film shall overlap a minimum of 6 inches and be tightly sealed with the use of sand, wood planks, pressure-sensitive tape, mastic, or glue to maintain close contact with the concrete surface, retain moisture, and prevent the formation of air pockets throughout the entire duration of the final curing method cycle.

(b) White Burlap-Polyethylene Sheeting

White burlap-polyethylene sheeting shall meet the requirements of ASTM C171, be securely bonded to the burlap so to avoid separation of the materials during handling and curing of the concrete, and be applied in the same manner as the polyethylene film.

ITEMS 916.01 and 916.02 (Continued)

(c) Reinforced Impervious Paper.

Reinforced impervious paper shall meet the requirements of ASTM C171, consist of two sheets of kraft paper cemented together with a bituminous adhesive and reinforced with embedded cords or strands of fiber running in both directions, and be white in color. Reinforced impervious paper shall be treated to prevent tearing when wetted and dried.

Reinforced impervious paper can be reused so long as it is effective in retaining moisture on the concrete surface. The Fabricator shall visually inspect the reinforced impervious paper for all holes, tears, and pin holes from deterioration of the paper through repeated use by holding the paper up to the light. The paper shall be discarded and prohibited from use when the moisture is no longer retained.

After the concrete has hardened sufficiently to prevent surface damage, the concrete surface shall be thoroughly wetted prior to the application of the reinforced impervious paper, and be applied in the same manner as the polyethylene film.

4. Liquid Membrane-Forming Compounds for Curing.

All exposed concrete surfaces shall remain moist with a continuous application of liquid membrane-forming compounds throughout the entire duration of the final curing method cycle (see *Table 7: Final Curing Method Cycle for Liquid Membrane-Forming Compounds*).

Table 7: Final Curing Method Cycle for Liquid Membrane-Forming Compounds

Sustained Concrete Temperature	Final Curing Method Cycle Duration	Compressive Strength
50°F ≤ °F ≤ 90°F	≥ Seven (7) days	≥ 80% f'_c

Liquid membrane-forming compounds shall meet the requirements of ASTM C 1315, Type I, Class A and shall exhibit specific properties, such as alkali resistance, acid resistance, adhesion-promoting quality, and resistance to degradation by ultraviolet light, in addition to moisture-retention capabilities. Liquid membrane-forming compounds shall consist of waxes, resins, chlorinated rubber, or other materials to reduce evaporation of moisture from concrete. Liquid membrane-forming compounds shall be applied in accordance with the manufacturer's recommendations.

Liquid membrane-forming compounds shall be applied immediately after the disappearance of the surface water sheen following final finishing. All exposed surfaces shall be wetted immediately after form removal and kept moist to prevent absorption of the compound, allowing the curing membrane to remain on the concrete surface for proper membrane moisture retention. The concrete shall reach a uniformly damp appearance with no free water on the surface prior to the application of the compound.

ITEMS 916.01 and 916.02 (Continued)

If patching or finishing repairs are to be performed prior to the application of the compound, the Precast Concrete Bridge Element shall be covered temporarily with saturated covers until the repairs are completed and the compound is applied. Only areas being repaired shall be uncovered during this period. While the saturated covers are removed to facilitate the patching process, the work shall continue uninterrupted. If for any reason the work is interrupted, saturated covers shall be placed onto the uncovered concrete surface, until the work continues and is completed, at which time the curing compound shall be applied to the repaired area.

Careful considerations shall be made by the Fabricator to determine if the evaporation rate is exceeding the rate of bleeding, thus causing the surface to appear dry even though bleeding is still occurring. Under such conditions, the application of liquid membrane-forming compounds to the concrete surface shall be delayed, in order to prevent bleed water from being sealed below the concrete surface and avert map cracking of the membrane films, reduction in moisture-retention capability, and reapplication of the compound. To diagnose and prevent this condition, the Fabricator shall place a transparent plastic sheet over a test area of the uncured and unfinished concrete surface and shall determine if any bleed water accumulates under the plastic.

The compound shall be applied in two applications at right angles to each other to ensure uniform and more complete coverage. On very deeply textured surfaces, the surface area to be treated shall be at least twice the surface area of a troweled or floated surface. In such cases, two separate applications may be needed, each at 200 ft^2/gal., with the first being allowed to become tacky before the second is applied.

The curing compound shall be applied by power sprayer, using appropriate wands and nozzles with pressures between 25 and 100 psi. For very small areas such as repairs, the compound shall be applied with a wide, soft-bristled brush or paint roller. The compound shall be stirred or agitated before use and applied uniformly in accordance with the manufacturer's recommended rate. The Fabricator shall verify the application rates are in accordance with the manufacturer's recommended rate.

When the concrete surface is to receive paint, finishes, or toppings that require positive bond to the concrete, it is critical that the curing procedures and subsequent coatings, finishes, or toppings be compatible to achieve the necessary bond.

After the termination of the final curing method cycle has occurred, liquid membrane-forming compounds shall be removed by blast-cleaning from any concrete surface that is to receive paint, finishes, plastic concrete from secondary pour, grout, or any other toppings that require bonding to the concrete surface. These surfaces shall be further blast-cleaned to remove the cement matrix down to exposed aggregate to ensure proper bonding to the material. The method used to remove the curing compound shall not damage the reinforcement and coating. Compounds are prohibited on any concrete surface that will have a penetrating or coating type treatment such as a sealer, stain, or waterproofing membrane applied to it.

ITEMS 916.01 and 916.02 (Continued)

5. Accelerated Curing.

Accelerated curing shall use live steam or radiant heat with moisture in accordance with PCI MNL-116 as modified herein. The concrete temperature shall meet the maximum heat increase and cool down rates as specified herein. Concrete temperature monitoring shall meet the requirements of the *Temperature Monitoring* section. Excessive and fluctuating rates of heating and cooling shall be prohibited. The concrete temperature shall not exceed 158°F at any time. The Fabricator shall meet the following accelerated curing sequencing and requirements.

(a) Initial Delay Period.

The initial delay period shall be defined as the duration immediately following the placement of the concrete and the attainment of initial set of the concrete. The Fabricator shall determine the time of initial set in accordance with AASHTO T 197 specifications. Throughout the entire duration of the preset period, initial curing shall be implemented. The temperature increase period (see *Temperature Increase Period* section) shall not occur until initial set of the concrete is attained. During the initial delay period, the concrete temperature shall meet the following requirements:

i. Concrete temperature rate of increase shall not exceed 10°F per hour.
ii. Total concrete temperature increase shall not exceed 40°F higher than the placement concrete temperature or 100°F, whichever is less

(b) Temperature Increase Period.

The temperature increase period shall be defined as the duration immediately following the completion of the initial delay period (after initial set) and immediately prior to the start of the constant maximum temperature period. Application of steam to the enclosure shall not occur until the initial delay period is complete. After the initial delay period is complete, all exposed concrete surfaces shall be cured in a moist environment where the concrete temperature increases at a rate not to exceed 36°F per hour.

(c) Constant Maximum Temperature Period.

The constant maximum temperature period shall be defined as the duration immediately following the completion of the temperature increase period and immediately prior to the start of the temperature decrease period. After the temperature increase period is complete, all exposed concrete surfaces shall be cured in a moist environment at a controlled and constant elevated temperature throughout the entire duration of the constant maximum temperature period. Termination of the constant maximum temperature period and the start of the termination decrease period shall occur after all specified conditions are met (see *Table 8: Constant Maximum Temperature Period*).

ITEMS 916.01 and 916.02 (Continued)

Table 8: Constant Maximum Temperature Period

Sustained Concrete Temperature	Constant Maximum Temperature Period	Compressive Strength
120°F ≤ °F ≤ 158°F	6 hrs ≤ Time ≤ 48 hrs	≥ 80% f'_c

(d) Temperature Decrease Period.

After the constant maximum temperature period is complete, the concrete temperature shall be cured in a moist environment at a controlled and reduced rate not to exceed 36°F per hour until the concrete temperature is within 20°F of the ambient temperature outside of the curing enclosure.

S. Stripping.

The Fabricator shall not strip forms or handle the Precast Concrete Bridge Element until Quality Control compressive strength cylinders attain a minimum compressive strength of 80% Design Strength (f'_c) or the value indicated on the approved drawings has been achieved. After removal from the form, all exposed concrete surfaces shall continue to be cured in conformance with the *Final Curing Methods* sections until completion.

T. Handling and Storage of Precast Concrete Bridge Elements.

Precast Concrete Bridge Elements may be exposed to temperatures below freezing (32°F) when the chosen curing cycle has been completed, provided that the following conditions are met:

(a) Precast Concrete Bridge Elements are protected from precipitation with polyethylene curing covers until 100% f'_c is attained
(b) Precast Concrete Bridge Elements maintain a minimum concrete temperature of 40°F until 100% f'_c is attained

Precast Concrete Bridge Elements damaged during handling and storage will be repaired or replaced at MassDOT's direction at no cost to MassDOT. Precast Concrete Bridge Elements shall be lifted at the designated points by approved lifting devices embedded in the concrete and in accordance with proper lifting and handling procedures. Storage areas shall be smooth and well compacted to prevent damage due to differential settlement. Precast Concrete Bridge Elements shall be supported on the ground by means of continuous blocking, in accordance with the approved dunnage plan.

Precast Concrete Bridge Elements shall be loaded on a trailer with blocking as described above, in accordance with the approved dunnage plan. Shock-absorbing cushioning material shall be used at all bearing points during transportation of the Precast Concrete Bridge Elements. Blocking shall be provided at all locations of tie-down straps. Precast Concrete Bridge Elements stored prior to shipment shall be inspected by the Contractor prior to being delivered to the site to identify damage that would be cause for repair or rejection.

ITEMS 916.01 and 916.02 (Continued)

U. Repairs and Replacement.

In the event defects are identified, they shall be classified in the following categories and a non-conformance report (NCR) shall be filed if required. The NCR shall be submitted to MassDOT for review. Defects in all categories shall be documented by plant Quality Control personnel and made available to MassDOT upon request. Any required repairs shall utilize materials listed on the MassDOT QCML.

Where noted, defects shall be repaired according to the PCI Northeast Region Guidelines for Resolution of Non-Conformances in Precast Concrete Bridge Elements, Report Number PCINE-18-RNPCBE. Please note that reference to PCINE-18-RNPCBE is made for repair details only. In the case of conflicts with this Special Provision, this Special Provision shall govern.

1. Category 1, Surface Defects.

Category 1 defects do not need to be repaired, and an NCR does not need to be filed. Surface defects are defined as the following:

(a) Surface voids or bug holes that are less than 5/8-inch in diameter and less than ¼-inch deep, except when classified as Category 4
(b) Cracks less than or equal to 0.006 inches wide
(c) Cracks less than or equal to 0.125 inches wide on surfaces that will receive a field-cast concrete overlay

2. Category 2, Minor Defects.

Category 2 defects shall be repaired, but an NCR does not need to be filed. Minor defects are defined as the following:

(a) Spalls, honeycombing, surface voids that are less than 2 inches deep and have no dimension greater than 12 inches
(b) Cracks less than or equal to 0.016 inches that will not receive a concrete overlay
(c) Broken or spalled corners that will be covered by field-cast concrete

Minor defects shall be repaired according to PCINE-18-RNPCBE. Cracks shall be sealed according to the PCI Repair Procedure #14 in PCINE-18-RNPCBE.

3. Category 3, Major Defects.

For Category 3 defects, the Fabricator shall prepare an NCR that documents the defect and describes the proposed repair procedure. The NCR shall be submitted to MassDOT for approval prior to performing the repair. Major defects are defined as the following:

(a) Spalls, honeycombing and surface voids that are deeper than 2 inches or have any dimension greater than 12 inches, when measured along a straight line
(b) Concentrated area of defects consisting of four or more Category 2 Defects within a 4-square foot area.
(c) Exposed reinforcing steel
(d) Cracks greater than 0.016 inches and less than or equal to 0.060 inches in width that will not receive a concrete overlay
(e) Bearing area spalls with dimensions not exceeding 3 inches

ITEMS 916.01 and 916.02 (Continued)

(f) Cracks, spalls and honeycombing that will be encased in cast in place concrete need not be repaired, but the limits and location of the defects shall be documented with an NCR

Upon MassDOT approval, defects and cracks shall be repaired according to PCINE-18-RNPCBE and this specification. All repairs shall be completed at the expense of the Contractor.

4. Category 4, Rejectable Defects.

Rejectable defects as determined by the MassDOT Inspector, RMS, and Engineer may be cause for rejection. Fabricator may submit an NCR with a proposed repair procedure, requesting approval. Some rejectable defects are defined as the following:

(a) Surface defects on more than 5% of the surface area which will be exposed to view after installation
(b) Minor defects that in total make up more than 5% of the surface area of the unit
(c) Cracks greater than 0.060 inches in width except as noted in Category 1
(d) Elements fabricated outside of the specified tolerances
(e) MassDOT compressive strength testing that does not meet the specified Design Strength, f'_c

V. Loading.

Prior to the Fabricator loading the Precast Bridge Element on to the truck for shipping, the Fabricator shall provide the MassDOT Plant Inspector and RMS a minimum seven (7) days' notice of the Fabricator's intent to load the Precast Bridge Element. Inspection by the MassDOT Plant Inspector shall take place while the element is still on dunnage in the yard. The element shall not be loaded onto the truck until the MassDOT Plant Inspector has performed the inspection.

W. Shipping.

Prior to shipment, the Fabricator shall perform the following actions and provide the required documentation to the MassDOT Plant Inspector:

(a) Precast Concrete Bridge Elements shall remain at the Fabricator's plant for a minimum of 7 days after cast date.
(b) QC Inspection Reports shall be signed by the Quality Control Manager and provided to the MassDOT Plant Inspector.
(c) QC Compressive Strength Test Report Forms attaining Design Strength, f'c for the Precast Concrete Bridge Element's representative Sublot shall be generated by the Fabricator and provided to the MassDOT Plant Inspector.
(d) Certificate of Compliance shall be generated by the Fabricator as described under the Fabricator Quality Control section and provided to the MassDOT Plant Inspector.
(e) All MassDOT RMS approved Corrective Actions submitted on the Non-Conformance Reports (NCR), shall be verified to have been completed by the MassDOT Plant Inspector and Quality Control Manager.
(f) All NCRs shall be signed off by the Quality Control Manager, MassDOT Inspector and MassDOT RMS.

ITEMS 916.01 and 916.02 (Continued)

X. Delivery.

Upon Delivery, the following documentation shall be provided to the MassDOT Resident Engineer or designee:

(a) QC Compressive Strength Test Report Forms attaining Design Strength, f'c for the Precast Concrete Bridge Element's representative sublot.
(b) Certificate of Compliance generated by the Fabricator as described under the Fabricator Quality Control section.
(c) QC Inspection Reports signed by the Quality Control Manager.

The Contractor shall inspect Precast Concrete Bridge Elements upon receipt at the site. Precast Concrete Bridge Elements damaged during delivery shall be repaired or replaced at MassDOT's direction at no cost to MassDOT.

CONSTRUCTION METHODS – FIELD CONSTRUCTION

A. General.

All of the Contractor's field personnel involved in the erection and assembly of the Precast Concrete Bridge Elements shall have knowledge of and follow the approved Erection Procedure and Quality Control Plan for Precast Concrete Bridge Element Assembly.

Prior to installation, the following documentation shall be reviewed and confirmed by the MassDOT Resident Engineer or designee:

(a) QC Compressive Strength Test Report Forms attaining Design Strength, f'c for the Precast Concrete Bridge Element's representative sublot.
(b) Certificate of Compliance generated by the Fabricator as described under the Fabricator Quality Control section.
(c) QC Inspection Reports signed by the Quality Control Manager.

Field construction staff shall verify that the Resident Engineer has accepted all Precast Concrete Bridge Elements prior to installation.

B. Erection Procedure and Quality Control Plan for Precast Concrete Bridge Element Assembly.

Prior to the erection, the Contractor shall submit an Erection Procedure and a Quality Control Plan for Precast Concrete Bridge Element Assembly for approval by the Engineer. This submittal shall include computations and drawings for the transport, hoisting, erection and handling of the Precast Concrete Bridge Elements. The Erection Procedure and Quality Control Plan for Precast Concrete Bridge Element Assembly shall be prepared and stamped by a Professional Engineer registered in the Commonwealth of Massachusetts with working knowledge of the Contractor's equipment, approved shop drawings, and materials to build the bridge. The Erection Procedure and Quality Control Plan for Precast Concrete Bridge Element Assembly shall, at a minimum, include the following:

ITEMS 916.01 and 916.02 (Continued)

1. Erection Procedure

The Erection Procedure shall be prepared to conform to the requirements of 960.61, Erection and the applicable sections in Chapter 8 of the PCI Design Handbook (seventh edition) for handling, erection, and bracing requirements. At a minimum, the Erection Procedure shall provide:

(a) Minimum concrete compressive strength for handling the Precast Concrete Bridge Elements.
(b) Concrete stresses during handling, transport, and erection.
(c) Crane capacities, pick radii, sling geometry, and lifting hardware.
(d) Verification that the equipment can handle all pick loads and weights with the required factor of safety.
(e) Evaluation of construction sequence and evaluation of any geometric conflicts in the lifting of the Precast Concrete Bridge Elements and setting them as shown on the plans.
(f) Design of crane supports including verification of subgrade for support.
(g) Location and design of all temporary bracing that will be required during erection.

Non-shrink grout and concrete materials, approved by the Engineer, shall be placed as shown on the plans. Fill joints, keyways, and voids, in strict accordance with the specifications and manufacturer's recommendations and instructions.

For footings, approach slabs and highway guardrail transitions, once these Precast Concrete Bridge Elements have been set to the correct horizontal and vertical alignment, the void between them and the supporting soil shall be filled with Controlled Density Fill – Non-Excavatable to the limits as shown on the plans. Add additional grout ports in the footings to facilitate the bedding process if required.

Joints shall be filled flush to the top with non-shrink grout, and any vertical misalignment between adjacent elements shall be feathered out on a slope of 1 to 12.

Curing of grout or concrete shall be performed in strict accordance with the specifications and manufacturer's recommendations. Filling shall not be completed in cold weather when either the ambient temperature or the precast member's temperature is below the manufacturer's recommendation. No localized heating of either the precast members or of the air surrounding the element will be permitted in an attempt to reach application temperatures.

If the joints or voids are not filled within five days after the Precast Bridge Elements are erected, the Contractor shall cover and protect the openings from weather and debris until they are filled.

ITEMS 916.01 and 916.02 (Continued)

2. Quality Control Plan for Precast Concrete Bridge Element Assembly

The Quality Control Plan for Precast Concrete Bridge Element Assembly is a document prepared and submitted by the Contractor prior to the start of work which requires the Contractor to identify and detail the sequence of construction in accordance with the project schedule and which clearly identifies all stages of field construction. The assembly procedures for the Precast Concrete Bridge Elements shall be submitted on full size 24"x36" sheets. This document will be treated as a Construction Procedure and will be reviewed by both the Designer and the District Construction Office. The approval of this document will serve as a guideline for setting interim concrete and grout strengths and curing procedures to allow construction to proceed without waiting for the final in-service strengths to be achieved.

The following list details the minimum criteria that should be included in the Quality Control Plan for Precast Concrete Bridge Element Assembly:

(a) A detailed schedule showing the sequence of operations that the Contractor will follow. The schedule shall include a timeline for installation of all major elements of the bridge accounting for the installation of temporary works and cure times of grouts or closure pour concrete and other selected materials.

(b) Calculations that support the schedule outlined above should be included verifying that the selected materials have adequate interim strength to proceed from one step to another. Final material strengths are not normally required until the bridge is opened to vehicular traffic. The minimum factor of safety of two (2) will be required for the interim strength of grouts and closure pour concrete before construction is allowed to proceed to subsequent steps. The factor of safety is applied to the service loads that are supported by the elements and materials during various stages of construction. For example, if the Contractor calculates that the grout between the precast pier cap and pier wall requires a strength of 100 psi to support the dead load of the beams in the next step, a cylinder break of 200 psi will be required prior to allowing the pier cap to be loaded with the beams. The required strength of materials for subsequent construction stages shall also be calculated and the material strength verified.

(c) The Contractor is responsible for determining the center of gravity for all elements. Special care shall be used for unusual elements that are not symmetric. These elements may require special lifting hardware to allow for installation in a plumb or flat position.

(d) Plan of the work area, depicting items such as temporary earth support, utilities within the immediate vicinity of the work, drainage structures, etc. The Contractor shall coordinate the various subcontractors that will need to occupy the same area and shall ensure that there are no conflicts. For example, if the Contractor is having different Subcontractors prepare and submit plans for temporary earth support and demolition, and the earth support is required to be installed prior to the demolition, it shall be the Contractor's responsibility to ensure that the Quality Control Plan for Precast Concrete Bridge Element Assembly submission allows both operations to be performed without field modification.

(e) Details of all equipment that shall be employed for the construction of the bridge.

(f) Methods of providing temporary support of the elements. Include methods of adjusting and securing the element after placement.

(g) Vertical Adjustment Assemblies to be used as a means of setting precast concrete footings to the correct elevations.

ITEMS 916.01 and 916.02 (Continued)

(h) Procedures for controlling the overall horizontal dimensions and the vertical elevations as each precast concrete bridge element is erected by using the tolerance limits of the joints as detailed on the plans.
(i) Methods for curing grout.
(j) Proposed methods for installing non-shrink grout and the sequence and equipment for the grouting operation.
(k) Methods for sealing the keyways in preparation for filling with non-shrink grout, including the use of backer rods. The Contractor shall not assume that the backer rods will restrain the pressure from the grout in vertical grout joints. Provide additional forming to retain the backer rod.

C. Survey and Layout.

Working points, working lines, and benchmark elevations shall be established prior to placement of all elements. The Contractor is responsible for field survey as necessary to complete the work. MassDOT reserves the right to perform additional independent survey. If discrepancies are found, the Contractor may be required to verify previous survey data.

D. Preparation of Closure Pour Keyways.

Immediately prior to erecting the Precast Concrete Bridge Elements, the closure pour shear keys shall be cleaned at the job site of all dust, dirt, carbonation, laitance, and other potentially detrimental materials which may interfere with the bonding of the closure pour concrete and precast concrete using a high-pressure water blast. The exposed reinforcing steel in the precast concrete shall be protected from damage during the cleaning of the keyways. Damaged epoxy coating of steel reinforcement shall be repaired, and the reinforcing steel shall be cleaned as directed by the Engineer. The surfaces of the shear keys shall be wetted so that the surfaces shall have a Saturated Surface Dry (SSD) condition for at least 24 hours prior to the placement of the closure pour concrete.

E. Erection.

The elements shall be placed in the sequence and according to the methods outlined in the Erection Procedure and Quality Control Plan for Precast Concrete Bridge Element Assembly. As the erection proceeds, the Contractor shall constantly monitor the assembly to ensure that the precast concrete bridge element is within proper horizontal and vertical location and tolerances prior to releasing it from the crane and setting the next unit. The Contractor may use shims to maintain proper setting tolerances.

The concrete elements shall be lifted only by the lifting devices, and the utmost care shall be taken to prevent distortion of the elements during handling, transportation or storage.

ITEMS 916.01 and 916.02 (Continued)

Suitable spreaders shall be used during lifting so that only a vertical pull will be made on the lifting device. A non-vertical lifting force may be permitted if prior written approval is given by the Engineer. This approval will be contingent on the Contractor demonstrating by calculations, prepared by a Professional Engineer registered in Massachusetts, that the elements will not be damaged by the non-vertical lifting force and by documentation that the capacity of the lifting devices is adequate for the non-vertical lifting force.

Precast components shall be pre-bed with non-shrink grout thicker than shim stacks prior to placing other precast elements on top of them.

After all Precast Concrete Bridge Elements have been placed, the actual overall dimensions of the structure both horizontal and vertical, as laid out shall not deviate from the nominal dimensions shown on the plans beyond a tolerance of +0 inches and -1 inches. Once the layout of Precast Concrete Bridge Elements has been accepted by the Engineer, the Contractor shall cut all lifting devices off below the surfaces of the elements.

F. Box Culverts.

Backfilling operations shall not begin until the following checks have been made:

(a) The culvert to footing key joints are grouted as shown on the plans;
(b) The joints between exterior culvert elements and wingwall stems are complete as shown on the plans;
(c) All joint seals are properly placed.

Backfill shall be paid for under separate items. The backfilling procedures shall be in accordance with Sections 120, 150, and 170 of the Standard Specifications and Supplemental Specifications modified as follows:

(a) Fill shall be placed and compacted in layers not exceeding one foot in depth;
(b) Dumping of fill shall not be allowed any nearer to the structure than 3.25 feet from a vertical plane extending from the back of the footing;
(c) Backfill shall be placed as symmetrically as possible around the structure with differential depths of backfill on each side of the structure not exceeding 1.5 feet with respect to each other;
(d) Compaction shall be achieved using hand compaction equipment for all fill within one foot of the structure;
(e) The bare structure shall not be crossed by any equipment heavier than that specified by the frame manufacturer. All damage resulting from equipment damage shall be rectified to the satisfaction of the Engineer at no cost to the Department;
(f) Construction equipment will not be permitted atop an uncompleted structure;
(g) Construction equipment whose weight exceeds the design capacity shall not be permitted atop the completed structure under any circumstances;
(h) The use of vibratory rollers for compaction purposes will not be permitted.

ITEMS 916.01 and 916.02 (Continued)

A representative of the manufacturer shall be on site at the commencement of the installation, at no cost to the Department, to assist the Contractor. The representative shall offer advisory assistance only and shall not supplant the Contractor's representative, or the Engineer.

G. Filling of Blockouts for Lifting Devices and Threaded inserts.

If the blockouts in the Precast Concrete Bridge Elements where the lifting devices were located will be exposed and visible after assembly is complete, the Contractor shall fill these blockouts with Cement Mortar (M4.02.15) or grout.

After the formwork has been removed, all threaded inserts that have been cast into the precast concrete bridge deck for support of the formwork shall be filled with a grout of the same color as that of the precast concrete.

BASIS OF PAYMENT

The furnishing, fabricating, and erecting of all Precast Concrete box culverts, headwalls, cutoff walls, and wingwalls shall be paid for at the contract unit price EACH, complete in place.

ITEM 943.2	**HELICAL PILE AND BRACKET ASSEMBLY**	**FOOT**
ITEM 948.6	**PRE-DRILLING FOR PILE OBSTRUCTIONS**	**FOOT**
ITEM 948.7	**HELICAL PILE VERIFICATION LOAD TEST**	**EACH**

This item shall conform to the requirements of all relevant Sections of the Standard Specifications and Supplemental Specifications.

This work shall include design, furnishing, installing, and testing helical piles (i.e. helical anchors) to support the loads as shown on the Plans, and as specified herein. The Contractor is responsible for furnishing all materials, equipment, labor, services, and supervision, and for selecting the means and methods for the installation and testing of helical piles for this project. The helical piles shall be designed (overall pile length, helix configuration, and minimum effective torsional resistance) to support the factored loads specified on the Plans or in these Specifications.

Each helical pile shall be installed with the top most helix installed within the bearing stratum, as defined in the Geotechnical Report, boring logs, and shown on the Plans, and to the minimum length determined by the Contractor, subject to verification by static load testing, and using installation torque indicative of the design factored resistance. Install helical piles through whatever material is encountered to the bearing stratum and minimum length to achieve design factored resistance. Helical piles shall be cut-off, as needed, at the elevations required to enable connection of bracket assemblies to the boardwalk decking or pile top to pile cap as shown on the Plans.

The Contractor is responsible to provide qualified personnel for design, and onsite installation, inspection, and record keeping as specified herein.

The helical pile resistance shall be confirmed by pre-production verification load testing. Testing must meet the test acceptance criteria specified herein. The helical pile design may be modified by the Engineer, pending results of verification load testing performed as an initial part of the work.

Pre-drilling may be required to penetrate cobbles or boulders encountered during helical pile installation. Prior to pre-drilling, the Engineer will consider the equipment, techniques, and level of effort by the Contractor and shall be the sole judge of the need for pre-drilling. This work shall be outlined in the submitted construction procedures.

Prior to the installation of helical piles, the Contractor shall perform additional site exploration to verify the location of the existing sewer. If the location of the existing sewer is closer to the proposed helical pile locations shown on the Contract Plans, the Contractor shall notify the Engineer.

RELATED WORK

Additional related items specified elsewhere include:

Item 995.01 BRIDGE STRUCTURE, BRIDGE P-03-020 (CAK)

ITEMS 943.2 through 948.7 (Continued)

MATERIALS

A. General

The Helical Pile Contractor shall be responsible for the selection, purchase, or manufacture of the appropriate size and type of helical piles and bracket assemblies, and all other necessary components to support the factored loads stated in these Specifications or on the Plans. These specifications provide minimum requirements to aid the Helical Pile Contractor in making appropriate materials selections. The size and number of helical blades (helices) must be such that the helical piles achieve the appropriate torque and resistance in the soils at this site. Failure to achieve proper torque and resistance shall result in the Contractor replacing helical piles as appropriate to support the required factored loads. All installation procedures, materials, and replacements shall be acceptable to the Engineer.

Helical pile components as specified herein and on the Drawings shall be manufactured by a facility whose quality systems comply with ISO (International Organization of Standards) 9001 requirements. Certificates of Registration denoting ISO Standards Number shall be submitted to the Engineer for review and acceptance. Acceptance will be at the sole discretion of the Engineer and Department.

Materials not conforming to this section of the specifications or from sources not listed in the Contract Documents shall not be used without written consent from the Engineer.

Contractor's design of the helical piles shall conform to the minimum material requirements stated below:

1. Central Steel Shaft

    a) Steel shaft consisting of lead helical segments, steel shaft helical extensions, steel couplers to connect extension shafts to mounting brackets, and adjustable steel mounting brackets.
    b) Steel shafts shall have minimum yield strength of 50 ksi and a minimum torque strength rating of 5,500 ft-lb.
    c) Hot rolled solid steel bars shall meet dimensional and workmanship requirements of ASTM A29. The bars shall be modified medium carbon steel grade with improved strength due to fine grain size and shall be at least 1.5 inches square.
    d) Structural steel pipe shall be seamless or straight-seam welded, per ASTM A500 or A513, 3.5 inch O.D. minimum. Wall thickness shall be 0.300 inch (Schedule 80) minimum.

Helical Bearing Plate

Helix bearing plate shall be hot rolled carbon steel sheet, strip, or plate formed on matching metal dies to true helical shape and uniform pitch. Bearing plate material shall meet or exceed the properties of ASTM A572, ASTM A1018, or ASTM A656 as applicable, with minimum yield strength of 50 ksi. Plate thickness shall be minimum 3/8 inch.

ITEMS 943.2 through 948.7 (Continued)

Bolts

Bolts used to connect anchor shaft sections together, anchor shafts to bracket assembly plates, and pile shaft to the pile cap shall be minimum ¾-inch diameter and shall conform to ASTM A325, ASTM A193 Grade B7, ASTM A320 Grade L7 or SAE J429 Grade 5 or 8.

Couplings

a) Couplings for square shafts shall be formed as an integral part of the helical extension segment and riser segment as hot upset forged sockets.

b) Couplings for structural steel pipe sections shall either be formed as an integral part of the riser as hot forge expanded sockets, or as internal sleeve wrought steel connectors. The steel connectors can be either tubing or solid steel bar with holes for connecting shaft sections together.

Plates, Shapes, or Pile Caps

Vertical and angled bracket assembly plates shall be rated for the design loads specified herein and the strength of the structure they support. The bracket assembly shall be bolted to the riser section to resist tension loading. Threaded bars shall be used to form the connection between the riser section and angled brackets for the helical piles. Bolts for the bracket assembly are specified on the Plans. Structural steel plates and shapes for pile top attachments shall conform to ASTM A36 or ASTM A572 Grade 50.

Corrosion Protection

Corrosion protection requirements for the various helical pile elements shall be provided by hot dip galvanization in conformance with ASTM A123.

QUALIFICATIONS

Due to the special requirements for installation of helical piles and the requirements for proper performance of the structural system helical pile systems, devices, and bracket assemblies shall be installed by a specialized Helical Pile Contractor. The Helical Pile Contractor shall have experience in the design, construction, and load testing of helical piles and have successfully constructed minimum of five (5) projects in the last five (5) years totaling at least 100 helical piles with similar design, loads, and requirements specified in these Plans and Specifications. The Helical Pile Contractor shall have previous helical pile installation experience with similar subsurface materials, groundwater conditions, helical pile sizes, and be thoroughly familiar with the specialized type of equipment needed to perform work of this type.

The Helical Pile Contractor shall be trained and certified by the helical pile manufacturer in the proper methods of design and installation of helical piles. The Helical Pile Contractor shall provide names of on-site personnel materially involved with the work, including those who carry documented certification from the manufacturer. At a minimum, these personnel shall include foreman, machine operator, and project engineer/manager.

ITEMS 943.2 through 948.7 (Continued)

The on-site foremen shall have minimum experience of at least 3 years installing helical piles of equal or greater resistance than required in these Plans and Specifications. The machine operators and tester shall have minimum experience of 2 years installing and testing helical piles of equal or greater resistance than required in these Plans and Specifications.

Prior to the Pre-construction Meeting, the Helical Pile Contractor shall submit the following information to verify the firm's experience and the qualifications of personnel scheduled to perform the helical pile design and construction:

1. Submit a list of at least five helical pile projects successfully completed in the last five years. Include construction details, structural details, load test reports, and client contact for each project listed.
2. Submit a list of the equipment and resources the Helical Pile Contractor plans to mobilize and utilize for the performance of the project.
3. Provide the names and detail the experience of the helical pile designer, on-site supervisor, foremen, and drill rig operators for this project.
4. A signed statement that the Helical Pile Contractor has inspected both the project site and all the subsurface information including any subsurface materials samples made available in the Contract Documents.

The Helical Pile Contractor shall employ a registered professional engineer licensed in the Commonwealth of Massachusetts to design the helical piles; load test set-up, and instrumentation for the pile load tests; monitor, record, and evaluate the test results; and prepare the report of the pile load tests. The engineer shall have at least five (5) years' experience in helical anchor design, installation and pile load test setup, monitoring, and analysis.

Work on any helical piles shall not be started, nor materials ordered until the qualifications and submittals have been accepted by the Engineer. The Engineer may suspend the helical pile construction if the Helical Pile Contractor substitutes unapproved personnel during construction. Requests for substitution of field personnel shall be submitted to the Engineer for acceptance. Additional costs resulting from the suspension of work will be the Helical Pile Contractor's responsibility, and no extension in contract completion date resulting from the suspension of work will be allowed.

All helical piles shall be installed in the presence of a designated representative of the Engineer. The designated representative shall have the right of access to any and all field installation records and test reports.

DESIGN REQUIREMENTS

The helical piles shall be designed to support the design loads shown on the Plans with a service life of not less than 75 years.

ITEMS 943.2 through 948.7 (Continued)

Helical pile systems shall be designed and installed in accordance with:

1. The manufacturer's requirements.
2. The requirements as specified herein.
3. The Contract Plans.
4. AASHTO LRFD Bridge Design Specification, current edition. Herein referenced as AASHTO LRFD.
5. AASHTO LRFD Bridge Construction Specifications, current edition.

Where conflicting requirements occur, the more stringent shall govern. Design shall consider Service, Strength, and Extreme Limit States.

Loads on the Plans are factored design loads. A maximum resistance factor of 0.70 shall be used to determine the required ultimate tensile and compressive resistance of the helical piles with regard to their interaction with soil upon successful completion of static load testing. Helical pile resistance in soil depends on the geometric configuration of the helical blades about the lead section and the subsurface conditions. The torque applied during installation provides an indirect verification of axial resistance. Manufacturer's recommendations and ICC-ES-AC358 should be followed regarding the torque and the tensile/bearing resistance relationship for the particular helical pile selected. The number and size of blades shall be determined by the Helical Pile Contractor so as to achieve the required torque and tensile/bearing resistance for the soil conditions at the site. However, the ratio of factored design resistance to the total area of the helical blades shall not exceed the subsurface material factored bearing resistance.

Design of the helical piles shall be based on Load Resistance Factor Design (LRFD) and conform to the following minimum design criteria:

1. Helical anchor manufacturer shall furnish a guarantee for a period of ten (10) years from date of delivery against defects due to manufacturing of helical pile and bracket assemblies. Helical pile manufacturer must carry product liability insurance.

2. Helical piles shall be designed to provide the minimum factored design loads as shown on the Contract Drawings.

3. Vertical and inclined helical piles are specified on the Contract Drawings. Two vertical helical piles and one inclined helical anchor are specified at each bent to resist axial compression and horizontal (transverse direction) deck loads. Two inclined piles are specified at every third bay of the boardwalk decking to resist longitudinal lateral loading. Contractor shall determine the required angle of inclination for inclined piles within the minimum and maximum range of angle of inclination shown on the Contract Drawings.

4. The overall length, helix configuration, and minimum torsional resistance of a helical pile shall be such that the required nominal resistance is developed by the helix plate(s) in the bearing stratum.

ITEMS 943.2 through 948.7 (Continued)

5. Piles shall be designed so that the helices derive support entirely in the inorganic soils underlying the soil strata. Therefore, the top helix for all piles should extend at least 9 feet into the sand and gravel strata below the fill strata.

6. Maximum resistance factor of 0.70 may be utilized upon successful completion of a preproduction verification load test. The design loads shall be confirmed with pile load tests as specified herein.

7. The pile design shall consider pile spacing, soil stratification, corrosion, and strain compatibility issues as are present for the project.

HELICAL PILE PRE-CONSTRUCTION SUBMITTALS

A. General

The Contractor shall prepare and submit to the Engineer: design calculations, shop drawing, helical pile installation plan, construction procedures, load testing procedures, and equipment calibration for review and acceptance. Verify the limits of the helical pile structure before preparing the detailed Working Drawings. The Contractor shall allow the Engineer four (4) weeks to review, comment, and return the submittal package after a complete set has been received. Work shall not begin, nor materials ordered until all submittals have been received, reviewed, and accepted in writing by the Engineer. All costs associated with incomplete or unacceptable submittals shall be the responsibility of the Contractor.

The helical pile submittals shall include:

1. Design

   Design computations demonstrating compliance with the criteria specified herein and shown on the Plans, prepared, and signed and stamped by a registered professional engineer licensed in the Commonwealth of Massachusetts and specializing in helical pile design and construction with a minimum of 5 years of design experience.

   The design calculations shall include but not be limited to:

   a) Statement of all assumptions made and copies of all references used in the calculations.
   b) A written summary report describing the overall helical pile design.
   c) A statement of applicable code requirements and design references.
   d) Helical pile structure critical design cross-section(s) geometry, including soil strata and piezometric levels and location, magnitude and direction of applied loadings, including slope or external surcharge loads.
   e) A description of design criteria to be applied to the work, including, soil shear strengths (friction angle and cohesion), unit weights for each soil stratum, and helix plate diameter(s), helix plate pitch, and installation torque to nominal resistance assumptions for the design bearing stratum.

ITEMS 943.2 through 948.7 (Continued)

f) All design calculations performed by hand, spreadsheet, or computer program and references used.
g) Design calculation sheets with the Project number, helical pile structure location, designation, date of preparation, initials of designer and checker, and page number at the top of each page. Provide an index page for the design calculations.
h) Design notes including a list of symbols and computer program used in the design.
i) Pile-to-footing connection calculations.

2. Plans

Working Drawings indicating:

a) Helical pile number, location, and pattern by assigned identification number.
b) Helical pile factored design load.
c) Type and size of central steel shaft for helix segments and riser segments, including transition bars.
d) Helix configuration (number and diameter of helix plates) on lead segment and extension segment(s), if required.
e) Minimum effective installation torque.
f) Minimum overall length.
g) Inclination of helical pile.
h) Cut-off elevation.
i) Helical pile bracket assembly and connection to boardwalk pier cap or pile cap, including thread bars (if used).

3. Construction Procedures

a) A detailed description of the construction procedures and equipment proposed for installation of the helical piles. Include description of methods to maintain alignment of the piles during installation and the required angle for inclined piles. Procedures shall include a description of mitigating measures to be taken if the torsional strength rating of the central steel shaft and/or installation equipment has been reached prior to achieving the minimum overall length required and if the helical pile is refused or deflected by a subsurface obstruction.

b) Shop drawings for all helical pile components, including transition adapters, helical segments, riser segments, thread bar adapters, brackets, and bolt connections. Include identification of manufacturer's catalog numbers.

c) Example field log to be used for recording installation details for each helical pile installation.

ITEMS 943.2 through 948.7 (Continued)

d) Information on space requirements for installation equipment that verify the proposed equipment can perform at the site.

e) If welding is proposed, submit the welding procedure. All welding shall be done in accordance with the current AWS Structural Welding Code.

f) Mill test reports for the central steel shaft for the materials delivered to the site for record purposes. The ultimate strength, yield strength, percent elongation, and chemistry composition shall be provided.

4. Load Testing Procedures

Procedures, equipment, and set up for pre-production static load testing for the helical piles. Locations of the load tests shall be selected by the Contractor and accepted by the Engineer. The purpose of the tests is to determine the load versus displacement response of the helical pile and provide an estimation/confirmation of nominal resistance. Both a tension and a compression load test will be performed on each of the helical piles to be load tested. The load test proposal shall be in general conformance with ASTM D1143 for compression testing and ASTM D3689 for tension testing. The following minimum information shall be provided for review:

a) Type and accuracy of load equipment.
b) Type and accuracy of load measuring equipment.
c) Type and accuracy of helical pile head deflection equipment.
d) Description of load reaction system, including description of reaction piles.
e) Calibration report for complete load test equipment, including hydraulic jack, pump, pressure gage, hoses, and fittings.

5. Equipment Calibration

Copies of calibration reports for each torque indicator or torque motor, and all load test equipment to be used on the project. The calibration tests shall have been performed within forty five (45) working days of the date submitted. Helical pile installation and testing shall not proceed until the Engineer has received the calibration reports. These calibration reports shall include, but are not limited to, the following information:

a) Name of Project and Contractor
b) Name of testing agency
c) Identification (serial number) of device calibrated
d) Description of calibrated testing equipment
e) Date of calibration
f) Calibration data

ITEMS 943.2 through 948.7 (Continued)

6. Qualifications Documents

   Qualifications of the Helical Pile Contractor and qualifications of the Contractor's Engineer, who will design the helical piles and design, monitor, evaluate and prepare report(s) for pile load tests. Qualifications shall satisfy the requirements of the Qualifications Section of these specifications.

7. Materials Documents

   ISO9001 certificate or helical pile manufacturer or complete description of product testing and manufacturing quality assurance programs used to assess and maintain product quality.

   Documentation of ICC ES AC358 acceptance criteria required for the testing and validation of the performance of a manufacturer's helical piles. Test standard involves lab and field testing of the helical pile components and within various soil types.

HELICAL PILE PRE-CONSTRUCTION MEETING

A mandatory pre-construction meeting will be scheduled by the Engineer and held prior to the start of helical pile construction. The Design Consultant, MassDOT Resident Engineer, Prime Contractor, and Helical Pile Contractor, including QC personnel, shall attend the meeting. The preconstruction meeting will be conducted to clarify the construction and QC requirements for the work, to coordinate the construction schedule and activities, specifically those pertaining to excavation for helical pile structures, installation of temporary support of excavation, anticipated subsurface conditions, helical pile installation and testing, and helical pile structure survey control.

SITE DRAINAGE CONTROL

The Contractor shall provide positive control and discharge of all surface water that will affect construction of the helical pile installation. Maintain all pipes or conduits used to control surface water during construction. Repair damage caused by surface water at no additional cost. Upon substantial completion of the work, remove surface water control pipes or conduits from the site.

EXCAVATION

Coordinate the work and the excavation so the helical pile structures are safely constructed and remain stable at all times. Perform the helical pile construction and related excavation in accordance with the Plans and accepted submittals. No excavation deeper than those specified herein or shown on the Plans will be made above or below the helical pile structure locations without written acceptance of the Engineer.

ITEMS 943.2 through 948.7 (Continued)

HELICAL PILE INSTALLATION

A. General

Contractor shall be responsible for selecting installation equipment, tooling, and procedures for installing helical piles. These specifications provide minimum requirements to aid the Contractor in making appropriate selections.

Piles shall be installed only in the presence of the Engineer's or MassDOT's Representative.

B. Site Conditions

The Contractor shall visit the site to review all details of the work and working conditions, to verify dimensions in the field and to advise the Engineer of any discrepancy before performing any work.

The Contractor shall verify that all helical piles may be installed in accordance with all pertinent codes and regulations regarding such items as underground obstructions, right-of-way limitations, utilities, etc. The Contractor shall consult the Contract Drawings and official records of existing utilities, both surface and subsurface, and their connections to be fully informed on all existing conditions and limitations as they apply to this work. Contractor shall repair or replace any construction induced damage to existing active utilities to the satisfaction of the governing utility owner at the Contractor's expense.

Subsurface explorations (drive sample borings) were performed on wide spacing along the elevated boardwalk alignment. Locations and logs of the borings are shown on the Contract Drawings. Contractor shall review logs of these explorations and other pertinent data for the site as described in the Geotechnical Engineering Report.

The Contractor may take whatever explorations deemed as necessary, at no additional cost to the Owner or Engineer, for designing the helical piles.

The aforementioned data is for general information and is accurate only at the particular locations and time the subsurface explorations were made. It is the Contractor's responsibility to make interpretations and draw conclusions on the character of the materials encountered and the impact on this work based on the Contractor's expert knowledge of the area and helical pile installation techniques.

C. Location and Survey

Helical piles shall be located and marked using survey and a template by the Contractor who shall maintain and be responsible for all location and elevation stakes.

ITEMS 943.2 through 948.7 (Continued)

D. Installation Equipment

The Contractor shall verify that site conditions will allow for access of proposed equipment and will support equipment for helical pile installation.

Each helical pile shall be advanced into the ground by application of rotational force using a hydraulic torque converter. Installation equipment shall include a direct means of determining the installation torque being applied to the helical pile. Percussion drilling methods shall not be permitted. The equipment shall be capable of continuous position adjustment to maintain proper helical pile alignment.

Where load testing is required, installation equipment shall include a means for applying and measuring loads and deflections of helical piles. Acceptable methods of load testing include a calibrated hydraulic jack or other means acceptable to the Engineer. Current evidence of calibration of Contractor's load testing and torque monitoring equipment shall be provided as part of the pre-construction submittals, but also upon request of the Engineer during installation.

Equipment shall be re-calibrated during helical pile installation, if in the opinion of the Engineer and/or Contractor, reasonable doubt exists as to the accuracy of the torque measurements. Re-calibrations shall be at the cost of the Contractor.

All drive tools and equipment shall be in accordance with the manufacturer's written installation instructions.

All helical pile installation equipment and materials shall be acceptable to the Engineer prior to delivery to the site. Acceptance will be based upon submission of records and data, as discussed in this specification. Once accepted, changes in installation equipment and materials will not be permitted without additional acceptance and will be considered only after the Contractor has submitted all information requested by the Engineer which must meet all requirements of this special provision.

E. Installation Procedure

Helical piles shall be advanced into the ground until the required minimum overall length criteria and minimum effective torsional resistance criteria are achieved to accommodate the nominal tensile and bearing resistance plus an additional distance to ensure proper embedment. For the helical piles, the embedment length shall be achieved by continuing advancement while maintaining or exceeding the required torsional resistance for the last three (3) feet of penetration.

Constant normal pressure shall be applied while screwing helical piles into the ground. The pressure applied shall be sufficient to ensure that, during each revolution, the helical pile progresses into the ground a distance equal to at least 80% of the blade pitch. Rate of helical pile rotation shall not exceed 20 revolutions per minute.

Inclined helical piles can be positioned perpendicular to the ground to assist in the initial advancement into the soil before the required batter angle is established.

ITEMS 943.2 through 948.7 (Continued)

All helical pile components including the shaft and bracket assembly shall be isolated from making a direct electrical contact with any concrete reinforcing bars or other non-galvanized metal objects since these contacts may alter corrosion rates.

F. Construction Tolerance

Helical piles and bracket assemblies shall be installed at the locations shown on the Plans.

1. Centerline of helical piles shall not be more than 3 inches laterally and longitudinally from indicated Plan location.
2. Piles shall be plumb within 2 degrees of design Plan alignment.
3. The top elevations of helical piles shall be within +1 inch to –2 inches of the design vertical elevation.
4. Bracket assembly placement shall be within 1 inch in both directions perpendicular to the pile shaft and ¼ inch in a direction parallel with the pile shaft.

G. Installation Records

The Contractor shall prepare and provide to the Engineer full-length installation records for each helical pile installed. The records shall be submitted within one work shift after that pile installation is completed. The data shall be recorded on a helical pile installation log. A separate log shall be provided for each helical pile. The log for each helical pile shall contain the following minimum information:

1. Project name, structure name, helical pile number, and contract number.
2. Name of Contractor's supervisor during installation.
3. Date and time of installation.
4. Installation equipment name and model, and operator name.
5. Type of torque indicator used.
6. Plan location of helical pile.
7. Pile reveal.
8. As-built helical pile type and configuration, including manufacturer's catalogue numbers for lead section (number and size of helix plates), number and type of extension sections, and associated hardware used to make shaft connections and bracket connections to deck.
9. Total length of installed helical pile.
10. As-built installation angle of pile.
11. Helical pile installation duration and observations.
12. Cut-off elevation.
13. Installation torque measurements at one-foot intervals for the final 10 feet of installed length, at a minimum.
14. Effective torsional resistance and calculated geotechnical resistance as derived from the pre-production load test program.
15. Comments pertaining to interruptions, obstructions, or other relevant information.
16. Rated load capacities.

ITEMS 943.2 through 948.7 (Continued)

The Contractor shall also submit within 2 weeks after installation of all piles, an as-built plan, certified by a surveyor, showing the as-installed location of all piles to the nearest ½ inch.

CONSTRUCTION QUALITY CONTROL

HELICAL PILE LOAD TESTS

A. General

The Contractor shall perform pre-production verification pile load testing (both compression and tension) on a sacrificial pile per bond zone stratum. The number and location of the verification test(s) shall be as specified on the Plans. In general, the location of the verification test(s) shall be within 10 feet of the footprint of a substructure unit, but at least 5 feet from any production pile as selected by the Contractor and accepted by the Engineer.

Installation methods, procedures, equipment, and overall lengths for the pre-production verification load test helical pile shall be identical to those proposed for use in installing production helical pile to the extent practical.

The load tests shall conform to the requirements of ASTM D1143 (vertical compression load testing) and ASTM D3689 (vertical tension load testing) except as modified herein. The maximum test loads shall be 150% of the Factored Design Load (FDL) for the Helical Pile Verification Test. The Factored Design Load is defined as the Factored Axial Design Load (compression and/or tension) as shown on the Plans. The Alignment Load (AL) should not be more than 0.04 FDL.

Before starting the work, the Contractor shall submit to the Engineer for acceptance, a pile load test plan including a written description of the equipment and methods which are intended to be used. The methods must be of an accepted type and shall be altered as necessary to meet the acceptance of the Engineer. The pile load test plan and description shall be prepared and signed and stamped by a professional engineer registered in the Commonwealth of Massachusetts.

If the load test fails to meet the design requirements, the Contractor shall modify the helical pile design and/or installation methods and retest the modified pile at no additional cost to the Owner.

The Contractor shall provide all personnel and equipment needed to perform the test, measure loads and movements, and record test data. A representative of the Department or the Engineer may observe and witness the test and record data independently. No testing is to be performed unless all the agreed representatives are present.

B. Load Test Equipment

Testing equipment shall include dial gauges, dial gauge support, jack and pressure gauge, electronic load cell, and a reaction frame. The Contractor shall provide a description of test setup and jack, pressure gauge and load cell calibration curves, in accordance with the Submittals Section.

ITEMS 943.2 through 948.7 (Continued)

Design the testing reaction frame to be sufficiently rigid and of adequate dimensions such that excessive deformation of the testing equipment does not occur. Provide a reaction frame capable of safely supporting 125 percent of the maximum test load. Align the jack, bearing plates, and stressing anchorage such that un-loading and repositioning of the equipment will not be required during the test. The direction of the applied load shall be collinear with the helical pile at all times.

Apply and measure the test load with a hydraulic jack and pressure gauge. The pressure gauge shall be graduated in 100 psi increments or less. The jack pressure gauge shall have a pressure range not exceeding twice the anticipated maximum test pressure. The jack shall be positioned at the beginning of the test such that unloading and repositioning during the test will not be required. The jack shall also be positioned co-axial with respect to the helical pile head so as to minimize eccentric loading.

Calibrate the test load jacking system including the hydraulic jack couplings, gas pump, pressure gauge, and hydraulic load cell prior to the test so that the load applied is controlled to within 3 percent of the total applied load. Submit calibration reports prior to the start of the pile load test. Monitor the creep test load hold during verification tests with both the pressure gauge and the electronic load cell. Use the load cell to accurately maintain a constant load hold during the creep test load hold increment of the verification test.

Readings of settlement and rebound shall be referred to a fixed benchmark and shall be made using dial gauges (micrometer dial extensometers) graduated to 0.001 inches and located so its stem is parallel with the axis of the helical pile. The stem may rest on a smooth plate located at the helical pile head and positioned perpendicular to the axis of the helical pile. The gauges shall be mounted on a reference beam supported at each end by reliable supports located at least 10 feet from the center of the test pile and independent from the jack, pile, or reaction frame.

The dial gauges shall have a travel sufficient to allow the test to be done without having to reset the gauges. Readings shall be taken at intervals specified in the Verification Test and Proof Test Section.

Protect the settlement measuring system against rain, wind, frost, and any other disturbances that could affect the reliability of the settlement observations. Provide sun shading for the measuring system for the duration of the test and for a minimum of 1 hour prior to the start of the test.

C. Helical Pile Verification Test

The Contractor shall perform pre-production verification pile load testing on sacrificial piles at a location selected by the Contractor and accepted by the Engineer. The location of the verification tests shall be within 10 feet of footprint of a substructure unit but at least 5 feet away from any production pile. Testing shall be performed in compression or tension in accordance with ASTM D1143 or ASTM D3689, respectively, except as modified herein.

Verification load tests shall be performed to verify that the Contractor installed helical pile will meet the required FDL and load test acceptance criteria and to verify the nominal resistance to the average installing torque of the helical pile for the project site.

ITEMS 943.2 through 948.7 (Continued)

The helical pile verification load test results must verify the helical pile design and installation methods, and be reviewed and accepted by the Engineer prior to beginning installation of production helical piles. The verification test pile and reaction piles shall not be used as production piles.

Test verification pile to a maximum Test Load of 150% of the Factored Design Load (FDL) defined above, as indicated on the Plans. The verification pile load test shall be made by incrementally loading the helical pile in accordance with the following cyclic load schedule:

Step	Loading	Applied Load	Hold Time (min.)
1	Cycle 1	AL	1
		0.15 FDL	4
		0.30 FDL	4
		0.45 FDL	4
		0.60 FDL	4
		0.75 FDL	4
		0.525 FDL	4
		0.375 FDL	4
		0.20 FDL	4
		AL	1.0
2	Cycle 2	AL	1
		0.25 FDL	4
		0.75 FDL	4
		0.90 FDL	4
		1.0 FDL	4
		1.2 FDL	4
		1.35 FDL	4
		1.5 FDL	10
		1.0 FDL	4
		0.75 FDL	4
		0.25 FDL	4
		AL	5

Test Notes: Pile top movement shall be measured at each load increment. The load-hold period shall start as soon as each test load increment is applied. The verification test pile shall be monitored for displacement at the 1.5 FDL increment. Displacement readings shall be recorded at 1, 2, 3, 5, 6, and 10 minutes. Dial gauges shall be reset to zero after the initial AL is applied.

The acceptance criteria for helical pile verification load test are:

1. The helical pile shall sustain the compression and tension design loads (0.75 FDL) with no more than 3/4-inch total vertical movement of the helical pile head as measured relative to the top of the helical pile prior to the start of testing.

ITEMS 943.2 through 948.7 (Continued)

2. Failure does not occur at the 1.50 FDL maximum compression and tension test loads. The failure load shall be defined by one of the following definitions, whichever results in the lesser load:

   - The point at which the movement of the helical pile tip exceeds the elastic compression/tension of the anchor shaft by 0.08 B, where B is defined as the diameter of the largest helix.

   - The point at which the slope of the load versus deflection (at end of increment) curve exceeds 0.05 inches/kip.

Both of the above acceptance criteria shall be met.

At the completion of verification testing, test pile shall be removed down to the elevation specified on the Plans or by the Engineer.

E. Helical Pile Load Test Report

Verification Load Test Report

For the verification load tests, reports must be written and submitted to the Engineer within 3 working days of the load test completion. This report will either confirm the helical piles' resistance as specified on the approved Working Plans or propose changes based upon the results of the pre-production tests. This report shall be reviewed and accepted by the Engineer prior to beginning installation of production helical piles. The contents of the verification load test report shall include:

1. Brief project description.
2. Description of site and subsurface conditions including information on the ground conditions at the location of the load test and a comparison to actual conditions encountered.
3. Key personnel including the installation equipment operator, the superintendent, and any other personnel involved in the installation and testing of the helical pile.
4. Helical pile installation data including information such as length of the helical pile, geology encountered (e.g. soil material, rock material, and water levels) during installation, and all relevant helical test pile information specified for production helical pile installation in Construction Quality Control Section C. Installation Records, above.
5. A scale drawing of helical test piles showing all relevant construction details and subsurface conditions encountered during installation of the helical test piles and helical reaction piles.
6. Results of load test including load-movement curves/figures and filled-out data sheets.
7. Statement of load test requirements and acceptance criteria.
8. Comparison of load test requirements and acceptance criteria.
9. Summary statement on the load test results.
10. Report shall be signed and stamped by the Contractor's Professional Engineer registered in the Commonwealth of Massachusetts.

ITEMS 943.2 through 948.7 (Continued)

If a tested helical pile fails to meet the acceptance criteria, the Contractor shall modify the design, the construction procedure, or both. These modifications may include but not limited to de-rating the helical pile resistance, modifying the installation methods and equipment, increasing the minimum effective installation torque, changing the helix configuration, or changing the helical pile material (for example central steel shaft). Modification shall be submitted as a revision to the Working Drawings and require the Engineer's review and acceptance. Additional load testing may be required until an acceptable pile load test meets the designated load test requirements.

NON CONFORMING PILES

Non-conforming helical piles include piles that are installed out of tolerance, are damaged, are not installed to the minimum required torque, are not installed to the minimum required depth, or the helical pile lead section is not installed in the specified bearing stratum. The Contractor shall submit a written remedial action plan to the Engineer for approval. To mitigate or remediate nonconforming helical piles, the Contractor may be required to provide additional helical piles or supplement helical piles to meet specified requirements at no additional cost to the Owner. Re-use of components of helical piles that had been previously installed and removed shall be at the acceptance of the Engineer.

FIELD MODIFICATIONS

Modification of manufactured helical anchor shaft, helical blades, bracket assemblies, and shaft connections is prohibited and shall not be performed without written approval of product manufacturing company and acceptance by the Engineer.

METHOD OF MEASUREMENT

Helical Pile and Bracket Assembly will be paid for at the contract unit price per Foot. Helical Pile and Bracket Assembly shall be measured between the tip of the pile and the bottom of the timber pile cap, which shall include the pile lead sections with helices, pile shaft materials, couplers, mounting bracket assemblies, bolts, hardware, and any other materials, equipment and labor required for proper installation of one helical pile at the required final installation torque, resistance, location, elevation, and minimum length specified. Installation torque records with depth and pile length shall be the basis for measurement.

Pre-Drilling for Pile Obstructions shall be measured for payment per Foot.

Helical Pile Verification Load Test shall be measured for payment per Each.

ITEMS 943.2 through 948.7 (Continued)

BASIS OF PAYMENT

Helical Pile and Bracket Assembly shall be paid at the contract unit price per Foot, complete in place and accepted. Payment for helical pile and bracket assembly shall be considered complete compensation for providing all design, materials, labor, equipment, services, and incidentals to complete the work. There will be no separate measurement for mobilization and demobilization associated with this item. Payment will only be made for piles that are installed in accordance with the requirements of these specifications, the accepted Contractor's design submittal, and the acceptance of installed piles by the Engineer. No payment shall be made for non-conforming helical piles.

The cost of the Contractor's design professional to design the helical piles and prepare the necessary submittals and respond to comments by the Engineer and the cost of the helical pile manufacturer's representative is incidental to the items listed in this Section.

The Contractor shall anticipate encountering obstructions during helical pile installation and shall utilize equipment and methods necessary to advance through the obstructions. Any cost associated with the pre-drilling for pile obstructions shall be paid for at contract unit price of Pre-Drilling for Pile Obstructions Item.

The cost of the additional site exploration to locate the existing sewer shall be paid under item 141.1 Test Pit for Exploration.

Helical Pile Verification Load Test shall be paid at the contract unit price per each completed and accepted test, for which payment shall be considered complete compensation for providing all design, materials, labor, equipment, load test report, and incidentals to complete the work including the installation and materials of the test pile, reaction piles, if used, and load frame. This payment shall also include full compensation for cutting the pile to the elevation necessary and for mounting bracket assemblies, bolts, hardware, and any other materials, equipment and labor required to properly incorporate the pile in the structure. If a pile is not to be incorporate in the structure, this payment item includes cutting the pile to the grade necessary to avoid its interference with the proposed construction. Payment for Helical Pile Verification Load Tests shall also include full compensation for installing the test pile

ITEM 983.6 NATURAL STREAMBED MATERIAL SQUARE YARD

The work under this heading shall consist of installation of natural streambed material within the channel excavation portion and up to the excavated material to provide a natural streambed for aquatic organisms. The natural streambed construction material is to be placed within the bottom 12” of the channel and on top of rip rap as depicted on the plans. The natural stream bed material shall be installed in dry conditions.

The existing streambed material to be excavated shall be stockpiled in separate locations or be separated by double-stacked straw bales or temporary concrete barriers within the limits of work to prevent mixing and allow for reinstallation of the correct material on the bed and banks.

The intent of this work is to ensure a natural streambed within the channel, to provide fisheries and wildlife habitat enhancement as part of the wetland replication area and natural wetlands. The natural streambed material shall be comprised of the stones 4 inches and under, that shall meet the following gradation:

Sieve opening	Percent by Mass Passing Through
4”	95
2”	55-65
¾”	30-45
#4	0-5

Partially angular rock is preferred over round and shall be able to lock together to prevent movement during high flows. Crushed stone will not be accepted for any components. The top of streambed elevations shall match existing streambed elevations.

METHOD OF MEASUREMENT

Item 983.6 will be measured by the area of natural streambed material, complete in place, 12” deep.

BASIS OF PAYMENT

Item 983.6 will be paid for at the Contract unit price per Square Yard which price shall include furnishing, installation, all labor, materials, tools, equipment, and all incidental costs required to complete the work.

ITEM 991.1	**CONTROL OF WATER – STRUCTURE NO. P-03-020 (CAK)**	**LUMP SUM**
ITEM 991.2	**CONTROL OF WATER – STRUCTURE NO. 2 (CULVERT NO. 1)**	**LUMP SUM**
ITEM 991.3	**CONTROL OF WATER – STRUCTURE NO. 3 (CULVERT NO. 2)**	**LUMP SUM**

The work under these Items shall conform to the relevant provisions of Subsection 140.60 of the Standard Specifications, and the following:

The work to be done under these Items shall consist of all work required for the control of water and siltation, if necessary, to ensure that all the proposed precast culverts and bridge abutments are installed in the dry as shown on the plans, or as directed by the Engineer. The work shall include all incidental dewatering, pumping, turbidity barriers, sandbagging, filtration or dewatering basins, or other measures inclusive of sheeting, necessary for sufficient water control to accomplish the construction of the proposed substructure/culvert in the dry.

For demolition purposes, dewatering shall be conducted on an as needed basis as determined by the Contractor. It is the responsibility of the Contractor to assess the site and determine the need and extent of dewatering required and to submit complete working drawings and computations of his/her proposed dewatering scheme to the Engineer for approval in accordance with Subsection 5.02 and these Special Provisions. A Professional Engineer registered in the Commonwealth of Massachusetts shall certify both. The furnishing of such schemes shall not serve to relieve the Contractor of any of his responsibility for the safety of the work or the responsibility for the successful completion of the project. Submittals shall include, but are not limited to, a sequence plan with a timetable and details specific to each of the phases of construction. The submittals shall include working drawings and calculations. Detailing the methods and materials proposed to account for all anticipated loads and construction conditions necessary to permit the work while maintaining a safe work area and protecting property from damage.

Pumping from the interior of any foundation enclosure shall be done in such a manner as to preclude the possibility of transporting by water any part of the concrete materials being placed. No such pumping will be permitted during the placing of concrete or for a period of at least 24 hours thereafter, unless it is done by a method approved by the Engineer. During dewatering operations, water that is pumped from the interior of any foundation enclosure shall be conveyed into a sedimentation basin or other device or methodology which will cleanse the water before being discharged away from the site or into adjacent wetlands. The locations of any sedimentation basin will be determined by the Contractor based on the selected methods of construction. Placement of the basin shall be in an upland area that is within the existing right of way and temporary easements. At no time shall the Contractor discharge untreated water from the site or into the wetlands. The proposed plan shall include methods and equipment necessary to discharge water from the sedimentation treatment basins.

The Engineer has the right to order the Contractor to stop all excavation operations when in his judgment the Contractor’s water control operations are failing to produce adequate results or are posing a threat to the environment.

ITEMS 991.1 through 991.3 (Continued)

BASIS OF PAYMENT

Items 991.11, 991.12 and 991.13 will be paid the respective Contract Lump Sum prices for Control of Water, which prices shall include full compensation for the design of the water control schemes, all equipment, materials, tools and labor necessary for the installation, maintenance, operation, removal and disposal of the materials used for water control including placement and/or removal of temporary sheeting or other retaining structures all as outlined above, and all incidental costs required to complete the work.

The payment method for Item 991.1 is partial progressive payment of the LUMP SUM Contract Bid Price of this Item. The partial payment schedule will be as follows:

- The first payment of these Items (50% of the Lump Sum bid price) will be made upon complete installation of the water control system to the satisfaction and approval of the Engineer.
- The final payment of these Items (50% of the Lump Sum bid price) will be made upon the satisfactory removal of the water control system after bridge construction is complete. All adjustments and repositioning of water control shall be considered as included under this Item. No separate payment will be made for the removal and disposal of the sediment material collected from the dewatering systems, but all costs in connection therewith shall be included in the Contract unit price bid.

ITEM 995.01 BRIDGE STRUCTURE, BRIDGE NO. P-03-020 (CAK) LUMP SUM

The work to be done under this Item shall conform to the relevant provisions of Subsection 995 of the Standard Specifications, and the following:

Work under this Item shall include all materials, equipment and labor needed to construct the following:

- Timber railing, decking, stringers, and pile bents;
- GRS-IBS abutments, wingwall, and elastomeric bearing pads;
- All items included hereinafter under Basis for Partial Payments.

It shall be the responsibility of the Contractor to provide all survey control necessary to assure accurate placement of all excavation and substructure work. This responsibility shall further include, but not be limited to; locating of utilities, drainage, copings and railing. The Contractor shall be responsible for making all measurements of angles, bearings, distances, and elevations from the original transverse line to the places of construction, as shown on the Plans and/or furnished by the Engineer within the limits of project. The Contractor shall make all data and reference points established in the course of the control surveys available to the Engineer for review and use by State survey parties.

The work does not include any items listed separately in the proposal. Payment for materials shown on the Plans as being part of this bridge structure or which may be incidental to its construction and are not specifically included for payment under another Item shall be considered incidental to the work performed under this Item and shall be included in the unit price of the component of which they are a part.

GRS-IBS ABUTMENTS

General

Work included in this section consists of furnishing all materials and construction of a geosynthetic reinforced soil-integrated bridge system (GRS-IBS) bridge to the lines and grades shown on the contract drawings and approved shop drawings. This will include Geosynthetics for GRS-IBS Abutments, Backfill for GRS-IBS Abutments, and CMU Facing for GRS-IBS Abutments.

Do not start any operation unless all materials and services needed for the work are delivered in such an order that there will be no interruption to the continuous and efficient progress in the completion of the project.

ITEM 995.01 (Continued)

Reference Documents

In the event of conflict between the documents referenced herein and the contents of this specification, the content of this specification shall be the superseding requirement. Various AASHTO and ASTM materials and testing designations are referenced in these specifications. The following FHWA reports are also relevant to the work:

- June 2018 Design and Construction Guidelines for Geosynthetic Reinforced Soil Abutments and Integrated Bridge Systems, Publication No. FHWA-HRT-17-080 (http://www.fhwa.dot.gov/publications/research/infrastructure/structures/11026/index.cfm.)

- Federal Highway Administration. (2012). Acceptance of Non-Structural Precast Elements, Report No. FHWA-HIF-12-045, Federal Highway Administration, Washington, DC.

In addition, Bidders are encouraged to watch an FHWA-produced video of the construction process. It can be seen at: https://www.youtube.com/watch?v=s9R-cznFgZA

QC	Quality Control
RSF	Reinforced Soil Foundation
CMU	Concrete Masonry Unit

Submittals

A. Schedule of Operations

Before starting any work under this Contract, submit a schedule of operations. Coordinate work with the work to be done by public utilities or other agencies.

B. Contractor QC Plan

Before the start of the work, the Contractor shall submit a written QC plan for approval by the Engineer. The QC plan is not intended to be a generic document, but rather, it must be project specific. The plan should sufficiently document the QC processes of all Contractor parties (i.e., prime Contractor, subcontractors, and producers) performing work required under this specification.

1. QC Plan Submittal Requirements:

- The Contractor shall be prepared to discuss the QC plan at pre-construction meetings, including the proposed submittal date, QC organization, and sources of materials.

ITEM 995.01 (Continued)

- The Contractor shall submit one hard copy and one electronic copy of the QC plan for approval by the Engineer no less than 45 days prior to the start of any work activities related to GRS-IBS construction, including excavation. The Contractor shall not start work on the subject work items without an approved QC plan.

2. QC Plan Format and Contents:

- The QC plan shall be structured to follow the format and section headings outlined below. The pages of the QC plan shall be sequentially numbered. The plan shall address, in sufficient detail, the specific information requested under each section and subsection.

Cover Page
Table of Contents
Section 1. Scope and Applicable Specifications
Section 2. Quality Control Organization
- 2.1 QC Organizational Chart
- 2.2 QC Personnel and Applicable Qualifications
- 2.3 QC Self-Checks by Production Personnel

Section 3. Quality Control Laboratories
- 3.1 QC Laboratory Accreditation or MassDOT Qualification

Section 4. Materials Control Procedures
- 4.1 Material Types and Source of Supply
- 4.2 QC of Project Produced Materials Offsite
- 4.3 QC of Standard Manufactured Items
- 4.4 On-site Material Storage and Handling

Section 5. QC Visual Inspection
- 5.1 QC Procedures for Equipment
- 5.2 Definition of Lots and Sublots (for Inspection)
- 5.3 Attributes Inspected for Project Produced Items
- 5.4 Attributes Inspected for Standard Manufactured Items
- 5.5 QC Inspection Report Forms
- 5.6 Evaluation of QC Inspection Results

Section 6. QC Sampling and Testing
- 6.1 Definition of Lots and Sublots
- 6.2 Random and Selective Sampling Procedures
- 6.3 Sample Identification, Storage, and Retention
- 6.4 Quality Characteristics Tested for QC
- 6.5 QC Sampling and Testing Report Forms
- 6.6 Evaluation of QC Testing Data

3. QC Plan Approval and Modifications

- Approval of the QC plan will be based on the inclusion of the information required in the Contractor QC section of this specification. Revisions to the QC plan may be required for any part of the plan that is determined to be insufficient by the Engineer.

ITEM 995.01 (Continued)

- Approval of the QC plan does not imply any warranty by the Engineer that the QC plan will result in completed work that complies with the specifications. It remains the responsibility of the Contractor to demonstrate such compliance.

- The Contractor may modify the QC plan as work progresses when circumstances necessitate changes in QC personnel, laboratories, or procedures. In such case, the Contractor shall submit for approval by the Engineer an amended QC plan identifying changes at least 3 calendar days prior to the proposed changes being implemented.

C. Backfill for GRS-IBS Abutments

1. Materials Source: Submit name and address of imported materials source.
2. Direct shear test results of the GRS backfill material prior to placement of material.
3. Quality Control (QC) Test Results: Submit QC test results within 24 hours of receipt.

D. Geosynthetics for GRS-IBS Abutments

1. Storage Plan: Indicate method of storage as approved by manufacturer.
2. Product Data: Indicate product standards, physical and chemical characteristics, technical specifications, limitations, maintenance instructions, and general recommendations regarding each material proposed for use as geotextile.
3. Mill Certificates or Affidavits: Provide mill certificate or affidavit signed by a legally authorized official from the company manufacturing the geotextile. The mill certificate or affidavit shall attest that the geotextile meets the chemical, physical, and manufacturing requirements of this Specification. A mill certificate shall be submitted for each lot of geotextile delivered to the Project site.
4. Results of Interface Friction Tests between geotextile and proposed GRS backfill material and between geotextile and underlying native soil.

E. CMU Facing Blocks

1. Materials Source: Submit name and address of imported materials source.
2. Proof of strength, water absorption, freeze thaw durability, and all other requirements described under Materials Section being met prior to placement of material.

Materials

Materials shall meet the requirements specified below and relevant Subsections of Division III, Materials.

Concrete Masonry Unit (CMU) Facing for GRS-IBS Abutments

Facing elements consisting of split-face CMU block units shall meet ASTM C90-11b requirements, with a minimum required compressive strength of 4,000 psi and a maximum water absorption rate of 5 percent after 24 h. The CMU block units shall be tested for freeze-thaw durability in accordance with ASTM C1262-10. Specimens used for absorption testing shall not subsequently be used for freeze-thaw testing.

ITEM 995.01 (Continued)

CMU blocks shall be furnished within the following tolerances:

- The height of each individual block shall be within 1/16 inches of the specified dimension.
- The length and width of each individual block shall be within 1/8 inches of the specified dimension.
- Hollow CMU block units shall have a minimum face shell thickness of 1-1/4 inches and a minimum web thickness of ¾ inches.

The CMU block units shall be randomly sampled and tested in accordance with ASTM C140-12. Contractor QC testing shall be conducted at a qualified agency or AASHTO-accredited laboratory as described below. Acceptance testing of the CMU blocks by the Engineer will be performed on a lot basis.

Backfill for GRS-IBS Abutments

Furnish sound, crushed durable particles, fragments of stone gravel free from organic matter or other deleterious material for the Geosynthetic Reinforced Soil (GRS) at the abutments and wingwalls, reinforced soil foundations (RSFs), integrated approach, and leveling course conforming to the following:

A. Geosynthetic Reinforced Soil (GRS) Backfill at Abutments and Wingwalls:
GRS backfill material for the abutments and wingwalls shall be crushed stone that meets the requirements of M2.01.0 Crushed Stone, gradation requirements of M2.01.4 (¾-inch), and have a minimum angle of internal friction of 38 degrees as confirmed by a direct shear test.

B. Reinforced Soil Foundation (RSF) Backfill:
The backfill material for the RSF shall meet the requirements of M2.01.4.

C. Integrated Approach Backfill:
The backfill material for the integrated approach shall meet the requirements of M2.01.1, Crushed Stone.

D. Leveling Course Backfill:
The leveling course backfill material shall meet the requirements of M2.01.0 Crushed Stone, and gradation requirements of M2.01.6 (3/8-inch).

Geosynthetics for GRS-IBS Abutments

Furnish geosynthetics consisting of geotextile for the GRS abutment, RSF and integrated approach. The geosynthetics material shall be manufactured from polypropylene, high-density polyethylene, or polyester.

ITEM 995.01 (Continued)

A. GRS Abutment and Wingwalls:

Geotextile shall meet the requirements of AASHTO M-288 Class 1 for stabilization with the additional requirement that the geotextile have a minimum ultimate tensile strength of 4,800 lb/ft according to ASTM D 4595-11 and that Geotextile reinforcement strength at 2 percent strain shall be at least 1320 lb/ft in the cross-direction but does not need to meet the requirements for permittivity. Geotextile machine-direction shall be rolled out parallel to the wall where shown on the plans.

B. RSF:

Geotextile shall meet the requirements of GRS Abutment and Wingwalls.

C. Integrated Approach:

Geotextile shall meet the requirements of AASHTO M-288 Class 1 for stabilization with the additional requirement that the geotextile have a minimum ultimate tensile strength of 2,400 lb/ft according to ASTM D 4595-11 but does not need to meet the requirements for permittivity.

Miscellaneous Materials

A. CMU Block Wall Concrete Fill - 4000 PSI, ¾ IN., 585 HP Cement Concrete.

B. Epoxy Coated Reinforcing steel bar—Deformed #4 (0.5-inch diameter) bars as described in STEEL REINFORCEMENT FOR STRUCTURES of the Standard Specifications, Section 901 and Division III Materials Specifications Section M8.01.0.

Construction Methods

Labor and Equipment

Section 7.2 of the *Geosynthetic Reinforced Soil Integrated Bridge System Interim Implementation Guide* may be consulted for information regarding typical labor, tools, equipment requirements proven to efficiently construct the GRS-IBS, and suggestions on how to improve productivity. However, it is the responsibility of the Contractor to choose the construction method, labor, and equipment that is most efficient for this project.

Excavation

A. All excavation shall comply with the Occupational Safety and Health Administration as well as State and local requirements.

B. Excavation shall include provisions for drainage with a sloped cut to facilitate the movement of water away from the work.

C. Any over-excavation that forms a pit shall be backfilled with suitable free draining material and compacted.

ITEM 995.01 (Continued)

RSF

A. The base of the RSF shall be cut smooth and excavated to uniform depth, and all loose, soft, wet, frozen, organic, and unsuitable material shall be removed from the base and sides of the excavation.

B. The base of the RSF shall be graded level for the entire area of the base to the limits shown in the plans. The intention is that bedrock will not be excavated, except that bedrock sloping toward the railroad tracks at an angle of more than 10 degrees from horizontal shall be cut to form nearly horizontal (i.e., less than 10 degrees from horizontal) benches.

C. Excavation shall be backfilled as soon as possible to avoid adverse weather delays. If this cannot be achieved, the excavation shall be graded to one end to facilitate the removal of any water. If excavation is flooded, all water shall be removed along with soft saturated soils.

D. The RSF shall be constructed with backfill material placed from the face to the back to push folds or wrinkles in the geotextile reinforcement to the free end of the reinforcement layer. Backfill shall be compacted in 6-inch-thick lifts.

E. The fill material shall be graded, leveled, and compacted before encapsulating the RSF.

F. The RSF shall be encapsulated in the geotextile reinforcement and placed perpendicular to the abutment face to protect it from possible erosion. The geotextile shall be sized to fully enclose the RSF on the face and the wing walls sides.

G. Overlap geotextile reinforcement a minimum of 3 feet on the top of the preceding layer.

H. The wrapped corners of the RSF need to be tight and without exposed soil within the RSF to complete the encapsulation.

Placement of Backfill and Compaction

A. For RSF and Integrated Approach Backfills, the backfill material shall be compacted to at least 95 percent maximum dry density according to AASHTO T-99-10.

B. For RSF and Integrated Approach Backfills, adjust the moisture content of the compacted backfill materials to within 2 percent of the optimum moisture content.

C. The GRS mass shall be constructed using compacted lifts of approximately 8 inches, equal to the facing block height.

ITEM 995.01 (Continued)

D. For GRS Backfill, compact each layer using a vibratory roller or other suitable compactor capable of compacting 8 inches of fill until there is no visible evidence of further compression. A minimum of four passes shall be applied per lift.

E. Hand-operated compaction equipment, such as lightweight mechanical tampers, plates, or rollers, is required within 3 feet of the front of the wall face so as not to damage or dislocate the facing blocks.

F. The top 5 feet of the abutment (i.e., just below the bridge seat) shall be compacted to 100 percent of the maximum dry density in accordance with AASHTO T-99-10.

G. Compaction equipment shall be selected to achieve the required fill material density.

Placement of Geotextile Reinforcement

A. Geotextile reinforcement shall be installed in accordance with the manufacturer's site-specific wall erection instruction.

B. The geotextile reinforcement shall be placed so that the strongest direction (i.e., cross machine direction) is perpendicular to the abutment or wingwall facing, as indicated on the drawings.

C. Reinforcement coverage shall be as shown on the drawings.

D. Adjacent sections of the geotextile reinforcement do not need to be overlapped except for the geotextile of the RSF, which shall overlap 3 feet.

E. Geotextile reinforcement shall be laid so that it is taut and free of wrinkles prior to backfilling.

F. Geotextile reinforcement shall be placed directly on the compacted horizontal fill surface.

G. The geotextile shall bear uniformly on the compacted reinforced soil from the connection to the wall to the free end of the geotextile layer.

H. The geotextile reinforcement shall extend between the layers of the CMU block.

I. The geotextile reinforcement shall cover a minimum of 85 percent of the top surface of the CMU block. Any excess reinforcement material showing through the face shall be removed in accordance with the manufacturer's directions.

J. A minimum backfill layer of 6 inches shall be placed on the geotextile prior to operating any vehicle or equipment over it.

ITEM 995.01 (Continued)

K. Bearing bed geotextile reinforcement shall be placed behind the CMU block at approximately 4-inch spacing with the main reinforcement layers for five layers of the GRS abutment directly under the bridge seat as shown on the drawings.

Wall Facing

A. Split-Block CMU units shall be used for the GRS wall facing.

B. The CMU block construction shall begin at the lowest portion of the excavation with each layer placed horizontally.

C. Each CMU block shall be placed tightly against the adjoining block without any gaps.

D. Each CMU layer shall be completely constructed and cleaned of any debris and fill material prior to placing the next layer of geosynthetic reinforcement and CMU.

E. A stretcher or running bond shall be maintained between courses of blocks to ensure that the joints between the blocks are offset with each row, with the vertical joints of each course midway between those of adjoining courses.

F. CMU blocks displaced out of required alignment during construction shall be carefully moved back into position by methods that will not cause damage to the CMU blocks or other work.

G. Any damaged CMU blocks shall be replaced to retain the new wall integrity.

H. Abutment wall and wing wall courses shall be staggered to form a tight interlocking stable corner where they are at right angles, as shown on the drawings.

I. Corner details for vertical joints shall be submitted to accommodate corners other than right angles. Suggested details are included in the drawings.

J. The top two courses of CMU blocks shall be filled with grout, pinned with No. 4 steel bar, and embedded within the reinforced concrete cap.

Leveling Course

A. The first course of the facing block shall be set level and to grade.

B. A thin leveling layer of 3/8 inch crushed stone, which shall not exceed 0.5 inches, may be used on the top of the RSF to facilitate construction of the first course of the facing block. If the leveling layer required exceeds 0.5 inches, then mortar or grout shall be placed in the gap between the RSF and the first CMU block course.

ITEM 995.01 (Continued)

Contractor QC

Description

The Contractor shall provide a QC program to ensure all materials and workmanship meet the required quality levels specified. The Contractor shall provide qualified QC personnel, laboratory facilities and perform QC sampling, testing, inspection, data analysis, corrective action (when necessary), and documentation as outlined below.

QC Personnel Requirements

All laboratory QCTs shall have qualifications acceptable to the Engineer.

A. The Contractor's QC program and QC plan shall be administered by a qualified QC manager. The manager shall have full authority to institute any actions necessary for the successful implementation of the QC plan. Principal responsibilities of the QC manager shall include preparation and submittal of the QC plan, managing the activities of all QC personnel, communicating on quality issues, and ensuring that all requirements in the approved QC plan are met. The QC manager shall have relevant QC experience and qualifications acceptable to the Engineer.

B. All QC sampling, testing, and inspecting conducted at the construction site shall be performed by qualified field QC technicians (QCTs). A minimum of one field QCT shall be present during construction of the GRS-IBS. Work will not be accepted by the Engineer unless the field QCT is present at the site during construction operations and performs the required QC inspection, testing, and documentation. All Field QCTs shall have qualifications acceptable to the Engineer.

C. Any QC testing that is performed at QC laboratories shall be performed by qualified laboratory QCTs. The Contractor shall ensure a sufficient number of laboratory QCTs to adequately implement the minimum QC requirements contained in this specification and as outlined in the approved QC plan. All laboratory QCTs shall have qualifications acceptable to the Engineer.

QC Laboratory Facility Requirements

A. All QC testing shall be performed in MassDOT-approved laboratories.

B. Laboratory facilities shall be kept clean, and all equipment shall be maintained in proper working condition. The QC manager shall have overall responsibility for ensuring that all laboratories utilized for QC are in compliance with the requirements of the LQP or AAP. This includes providing required AASHTO, ASTM, and MassDOT reference documents and ensuring that all required testing equipment and tools are properly functioning and calibrated.

ITEM 995.01 (Continued)

C. The Engineer shall be permitted unrestricted access to inspect and review the Contractor's QC laboratory facilities. The Engineer will advise the Contractor in writing of any noted deficiencies concerning the laboratory facility, equipment, supplies, testing personnel, and procedures. Deficiencies shall be grounds for the Engineer to order an immediate stop to incorporating materials into the work until they are corrected.

QC of Standard Manufactured Items

A. All manufacturers of standard manufactured items shall have a QC system in place that meets the requirements established in AASHTO R38-10. Each manufacturer shall maintain a Quality System Manual (QSM) that addresses the format and content of AASHTO R38-10. The manufacturer shall perform QC inspection and testing in accordance with their QSM.

B. All standard manufactured items delivered to the project site shall be accompanied by a manufacturer's certificate of compliance (COC), which includes the QC inspection and testing results for the corresponding manufacturer's lot.

C. The Contractor shall be responsible for reviewing the manufacturer's COC and accompanying QC results for all standard manufactured items delivered to the project, including, but not limited to, the following:

- CMU blocks
- Geosynthetic reinforcement

D. The Contractor shall provide copies of each manufacturer's COC to the Engineer. The Contractor's QC personnel will assist the Engineer in obtaining acceptance samples for any standard manufactured items, as required by the Engineer.

E. The Contractor will perform QC inspection of all standard manufactured items upon delivery to the project site and during storage. Contractor QC personnel will also provide inspection of all standard manufactured items throughout field installation of the GRS-IBS system.

QC Inspection

The Contractor shall perform QC inspection of all work items addressed under this specification. Inspection activities during production and placement may be performed by qualified production personnel (e.g., skilled laborers, foremen, and superintendents). However, the Contractor's QC personnel shall have overall responsibility for QC inspection.

QC inspection activities must address the following primary components: equipment, environmental conditions, materials, and workmanship. The minimum frequency of QC inspection activity shall be in accordance with the requirements below and as outlined in the approved QC plan.

ITEM 995.01 (Continued)

A. QC Inspection of CMU Facing Element, Backfill, and Geosynthetics

The Contractor's personnel will perform QC inspection during installation of the CMU facing element, backfill material, and geosynthetics in accordance with the requirements of this specification. The minimum attributes to be inspected are outlined in Table 1 and Table 2. The Contractor shall identify in the QC plan the specific inspection activities necessary to ensure the quality of the work, including any additional QC inspection attributes not specifically listed in Table 1 and Table 2.

Table 1. Minimum QC Inspection of CMU Facing Element

Inspection Component	Attributes Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Equipment	As specified in QC plan	Per QC plan	Per QC pan	Per QC plan
Environmental conditions	Underlying surface soundness and moisture	Per QC plan	Underlying surface	Visual check
	Temperature of air and underlying surface	One per day	At placement location	Check measurement
Materials	CMU blocks (correct type)	Per QC plan	Stockpile on site	Visual check and manufacturer COC
	CMU block dimensions	Per QC plan	Stockpile on site	Check measurement
	Reinforcing steel bar (correct type)	Per QC plan	Stockpile on site	Visual check and manufacturer COC
	Concrete wall fill (correct type)	Per QC plan	At placement location	Check concrete batch ticket
Workmanship	CMU block course (free of debris)	One per CMU course	Each CMU course	Visual check
	CMU block fit (free of gaps)	One per CMU course	Each CMU course	Check measurement or visual check
	CMU block horizontal alignment	One per CMU course	Each CMU course	Check measurement or visual check
	CMU block vertical alignment	One per two CMU courses	Each two CMU courses	Check measurement
	Reinforcing steel bar alignment/cover	One per top of wall or wall parapet	At placement location	Check measurement or visual check
	Concrete wall fill finishing/curing	One per top of wall or wall parapet	At placement location	Visual check
	Concrete coping wall fill finishing/curing	One per top of wall or wall parapet	At placement location	Visual check

ITEM 995.01 (Continued)

Table 2. Minimum QC Inspection of Backfill Material and Geosynthetic Reinforcement

Inspection Component	Attributes Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Equipment	As specified in QC plan	Per QC plan	Per QC plan	Per QC plan
Environmental Conditions	Underlying surface soundness and moisture	Per QC plan	Underlying surface	Visual check
	Temperature of air and underlying surface	One per day	At placement location	Check measurement
Materials	Abutment backfill (correct type and free of organics)	One per backfill layer	At placement location	Visual check
	RSF backfill (correct type and free of organics)	One per backfill layer	At placement location	Visual check
	Integrated approach backfill (correct type and free of organics)	One per backfill layer	At placement location	Visual check
	Geosynthetics (correct type and free of tears)	One per backfill layer	At placement location	Visual check and manufacturer COC
Workmanship	Abutment backfill (lift thickness)	One per backfill layer	Post-compaction of each lift	Check measurement
	RSF backfill (lift thickness)	One per backfill layer	Post-compaction of each lift	Check measurement
	Integrated approach backfill (lift thickness)	One per backfill layer	Post-compaction of each lift	Check measurement
	Level of backfill behind CMU facing block	One per backfill layer	Post-compaction of each lift	Visual check
	Geosynthetics (embedment area coverage = 100 percent)	One per backfill layer	Each geosynthetic layer	Visual check
	Geosynthetics (coverage of top surface of CMU blocks > 85 percent)	One per backfill layer	Each geosynthetic layer	Visual check
	Geosynthetics (no excessive construction damage)	One per backfill layer	Each geosynthetic layer	Visual check
	Geosynthetics (splice seams staggered)	Per reinforcement schedule	Each geosynthetic layer	Visual check

ITEM 995.01 (Continued)

QC Sampling and Testing

The Contractor's QC personnel will perform QC sampling at the site of GRS field placement. QC testing will be performed at the field placement site or at the Contractor's QC laboratory depending on the quality characteristic being tested. The Contractor shall furnish approved containers for all material samples. The engineer shall be provided the opportunity to monitor and witness all QC sampling and testing.

A. GRS Lot and Sublot Sizes

Each lot of GRS backfill material will represent material from the same source, be produced or obtained under the same controlled process, and will possess normally distributed specification properties. Each lot will be divided into sublots of equal size to assess the quality characteristics of the lot. The lot size and corresponding sublot size for each GRS backfill material item is listed in Table 3.

Table 3. GRS Backfill Material Lot and Sublot Sizes

Backfill Item	Material Type(s)	Lot Size	Sublot Size
Abutment backfill	GRS Backfill	Total quantity (cubic yard) of backfill material type/ same source/abutment	See Table 4
RSF backfill	RSF Backfill	Total quantity (cubic yard) of backfill material type/ same source/RSF	See Table 4
Integrated approach backfill	Integrated Approach Backfill	Total quantity (cubic yard) of backfill material type/ same source/integrated approach	See Table 4

B. Random QC Sampling

The Contractor's QC system shall utilize stratified random sampling of each lot produced and placed. The Contractor's qualified QC personnel shall obtain random QC samples at the minimum frequencies specified in Table 4. In all cases, the QC sampling frequencies shall result in a minimum of one random sample per sublot.

Random sample locations shall be determined using the random number tables and procedures contained in ASTM D 3665-07 or an electronic random number generator. The determination of all random sample locations shall be documented on standard test report forms (TRFs). The Contractor will provide the engineer with the random QC sampling locations for each sublot prior to production and placement of the relevant sublots.

ITEM 995.01 (Continued)

C. Selective Sampling

The Contractor's QC system will also utilize selective sampling (i.e., non-random samples) as needed to provide supplemental information to assist in maintaining all production and placement processes in control. The Contractor's qualified QC personnel shall obtain selective QC samples from any sublot as determined necessary and in accordance with the guidelines established in the approved QC plan.

D. QC Sample Identification System

The Contractor shall establish a reliable system for the identification of all QC samples obtained. All samples shall be correctly labeled with the following minimum information:

- Contract number
- Date of sample
- Material type
- Lot and sublot number
- Sample number
- Sample type (i.e., random or selective)
- Sample location (e.g., station and offset)

E. Retention of Split Samples

The Contractor will retain split samples from each QC material sample and provide a split sample to the engineer if requested. All split samples shall be properly labeled and stored for a period of 30 days or until tested. These split samples will be utilized, if necessary, in the dispute resolution process. The retained split samples may be discarded prior to the required 30 days if mutually agreed on by the Contractor and the Engineer.

F. QC Testing of GRS Lots

The Contractor's QC personnel will perform QC testing during production and field placement of the backfill material to ensure that the production and placement processes are providing work conforming to the contract requirements. All QC testing shall be in accordance with procedures specified in Table 4. The Engineer shall be provided the opportunity to monitor and witness all QC testing.

ITEM 995.01 (Continued)

Table 4. Minimum QC Sampling and Testing Backfill Material

Quality Characteristic	Test Method	Sublot Size	Minimum Test Frequency	Point of Sampling	Sampling Method
Gradation	AASHTO T 11-05(6) and AASHTO T 27-05[19]	—	One per lot	Source of material (before use)	Random; AASHTO T 2-91[20] and AASHTO T 248-11[21]
PI	AASHTO T 89-10(7) and AASHTO T 90-00[8]	—	One per lot	Source of material (before use)	Random; AASHTO T 2-91[20] and AASHTO T 248-11[21]
Maximum dry density and optimum moisture content	AASHTO T 99-10[16] (method C) and AASHTO T 180-10[22] (method D)	—	One per lot	Source of material (before use)	Random; AASHTO T 2-91[20] and AASHTO T 248-11[21]
In-place density and moisture content (per targets)*	AASHTO T 310-11[23] (method B) and other approved procedures	Minimum two per lift per day	One per sublot	In-place compacted backfill (before placing subsequent layer)	Random; AASHTO T 310-11[23]

— Indicate that the there is no sublot size.

*If density requirements cannot be achieved due to material incapable of being compacted or tested to maximum values as determined by AASHTO T 99-10, compact each layer a minimum of four passes using vibratory compactor until there is no visible evidence of further consolidation.

QC Documentation and Data Evaluation

A. QC Inspection Documentation & Evaluation

The Contractor shall document all QC inspection activity for each GRS lot produced and placed. All inspection results shall be recorded within 24 hours of inspection on current standard inspection report forms (IRFs). The QC manager shall evaluate inspection results in a timely manner to confirm that production and placement processes are in control. The Contractor shall submit hard copies of all IRFs to the engineer at the completion of each lot.

ITEM 995.01 (Continued)

B. QC Sampling and Testing Documentation and Data Analysis

The Contractor shall document all QC sampling and testing data for each GRS lot produced and placed. All sampling and testing data shall be recorded within 24 hours of sampling and testing on current standard TRFs. The QC manager shall evaluate sampling and testing results in a timely manner to confirm that production and placement processes are in control. The Contractor shall submit hard copies of all TRFs to the engineer at the completion of each lot.

QC Records System

A. QC Daily Diary

The QC manager should maintain a QC daily diary to document all major activities or actions related to the Contractor's QC system. The QC daily diary serves as a summary record of key actions taken by QC personnel each day. Recommended information that should be recorded in the QC daily diary includes the following:

- The day's weather or environmental conditions.
- A summary of production or placement activities completed.
- Any non-conforming material or workmanship identified.
- Any corrective actions recommended or taken by QC personnel.
- Discussions held with other Contractor personnel or MassDOT personnel.
- Visitors to the production facility or field placement operation.

B. QC Record Books

The Contractor shall maintain one or more ringed binders referred to as "QC record books" to store all required QC documents. Separate QC record books shall be kept at each backfill material production facility and at the project field site. QC data for each pay item number shall be organized into separate sections by quality characteristic and by lot number. QC documents to be stored in the QC record book(s) include the following:

- A signed copy of the current approved QC plan.
- The original signed copies of all completed IRFs.
- The original signed copies of all completed random sampling location forms.
- The original signed copies of all completed TRFs.
- A current copy or printout of all control charts.
- A current copy or printout of all running QLA performed.
- Current summaries of all individual QC test results to date (by lot and sublot).
- Summary sheets of material quantities produced or placed (by lot and sublot).

Each required record shall be inserted into the corresponding QC record book within 24 hours after the document has been completed. All QC record books shall be maintained in a suitable location. The Engineer shall be provided access to all QC record books as part of the Engineer's monitoring of Contractor QC activity.

ITEM 995.01 (Continued)

C. QC Records Retention

All Contractor QC records identified above shall be retained for a minimum of 3 years. The records shall be protected from damage or alteration. When requested by any State or Federal agency for audit or similar purposes, the Contractor shall provide complete access to all QC records.

ACCEPTANCE

MassDOT is responsible for performing all acceptance activities and making the final acceptance determination for each GRS-IBS lot produced and placed. MassDOT's acceptance system will include monitoring the contractor's QC activity, performing acceptance inspection, sampling, and testing, and determining the quality and corresponding payment for each lot. These activities will be performed for each GRS-IBS lot.

Materials and construction for GRS-IBS shall be pre-approved materials, construction methods and services shall follow the latest MassDOT Standard Specifications requirements.

TREATED TIMBER

The work under this heading shall conform to the relevant provisions of Section 955 of the Standard Specification and shall include the supply, fabrication, and installation of treated timber framing, posts and hand railing as shown on the Plans. All materials under this items shall adhere to the requirements provided in the Plans.
The treated timber bent end faces shall have a sealant applied to them which is incidental to the treated timber item. The sealant shall be a non-toxic, water-based material that only uses natural plant-based polymers and wax for protection.

Please refer to Contract Plans for all requirements and notes on the required steel hardware components needed for the boardwalk assembly.

BLACK LOCUST DECKING

The work under this heading shall conform to the relevant provisions of Section 955 of the Standard Specification and shall include the supply, fabrication, and installation of the Black Locust decking boards and top rail as shown on the Plans.

The Black Locust decking material shall meet the following requirements:

- Janka Hardness: 48 pcf at 11% moisture content
- Modulus of Rupture: 19,400 lbf/in
- Elastic Modulus: 2,050,000 lbf/in2
- Crushing Strength: 10,200 lbf/in2
- Volumetric Shrinkage: 10.2%
- Forest Stewardship Council (FSC) Certified product

The Contractor shall submit shop drawings for the Black Locust decking to the Engineer for approval.

ITEM 995.01 (Continued)

Black Locust decking shall be quantified as the square footage as shown on the Plans, and will be paid for as part of this Lump Sum item.

SCHEDULE OF BASIS FOR PARTIAL PAYMENTS

At the time of bid, the Contractor shall submit on his/her proposal form a schedule of unit prices for the major component Sub-Items that make up Item 995.01 as well as his/her total wall structure Lump Sum cost for the Bridge Structure, Bridge No. P-03-020 (CAK). The wall structure Lump Sum breakdown quantities provided in the proposal form are estimated and not guaranteed. The total of all partial payments to the Contractor shall equal the Lump Sum contract price regardless of the accuracy of the quantities furnished by the Engineer for the individual wall components. The cost of labor and materials for any Item not listed but required to complete the work shall be considered incidental to Item 995.01 and no further compensation will be allowed.

The schedule on the proposal form applies only to Bridge Structure, Bridge No. P-03-020 (CAK). Payment for similar materials and construction at locations other than at this bridge structure shall not be included under this Item. Sub-Item numbering is presented for information only in coordination with MassDOT Standard Nomenclature.

Sub-Item	Description	Quantity	Unit	Unit Price	Total
151.6	Backfill for GRS-IBS Abutments	40	CY		
698.5	Geosynthetic for GRS-IBS Abutments	200	SY		
906..	5000 psi, 1.5 Inch, 660 Cement Concrete	2	CY		
933.	Elastomeric Bearing Pad	48	EA		
955.	Treated Timber	16	MBF		
955.1	Black Locust Decking	9.5	MBF		
960.1	Structural Steel – Coated Steel	2,900	LB		
987.99	Concrete Masonry Unit Facing for GRS-IBS Abutments	360	SF

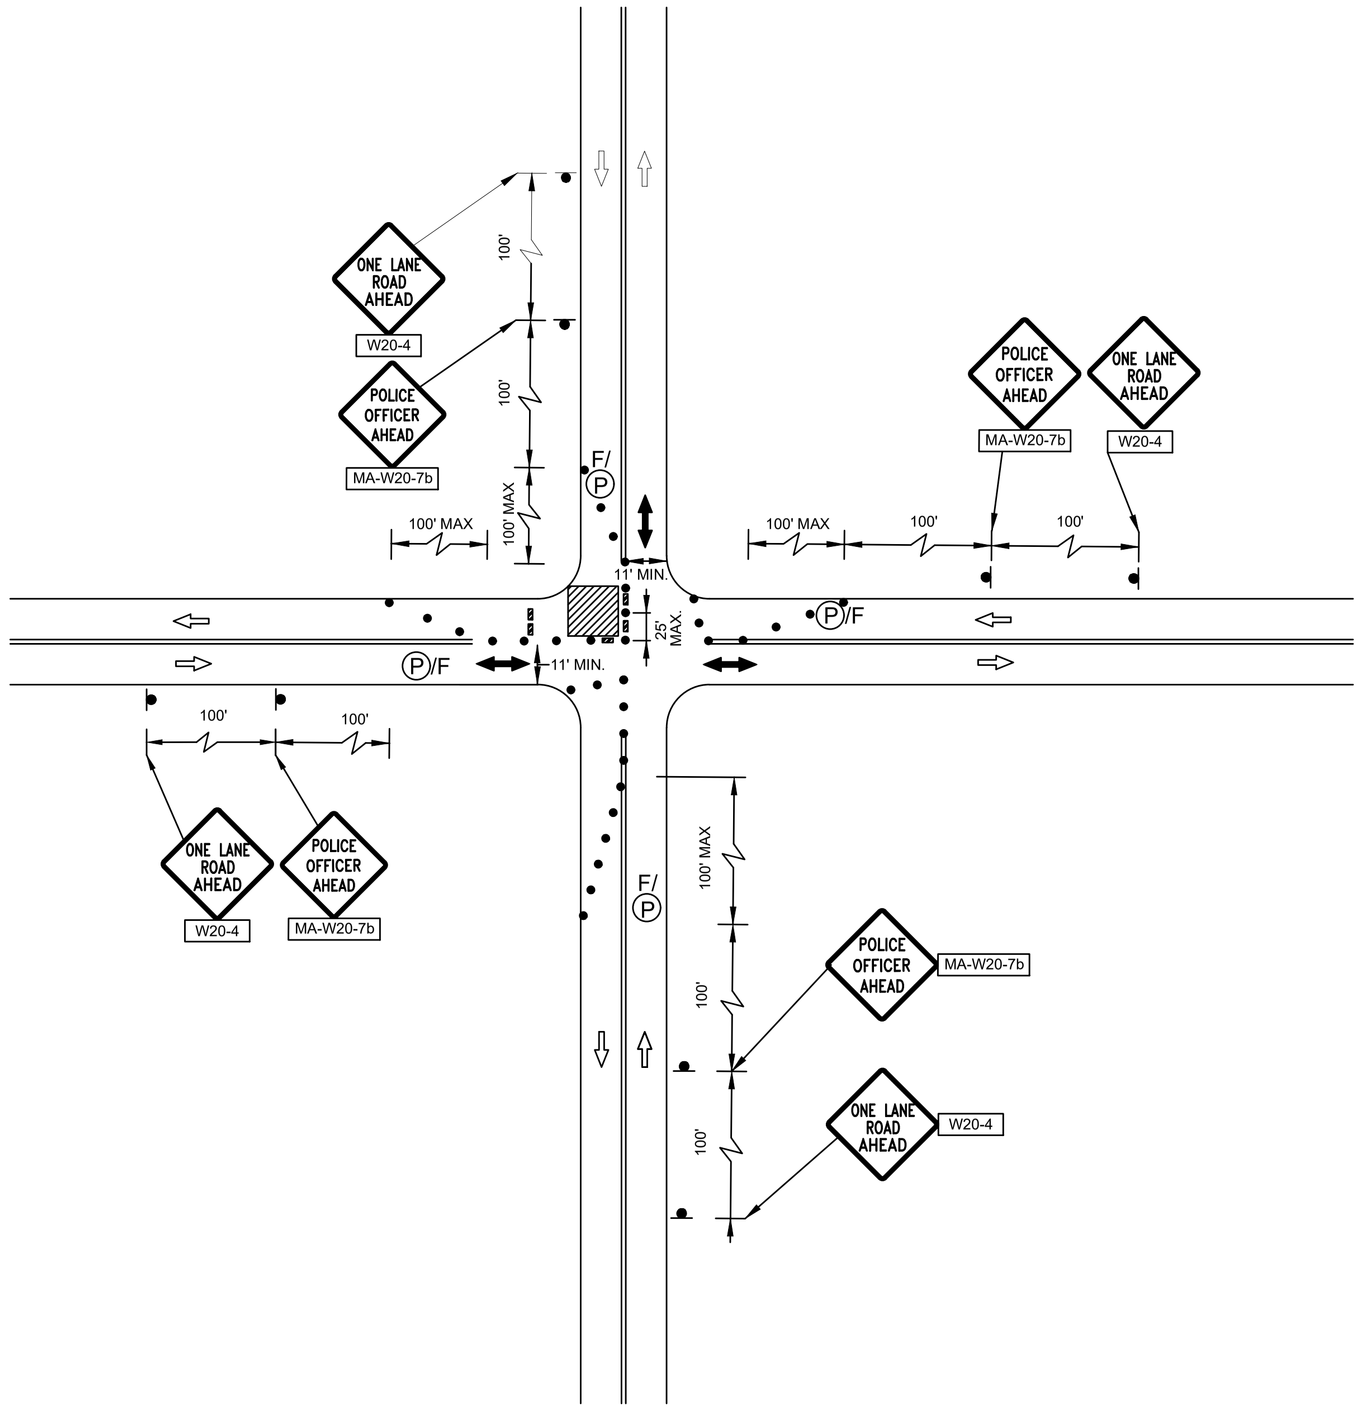
TRAFFIC MANAGEMENT PLAN - 1

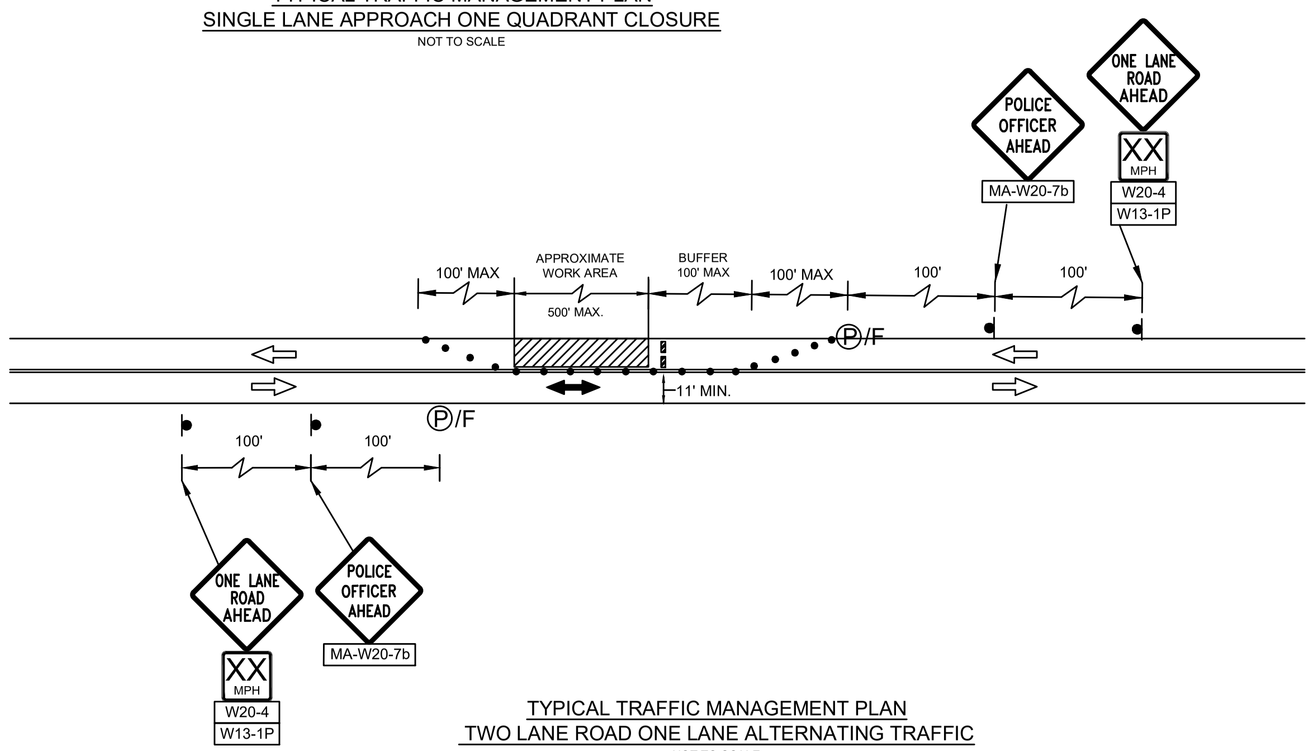
SHT015_HD(TMP).DWG Plotted on 16-Jul-2025 4:51 PM

TEMPORARY TRAFFIC CONTROL NOTES:

1. MINIMUM LANE WIDTH OF 11 FEET SHALL BE MAINTAINED AT ALL TIMES. MINIMUM LANE WIDTHS TO BE MEASURED FROM THE EDGE OF THE DRUMS OR CONES (IF USED).
2. SIGNS AND SIGN SUPPORTS LOCATED ON OR NEAR THE TRAVELED WAY MUST PASS THE CRITERIA SET FORTH IN THE NHCRP 350 REPORT.
3. THE CONTRACTOR SHALL COORDINATE APPROVAL AND IMPLEMENTATION OF THIS TEMPORARY TRAFFIC CONTROL PLAN WITH MASSACHUSETTS DEPARTMENT OF TRANSPORTATION (MASSDOT) PRIOR TO CONSTRUCTION ACTIVITIES.
4. THE CONTRACTOR SHALL COORDINATE APPROVAL OF ANY CHANGES TO THE TEMPORARY TRAFFIC CONTROL PLAN WITH MASSDOT PRIOR TO CONSTRUCTION ACTIVITES. THE CONTRACTOR SHALL ALSO NOTIFY MASSDOT, THE NORTH SHORE MALL, AND THE CITY OF PEABODY THREE (3) WEEKS IN ADVANCE OF PLACING TEMPORARY TRAFFIC CONTROL SIGNS.
5. ALL CONSTRUCTION SIGNING, DRUMS, BARRICADES, AND OTHER TRAFFIC CONTROL DEVICES SHALL CONFORM WITH THE 2023 MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD) AND "STANDARD HIGHWAY SIGNS" CURRENT EDITION.
6. PLACE ALL SAFETY DEVICES AND CONSTRUCTION SIGNING BEFORE ACTUAL CONSTRUCTION WORK BEGINS.
7. DISTANCES ARE A GUIDE AND MAY BE ADJUSTED BASED ON FIELD CONDITIONS WITH THE DIRECTION AND APPROVAL OF ENGINEER.
8. ALL WARNING SIGNS SHALL BE BLACK LEGEND ON A REFLECTIVE ORANGE BACKGROUND.
9. ALL DRUMS SHALL BE PLACED APPROPRIATELY OR MOVED AS NECESSARY TO MAINTAIN SAFE AND REASONABLE ABUTTER ACCESS AT ALL TIMES.
10. ALL SIGNS NOT APPLICABLE TO THE CURRENT TRAFFIC SETUP SHALL BE REMOVED AND RESET UPON COMPLETION OF CONSTRUCTION OR COVERED.
11. A LONGITUDINAL BUFFER SPACE SHALL BE UTILIZED IN ADVANCE OF WORK AREAS. REFER TO PART VI OF THE 2009 MUTCD FOR GUIDELINES AND DETAILS.
12. AT THE END OF EACH WORKING DAY, EXCAVATED AREA OF TRAVEL LANE SHALL BE RESURFACED OR STEEL PLATED FOR VEHICLE USE.
13. CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTAINING ACCESS/EGRESS AT ALL CURB CUTS, BUSINESS ENTRANCES, RESIDENTIAL ENTRANCES LOCATED WITHIN THE WORK ZONES.
14. CONTRACTOR SHALL PROVIDE AND MAINTAIN A TEMPORARY ADA AND AAB COMPLIANT ACCESSIBLE PEDESTRIAN ROUTE AROUND BLOCKAGES TO AN EXISTING PEDESTRIAN ROUTE (E.G. SIDEWALKS, CROSSWALKS, PEDESTRIAN CURB RAMPS, ETC.). ALL TEMPORARY WHEELCHAIR RAMPS SHALL MEET MASSACHUSETTS ARCHITECTURAL ACCESS BOARD (AAB) AND AMERICANS WITH DISABILITIES ACT (ADA) STANDARDS. BLOCKAGES INCLUDE, BUT ARE NOT LIMITED TO CONSTRUCTION WORK, EXCAVATIONS, EQUIPMENT AND VEHICLES, TEMPORARY WATER AND UTILITY LINES PLACED ON THE SURFACE, TRAFFIC DIVERTERS, ETC. PROVIDE TEMPORARY FENCING OR BARRIERS AS NECESSARY TO MAINTAIN SAFE PEDESTRIAN PASSAGE AT ALL TIMES.
15. CONTRACTOR SHALL MAINTAIN EMERGENCY PASSAGE AT ALL TIMES TO BUILDINGS WITHIN AND ADJACENT TO THE PROJECT LIMITS AS WELL AS A LARGER AREA IF AFFECTED BY CONSTRUCTION CONDITIONS. CONTRACTOR SHALL MAINTAIN 24 HOUR EMERGENCY VEHICLE ACCESS TO CONSTRUCTION AREAS.
16. CONTRACTOR SHALL COORDINATE WITH ABUTTERS FOR THE PROPOSED WORK AND SHALL NOTIFY EACH ABUTTER AT LEAST 24 HOURS IN ADVANCE OF THE START OF THE WORK THAT WILL REQUIRE TEMPORARY CLOSURE OF ACCESS.
17. SAFETY SIGNS PROPOSED FOR LOCATIONS OTHER THAN ERECTED ON TEMPORARY BARRICADES SHALL BE CONSTRUCTED WITH THEIR OWN SUPPORTS OR SIGN POSTS.
18. TEMPORARY CONSTRUCTION SIGNING, BARRICADES AND ALL OTHER NECESSARY WORK ZONE TRAFFIC DEVICES SHALL BE REMOVED FROM THE ROADWAY WHEN THEY ARE NOT REQUIRED FOR CONTROL OF TRAFFIC.
19. UNLESS OTHERWISE NOTED, ALL PAVEMENT MARKINGS, SIGNS AND OTHER TRAFFIC EQUIPMENT REMOVED OR DAMAGED AS A RESULT OF THE CONTRACTOR'S OPERATIONS SHALL BE REPLACED IN CONFORMANCE WITH THE STANDARDS OF APPLICABLE STATE AND LOCAL AGENCIES.
20. CONTRACTOR SHALL INSTALL, RENEW AND MAINTAIN ALL TRAFFIC CONTROL DEVICES AS SHOWN ON THE DRAWINGS IN ACCORDANCE WITH THE CONTRACT DOCUMENTS AND AS REQUIRED BY APPLICABLE STATE AND LOCAL AGENCIES.
21. THE CONTRACTOR SHALL NOTIFY APPLICABLE STATE AND LOCAL AGENCIES TWO (2) WEEKS IN ADVANCE OF PLACING TEMPORARY TRAFFIC CONTROL SIGNS.
22. THE CONTRACTOR SHALL LOCATE ALL TEMPORARY BARRIERS (IF USED) SO THERE ARE NO EXPOSED BLUNT ENDS WHICH WILL CAUSE HAZARDOUS CONDITIONS TO TRAFFIC. IN SUCH CASES, THE CONTRACTOR SHALL PROVIDE AND LOCATE BARRIER TAPERED END SECTIONS TO PROTECT VEHICULAR TRAFFIC AND THE WORK AREA.
23. THE FIRST TEN (10) PLASTIC DRUMS OF A TAPER SHALL BE MOUNTED WITH SEQUENTIAL FLASHING LIGHTS.
24. THE CONTRACTOR SHALL COORDINATE WITH ANY ABUTTING PROJECTS.
25. ON-STREET PARKING, IF APPLICABLE, TO BE RESTRICTED PRIOR TO WORK.
26. THESE PLANS ARE NOT INTENDED TO LIMIT THE CONTRACTOR'S APPROACH TO SCHEDULE THE WORK BUT TO OUTLINE ONE WAY OF PROGRESSING. THE CONTRACT IS EXPECTED TO USE KNOWLEDGE AND EXPERIENCE TO PERFORM THE WORK IN THE MOST EFFICIENT AND SAFE MANNER IN COMPLIANCE WITH THE DRAWINGS AND SPECIFICATIONS.
27. THE ADVISORY SPEED LIMIT, IF REQUIRED, SHALL BE DETERMINED BY THE ENGINEER.
28. MAXIMUM SPACING OF TRAFFIC DEVICES IN A TAPER (DRUMS OR CONES) IS EQUAL IN FEET TO THE SPEED LIMIT IN MPH.
29. ALL SIGNS SHALL BE MOUNTED ON THEIR OWN STANDARD SIGN SUPPORTS.
30. MBTA BUS ROUTES 435 AND 436 WILL BE AFFECTED DURING FULL-DEPTH OPERATIONS. WORK ON ESSEX CENTER DRIVE AND NORTHSHORE ROAD SHALL BE COORDINATED WITH MILES TAYLOR (MTAYLOR@MBTA.COM) OF BUS OPERATIONS.
31. WORK REQUIRING LANE CLOSURES SHALL BE PERFORMED BETWEEN 9:30 A.M. AND 3:30 P.M. FOR DAYTIME WORK OR BETWEEN 8:00 P.M. AND 6:00 A.M. FOR NIGHTTIME WORK. REFER TO SUBSECTION 8.02 SCHEDULE OF OPERATIONS LANGUAGE IN THE SPECIAL PROVISIONS.



TYPICAL TRAFFIC MANAGEMENT PLAN
SINGLE LANE APPROACH ONE QUADRANT CLOSURE
NOT TO SCALE



TYPICAL TRAFFIC MANAGEMENT PLAN
TWO LANE ROAD ONE LANE ALTERNATING TRAFFIC
NOT TO SCALE

TRAFFIC DEVICE LEGEND

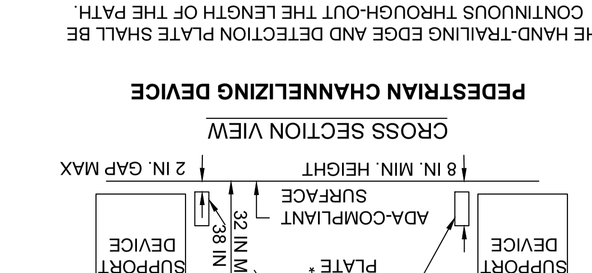
- TYPE III BARRICADE
- REFLECTORIZED PLASTIC DRUM OR 36" CONE
- (P) POLICE OFFICER

NOTES:

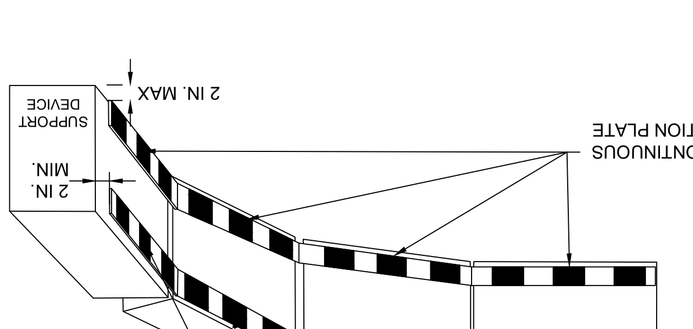
1. CURB RAMPS SHALL BE 60 IN. MINIMUM WIDTH WITH A FIRM, STABLE AND NON-SLIP SURFACE.
2. PROTECTIVE EDGING WITH A 2 IN. MINIMUM HEIGHT SHALL BE INSTALLED WHEN THE CURB RAMP OR LANDING PLATFORM HAS A VERTICAL DROP OF 6 IN. OR GREATER OR HAS A SIDE APRON SLOP STEEPER THAN 1:3 (33%). PROTECTIVE EDGING SHOULD BE CONSIDERED WHEN THE CURB RAMPS OR LANDING PLATFORMS HAVE A VERTICAL DROP OF 3 IN. OR MORE.
3. DETECTABLE EDGING WITH 6 IN. MINIMUM HEIGHT AND CONTRASTING COLOR SHALL BE INSTALLED ON ALL CURB RAMP LANDINGS WHERE THE WALKWAY CHANGES DIRECTION (TURNS).
4. THE CURB RAMP WALKWAY AND LANDING AREA SURFACE SHALL BE OF A SOLID CONTINUOUS CONTRASTING COLOR ABUTTING UP TO THE EXISTING SIDEWALK.
5. CURB RAMPS AND LANDINGS SHOULD HAVE A 1:50 (2%) MAX CROSS-SLOPE.
6. CLEAR SPACE OF 60X60 IN. MINIMUM SHALL BE PROVIDED ABOVE AND BELOW THE CURB RAMP.
7. WATER FLOW IN THE GUTTER SYSTEM SHALL HAVE MINIMAL RESTRICTION.
8. LATERAL JOINTS OR GAPS BETWEEN SURFACES SHALL BE LESS THAN 0.5 IN. WIDTH.
9. CHANGES BETWEEN SURFACE HEIGHTS SHOULD NOT EXCEED 0.5 IN. LATERAL EDGES SHOULD BE VERTICAL UP TO 0.25 IN. HIGH, AND BEVELED AT 1:2 BETWEEN 0.25 IN. AND 0.5 IN. HEIGHT.
10. IF A TEMPORARY PEDESTRIAN RAMP LEADS TO A CROSSWALK, THEN A DETECTABLE WARNING PAD MUST BE ADHERED TO THE BASE OF THE RAMP. IF IT LEADS TO A PROTECTED PEDESTRIAN BYPASS THAT DOES NOT CONFLICT WITH VEHICULAR TRAFFIC, THEN A PAD SHALL NOT BE INSTALLED ON THE RAMP.



CROSS SECTION VIEW

PEDESTRIAN CHANNELIZING DEVICE

* THE HAND-TRAILING EDGE AND DETECTION PLATE SHALL BE CONTINUOUS THROUGH-OUT THE LENGTH OF THE PATH.

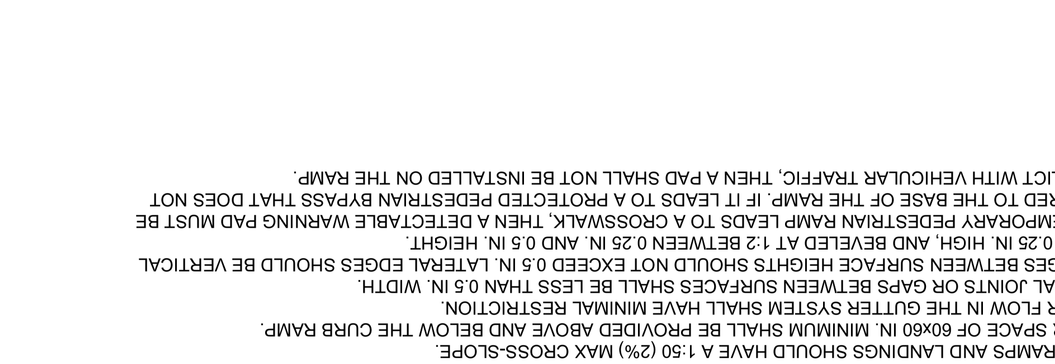


NOTES:

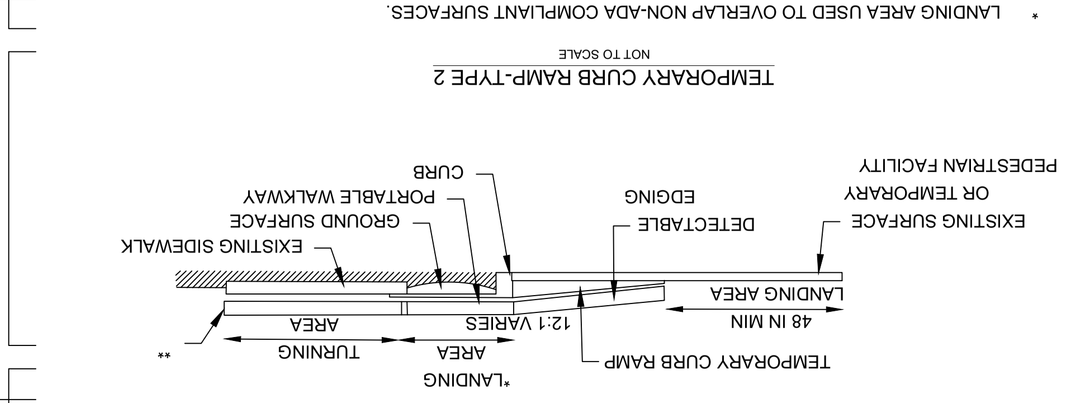
1. THERE SHOULD BE AT LEAST A 2-INCH GAP BETWEEN THE HAND-TRAILING EDGE AND ITS SUPPORT.
2. A MAXIMUM 2-INCH GAP BETWEEN THE BOTTOM OF THE CONTINUOUS DETECTION PLATE AND THE WALKWAY MAY BE USED TO PROVIDE DRAINAGE.
3. SHEETING PANELS MAY BE EITHER VERTICAL OR AT A 45-DEGREE ANGLE.
4. HAND-TRAILING EDGE AND/OR DETECTION PLATES ARE OPTIONAL FOR CONTINUOUS WALLS.

TEMPORARY CURB RAMP - PERPENDICULAR TO CURB

NOT TO SCALE



TEMPORARY CURB RAMP-PARALLEL TO CURB



TEMPORARY CURB RAMP-TYPE 2

NOT TO SCALE

* LANDING AREA USED TO OVERLAP NON-ADA COMPLIANT SURFACES.
** A DETECTABLE EDGE REMOVED IF A CONTINUOUS SIDEWALK.
*** 60 IN. IF AN OBSTRUCTION IS AT BACK OF SIDEWALK.

AUDIBLE DEVICES

FOR LONG TERM SIDEWALK CLOSURES (AT A MINIMUM OVERNIGHT) A FORM OF SPEECH MESSAGING FOR PEDESTRIANS WITH VISUAL DISABILITIES SHALL BE PROVIDED. AUDIBLE INFORMATION DEVICES SUCH AS DETECTABLE BARRIERS OR BARRICADES AND OTHER PASSIVE PEDESTRIAN ACTIVATION (MOTION ACTIVATED) DEVICES SHOULD BE CONSIDERED FOR THESE CASES. THESE AUDIBLE DEVICES CAN BE MOUNTABLE OR STAND ALONE.

10. EXISTING AUDIBLE DEVICES NO LONGER APPLICABLE DUE TO CONSTRUCTION SHALL BE DISABLED.

9. AUDIBLE INFORMATION DEVICES SHOULD BE CONSIDERED WHERE MIDBLOCK CLOSINGS AND CHANGED CROSSWALK AREAS CAUSE INADEQUATE COMMUNICATION TO BE PROVIDED TO PEDESTRIANS WHO HAVE VISUAL DISABILITIES.

8. THE PEDESTRIAN DETAILS SHOW ONLY CONTROLS FOR PEDESTRIAN TRAFFIC; VEHICULAR TRAFFIC SHOULD BE DESIGNED AS SHOWN ELSEWHERE. THESE DETAILS ARE USED IN CONJUNCTION WITH THE PROPOSED LANE CLOSURE DETAILS AND DURING CONSTRUCTIONS STAGING AS DETERMINED BY THE ENGINEER.

7. THE PROTECTIVE REQUIREMENTS OF A WORK ZONE HAVE PRIORITY IN DETERMINING THE NEED FOR TEMPORARY TRAFFIC BARRIERS OR BARRICADES AND THEIR USE IN THIS SITUATION SHOULD BE BASED ON ENGINEERING JUDGEMENT.

6. THE TEMPORARY SIDEWALK SHOULD BE A MINIMUM OF 5 FEET WIDE.

5. THE ALTERNATIVE PATHWAY SHOULD HAVE A SMOOTH CONTINUOUS HARD SURFACE FOR THE ENTIRE LENGTH OF THE TEMPORARY PEDESTRIAN FACILITY.

4. WHEN USED, TEMPORARY RAMPS SHALL COMPLY WITH AMERICANS WITH DISABILITIES ACT.

3. A PEDESTRIAN CHANNELIZING DEVICE THAT IS DETECTABLE BY A PERSON WITH A VISUAL DISABILITY TRAVELING WITH THE AID OF A LONG CANE SHALL BE PLACED ACROSS THE FULL WIDTH OF THE CLOSED SIDEWALK.

2. WHEN EXISTING PEDESTRIAN FACILITIES ARE DISRUPTED, CLOSED, OR RELOCATED IN A WORK ZONE, TEMPORARY FACILITIES SHALL BE PROVIDED. THEY SHALL BE DETECTABLE AND INCLUDE ACCESSIBILITY FEATURES CONSISTENT WITH THE FEATURES PRESENT IN THE EXISTING PEDESTRIAN FACILITY.

1. PEDESTRIAN DETOUR ROUTES MUST BE ADA/MAAB COMPLIANT.

Utility Relocation Notes for MassDOT Contractor

Unless otherwise noted by Contract, the MassDOT Contractor is to provide the District Construction Office with 7 Calendar Days advance notification in order to validate the current progress and provide the required 30 Days advance notice-to-proceed for the first Utility - and each subsequent Utility. These advance notifications are to be identified in the Contractor's Schedules (Pre-Con preparation, Baseline, Subnets, and Updated/Monthly Schedules) as specified in Subsection 8.02 (for DBB Contracts) and/or Section 9 (of DB Contracts). Note: The durations included below do not include these lead-times. See Additional 'Important Basis notes for Contractor' - on last PUC Form page.

Additional notes:

Underpass lighting to be owned/ maintained by City of Peabody when final installation is complete
Electric manholes on Essex center drive - coordinate with property owner (Sports Medicine North) before adjust work begins
Coordinate with NGrid Gas with any work around Endicott Street regular pit, Request As-Built Plans from "Gas Data Req" <gasdatareq@nationalgrid.com>

Suggested Sequence of Relocation (Based on Consultant proposed construction staging)

The sequence as detailed on the following pages is based on the consultants proposed staging plan. This information was compiled through meetings that included all of the utilities listed below along with the designer and Peabody. The information provided is the best available information prior to project advertisement.

PUC FORM - CONTINUED

Is 'enabling' (prep) work, by the Contractor, necessary prior to the start of the first series of utility relocations:	Yes	No
	X	

Has any of the Utility work been identified to work concurrently	Yes	No
	X	

Project File #:	609211
City/Town:	Peabody
Route/Street:	Independence Greenway Extension

massDOT Highway Division

	RESPONSIBLE PARTY		DESCRIPTION - Utility Relocation Phases, Tasks and Activities	Estimated Duration (Work Days) by Utilities (Lead time not included)	Concurrent / Exclusive Utility Work. Contractor note: In planning and executing the work, the Access Restraints listed in the Special Provisions, takes precedence over the checklist in these 4 columns.				Access Restraint & Limitations of Operations Notes. Should an AR be considered for the Contractor ?	
	C = Contractor	U = Utility Co.			Exclusive Utility on site: Utility working with no other Utilities in vicinity	Concurrent Utilities: Utility working with other Utilities on site	Contractor Off-Site: No Contractor physical construction operations on-site (while Utility is	Contractor Concurrent: Contractor and Utility are working on-site - but NOT in the same vicinity	Potential Access Restraint (Yes/No)	Reason/Note (optional)
Stage : 1 Phase : A			Enabling' work by the Contractor - Call in dig safe to mark out UG, Coordinate with MassDOT RE, Survey and DURE to mark poles, Curb and Back of SW, Coordinate with DURE to meet all Utilities and walk site to confirm Prop. Pole Re-Locations and delineation of work. Coord with DURE to send 30 day notices for pole work. Request WO #s from Peabody Electric for Disconnect/Reconnects for Existing / Proposed Signal(if applicable), Cobra heads(relocated by PMLP), and other work as necessary. Coordinate tree trimming/ clearing with PMLP or any other affected utility. Coordinate MBTA Bus operations for Essex Center drive - route # 435 if any disruption to their Bus route will happen during any construction activities, and for full depth.							
			UTILITY OPERATIONS - MBTA BUS Operations							
Task: 1			***Utility Co. MBTA BUS OPS***							
	c		Coord w/Bus Ops for #435 at Essex Drive for any disturbance to their route. Full depth operations, lane closures, detours, etc.			x		x	n	
			Sub-Total	**0**						
			UTILITY OPERATIONS - Existing ITS at 308+00 right							
Task: 2			***Utility Co. MassDOT ITS and Contractor***							
	C		Test pitting recommended to find, and expose existing ITS conduit for current electric message board on Rt.128			**x**		**x**	**n**	
	C		Care should be taken as not to disturb existing conduit during any excavation activities			**x**		**x**	**n**	
			Sub-Total	**0**						
Stage : 1 Phase : B			Enabling' work by the Contractor - Coordinate with Peabody Sewer Department to begin construction efforts all along their existing sewer main. Coordinate CCTV or any special sub contractor for protection/ monitoring of sewer main, as built CCTV, etc.							
			UTILITY OPERATIONS - Sewer, clearing and grubbing, path construction							
Task: 3			***Contractor***							
	c		Coordinate CCTV operations of existing sewer line, culverts, existing pipes.			x		x	n	
	c		Confirm all clearing and grubbing limits, and tree trimming needed			x		x	n	
	c		Agree on access needed for sewer department, and maintain during construction			x		x	n	
			Sub-Total	**0**						
Stage : 1 Phase : C			Enabling' work by the Contractor - Coordinate with PMLP to begin utility pole relocations. Determine material and install lead times for all the utility pole moves - This has bee identified as a Possible early action Item. Dig Safe, Meet with DURE &RE, Stake out poles, guy wires, confirm any critical clearances(ADA or path construction), Verify if Contractor or PMLP will Perform Tree Trimming, Clearing, confirm tree trimming requirements, ensure access is created for all UPL relocations.							
			UTILITY OPERATIONS - Utility poles, guy anchors, OHW transfers, guy poles							
Task: 4			***Utility Co. Peabody Municipal Light Plant (PMLP)***							
	c		Confirm all necessary clearing and access is done for PMLP or if they will do some trimming themselves.							
		u	Install Poles & transfer OHW(primaries & secondaries), Guys, Strand, Flood Lights, any cobra heads, and Police Camera	12	x			x		
		u	343+50 - left: Pole #5 Adjust guy anchors to existing pole. Contractor to confirm access and clearing performed for PMLP	1	x			x		DUCE Estiamte
			Sub-Total	**13**						
Task: 5			***Utility Co. Fire Alarm***							
		u	Remove inactive Cable 1 or 2 spans only - Consider this may have been done in advance. - no force account.	1	x			x		*DUCE ESTIMATE*
			Sub-Total	**1**						
Task: 6			***Utility Co. Astound/ RCN***							
		u	Transfer OHW & splice new fiber -(Review slack and duration in advance with Astound, - If slack is available time saving possible)	58	x			x		
			Sub-Total	**58**						
Task: 7			***Utility Co. Comcast***							
		u	Transfer OHW to new poles - no force account being submitted.	4	x			x		*DUCE ESTIMATE*
			Sub-Total	**4**						
Task: 8			***Utility Co. Verizon***							
		u	Transfer OHW to new poles	4	x			x		
		u	Install guy anchor attachments	4	x			x		
			Sub-Total	**8**						
Task: 9			***Utility Co. Peabody Municipal Light Plant (PMLP)***							
	c		Remove old UPL's	1	x			x		*DUCE ESTIMATE*
			Sub-Total	**1**						
			Total OHW Relocations	**85**						
Stage 3 Phase A			Enabling' work by the Contractor - Call in dig safe, notify MBTA bus operations, saw cutting, environmental controls throughout project. Coordinate with utilities to adjust structures in advance of full depth box widening and milling/ paving operations. Set grades for all structures to be adjusted. Coordinate with North Shore Sports Medicine to adjust electric MH's on Essex Center Drive.							
			UTILITY OPERATIONS - Adjust structures for finish grade including full depth on Essex drive, and path construction							
Task: 10			***Utility Co.***							
	U		NGrid gas - adjust gates	2		**x**		**X**		*DUCE ESTIMATE*
	U		Verizon - adjust telephone manholes	2		**x**		**X**		*DUCE ESTIMATE*
	C		Adjust water gates, drainage, sewer, traffic signal HH(if applicable), Electric MH's along Essex Center Drive							
	C		Sewer remodels and adjusts							
			Sub-Total	**4**						
			National Grid Gas - No force account, but work in area							
Task: 11			***NGrid Gas / Contractor to coordinate work***							
		u	At 75 Endicott St National Grid just completed the installation of a plastic main across the Proctor Brooke bridge and the regulator station. Work scheduled in 2024 to replace gas main on #54-91 Warren Street.							
	c		For any gas gate work please contact Michael Colpitts 978-778-5750							
			Sub-Total	**0**						
			Peabody Municipal Light							
Task: 12			***Pedestrian lighting under bridge***							
	c		Coordinate with PMLP to disconnect/ reconnect to work on lighting							
	c		Set up final inspection of lighting with PMLP and Owner (City of Peabody)							
			Sub-Total	**0**						

IMPORTANT BASIS NOTES - FOR CONTRACTOR

1. Unless otherwise specified in the MassDOT Construction Contract, or unless specifically noted within this PUC Form, these durations (herein) are based upon the Contractor providing *unimpeded access* to the Utility company to perform Utility relocations (see Note 5 - Access).
2. "Concurrent Utilities" operations noted herein, are to signify those Utility Company operations that can be worked concurrently (e.g. Utility A and Utility B work on-site together) - MassDOT and the Contractor are to prepare NTPs to Utilities accordingly.
3. "Potential Access Restraints" noted within this PUC Form are for planning purposes. See MassDOT Contract for Contractual Access Restraints (refer to Subsections 8.02, 8.03, and/or 8.06 for Design Bid Build Contracts and Volume II Section 9 for Design Build Contracts).
4. Utility non-work periods - For planning purposes, the durations above contain some non work days (contingency) for New England conditions (precipitation, high temperatures, low temperatures, snow, ice). Gas line work however, typically has a seasonal restriction and can NOT be installed from 15-November to 15-March. Municipally Owned Electric and Gas Utilities are also restricted from proceeding from 15-November to 15-March. The Contractor shall (and the CTD plan) reflect this calendar restriction within the schedule (unless otherwise note).
5. Access - Unless otherwise noted in the Contract, and in addition to the 'enabling' notes above, the Contractor must provide safe and unimpeded access (for trucks, lifts, cranes, etc.) to the Utilities, to allow for the proposed relocation(s) - including but not limited to snow removal, clearing and grubbing, guard rail removal, barrier removal, tree removal, and grading. Any costs associated with these tasks are deemed to be incidental to the project.
6. For all MassDOT construction contracts issued after January 2014, the new Utility Coordination/documentation specification is required. This is Section 8.14 in Design-Bid-Build Contracts (see Design-Build index reference for applicable section #).
7. Prior to starting any and all enabling work for Utilities, the Contractor is to plan in advance with submittals and approved durations.
8. * Potential District Initiated Early Utility Relocation - if noted herein, the District reserves the right to initiate early utility relocation in advance of the Contract NTP. In submitting a bid price and in the development/basis of the Baseline Schedule, the Contractor shall not plan the Work with the potential benefit of any form of 'early utility relocation.' As a requirement of the Baseline submission, unless otherwise noted in this Specification, the earliest that the first Utility company is to receive the 30 days advance notification to mobilize to the site, will be 7 calendar days after the pre-construction meeting and never sooner than 7 days after the Contract NTP.
9.

Subject: **Water Quality Certification Application**
BRP WW 26 Combined Application for Minor Fill and Minor Dredging Project Certification
Independence Greenway Extension
Peabody, MA
MassDOT File No. 609211

Dear Ms. Davis:

On behalf of the City of Peabody, with construction funding from the Massachusetts Department of Transportation (MassDOT) Highway Division, Green International Affiliates, Inc. is submitting this Joint Application for 401 Water Quality Certification (WQC) for Minor Fill and Minor Dredging Projects (BRP WW 26) and 404 ACOE Pre-Construction Notification (PCN) for the proposed Independence Greenway Extension in the City of Peabody.

The project requires a 401 WQC and authorization under Section 404 as the construction of the proposed Independence Greenway Extension is anticipated to permanently impact approximately 10,343 square feet and will temporarily impact approximately 2,082 square feet of Land under Water/Waters of the U.S. and will also result in approximately 1,491 cubic yards of dredging below the Ordinary High Water mark . The project is anticipated to permanently impact approximately 2,225 square feet and will temporarily impact approximately 4,641 square feet of Vegetated Wetlands (VWs). A Notice of Intent application for the proposed work has been submitted to the Peabody Conservation Commission on April 10, 2024 under the Wetlands Protection Act and its implementing regulations 310 CMR 10.00. on April 9, 2024 and is currently under the Commission's review (DEP File No. 055-0939).

A pre-filing site visit for this project was held with the Massachusetts Department of Environmental Protection (MassDEP) on February 26, 2024. The project proponent hereby certifies that all information contained herein is true, accurate, and complete to the best of my knowledge and belief. The project proponent hereby requests that the certifying authority review and take action on this CWA 401 certification request within the applicable reasonable period of time.

If you require any additional information regarding the subject project, please contact me at (978) 843-5218 or by email at dspicer@greenintl.com.

Sincerely,
Green International Affiliates, Inc.

Date you consulted with MassDEP	02/26/2024

Application Information

Please select the 401 Water Quality Certification for Dredging Application (if applicable)	WW08 - 401 Minor Dredging - Minor < 5000 cubic yards
Please select the 401 Water Quality Certification for Fill/Excavation Application (if applicable)	WW10 - 401 Major Fill and Excavation - Major >= 5000 square feet

Other Primary Location Info

Parcel ID	Map# 062, 063, 074; no assigned Parcel ID
Municipality	PEABODY

Project Location Info

Will the project occur in multiple municipalities?	No

Pre-Application Information

Has the DEP Agency specified that you are exempt from this process?	No
Has the project's Sampling Analysis Plan been approved by the DEP Agency? If yes, please attach a document 'DEP Sampling Analysis Plan' in the document section.	Yes

Project Information

Project Name	Independence Greenway Extension, City of Peabody
Have you completed the Public Notice as per 314 CMR 9.00? If yes, please attach a completed ‘Proof of Public Notice’ document in the document section.	Yes
Date of Public Notice per 314 CMR 9.05(3)	05/23/2024
Name of the Local Newspaper	Peabody Weekly News
Will the proposed project occur in any wetlands or waters designated as 'Outstanding Resource Waters'?	No
Identify the loss, or alteration, in square feet for Land under water	12425
Identify the loss, or alteration, in square feet for Other Resources	6866

Material to be Dredged

Briefly describe in general the proposed project or activity, including the purpose and intended use of the project, and the duration of the work within any waterbody	This Joint Application for 401 Water Quality Certification (WQC) and 404 ACOE Pre-Construction Notification (PCN) has been prepared on behalf of the City of Peabody for the Independence Greenway Extension transportation improvement project in the City of Peabody. The City of Peabody with construction funding from the Massachusetts Department of Transportation, Highway Division (MassDOT) proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, Massachusetts for a total project length of approximately 1.3 miles (MassDOT Project No. 609211). The proposed project is located along the former railroad right-of-way, which is owned and maintained by the City of Peabody. The Independence Greenway Extension project is a continuation of a rail trail facility that can be utilized by pedestrians and bicyclists for recreation or for short-range trips to businesses or other destinations along the Greenway. This project will expand the City's network of bicycle routes and provide a dedicated bike trail between the busy Northshore Mall and residential/commercial areas adjacent to downtown Peabody. The project will consist of the following improvements: • Modification of the existing eastern terminus of the Independence Greenway at the Essex Center Drive behind the Northshore Mall, its Route 128 underpass, and a portion of the Northshore Road from the Northshore Mall driveway to Proctor Brook to accommodate the connection to the proposed shared use path; • Construction of the proposed bituminous shared-use trail along the existing abandoned railroad right-of-way between Northshore Road and Endicott Street; • Construction of a light duty timber boardwalk structure supported on helical piles; • Various drainage improvements, including replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed; and • Construction of modifications at Endicott Street, including sidewalk reconstruction and drainage improvements. The project requires a 401 WQC and authorization under Section 404 as the construction of the proposed Independence Greenway Extension is anticipated to permanently impact approximately 10,343 square feet and will temporarily impact approximately 2,082 square feet of Land under Water/Waters of the U.S. and will also result in approximately 1,491 cubic yards of dredging below the Ordinary High Water mark. The project is anticipated to permanently impact approximately 2,225 square feet and will temporarily impact approximately 4,641 square feet of Vegetated Wetlands (VWs). A filing of a Pre-Construction Notification (PCN) Form in accordance with Section 404 with the U.S. Army Corps of Engineers under GP 7, 9, 23, and 24 will also occur concurrently with this Section 401 WQC filing. A Notice of Intent application for the proposed work has been submitted to the Peabody Conservation Commission on April 10, 2024 under the Wetlands Protection Act and its implementing regulations 310 CMR 10.00. on April 9, 2024 and is currently under review (DEP File No. 055-0939). In addition, the proposed work exceeds the activity thresholds described in 301 CMR 11.03 (3)(b)(1)(f), 301 CMR 11.03(3)(b)1(d); and 301 CMR 11.03(3)(b)1(b); consequently, the project is cutrently undergoing a MEPA review process by the Executive Office of Energy and Environmental Affairs (EEA) (EEA File No. 16778). The anticipated duration of construction is a period of 24 months. (see Project Narrative for more information).
Proposed Start Date	12/21/2024
What is the expected frequency of maintenance dredging of this project?	N/A

Length of the proposed project (If applicable, please include the maximum and minimum)	110 (maximum near Culvert# 1 location)
Width of the proposed project (If applicable, please include the maximum and minimum)	110 (maximum near Culvert# 1 location)
Depth of the proposed project (If applicable, please include the maximum and minimum)	4 (maximum at all locations)
Volume of the proposed project(Cubic yards)	1,491
Type of proposed project	Improvement dredging
Briefly describe the physical dredging operation (such as., dredging methods), the method of release of the dredged material into the disposal site, and the name of the contractor if other than the applicant. (Please attach a detailed document - "Dredging and Disposal Operation" in the document section of the application)	Construction means and methods will ultimately be determined by the project contractor. Excess material will be disposed of at the State designated disposal upland site as needed. There will be no ocean disposal.
Briefly describe all measures designed to avoid and minimize adverse impacts of the project on aquatic life and the aquatic ecosystem. Where impacts cannot be avoided or minimized, what mitigation measures are proposed? (If necessary, please attach a document - "Performance Standard to avoid and minimize and mitigate impact" in the document section of the application)	The extent of dredging will not exceed that reasonably necessary to accommodate the need for culvert structure replacements and adjacent scour protection and bank stabilization countermeasures. The design and timing of dredging and dredged material disposal activity will minimize impacts on aquatic life and the aquatic ecosystem to the maximum extent feasible. The disturbed areas will be stabilized and restored upon completion of construction. During construction, sediment control barriers will be installed on both sides of the structure to protect the adjacent resource areas. The erosion controls will be maintained in good condition until on-site soils are stabilized.
Does the proposed project have any past history of chemical or oil spills of discharge?	Yes
Does the proposed project have any past history of Upstream or on-site industrial or municipal discharge within 1,000 feet of the proposed project?	No
Does the proposed project have any past history of chronic pollutant loading from port or harbor use and/or other sources of pollutants? (eg. CSO or POTW discharges)	No
Please provide as much historical information as you have, including dates, amounts, concentrations, etc. of such spills or discharge. If necessary, please attach a document - "Due diligence Review".	See "Due Diligence Review" document in the Attachments.

Proposed Ocean Site

Location of proposed disposal site and its physical boundaries	N/A

Has the site been designated by the State or E.P.A. as a dredge disposal site?	No
If no, give a brief description of the characteristics of the proposed disposal site and an explanation as to why no currently designated site is feasible for this project.	When suitable, dredged materials will be reused as structural fill on site to the maximum extent practicable. Excess material will be disposed of at the State designated disposal upland site as needed. There will be no ocean disposal.
Is the anticipated disposal site located within a designated ocean sanctuary as established by federal law or G.L.c. 132A, sec. 13?	No

Disposal/Dewatering Land Site

Location of proposed disposal and dewatering sites and physical boundaries	It is anticipated that a NPDES Construction General Permit (CGP) will be required for the project; therefore, if trench dewatering is needed, all pumped effluent will be done in compliance with the dewatering requirements within the CGP. There will be no direct discharge of pumped water into any wetland, resource area, or closed drainage system. Dewatering of excavated stream bed materials shall take place on an impervious surface within or near the project site. Material will be stockpiled at the construction staging area and reused as fill when suitable.
Indicate drainage characteristics of dewatering and disposal sites from the results of test pits, borings, and percolation tests as applicable	Material will be stockpiled at a construction staging area and reused as structural fill on site when found to be suitable.
How long are the dewatering and disposal sites estimated to be in use from this project?	Areas of temporary storage and dewatering of excavated riverbed materials should only be in use for the duration of this project. It is expected that much of the material will be re-used at the site as fill. The dewatering site will not be used for any future project. Means and methods will ultimately be determined by the contractor.

Proposed Barge Site

Are you proposing dewatering of dredged sediment on a barge? If yes, please attach a document 'Plans for adequate containment' in the document section.	No

Additional Information

Is your project subject to U.S. Army Corps of Engineers – Section 404 of Federal Clean Water Act? If yes, please attach a document 'USACE Authorization' in the document section.	Yes
USACE File Number	TBD - pending

Is your project subject to Massachusetts Environmental Policy Act (MEPA)? If yes, application cannot be submitted until 1) the MEPA process is completed and 2) a Final certificate issued by MEPA is submitted to the “Document(s)” Tab. If no, please attach a document with justification that this project is not subject to MEPA review in the document section (including addressing the applicability of the MEPA review thresholds at 301 CMR 11.03)	Yes
MEPA File Number	16778
Date of MEPA Certificate Issuance	05/24/2024
Is your project subject to Massachusetts Wetlands Protection Act?	Yes
MassDEP Wetlands File Number(s)	055-0939
Is the project going to impact Eelgrass bed? If yes, please attach a document 'Eelgrass Management Plan' in the document section.	No
Does this project contain an attached written Alternatives Analysis? If yes, please attach a document 'Alternatives Analysis' in the document section.	Yes
If yes, does this Alternatives Analysis screen all practicable alternatives to the proposed discharge that would have less adverse impact on the aquatic ecosystem?	Yes
Does this project require a license from the Federal Energy Regulatory Commission?	No
Is any of your proposed work exempt from the Massachusetts Wetlands Protection Act or taking place in a federal non-state wetland?	No

Statement and Disclosures

Proposed dredging activity or dredged material management might occur within Rare Species Habitat as defined at 314 CMR 9.02. By checking this box, you agree that you have consulted with the Natural Heritage and Endangered Species Program of the Massachusetts Division of Fisheries and Wildlife. Please attach a 'NHESP Determination Letter or Conservation Management Permit' in the document section.	

Any in-water activity may effect fish or shellfish, spawning and/or habitat.
By checking this box, you agree that you have consulted with Massachusetts Division of Marine Fisheries (DMF) and/or Massachusetts Division of Fisheries and Wildlife (DFW) about Time of Year Restriction (TOY).
Please attach Consultation Letter from DMF and/or DFW in the document section.

Project Information

Project Name	Independence Greenway Extension, City of Peabody

Proposed Activity

This Joint Application for 401 Water Quality Certification (WQC) and 404 ACOE Pre-Construction Notification (PCN) has been prepared on behalf of the City of Peabody for the Independence Greenway Extension transportation improvement project in the City of Peabody. The City of Peabody with construction funding from the Massachusetts Department of Transportation, Highway Division (MassDOT) proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, Massachusetts for a total project length of approximately 1.3 miles (MassDOT Project No. 609211). The proposed project is located along the former railroad right-of-way, which is owned and maintained by the City of Peabody.

The Independence Greenway Extension project is a continuation of a rail trail facility that can be utilized by pedestrians and bicyclists for recreation or for short-range trips to businesses or other destinations along the Greenway. This project will expand the City's network of bicycle routes and provide a dedicated bike trail between the busy Northshore Mall and residential/commercial areas adjacent to downtown Peabody.

The project will consist of the following improvements:
• Modification of the existing eastern terminus of the Independence Greenway at the Essex Center Drive behind the Northshore Mall, its Route 128 underpass, and a portion of the Northshore Road from the Northshore Mall driveway to Proctor Brook to accommodate the connection to the proposed shared use path;
• Construction of the proposed bituminous shared-use trail along the existing abandoned railroad right-of-way between Northshore Road and Endicott Street;
• Construction of a light duty timber boardwalk structure supported on helical piles;
• Various drainage improvements, including replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed; and
• Construction of modifications at Endicott Street, including sidewalk reconstruction and drainage improvements.

The project requires a 401 WQC and authorization under Section 404 as the construction of the proposed Independence Greenway Extension is anticipated to permanently impact approximately 10,343 square feet and will temporarily impact approximately 2,082 square feet of Land under Water/Waters of the U.S. and will also result in approximately 1,491 cubic yards of dredging below the Ordinary High Water mark. The project is anticipated to permanently impact approximately 2,225 square feet and will temporarily impact approximately 4,641 square feet of Vegetated Wetlands (VWs). A filing of a Pre-Construction Notification (PCN) Form in accordance with Section 404 with the U.S. Army Corps of Engineers under GP 7, 9, 23, and 24 will also occur concurrently with this Section 401 WQC filing.

A Notice of Intent application for the proposed work has been submitted to the Peabody Conservation Commission on April 10, 2024 under the Wetlands Protection Act and its implementing regulations 310 CMR 10.00. on April 9, 2024 and is currently under review (DEP File No. 055-0939).

In addition, the proposed work exceeds the activity thresholds described in 301 CMR 11.03 (3)(b)(1)(f), 301 CMR 11.03(3)(b)1(d); and 301 CMR 11.03(3)(b)1(b); consequently, the project is cutrently undergoing a MEPA review process by the Executive Office of Energy and Environmental Affairs (EEA) (EEA File No. 16778).

The anticipated duration of construction is a period of 24 months. (see Project Narrative for more information).

Proposed Areal Extent Info

Bordering Vegetated Wetland (sqft)	6866
Isolated Vegetated Wetland (sqft)	0
Non-tidal Land Under Water (sqft)	12425
Salt Marsh (sqft)	0
Land Under the Ocean (sqft)	0
Intertidal Zone (sqft)	0
Total cumulative loss (sqft)	19291

Compliance with 314 CMR 9.00

Does the proposed project meet the definition of a Single and Complete Project at 314 CMR 9.02?	Yes
Does the proposed project include "multi-phased activities"?	Yes
Does the proposed project meet the definition of an Ecological Restoration Project?	No
Have you completed the Public Notice as per 314 CMR 9.05(3)? If yes, please attach a completed 'Proof of Public Notice' document in the document section.	Yes
Date of Public Notice per 314 CMR 9.05(3)	05/23/2024
Does the required Alternatives Analysis screen all practicable alternatives to the proposed discharge that would have less adverse impact on the aquatic ecosystem?	Yes
Does this proposed project meet the definition of Water-Dependent at 314 CMR 9.02?	Yes
Is the proposed project restricted to access to one dwelling unit?	No
Will the cumulative discharges of dredged or fill material to Waters of the United States within the Commonwealth exceed 1 acre in areal extent?	No
Report the areal extent, as expressed in square feet, of all proposed restoration or replication of Bordering Vegetated Wetlands and/or Isolated Vegetated Wetlands	2500 (Proposed Wetland Replication Area); 4,641 (Restoration or temporary disturbed wetlands)
Will any proposed discharges of dredged or fill material or any proposed restoration or replication occur within Rare Species Habitat as defined at 314 CMR 9.02?	No

Will the proposed project include or consist of the construction of a new non-tidal crossing of any Land Under Water?	No
Will the proposed project include or consist of the construction of a new tidal crossing of any Land Under Water?	No
Will the proposed project include or consist of the repair, replacement, and/or expansion of an existing non-tidal crossing of any Land Under Water?	Yes
If yes, will such repair, replacement, and/or expansion of an existing crossing comply with the Massachusetts River and Stream Crossing Standards (March 8, 2012) to the maximum extent practicable (see Practicable at 314 CMR 9.02)?	Yes
Will the proposed project include or consist of the repair, replacement, and/or expansion of an existing tidal crossing of any Land Under Water?	No
Does the proposed project include any amount of discharges of dredged or fill material to any Outstanding Resource Water?	No
Will any proposed "discharge of dredged or fill materials" occur within any certified Vernal Pool (as defined at 314 CMR 9.02)?	No

Additional Information

Is your project subject to Massachusetts Environmental Policy Act (MEPA)?	Yes

By checking the box below, I understand and agree that I am electronically signing and filing this application.

1.0 INTRODUCTION AND OVERVIEW

This Joint Application for 401 Water Quality Certification (WQC) and 404 ACOE Pre-Construction Notification (PCN) has been prepared on behalf of the City of Peabody for the Independence Greenway Extension transportation improvement project in the City of Peabody. The City of Peabody with construction funding from the Massachusetts Department of Transportation, Highway Division (MassDOT) proposes to extend the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, Massachusetts for a total project length of approximately 1.3 miles (MassDOT Project No. 609211). The proposed project is located along the former railroad right-of-way, which is owned and maintained by the City of Peabody.

The Independence Greenway Extension project is a continuation of a rail trail facility that can be utilized by pedestrians and bicyclists for recreation or for short-range trips to businesses or other destinations along the Greenway. This project will expand the City's network of bicycle routes and provide a dedicated bike trail between the busy Northshore Mall and residential/commercial areas adjacent to downtown Peabody.

The project will consist of the following improvements:

- Modification of the existing eastern terminus of the Independence Greenway at the Essex Center Drive behind the Northshore Mall, its Route 128 underpass, and a portion of the Northshore Road from the Northshore Mall driveway to Proctor Brook to accommodate the connection to the proposed shared use path;
- Construction of the proposed bituminous shared-use trail along the existing abandoned railroad right-of-way between Northshore Road and Endicott Street;
- Construction of a light duty timber boardwalk structure supported on helical piles;
- Various drainage improvements, including replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed; and
- Construction of modifications at Endicott Street, including sidewalk reconstruction and drainage improvements.

This project transforms the former railroad bed into a shared use pathway. As the proposed project is a pathway for pedestrian and/or nonmotorized vehicle access, it is therefore categorized as a "Redevelopment Project" under the Massachusetts Stormwater Management Standards. The project is therefore designed to meet the Standards to the maximum extent practicable. A stormwater report is attached in Appendix G to this Application demonstrating the compliance of the project with the ten state stormwater standards.

In addition, the proposed work exceeds the activity thresholds described in *301 CMR 11.03 (3)(b)(1)(f)* for alteration of ½ or more acres of any other wetland, 301 CMR 11.03(3)(b)1(d) for alteration of 5,000 or more of bordering or isolated vegetated wetlands; and 301 CMR 11.03(3)(b)1(b) for alteration of 500 or more linear feet of inland bank; consequently, an Expanded Environmental Notification Form (EENF) was filed to initiate project review under MEPA by the Executive Office of Energy and Environmental Affairs (EEA). An EENF Certificate for the EEA File No. 16778 was issued on January 29, 2024 determining that the project required the submission of an Environmental Impact Report (EIR). The Draft Environmental Impact Report addressing the comments and scope received in the EENF Certificate was filed with the MEPA Office on April 1, 2024 and is currently under review.

The proposed work within Waters of the United States requires a Section 401 Water Quality Certification pursuant to 314 CMR 9.04(1) since the project will result in dredging of more than 100 CY of material and placement of fill within Land Under Water. Therefore, the Combined Major Fill/Minor Dredging Water Quality Certification application package is being submitted to the Department of Environmental Protection (DEP) in association with this project. A filing of a Pre-Construction Notification (PCN) Form in accordance with Section 404 with the U.S. Army Corps of Engineers under GP 7, 9, 23, and 24 will also occur concurrently with the Section 401 WQC filing.

The MassDEP Waterways Program evaluated the site conditions within the limits of the proposed work areas (i.e., culvert crossings and boardwalk crossing), and has identified that Proctor Brook is not practicably navigable within the boundaries of the project footprint due to the bottom topography and shallow water depths. As a result, the portions of the proposed project located in/on/over/under Proctor Brook as identified on the plans do not require authorization pursuant to M.G.L. Chapter 91 or the Waterways Regulations at 310 CMR 9.00.

The proposed work requires submission of a Notice of Intent (NOI) to the Peabody Conservation Commission pursuant to the Massachusetts Wetlands Protection Act (WPA) Regulations and its implementing regulations 310 CMR 10.00 for work within the Bordering Vegetated Wetland (BVW), the Land Under Water (LUW), the 100-foot Buffer Zone, the Bordering Land Subject to Flooding (BLSF), Bank and within the Riverfront Area and pursuant to the City of Peabody local Wetlands and Rivers Protection Regulations. The Notice of Intend was submitted on April 10, 2024 is currently under review. An Order of Conditions (OOC) for the project (DEP File No. 055-0939) will be forthcoming by the Peabody Conservation Commission.

2.0 EXISTING CONDITIONS

2.1 Property Information

The existing Independence Greenway was built in 2008 and is functionally classified as a Bike Path, being an exclusive pedestrian/bicycle facility open year-round from dusk until dawn. It currently consists of two discontinuous segments separated by Interstate 95 and Route 1. The overall length of the west section is 2.9 miles, and it starts between Russell Street and the Ipswich River, and the section ends at Lt. Ross Park. The east section starts from Peabody Road near Proctor Brook and runs for 1.7 miles to end at Essex Center Drive behind the Northshore Mall. The trail was built on the route of the former Boston and Maine Railroad right-of-way north of Lowell Street. The existing Greenway is owned and maintained by the City of Peabody.

The existing west and east sections of the Independence Greenway provide 14’-0” wide pavement carrying two-way traffic on two 5’-0” wide travel lanes and two 2’-0” wide shoulders. The present eastern terminus of the Independence Greenway is located at Essex Center Drive behind the Northshore Mall. The allowed uses on the Greenway include walking/running, bicycling, inline/roller skating, snowshoeing and cross-country skiing. No motorized vehicles, snow mobiles, or horseback riding is allowed on the trail.

Essex Center Drive is classified as a Local Roadway maintained under the private jurisdiction of the Northshore Mall. It serves mostly as a circulating road for the Northshore Mall and its adjacent office and commercial buildings, including Lahey Medical Center. Essex Center Drive is a two-lane, two-way road with a typical pavement width of 30 feet. The travel lanes, separated by a double yellow centerline, are approximately 15 feet wide. There is a consistent 5-foot bituminous sidewalk along the east side of the road and a cement concrete sidewalk on the west side of the road in front of Lahey Medical Center.

The second segment of the Essex Center Drive runs through an underpass under Route 128, connecting the rest of the Essex Center Drive and the mall driveway to the Northshore Road and from Route 128 North. This segment is under the jurisdiction of MassDOT as part of Route 128 above. The roadway is 23 feet wide, with an 11-foot right turn lane and a 12-foot right turn lane in the eastbound direction, with a 9.5-foot-wide raised median between the directions, which contain support columns for the bridge above. There are 3.5-foot-wide sidewalks in the underpass, which do not allow ADA accessible path of travel. In addition, the sidewalks are too narrow for cyclists to comfortably ride on or even walk with a bicycle to pass someone walking in the other direction without one person having to walk in the roadway.

Northshore Road is a local roadway under the City of Peabody jurisdiction south of the Route 128 underpass, and under the jurisdiction of MassDOT north of the underpass. Northshore Road connects the Northshore Mall south entrance with Lowell Street and Route 114, as well as ramps to Route 128 North. Northshore Road is 23 feet wide with 11-foot-wide lanes separated by a double yellow centerline. There is a 4.5-foot-wide bituminous sidewalk on the west side of the street. The posted speed limit on Northshore Road is 25 mph in both directions.

The former B&M railroad-owned easement between Northshore Road and Endicott Street is currently wooded and is roughly parallel to, and overlaps with, Proctor Brook, which generally flows west to east until its confluence with Goldthwaite Brook near Peabody Square to form the North River, which eventually empties downstream into Salem harbor. There are currently no existing trails, roadways, or railroad tracks at this location.

The project corridor contains a former bridge structure, oriented west to east, that used to carry railroad tracks over Proctor Brook. There are presently granite stone blocks extending across Proctor Brook and granite stone abutments, which remain intact along Proctor Brook's western bank with remnants of stone wingwalls splayed along the sides of the abutments.

The wetlands and waterbodies exist directly adjacent to the former railroad right-of-way on both sides along the project corridor. There are several existing stream crossings and hydrologic connections beneath the former railroad track bed within the project limits:

- The existing twin culverts consisting of 42-inch diameter Reinforced Concrete Pipes (RCPs) at Sta. 329+85 convey Proctor Brook which flows south-to-north at this location. Due to the existing 42-inch twin culverts being obstructed with sediment and debris, the pipes are not able to pass the sufficient flow during larger storm events and the bank overtime became eroded and expanded west of the existing culverts at this location.
- The existing 30-inch diameter Corrugated Metal Pipe (CMP) at Sta. 340+10 conveys an intermittent stream flowing into Proctor Brook on the north side of the former railroad bed. The existing culvert is corroded.
- The existing 24-inch diameter CMP at Sta. 342+20 conveys hydrological connection of Proctor Brook with wetland V-series on the south side of the former railroad tracks. The existing culvert is corroded.
- The former 4'H x 6.4'W concrete culvert at Sta. 346+20 used to convey Proctor Brook beneath discontinued railroad bed; Proctor Brook flows in the north-to-south direction at this location. The culvert was washed out after the railroad was discontinued and the tracks were removed; there are remains of the former culvert in the existing channel at this location.

- The existing remains of the former railroad bridge crossing over Proctor Brook at Sta. 351+50, which crosses the former railroad right-of-way in the south-to-north direction at this location. The bridge was washed out after the railroad was discontinued and track were removed.
- The existing 15-inch RCP culvert conveying intermittent stream at Sta. 358+51 near the eastern limit of the project at Endicott Street. There are no known deficiencies with the existing culvert.

2.2 Description of Water Bodies Adjacent to Project Site

Wetland resource areas exist within and adjacent to the project area (see Appendix B – Wetlands Delineation Report and Appendix E - Figure 3, Protected Resource Areas Map for details).

Surface runoff on Essex Center Drive, its Route 128 underpass, Northshore Road, and Endicott Street is mainly distributed by "country drainage", where runoff sheet flows into the pervious shoulder, roadside ditches, wetlands, or private front yards. Additionally, there are separate closed drainage systems spread throughout the project, servicing existing watershed areas via catch basin curb inlets and at low points. Where stormwater does not sheet flow off the roadway via country drainage, it travels via curb along the roadway into these closed drainage systems. The existing site can be analyzed as ten (10) watershed areas that contribute runoff to ten (10) discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. There are several culverts that convey Proctor Brook and intermittent streams that provide hydrological connections beneath the existing railroad track bed as described in detail above. The bankfull width of Proctor Brook varies over the project corridor and at each culvert crossing, with the bankfull widths ranging from 6 to 35 feet throughout the corridor.

Per the Flood Insurance Rate Maps (FIRM) for the City of Peabody, Massachusetts, Essex County, Panel 25009C0412F, dated 07/03/2012, and Panels 25009C0416G, 25009C0418G, dated 07/16/2014, portions of the project in the vicinity of Proctor Brook are located within the 100-year floodplain. The floodplain areas are shown on Figure 4 – FEMA Map. The Flood Insurance Study, by the Federal Management Agency and last revised on July 16, 2014, includes a detailed study of the project area, showing the 100-year floodplain elevations in the project vicinity. Sections of Proctor Brook flowing along the project corridor have various 100-year flood elevations which drop from 47.1 feet near the western project limit to 39.6 feet at the eastern project limit (NAVD 88). See Figure 7A-7H in Appendix E for details and exact locations of the FEMA 100-year flood lines and elevations.

All waterbodies, wetlands and streams on site belong to the North Coastal watershed. There is one perennial stream, Proctor Brook, within the project area. Within the vicinity of the project, Proctor Brook flows in the west-to-east direction until its confluence with Goldthwaite Brook near Peabody Square to form the North River, which eventually empties downstream into Salem harbor. Proctor Brook is classified as a Class "B" water, which designates these waters as a habitat for fish, other aquatic life, and wildlife including for their reproduction, migration, growth and other critical functions, and for primary and secondary contact recreation, even if not allowed. Where designated in 314 CMR 4.06, they shall be suitable as a source of public water supply with appropriate treatment ("Treated Water Supply"). These waters shall be suitable for irrigation and other agricultural uses and for compatible industrial cooling and process uses and shall have consistently good aesthetic value. Additionally, there are no National Wild & Scenic Rivers, National Wildlife Refuges, National Forests, National Marine Sanctuaries, National Parks, or any other areas administered by the National Park Service, U.S. Fish and Wildlife Service, or U.S. Forest Service, and USACE project lands and easements within the project site.

According to the 2018 Integrated List of Waters, Proctor Brook (Waterbody ID MA 93-39) belongs to Massachusetts Category 5 Waters, due to several impairments and has a Final Pathogen TMDL. Additionally, Proctor Brook is not designated as a Cold-Water Fishery.

Per MassGIS online data mapping, there are no stormwater "critical areas" as defined in MassDEP's wetland regulations as Outstanding Resource Waters (ORW), Special Resource Waters, recharge areas for public water supplies or cold-water fisheries either crossing or located adjacent to the project area. There are also no Areas of Critical Environmental Concern (ACECs) within or adjacent to the project area (see Figure 3).

3.0 PROPOSED CONDITIONS

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is approximately 1.3 miles.

The proposed project is located along the former railroad right-of-way that has not seen any improvements since the rails were removed. The proposed bituminous shared-use trail pavement will match the dimensions of the existing discontinued railroad structure. This will include 10’-0” wide hot mix asphalt pavement carrying two 5’-0” wide travel lanes, one in each direction, and two 2’-0” wide stone dust shoulders on both sides.

To make the former railroad right-of-way usable for a bicycle/pedestrian path, and to avoid filling protected wetland resources areas and FEMA-designated 100-year floodplain associated with Proctor Brook, a light duty timber boardwalk structure supported on helical piles is proposed to replace the previous railroad bridge that was washed away.

The proposed 56-span light duty timber boardwalk structure will be approximately 437’- 9” long with an out-to-out width of 13’-00” and will provide a clear width of 12’- 1” to accommodate two 5’- 0” wide travel lanes, one in each direction, and two 1’-0” shoulders on each side to provide service to bikers, pedestrians and and/or nonmotorized vehicle access. The shared use path will support emergency vehicles, but the boardwalk section will not.

The proposed shared-use trail will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Guide for the Development of Bicycle Facilities (Fourth Edition, 2012) and the MassDOT Separated Bike Lane Planning & Design Guide 2015. The proposed bridge will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Standard Specifications for Highway Bridges and the most recent supplemental Specifications, Standard Nomenclature and Engineering Directives.

The project will result in approximately 2.5 acres of clearing and grubbing along the former railroad right-of-way between Northshore Road and Endicott Street.

The project includes drainage improvements, including replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the former track bed.

There are ten discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. The proposed drainage design will add catch basins to replace

existing catch basins at certain locations where proposed roadway geometry differs from existing conditions. New catch basins are also proposed where the new Independence Greenway Extension proposes a higher ground elevation than existing conditions and existing headwalls/culverts will no longer be utilized along North Shore Road. The proposed catch basins will have deep sumps to provide additional stormwater treatment. A stormwater BMP (infiltration trench) is proposed to be installed in the eastern end of the project to help with peak rate attenuation and improve water quality. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge. There are no new untreated point source discharges created because of this project (see Stormwater Report in Appendix G for details).

Drainage and structural improvements to the following stream crossings are proposed as part of this project:

- The existing 42-inch twin culverts crossing at Sta. 329+85 is proposed to be replaced with a 4'H x 8'W precast reinforced concrete box culvert with a natural stream bottom and will match existing invert elevations.
- The existing corroded 30-inch diameter CMP culvert at Sta. 340+10 is proposed to be replaced with 36-inch DIP and will be embedded 12-inches and will have a layer of natural streambed material to match the existing surface elevations. The Hydraulic opening of this culvert will be maintained. A 12-inch layer of natural streambed material will also be placed on top of stone at the pipe ends on each side of the culvert to restore natural substrate.
- The existing 24-inch diameter CMP at Sta. 342+20 is proposed to be replaced with 24-inch DIP with placement of the riprap at pipe ends for scour protection. A 12-inch layer of natural streambed material will also be placed on top of stone at the pipe ends at the outlet of this culvert within Proctor Brook to restore natural substrate.
- The former 4'H x 6.4'W concrete culvert at Sta. 346+20 is proposed to be replaced with a 4'H x 8'W precast reinforced concrete box culvert with a natural stream bottom and will match existing invert elevations.
- As described above, the proposed light duty timber boardwalk structure will replace the former washed out railroad bridge crossing over Proctor Brook at Sta. 351+50.
- The existing 15-inch RCP culvert conveying the intermittent stream at Sta. 358+51 is proposed to be replaced with a 16-inch DIP to be able to support the H-20 vehicle loading with a shallow depth of cover.

Compliance of the proposed culvert replacements with the Massachusetts River and Stream Crossing Standards are discussed in Section 11 of this Application.

The proposed drainage will overall maintain historic drainage patterns, distributing runoff to the existing discharge points. All work will be done in a manner that will limit the impacts to adjacent protected wetland resource areas.

4.0 ANTICIPATED CONSTRUCTION SEQUENCE

Construction phasing will ultimately be determined by the project contractor. The construction phasing is assumed to generally include the following items:

1. Installation of sediment and erosion control measures.
2. Clearing and rough grading of the former railroad right-of-way between Northshore Road and Endicott Street.
3. Construction of wetland replication area.

4. Construction of flood storage compensation area.
5. Reconstruction of existing culverts and other drainage improvements sections along the project corridor.
6. Construction of light duty timber boardwalk structure supported on helical piles.
7. Construction of proposed bituminous shared-use trail along the project corridor.
8. Construction of modifications at Endicott Street, including sidewalk reconstruction and drainage improvements.
9. Construction of modifications at the existing eastern terminus of the Independence Greenway at the Essex Center Drive behind the Northshore Mall, its Route 128 underpass, and a portion of the Northshore Road from the Northshore Mall driveway to Proctor Brook to accommodate the connection to the proposed shared-use path.
10. Completing shared-use path construction, upgrading signage and pavement markings.
11. Installation of landscaping and grassed areas.
12. Maintaining wetland replication area: checking for plantings that are damaged or failing to thrive and adjusting/replacing plantings as recommended by Wetland Specialist.
13. Removal of sediment and erosion control measures and dispose of same.

Equipment that is likely to be utilized for this project includes dump trucks, flatbed trucks, front-end loader(s), backhoe(s), skid steer(s), excavator, hoe rams, drilling rigs, concrete pumpers, boom trucks, air hammers, air compressor(s), and a crane. Equipment can be parked on roadway pavements off-limits for construction staging purposes. Staging equipment in Vegetated Wetland or Waterway resource areas shall be prohibited.

5.0 IMPACTS TO WATERS OF THE UNITED STATES

The project's resource area impacts will occur in Vegetated Wetlands, Land Under Water (LUW)/Waters of the United States (WOTUS), and Bank, resulting from both permanent and temporary construction taking place from Northshore Road to Endicott Street. The main perennial stream present on the project site is Proctor Brook, which is a perennial stream traveling in the west-to-east direction. Proctor Brook crosses the project corridor at three (3) locations: at approximate Sta. 329+85, Sta. 346+20 and Sta. 351+50.

5.1 Permanent Vegetated Wetland and Land Under Water/Waters of the United States Impacts

There are direct impacts to VWs and LUW/WOTUS associated with the project, as shown in Tables 1 and 2 above. The direct impacts to VWs and LUW/WOTUS were minimized to the maximum extent feasible but cannot be avoided in order to achieve the project goals.

The overall impacts to Vegetated Wetlands (VWs) and Land Under Water (LUW)/Waters of the United States (WOTUS) are summarized below:

Table 5.1: VWs Impacts

Wetland Area Series (STA. #)	Permanent Impacts (ft^2)	Temporary Impacts (ft^2)
Z (STA. 329+85)	264	245
Y (STA. 329+85)	447	58
V (STA. 340+10)	168	88
V (STA. 342+20)	183	435
V (STA. 346+20)	914	216
E (STA. 346+20)	126	72
E (STA. 346+90)	117	66
X (STA. 352+00)	6	3,461
Total	**2,225**	**4,641**

Table 5.2: LUW/WOTUS Impacts

Resource Area	Permanent Impacts (ft^2)	Temporary Impacts (ft^2)	Dredge Volume (cy)
STA. 329+85	8,365	1,009	1,210
STA. 340+10	107	32	16
STA. 342+20	79	64	12
STA. 345+50	13	72	-
STA. 346+20	1,474	355	241
STA. 351+50	305	550	12
Total	**10,343**	**2,082**	**1,491**

The majority of permanent VW impacts are associated with the proposed bank protection and stabilization countermeasures near the proposed culverts; other BVW impacts are associated with the adjacent areas of slope stabilization and regrading. The extensive work within the LUW at the locations of Culvert No. 1 (Sta. 329+85) and Culvert No. 2 (Sta. 346+20) is required to place riprap countermeasures, which were designed in accordance with the guidelines outlined in Hydraulic Engineering Circular No. 14, specifically Chapters 5 and 10. These guidelines were utilized to estimate scour levels at culvert outlets and to develop the design for riprap basins and aprons, respectively. In order to mitigate the impacts of the high volume of riprap at the culvert inlets and outlets of these two culverts at Sta. 329+85 and Sta. 346+20, as well as at the outlets of the smaller culverts within Proctor Brook at Sta. 340+10 and Sta. 342+20, additional 12-inch layer of natural streambed material will be placed on top of the riprap and stone for pipe ends on each side of the culvert as shown on the plans to restore natural substrate. Dredging of approximately 1,491 CY below Ordinary High Water (OHW) mark will be required to complete proposed culvert replacement and for placement of riprap and stone for pipe ends topped with a 12-inch layer of natural streambed material as shown on the plans to restore natural substrate. The dredging volumes are shown in Table 2 above as well as on the plans.

In order to mitigate impacts to bank of Proctor Brook and intermittent stream crossings caused by the placement of riprap for scour protection and bank stabilization near the proposed culvert replacements, the vegetated riprap is proposed for bank protection and stabilization. The bankfull width of Proctor Brook varies over the project corridor and at each culvert crossing, with the bankfull widths ranging from 6 to 35 feet throughout the corridor.

In addition to the placement of the natural streambed material at culverts, vegetated stakes will also be utilized within the riprap area in order to further aid in slope stabilization and restoring the area to natural conditions. The selected method is to plant live vegetated stakes in the voids between the riprap area in order to further aid in slope stabilization and restoring the area to natural conditions. The proposed live stakes will integrate brush layering, pole planting, and live siltation techniques during rock placement to ensure contact with native ground and will be laid horizontally to maximize rooting in accordance with MassDOT specifications for Live Stakes (See Special Provision Item 799.775 – Live Stakes) which is included in Appendix D – Special Provisions. The MassDOT Special Provision for Item 799.775 Live Stakes specifies that the live stakes be a minimum of four feet in length, a minimum of three-quarter inch (3/4") in diameter, harvested locally, and have side branches removed with the bark intact. Additionally, the stakes will have at least two (2) bud scars near the top to facilitate branch development and shall be planted at 90-degrees to the slope.

The proposed extension on the Independence Greenway and stream crossing replacements necessary to achieve the project purpose are expected to result in an overall improvement of the existing wetland resource areas and the area in general, which are currently degraded, overgrown with invasives and brush, and contain a lot of debris and garbage. There are no Essential Fish Habitat, land containing shellfish or wildlife habitat located within or in close proximity to the project area, therefore the project will not negatively impact these interests.

Permanent impacts will be caused by the replacement of the existing Proctor Brook crossings beneath the former railroad bed (proposed shared-use path), including placement of riprap at the proposed culvert inlets and outlets for scour protection and associated regrading near proposed culverts.

GZA GeoEnvironmental Inc. collected four sediment samples at various locations specified by Green International Affiliates Inc. on May 17, 2023 and the samples were delivered to ESS Laboratory in Cranston, Rhode Island for analysis. The analysis was done on January 15, 2019, and the results of these analyses are presented in Appendix F of this submittal. Any contaminated dredged materials will be managed in accordance with MassDOT Specification Items 180 and 181 included in the Contract as well as in accordance with all applicable local, state, and Federal regulations.

5.2 Temporary Vegetated Wetland Land Under Water/Waters of the United States Impacts

Temporary disturbance to VW (4,641 square feet) will be required for installation of Erosion & Sediment Control BMPs. The 3,461 square feet of temporary impact to VW X is caused by placement of the temporary timber matting to protect the VW X from negative impacts by construction machines during installation of helical piles for the duration of its construction. Approximately 1,180 square feet of temporary impacts to VWs will result from the installation of Erosion & Sediment Control BMPs during construction. After the erosion controls have been removed the VWs will be restored to preexisting conditions in accordance with the MassDOT Specifications for Item 755.45 – Wetland Restoration included in Appendix D of this Application.

The temporary impacts of 2,082 square feet of LUW/WOTUS are associated with the control of water during construction and installation of erosion and sediment controls to protect the downstream waterway during the replacements of the stream crossings, installation of boardwalk. The proposed replacement of Culverts 1 and 2 at Sta. 329+85 and 346+20, respectively, may require dewatering to take place, and installation of erosion & sediment controls at the boardwalk will result in temporary LUW/WOTUS impacts at these locations. During construction, dewatering for culverts within temporary cofferdams to allow for construction "in the dry" will be required for removal of groundwater from excavations for structural components and from surface water that enters the work area by precipitation or splash-over.

The Contractor will be expected to perform this work in accordance with MassDOT specifications for Control of Water (Items 991.11, 991.12 and 991.13 – Control of Water for Structures - Culvert No. 1, Culvert No. 2 and Bridge Structure No. P-03-020 (CAK) respectively). The Contractor must treat dewatering discharges, prior to outletting these flows to local waterways, for removal of sediments. This will be done by use of sediment tanks, fractionalization tanks, sediment basins, or other approved means. Outlets from these treatment measures will discharge onto splash pads or other measures that will prevent concentrated flows that could erode bank soils or streambed materials en route to the receiving watercourse. See Section 8.0 for further information about dewatering.

There will be no direct discharge of pumped water into any wetland, resource area, or closed drainage system.

5.3 Bank Impacts

As summarized in Table 5.3 below, the proposed project activities will impact Bank associated with Proctor Brook and two (2) intermittent streams within the project limits:

Table 5.3: Bank Impacts

Bank (STA. #)	Permanent Impacts (LF)	Temporary Impacts (LF)
Proctor Brook (West STA. 329+85)	117	9
Proctor Brook (East STA. 329+85)	125	39
Proctor Brook (North STA. 340+10)	10	3
Intermittent Stream (South STA. 340+00)	17	13
Proctor Brook (STA. 342+20)	15	17
Proctor Brook (West STA. 346+20)	94	4
Proctor Brook (East STA. 346+20)	78	5
Proctor Brook (West STA. 351+00)	37	4
Intermittent Stream (358+00)	125	107
Total	**618**	**201**

These activities consist of the proposed replacement of culverts conveying Proctor Brook beneath the former railroad/proposed shared-use path and 2 adjacent intermittent streams. Permanent impacts to Bank will be caused by the replacement of the existing Proctor Brook crossings beneath the former railroad bed (proposed shared-use path), including placement of riprap at the proposed culvert inlets and outlets required for scour protection and associated regrading near proposed culverts.

Temporary disturbance to Bank will be required for installation of Erosion & Sediment Control BMPs. The permanent and temporary impacts to Bank are summarized in Table 5.3 above.

As demonstrated in Table 5.3 above, thought the project will result in cumulative permanent bank impacts of more than 200 linear feet, it will not result in 200 linear feet or more of bank impacts to any one segment of Bank. As shown on the project plans, the affected streambed and bank will be restored upon completion of construction, therefore, there will be no adverse effects to WOTUS from the proposed project activities. In addition, the project provides compensatory mitigation for impacted resource areas, as required by applicable state and federal regulations and described in detail in Section 6.0 of this report.

6.0 RESOURCE AREA IMPACTS MITIGATION

The Project has been designed to minimize environmental impacts and mitigate damage to the environment to the maximum extent practicable. Measures to mitigate impacts resulting from the project activities have been developed throughout the planning and environmental review processes. A combination of erosion and sediment control BMPs will be installed and maintained for the duration of construction to protect the adjacent resource areas, as described in the approved plans.

6.1 Wetland Replication

The project has been designed to avoid wetland resource area impacts to the maximum extent practicable and will mitigate unavoidable resource area impacts in accordance with state regulations (Massachusetts Wetland Protection Act regulations at 310 CMR 10.55(4)(b), and the Massachusetts Department of Environmental Protection's ("MassDEP") "Massachusetts Inland Wetland Replication Guidelines" (MassDEP, March 2002). Vegetated Wetland areas impacted by the construction activities will be replicated in accordance with the standards cited above. Project elements are incorporated into the proposed work that help to minimize impacts to wetland resource areas.

To mitigate for total Vegetated Wetland (VW) losses (fill) of 2,225 square feet associated with the subject project, a wetland replication area of approximately 2,500 square feet on the northern side of the proposed bikeway around Sta. 327+00 adjacent to VW Z is proposed and designed in accordance with 310 CMR 10.55 (4)(b) provisions and MassDOT Specification 755.35, Inland Wetland Replication Area, which is included in Appendix D – Special Provisions.

6.2 Floodplain Impacts Mitigation

As, required by the State 310 CMR 10.00 regulations, a compensatory flood storage area of 3,472 cubic feet was designed to compensate for the project's net fill of approximately 2,859 cubic feet. The compensatory flood storage has been designed to exceed the project's net fill in order to provide a net cut across the project which will aid in the project's flood mitigation. The proposed flood storage compensation area will be located near the eastern end of the project approximately 350 feet west of Endicott Street (approx. Sta. 355+50) and has been designed to comply with the General Performance Standards presented in 310 CMR 10.57 (4)(a).

6.3 Streambed and Bank Impacts Mitigation

In order to mitigate the impacts of the high volume of riprap at the culvert inlets and outlets placed for scour protection, a 12-inch (minimum) layer of natural streambed material will be placed on top of the riprap of the two culverts to reestablish the natural streambed, and it will match existing invert elevations.

In addition to the placement of the natural streambed material at these two culverts, vegetated stakes will also be utilized within the riprap area in order to further aid in slope stabilization and restoring the area to natural conditions. Due to the proposed slope being 1.5:1 at both stream crossing locations (Culvert No.1 and Culvert No. 2), there are limited biotechnical engineering countermeasures for bank stabilization. The proposed live stakes will integrate brush layering, pole planting, and live siltation techniques during rock placement to ensure contact with native ground and will be laid horizontally to maximize rooting in accordance with MassDOT specifications for Live Stakes (for details see Item 799.775 – Live Stakes, which is included in Appendix D – Special Provisions).

6.4 Stormwater Mitigation

The proposed drainage systems will maintain the historic drainage patterns, distributing runoff to the existing discharge points. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge. One stormwater BMP, an infiltration trench, is proposed to capture and treat runoff and reduce peak rates. New catch basins with deep sumps and hoods are proposed to provide additional treatment.

6.5 Other Mitigation Activities

Existing areas that are currently degraded by the presence of invasive plants, debris, and garbage will be improved by the proposed work which will involve herbicide treatment of invasive plants currently existing within the project limits and as directed will occur as part of this project in accordance with MassDOT specifications for Invasive Plants Management (Items 102.3 and 102.33, included in Appendix D – Special Provisions) as well as the removal of debris and garbage from the project site. All areas will be stabilized upon completion of the work.

7.0 SEDIMENTATION CONTROL MEASURES

To protect the wetland resource areas during construction, a combination of erosion and sediment control BMPs will be installed. Erosion control measures will be implemented as described in the approved plans. Primary erosion control techniques proposed include compost filter tubes, coir rolls/logs, sedimentation fence barriers, and street sweeping. The Contractor will have a stockpile of materials required to control erosion on-site to be used to supplement or repair erosion control devices. These materials will include, but are not limited to, compost filter tubes, sedimentation fence, silt sacks for catch basins, erosion control matting and crushed stone. The erosion controls will be maintained in good condition until on-site soils are stabilized. All areas will be permanently stabilized following the completion of construction work.

8.0 DEWATERING

It is anticipated that a NPDES Construction General Permit (CGP) will be required for the project; therefore, if trench dewatering is needed, all pumped effluent will be done in compliance with the dewatering requirements within the CGP. There will be no direct discharge of pumped water into any wetland, resource area, or closed drainage system.

Dewatering of excavated stream bed materials shall take place on an impervious surface within or near the project site. Material will be stockpiled at the construction staging area and reused as fill when suitable. Dewatering for bridges within temporary cofferdams to allow for construction “in the dry” will be required for removal of groundwater from excavations for structural components and from surface water that enters the work area by precipitation or splash-over.

Areas of temporary storage and dewatering of excavated riverbed materials should only be in use for the duration of this project. It is expected that much of the material will be re-used at the site as fill. The dewatering site will not be used for any future project. Means and methods will ultimately be determined by the contractor.

9.0 STORMWATER MANAGEMENT

As the proposed project is a pathway for pedestrian and/or nonmotorized vehicle access, it is therefore categorized as a "Redevelopment Project" under the Massachusetts Stormwater Management Standards. The project is therefore designed to meet the Standards to the maximum extent practicable.

Stormwater management for this project has been designed in compliance with the Stormwater Management Standards as outlined in 310 CMR 10.05(6)(k) through (q) and defined in detail in the DEP's Stormwater Management Handbook. The project has been designed to improve upon existing stormwater conditions while minimizing impacts to nearby resource areas from both the construction and operation of the proposed project.

To improve upon existing conditions, stormwater runoff contributing to one of the existing discharge points will have a portion of the catchment area routed to a treatment BMP prior to discharge. The proposed BMP is an infiltration trench located in the median adjacent to the proposed shared use path along North Shore Road, between the shared-use path and Route 128 (Northbound). While the location of this proposed infiltration trench is outside of WPA jurisdiction, the proposed infiltration trench will still help improve the quality of discharged stormwater from the overall project. Due to the close proximity of wetlands to the proposed shared-use path throughout the rest of the project, as well as the seasonal high groundwater elevation and presence of existing utilities, it is not possible to provide additional infiltration SCMs within WPA jurisdiction. Additionally, new catch basins have been proposed to replace existing catch basins at certain locations where proposed roadway geometry differs from existing conditions. New catch basins are also proposed where the new Independence Greenway Extension proposes a higher ground elevation than existing conditions and existing headwalls/culverts will no longer be utilized along North Shore Road. The proposed catch basins will have deep sumps and hoods to provide additional treatment. This project also includes the replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the former track bed. All proposed drainage systems will maintain the historic drainage patterns, distributing runoff to the existing discharge points. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge.

A full Stormwater Management Report documenting compliance with the DEP's Stormwater Management Standards, including required calculations and description of methodology, is attached as Appendix G to this report.

10.0 FISHERIES AND WILDLIFE / NATURAL HERITAGE ENDANGERED SPECIES / VERNAL POOLS

The project site is not located within an area designated as a Priority Habitat of Rare Species or Estimated Habitat of Rare Wildlife by the Natural Heritage & Endangered Species Program (NHESP) 2021 Maps. No certified vernal pools are located in proximity to the project area. The closest potential vernal pool (PVP18854) is located approximately 300 feet west of the project limit, below the current boundary of the

Independence Greenway behind the North Shore Lahey Clinic. The project activities are not expected to negatively affect this vernal pool. A combination of erosion and sediment control measures will be installed as shown on the attached plan set in the vicinity of the resource areas, therefore, the above areas will not be affected during construction.

Additionally, there are no Cold-Water Fisheries or Essential Fish Habitat within the project area. The project is not located within or in close proximity to Areas of Critical Environmental Concern (ACECs). There are no Outstanding Resource Waters (ORW) within or adjacent to the project limits. Please refer to Figure 3 – Protected Resource Area Map in Appendix E for details.

According to the Federally Listed Endangered and Threatened Species in Massachusetts, the Northern Long-eared Bat (*Myotis septentrionalis*) (NLEB) is an Endangered bat species located Statewide and is protected by the Massachusetts Natural Heritage and Endangered Species Program (NHESP). The closest recorded NLEB hibernaculum is located 6.5 miles west in the Town of Lynnfield. This project has been reviewed by MassDOT Highway Division's Environmental Services Section and received a "No Effect" determination on the endangered Indiana bat (*Myotis sodalis*) or the endangered northern long-eared bat (*Myotis septentrionalis*) on June 21, 2023. No time of year restrictions are required for the project at this time. If additional cutting is proposed by the Contractor that is outside the scope of this contract, additional review is required by the MassDOT Highway Division's Environmental Services Section, and time of year restrictions may apply to such tree cutting.

A recent initiative by USFWS lists the Monarch Butterfly (*Danaus plexippus*), as a Candidate species, which may also be present within the project limits. The migratory population of these species may occur in the eastern United States. Since the Monarchs lay eggs on milkweed, and larvae feed only on plants in the milkweed family (*Asclepiadaceae*), the loss of milkweed from agricultural lands has been mentioned to negatively affect Eastern North America Monarch population along with other factors such as droughts, nectar source, and, not as often, roadkill. There are generally no Section 7 requirements for Candidate species; however, the USFWS encourages all agencies to take advantage of any opportunity they may have to conserve the species.

11.0 STREAM CROSSING NARRATIVE

The existing 24-inch diameter CMP culvert at Sta. 342+20 conveys a hydrological connection between Proctor Brook and the BVW V-series beneath the former railroad bed; therefore, the replacement of this culvert is not required to meet the MA Stream Crossing General Standards (SCGS). However, the proposed stone for pipe ends on the outlet side of the culvert in Proctor Brook will be topped with a 12-inch layer of natural streambed in order to reestablish natural substrate upon completion of construction.

The compliance of each stream crossing with the Massachusetts River and Stream Crossing Standards are summarized in Table 11.1 below.

Table 11.1: Compliance with Massachusetts River and Stream Crossing Standards

Stream Crossing (STA. #)	SCGS #1	SCGS #2	SCGS #3	SCGS #4	SCGS #5	SCGS #6
Culvert No. 1 Replacement at STA. 329+85	Not met	Partially Met	Not met	Met	Met	Met
Culvert Replacement STA. 340+10	Not met	Met	N/A	Met	Met	Not met
Culvert No. 2 Replacement at STA. 346+20	Not met	Partially Met	Met	Met	Met	Met
Prop. Timber Boardwalk at STA. 351+50	Met	N/A	Met	N/A	Met	Met
Culvert Replacement at STA. 358+51	Not met	Not met	N/A	Met	Met	Not met

The proposed replacement concrete box culverts at Sta. 329+85 and Sta. 346+20 achieve partial compliance with the Massachusetts River and Stream Crossing Standards (revised March 2011) as discussed below and summarized in Table 11.1 above. SCGS #1 cannot be complied with for either culvert. An open bottom culvert requires the installation of a footing which will result in significantly more excavation and, as a result, significantly more impacts within the surrounding wetland resource areas.

The proposed timber boardwalk pedestrian bridge at Sta. 351+50 achieves compliance with the Massachusetts River and Stream Crossing Standards by conforming with the SCGS #1, #3, #5, and #6. SCGS #2 and SCGS #4 do not apply.

The proposed embedded 36-inch diameter DIP culvert at Sta. 340+10 and the proposed 16-inch DIP culvert Sta. 358+51 both convey intermittent streams under the former railroad bed. These culverts will achieve partial compliance with the MA SCGSs as discussed below and summarized in Table 11.1 above.

SCGS #1 posits that "*Spans (bridges, 3-sided box culverts, open-bottom culverts or arches) that preserve the natural stream channel are strongly preferred*." The project proposes the replacement of the existing undersized culverts with larger box culverts. The existing culverts are not open bottom, and replacement of the culverts with open bottom structures is not feasible in order to expeditiously complete the replacement of the culverts, without disturbing substantially more adjacent resource areas and established site hydrology. An open bottom culvert requires the installation of a footing which will result in significantly more excavation and fill within the surrounding wetland resource areas. Therefore, this standard cannot be complied with. The proposed timber boardwalk pedestrian bridge at Sta. 351+50 will preserve Proctor Brook's natural stream channel and therefore complies with SCGS #1.

SCGS #2 provides recommendations for a culverted crossing to be embedded a minimum of 2 feet for box culverts or at least 25% for round pipe culverts. When embedment material includes elements > 15 inches in diameter, embedment depths should be at least twice the D84 (particle width larger than 84 % of particles) of the embedment material.

As shown in the Plans, the proposed concrete box replacement Culverts 1 and 2 will be embedded 12" with a natural streambed material proposed in the bottom of Culverts 1 and 2 at the same elevations as the existing surface. Embedding of these box culverts to the depth of 2 feet is not feasible due to the need to maintain the distance between the bottom of the structures and the existing 42-inch sewer lines located below both crossings, as shown on the Culvert 1 and Culvert 2 Plan and Longitudinal Section sheets in Appendix I. Considering that the embedment depth of a minimum of 2 feet for box culverts is

recommended in order to prevent streambed washout, and ensure compliance and long-term success of the proposed replacement stream crossing, the proposed design at both culverts includes concrete baffles in the bottom of box culverts to help hold the 12-inch layer of natural streambed in place and prevent washouts.

The proposed 36-inch culvert at Sta 340+10 will be embedded 12-inches, which exceeds the recommended minimum embedment depth of 25% for the round pipe culverts. This culvert was upsized in order to be embedded to provide a layer of natural streambed to match the existing surface elevations.

The proposed 16-inch DIP conveying an intermittent stream beneath the proposed bikeway at Sta 358+51 is not being embedded due to the small diameter of the culvert under both the existing and proposed conditions; upsizing this culvert significantly to allow for embedment and placement of natural streambed within it is precluded due to the hydraulic requirements. In addition, significantly upsizing this culvert to be embedded to provide enough room for placement of the natural streambed material would result in the need to elevate the profile of the bike path at this location, resulting in more impacts to the existing Bank of the stream as well as fill within the 100-year floodplain.

SCGS #3 calls for a new span to incorporate a width that, at a minimum, equals 1.2 times bankfull width of the stream.

- Proposed Culvert No. 1 (Sta. 329+85) – The existing bankfull width is approximately 19 feet, however, the existing twin culvert spans approximately 7 feet and therefore does not comply with the SCGS. The proposed span of the culvert replacement is 8 feet. Although the proposed span still does not meet the SCGS of 1.2 times bankfull width, this is an improvement upon the existing conditions and meets the standards to the maximum extent practicable. It is not feasible to replace the culvert with a span greater than 8 feet, without disturbing substantially more adjacent resources areas and the established site hydrology. A hydraulic study was done to match existing flows and not to increase the base flood elevation associated with Proctor Brook. The culvert was sized using hydrological calculations to ensure no potential flooding of the properties and infrastructure will occur as a result of this replacement. It was found that further increasing the hydraulic opening for this culvert in order to meet this standard would increase downstream flooding, which is not permitted. Therefore, this standard is met to the MEP.

- Proposed Culvert No. 2 (Sta. 346+20) – The bankfull width of the stream at the location of Culvert No. 2 is approximately 6 feet. The proposed culvert replacement has a span of 8 feet, which approximately 1.33 times the bankfull width of the stream, and therefore meets SGS #3.

- Proposed Timber Boardwalk Pedestrian Bridge (Sta. 351+50) – The bankfull width of the stream at the location of the proposed timber boardwalk is approximately 35 feet. The span of the proposed timber boardwalk is approximately 437 feet which greatly exceeds the minimum of 1.2 times the bankfull width of the stream in order to avoid greater impacts to surrounding resource area, and therefore meets SCGS #3.

- Proposed embedded 36-inch DIP culvert (Sta. 340+10) – Per ACOE terminology, an intermittent stream has flowing water during certain times of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow. Since this culvert conveys an intermittent stream that does not have a year-round flow, this standard is not applicable. However, the proposed design evaluated all opportunities for improvement recommended by the

MA Stream Crossing standard. The approximate width of the intermittent stream during the flow period both at the culvert inlet and outlet is approximately 9 feet. The existing 30-inch CMP is proposed to be replaced with the 36-inch DIP culvert, that will be embedded 12 inches with a layer of natural streambed material in the bottom of it to meet the existing surface elevations. Therefore, the proposed design results in an improvement upon the existing conditions at this stream crossing by embedding the culvert 12 inches and, therefore, increasing the width of the crossing at this location.

- Proposed 16-inch DIP culvert (Sta. 358+51) – As mentioned above, this standard it not applicable to intermittent streams. However, the proposed design evaluated all opportunities for improvement recommended by the MA Stream Crossing standard. The width of the intermittent stream both at the culvert inlet and outlet is approximately 9 feet. The existing 15-inch RCP is proposed to be replaced with the 16-inch DIP culvert, which is an improvement upon the existing conditions at this stream crossing. Since this culvert is conveying and an intermittent stream beneath the existing railroad bed, significant widening of the crossing is precluded due to the hydraulic requirements and to maintain a shallow for depth of cover required to avoid additional fill within the 100-year floodplain.

SCGS #4 calls for placement of natural substrate within the structure. As shown in the Plans, the proposed replacement Culverts No. 1 and 2 will utilize concrete box culvert span-type structures of larger dimensions than existing culverts and will accommodate 12 inches of natural streambed material in the bottom. In addition, natural streambed material will be placed on top of the riprap in the areas of scour countermeasures outside of the culverts in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The limits if riprap required for scour protection were minimized to the maximum extent feasible.

The proposed embedded 36-inch culvert at Sta. 340+10 and the proposed 16-inch culvert Sta. 358+51 both convey intermittent streams under the former railroad bed; placement of the stone at pipe ends is required to prevent scour. As shown on the plans, a 12-inch layer of natural streambed material will be placed on top of the stone for pipe ends at Sta 340+10 within the stream areas in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The proposed measures will result in providing a smooth transition from upstream to downstream of the crossing upon completion of construction.

SCGS #5 calls for "… *bed forms and streambed characteristics so that water depths and velocities are comparable to those found in the natural channel at a variety of flows*." The proposed Culverts No. 1 and 2 have been designed to provide as much accommodation to the existing channel as possible, and natural stream bed will allow for a smooth transition from upstream to downstream of each crossing upon completion of construction. Natural streambed material will be placed on top of the riprap in the areas of scour countermeasures outside of the culverts in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The proposed timber boardwalk pedestrian bridge will preserve Proctor Brook's existing streambed characteristics. The proposed 36-inch Culvert at Sta. 340+10 will be embedded 12-inches with a layer of natural streambed material in the bottom of the culvert to meet the existing surface elevations. In addition, natural streambed material will be placed on both ends of the culvert on top of the stone for pipe ends in order to reestablish natural substrate adjacent to the proposed structures upon completion of construction. The proposed 16-inch DIP culvert at Sta. 358+51 will also maintain the existing streambed characteristics. Due to a very small area of riprap at the inlet and outlet at the proposed 16-inch DIP culvert at Sta. 358+51, no natural streambed layer is proposed; however, due to the location and the flow of this intermittent steam in the west-to-east directed, it is expected to be naturally reestablished shortly upon completion of construction.

SCGS #6 provides a desired level of "*openness*" for stream crossings so that wildlife will utilize the crossing for passage beneath a roadway. The desired ratio of cross-sectional area of opening to passage length is a minimum value of 0.82 feet. The embedded portion of a culvert is not included in the calculation of cross-sectional area for determining openness.

- Proposed Culvert No. 1 (Sta. 329+85) – A cross-sectional area of 24 square feet for the proposed culvert, divided by a passage length of 24 feet, both as shown in the Plans, yields a value of 1 foot.
- Proposed Culvert No. 2 (Sta. 346+20) – A cross-sectional area of 24 square feet divided by a passage length of 18 feet, both as shown in the Plans, yields a value of 1.33 feet.
- Proposed Timber Boardwalk Pedestrian Bridge (351+50) – A cross-sectional area of approximately 368 feet divided by a passage length of 13 feet, both as shown in the Plans, yields a value of 28.27 feet.
- Proposed embedded 36-inch DIP culvert (Sta. 340+10) – A cross-sectional area of the existing 30-inch CMP is approximately 4.9 square feet, divided by a passage length of 20 feet, both as shown in the Plans, yields a value of 0.24 feet. As mentioned above, upsizing this culvert significantly to allow to increase a level of "openness" is precluded due to the hydraulic requirements. The proposed 36-inch embedded replacement culvert's cross-sectional area is 5 square feet, therefore, though it is an improvement over existing conditions, it is not able to meet Standard #6 by providing a minimum level of openness of 0.82 feet.
- Proposed DIP culvert (Sta. 358+51) - A cross-sectional area of the existing 15-inch culvert is approximately 2.5 square feet. The proposed cross-sectional area of the 16-inch DIP culvert is 2.6 square feet, both divided by a passage length of 25 feet yield a value of approximately 0.1 feet. Therefore, the proposed replacement culvert is not able to meet Standard #6 by providing a minimum level of openness of 0.82 feet due to the. As mentioned above, upsizing this culvert significantly to allow to increase a level of "openness" is precluded due to the hydraulic requirements and to avoid additional impact the BLSF and the Bank of the stream.

As shown above, the proposed replacement of the perennial stream culverts and the proposed timber boardwalk pedestrian bridge are all able to meet Standard #6 by providing a minimum level of openness of 0.82 feet.

12.0 ALTERNATIVES ANALYSIS

Alternatives for the project included the "No-Build Alternative". The "No-Build Alternative" would lead to the bikeway extension not being constructed. Since the intent of this project is to extend the Independence Greenway by constructing a continuous shared-use path for bikers and pedestrians in order to continue the development of the Independence Greenway for Peabody's residents and visitors and as an important community and regional greenway network, therefore, the "No-Build Alternative" will not meet the purpose and need of the project, and it was therefore dismissed from further consideration.

A variety of alternatives were evaluated during the planning stages of the project. Options such as alternative sites, alternative alignments, and typical cross sections were evaluated. The primary purpose of the project was to develop a connection from the existing Peabody Independence Greenway path to the greater Border to Boston Trail, a developing shared use path network that will stretch 70 miles between the MA-NH state line and Boston. An alternative that involved using Warren Street extension as a segment of the path was also evaluated; however, one of the major design considerations was avoiding placing the shared use path for bicyclists and pedestrians directly adjacent to an existing high-traffic roadway in order

to promote safety. Additionally, this alternative location would not keep the shared use path as a linear connection, another one of the primary design goals for the project.

Additionally, options for narrowing sections of the shared use path, when wetland resources would be impacted, were also considered in order to reduce the overall resource area impacts of the project. However, the minimum width for a shared use path is 10 feet per MassDOT PDDG Section 11.4.1.1 and the minimum should width for a shared use path is 2 feet per MassDOT PDDG Section 11.4.1.2 and therefore these options were not feasible and therefore were not developed into substantial alternatives. While the path was not able to be narrowed in order to avoid wetland impacts, the grade of the proposed pathway was lowered to the maximum extent feasible to reduce floodplain impacts, the slide slopes of the path were tightened as much as possible, and a boardwalk with helical piles was proposed in lieu of traditional foundations to avoid large amount of fill within the floodplain and wetlands. The proposed depth of riprap is the minimum amount required to provide scour counter measures at the culverts in order to mitigate greater impacts to the brook while also meeting the project goals of restoring the natural stream bed and preventing future scour.

The following alternatives detailed below reflect the alternatives that were deemed the most feasible in order to meet the objectives of the project while also minimizing the environmental impacts to the maximum extent practicable. Each of the alternatives below more thoroughly detail the proposed alternatives that were carefully evaluated, and each reflect the above-described efforts to avoid, minimize, and mitigate environmental impacts while still meeting the project's purpose.

This section describes the alternatives for the major features, broken down by segment, of the proposed Greenway Extension that were analyzed and considered during the design process.

SEGMENT 1: ESSEX CENTER DRIVE: INDEPENDENCE GREENWAY TRAILHEAD TO UNDERPASS UNDER ROUTE 128

Alternative 1: 10-foot-wide travel lanes, five-foot striped bicycle lanes

Alternative 1 proposes to restripe Essex Center Drive with 10-foot-wide travel lanes and five-foot striped bicycle lanes. The bicycle lanes will be located on the outside of the motor vehicle lanes. Roadway widening or reconstruction is not anticipated under this alternative.

The westernmost 400 feet, passing the Lahey Medical Center parking lot from the existing trailhead, will be marked with shared lane markings and appropriate signage under this alternative. This is necessary due to the narrower width of the roadway in this area. This Alternative separates bicyclists from pedestrians, increasing the comfort of the latter relative to that of a shared-use path. However, bicyclists would need to share the roadway with motor vehicles. This represents a change in character from that of the existing bicycle route on the Greenway.

Alternative 2: 11-foot-wide travel lanes, 10-foot-wide multiuse path with buffer

Alternative 2 proposes Essex Center Drive to be reconstructed to provide 11-foot-wide vehicle travel lanes and replacing the existing sidewalk along the south side with a 10-foot-wide raised multiuse path with 5 feet of separation from the roadway. This will continue the character of the Greenway and will increase comfort for Greenway users when compared with on-street lanes. The raised multiuse path would be widened into the existing roadway and beyond the existing sidewalk, while maintaining the existing curb

along the north side of Essex Center Drive. A catch basin will need to be constructed at the corner of the intersection with the mall driveway and underpass to replace the existing due to the change in curb line.

Coordination with Northshore Mall and MassDOT has occurred and approval was stated in August 2023 to reconstruct the roadway with horizontal and vertical separation from the proposed shared-use path and to have part of the shared-use path occur within state layout with the City of Peabody maintaining the path. Coordination is ongoing regarding changes to access to the existing trailhead parking area that borders the Mall-owned portion of Essex Center Drive and the Lahey Medical Center. Additionally, to accommodate the continuation of the trail, parking would be prohibited on the south side of the shared roadway section before the sidewalk and bicycle lanes begin. This being stated, separating bicycle traffic from motor vehicle traffic is the preferred alternative for comfort and safety reasons.

SEGMENT 2: UNDERPASS UNDER ROUTE 128 BETWEEN ESSEX CENTER DRIVE AND NORTHSHORE ROAD

Alternative 1: Divert trail users onto sidewalk of the underpass

Alternative 1 proposes to have trail users divert from the proposed bicycle lanes on Essex Center Drive and from the proposed separated path on Northshore Road to use the sidewalk to connect through the underpass under Route 128. Bicyclists coming from the underpass sidewalk would be alerted to walk across Essex Center Drive at a proposed mid-block crossing west of the intersection of Essex Center Drive with the mall roadway to access the proposed westbound bicycle lane on Essex Center Drive. Although this would have minimal cost, this is not an ideal condition given that the existing sidewalk on the south side of the underpass is less than five feet wide.

Alternative 2: Sign and mark the outside lanes of the underpass as shared lanes, accommodate WB traffic with two stage left turn box and enhanced crossing markings through the Essex Center Drive intersection

Alternative 2 would stripe the outside lanes of the underpass with shared lane markings in each direction, and with appropriate signage alerting roadway users to the presence of the shared use lanes. In addition, this alternative would stripe a bicycle travel path through the intersection at the north end of the underpass to connect to Essex Center Drive. This path of travel would include a two-stage left- turn queue box which will provide bicyclists with a better opportunity to wait for a gap in opposing traffic to turn left. This alternative allows bicyclists to avoid the discomfort of dismounting and walking on the narrow sidewalk of the underpass. However, bicyclists would be requested to cross the underpass road on the roadway surface to continue towards the direction of the existing Greenway trail and thus presents bicyclist comfort and safety issues.

Alternative 3: Convert one roadway lane into 10-foot-wide multiuse path with 2 feet of buffer

As approved per discussion with the Northshore Mall and MassDOT in August 2023, the southbound underpass connecting Essex Center Drive and Northshore Road will be reduced from two to one vehicle lanes to provide a 10-foot-wide raised multiuse path with a 2-foot buffer and vertical separation from the curb abutting the roadway traffic. The roadway would be restriped to have one 11-foot travel lanes with 1.5-foot-wide shoulders. The curb along the roadway median will be maintained. This conversion will continue the character of the Greenway and will increase comfort for Greenway users when compared with on-street lanes in an unlit underpass. Review of existing and projected future traffic volumes indicates that it is not anticipated that the southbound lane reduction will result in traffic blocking Essex

Center Drive. This alternative would maintain motor vehicle/bicyclist separation and thus provide the greatest level of safety and comfort amongst the underpass alternatives. A catch basin will need to be constructed to replace the existing catch basin location approximately midway along the underpass due to the change in curb line.

Alternative 4: Seasonal closure of underpass lane for use as shared-use path

A variant of Alternative 3 proposes to close the leftmost southbound underpass lane to motor vehicle traffic during warmer months to provide a shared-use path with temporary bollards separating the path from the remaining lane. The temporary bollards would be removed in colder months when the shared-use path would be less frequently used such that the underpass would maintain two motor vehicle lanes in the southbound direction and bicyclists would dismount to use the remaining sidewalk. This alternative is not recommended as dismounting compliancy may be low and that this alternative would not always provide separation from motor vehicle traffic.

The preferred alternative for the Route 128 underpass is Alternative 3. Continuing the character of the existing shared-use path is important, especially in this section where shading from the overhead roadway would reduce visibility of bicyclists. Maintaining physical separation between bicyclists and motor vehicles is important in maintaining the safety and comfort of trail users.

SEGMENT 3: NORTHSHORE ROAD FROM ESSEX CENTER DRIVER TO RAILROAD RIGHT-OF-WAY

The proposed design for the Greenway Extension along Northshore Road comprises a multiuse path along the west side of the road and parallel to Route 128. The cross section is proposed to consist of a 10-foot-wide paved shared-use path with nine feet of separation from the path and curb along Northshore Road. On the highway side a grass drainage swale is proposed beyond the shoulder.

A road crossing is necessary to connect the path from the north side of Northshore Road to the proposed segment following the former railroad layout to the south.

Alternative 1: Install Standard W11-1 bicycle warning signage at the crossing

Alternative 1 proposes installing a standard crosswalk treatment, with W11-1 signage at the crosswalk and approximately 200’ in advance of the crosswalk. This treatment will make the crossing visible to drivers and ensure the safety of trail users crossing to/from North Shore Road and the old railroad ROW.

Alternative 2: Install W11-15 with RRFB and detection

Alternative 2 Proposed at this crossing is enhanced crosswalk treatment consistent with what has been installed on the trail in West Peabody at the Russell Street crossing. This treatment would install W11-15 signage with a Rectangular Rapid-Flash Beacon (RRFB) at the crosswalk, with standard advance warning signage approximately 200’ away from the crosswalk.

SEGMENT 4: RAILROAD ROW FROM NORTHSHORE ROAD TO ENDICOTT STREET:

The proposed design for the Greenway Extension in this segment consists of a mostly consistent cross-section with a 10-foot paved bikeway and two-foot-wide shoulders. This segment consists of a vacant

railroad Right-of-Way which is owned by the City for open-space/recreational use and has long been abandoned.

It is noted that due to the railbed's paralleling of Proctor Brook, there are three brook crossings proposed within this segment. Two precast concrete culverts are proposed while an approximately 450-foot-long wooden boardwalk with 11 feet of clear width is proposed approximately 350-750 feet west of Endicott Street.

Landscaping treatments with textured asphalt are proposed at the Northshore Road and Endicott Street trailheads. These treatments will serve to transition trail users to either the roadside trail segment along Northshore Road, or the sidewalk/roadway along Endicott Street. At each of these roadway crossings, a high-visibility crosswalk with RRFB are proposed.

The portion of the shared-use trail in the vicinity of the washed away railroad bridge requires construction of a light duty structure in order to make the former railroad right-of-way usable for a bicycle/pedestrian path and to avoid filling protected wetland resources areas and FEMA-designated 100-year floodplain associated with Proctor Brook. This structure would then tie into the proposed timber boardwalk from the east, which was designed at this location in order to avoid filling the wetland resource areas and the FEMA 100-year floodplain.

The various proposed bridge design alternatives are detailed below. Two (2) viable structure types and four (4) viable substructure and foundation types were considered, and the recommended foundation type of helical piles spaced 8'-0" to 14'-0" center-to-center and retaining walls comprised of timber lagging at each end of the boardwalk, was used in developing the following four (4) bridge alternatives:

Alternative A: Timber Boardwalk (Preferred)

The proposed timber boardwalk alternative consists of a timber deck with a 60'-0" structure length with multiple 8'-0" equal spans for the length of the structure. The boardwalk will have an out-to-out width of 13'-0" to provide a clear width that accommodates a 10'-0" wide pedestrian/bike path with two (2) 1'-0" shoulders. The proposed timber railing is 3'-6" high with vertical timber pickets spaced less than 4" apart with a continuous top handrail and bottom rub rail. All these railing components are required to meet state and federal (OSHA) safety standards for this type of path. The proposed timber decking is comprised of 2x6 timber boards placed transverse to the centerline of the path. The deck boards have a ¼" between their edges to provide a safe continuous riding surface that also allows for minor thermal expansion and contraction. There is an average of ~4-feet between the ground and the bottom of the 2x8 stringers which are spaced ~1-ft on center and support the deck planks for the full length of the boardwalk. Below the stringers there are timber bents comprised of three (3) 2x12s spaced every ~8-feet perpendicular to the center line of the path. This alternative has simple constructure methods, minimal environmental impacts, and requires minimal maintenance, resulting in lower lifecycle costs. In addition, it would be an extension of the timber boardwalk proposed east of this crossing, eliminating the need for additional substructure components on the east side, therefore, minimizing impacts to wetland resource areas and FEMA 100-year floodplain. The proposed substructure type would provide ease of constructability, lower material cost, and lessen the environmental impacts to adjacent sensitive areas. Timber Boardwalk on Helical Piles is the recommended alternative because it provides the most cost-effective structure with the fewest impacts to the surrounding environmentally sensitive areas. This design also has the shallowest

superstructure for meeting hydraulic criteria and the simplest construction method, which uses smaller equipment that can access the site from the trail.

Alternative B: Prefabricated Steel Truss with a Concrete Deck

This proposed bridge design is 60'-0" long with an out-to-out width of 12'-0". The truss will be constructed offsite and delivered to the construction site. The installation will be quicker than traditional bridge construction and have the option for technical guidance and oversight provided by the prefabricator. The installation has minimal impact to the environment when compared to more traditional construction materials and methods, though, would result in more impacts to wetland resource areas and FEMA 100-year floodplain than the preferred alternative A due to installation to the substructure components to support the fabricated steel truss superstructure. The installation might be difficult due to site accessibility for construction equipment and vehicles.

Alternative C: Prestressed Concrete Spread Box Beams with a Composite Concrete Deck

In this proposed bridge design, four (4) S36-12 prestressed concrete spread box beams will be used. The beams will be composite with a 5" cast-in-place deck and have a 3" paved wearing surface. The beams may not be able to support a span length of 60'-0" without a pier. These prestressed concrete beams are manufactured under controlled conditions and are more resistant to corrosion and deterioration than their steel counterparts. This option is a better choice for bridges over water with high constant humidity and for areas where it is difficult to access the superstructure for maintenance work. This alternative requires minimal maintenance, resulting in lower life cycle costs; however, the constructability and component delivery may be difficult due to site accessibility. This design is also significantly heavier than the timber boardwalk or timber beam alternatives and requires large equipment to ship and erect. This alternative would result in more impacts to wetland resource areas and FEMA 100-year floodplain than both Alternatives A and B due to installation to the substructure components, including potential need for an additional pier, to support the proposed superstructure with a span length of 60'-00".

Alternative D: Timber Bridge Structure with Timber Deck

This proposed design consists of three (3) 60'-0" glulam stringers spaced 5'-0" apart. Due to the loading requirements, the minimum depth of each beam would be 36". This depth exceeds the permissible depth requirements for wetland protection and hydraulic opening requirements and would result in even more extensive wetland resource area and FEMA 100-year floodplain impacts. The constructability and delivery of beams would prove to be difficult due to site constraints. However, the timber aesthetic would match the timber of the timber boardwalk and the design would require less maintenance than a steel structure over water.

Culvert Replacements

The potential benefits of replacing the existing culverts with culverts with larger openings under the projected 2070 storm conditions were evaluated. It was found that, based on the hydraulic analysis, replacing the existing culverts with larger openings, even just slightly larger openings than proposed, would result in increased downstream flooding, which is not permitted and would result in flood impacts to the surrounding community. HEC-RAS was used to calculate the water levels with projected flows based on updated precipitation estimates from NOAA 14 Plus. See the table 12.1 below for comparisons of water

levels and flows at the culvert crossings for the 10-year, 50-year, and 100-year storms for current flows versus the 2070 projected flows. The culverts were already experiencing overtopping and are also projected to overtop under the projected 2070 flows. For the boardwalk, the elevations do not overtop, even under the projected 2070 flows.

Table 12.1: HEC-RAS Results for 2070 Projected Flows

Location	10-Yr Storm (ft)	10-Yr Storm (2070) (ft)	50-Yr Storm (ft)	50-Yr Storm (2070) (ft)	100-Yr Storm (ft)	100-Yr Storm (2070) (ft)
Upstream of Culvert 1	45.01	*45.94*	46.17	*46.37*	46.33	*46.5*
Upstream of Culvert 2	40.86	*41.04*	41.25	*41.44*	41.39	*41.59*
Upstream of Boardwalk	39.33	*39.54*	39.82	*40.05*	40.19	*40.44*

Scour Countermeasures and Bank Protection Alternatives

In addition to evaluating a variety of different alternatives for the locations and design of the pathway segments, various alternatives for the areas of riprap placed for slope stabilization in BVWs adjacent to the top of the bank associated with Proctor Brook near the proposed Culverts No. 1 (Sta. 329+85) and No. 2 (Sta. 340+10) were evaluated in order to select the alternative with the least impacts to the surrounding resource areas. The alternatives analysis that was conducted for the rip rap areas is listed in Table 12.2 below.

Table 12.2: Alternatives for Rip Rap at Culvert Inlets/Outlets

Alternative	Details/Reason for Selection/Dismissal
Riprap for Scour Protection and Bank Stabilization	Dumped riprap was originally proposed in the riverbed at the proposed culvert inlets and outlets for scour protection. These riprap countermeasures extended slightly into the adjacent BVWs affecting the existing limits of the Bank of Proctor Brook. The proposed design minimized the extent of the required riprap countermeasures at culvert ends to the maximum extent feasible to still be able to provide the required protection from future scour. However, these impacts are unavoidable. The riprap countermeasures were designed in accordance with the guidelines outlined in Hydraulic Engineering Circular No. 14, specifically Chapters 5 and 10. These guidelines were utilized to estimate scour levels at culvert outlets and to develop the design for riprap basins and aprons, respectively. This alternative was modified to address MassDEP comments received during the MEPA ENF Review.

Vegetated Bank without Riprap	Nature-based solutions and biotechnical engineering countermeasures, such as are described in FEMA's document entitled "*Engineering With Nature - Alternative Techniques to Riprap Bank Stabilization*" and FHWA "*HEC 23 - Bridge Scour and Stream Instability Countermeasures Experience, Selection, and Design Guidance Third Edition"* were also evaluated in order to minimize adverse impacts to Bank, LUW and other jurisdictional resource areas. Utilizing natural methods of slope stabilization such as coir logs, willow whips, deeply rooted bunch grasses, keyed logs, etc. is not feasible for the banks steeper than 2:1. The proposed bank is 1.5:1 and the majority of the reviewed natural methods are not suitable for this incline. Therefore, not utilizing riprap does not achieve the goal of protecting and stabilizing the bank of Proctor Brook near the proposed replacement stream crossings beneath the bike path. It is also required to protect against scour during overtopping flow. Therefore, this alternative was dismissed from further consideration.
Vegetated Riprap for Bank Protection (Selected)	Due to the proposed slope being 1.5:1 at both stream crossing locations (Culvert No.1 and Culvert No. 2), there are limited biotechnical engineering countermeasures for bank stabilization. Most vegetative measures for bank stabilization are only recommended for up to 2:1 slopes. We reviewed the FHWA "*HEC 23 - Bridge Scour and Stream Instability Countermeasures Experience, Selection, and Design Guidance Third Edition*" and determined that one method they provide could be modified for the rip rap slope at Culvert No. 1 and Culvert No. 2. The selected method is to plant live stakes in the voids between the riprap. Because of the size and depth of the rip rap needed to protect the bank, live stakes will need to be 4 feet in length to allow them to be installed into the granular fill and subsoil under the rip rap. A description of the live stakes is provided in (Item 799.775 – Live Stakes), attached to this Report in Appendix E. A detail including installation methods is provided on the drawings.
Natural Streambed Restoration within Riverbed (selected)	In order to mitigate the impacts to the LUW of Proctor Brook associated with the high volume of riprap required at the culvert inlets and outlets for scour protection, a 12-inch (minimum) layer of natural streambed material will be placed on top of the riprap to reestablish the natural streambed, and it will match existing invert elevations.

Stormwater Mitigation

Several different stormwater best management practices were also evaluated in various locations throughout the project, including environmentally sensitive site design, low impact development techniques that minimize land disturbance and impervious surfaces, structural stormwater best management practices, pollution prevention, erosion and sedimentation control, and proper operation and maintenance of stormwater best management practices.

Primarily, infiltration SCMs were considered for the project in various locations; however, only one location was found to be feasible for an infiltration SCM due to limited space constraints, the seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. The only location that was found feasible for an infiltration SCM is the location of the proposed infiltration trench located adjacent to the proposed shared use path along North Shore Road, between the shared-use path and Route 128 (Northbound). While the location of this proposed infiltration SCM is outside of WPA jurisdiction, the proposed infiltration trench will still help improve the quality of discharged stormwater from the overall project. Due to the close proximity of wetlands to the proposed shared-use path throughout the rest of the project, as well as the seasonal high groundwater elevation and presence of existing utilities, it is not possible to provide additional infiltration SCMs within WPA jurisdiction.

Additionally, drywells were considered for additional stormwater treatment, but these provide very little stormwater treatment volume, require 2 feet of separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points. Another alternative that was evaluated for this project was the use of proprietary devices at each discharge point for the stormwater treatment volume, but due to the majority of the site discharging runoff via overland flow, these systems are not practical for this project.

13.0 CONCLUSION

After careful analysis of the many different alternatives, the overall proposed chosen project was designed to meet its purpose and need which is to extend the Independence Greenway along the existing railroad right of way between the terminus point near the Northshore Mall to Endicott Street and to create a shared-use path intended to provide the highest level of service to bikers and pedestrians, providing protection from vehicles and limiting the number of crossings to the extent possible. The proposed Greenway provides public health benefits, economic and alternative transportation benefits, and provides a source of community pride and identity. It provides people of all ages with an attractive, safe, accessible, and no-cost destination to cycle, walk, or jog. Additionally, it provides a safe route to schools and neighborhoods for Peabody residents and away from Peabody's congested roadways. It is an efficient and safe alternative transportation resource for residents to commute to work, public transportation stations, as well as areas of commerce or public spaces. Finally, the Greenway connects the community to several large open space/conservation areas, such as Marble Meadows, Proctor Brook, Crystal Lake, and the Ipswich River, as well as areas of historical significance, such as Jacobs Cemetery and the Giles Corey Memorial, while simultaneously preserving a former transportation corridor providing the community a glance at the importance of Peabody's role in the region's railway network.

The project has been designed to avoid wetland resource area impacts to the maximum extent practicable. All unavoidable impacts will be mitigated in accordance with regulatory requirements. The applicant respectfully requests that MassDEP find these measures adequately protective of the interests identified in the 401 Water Quality Regulations and issue a Water Quality Certificate approving the work shown on the accompanying plan set.

APPENDICES

APPENDIX A – PUBLIC NOTICE

Public Notice

Massachusetts Department of Environmental Protection
Division of Wetlands and Waterways
100 Cambridge Street, Suite 900
Boston, MA 02114

Pursuant to 33 U.S.C. 1341 and M.G.L. c. 21 § 43 and 33 U.S.C. 1341 and M.G.L. c. 21 §§ 26 - 53, notice is given of a Combined Application for 401 Dredging, Fill/Excavation Water Quality Certification for the proposed work associated with the Independence Greenway Extension Project in the City of Peabody, Massachusetts by the City of Peabody Department of Community Development and Planning, 24 Lowell Street, Peabody, MA 01960 with construction funding from Massachusetts Department of Transportation – Highway Division, Ten Park Plaza, Room 7360, Boston, MA 02116. This project will involve extending the existing Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street in Peabody, Massachusetts for a total project length of approximately 1.3 miles. Additional information may be obtained from the Applicant's representative, Green International Affiliates, Inc. located at 100 Ames Pond Drive, Suite 200 Tewksbury, MA 01876, attention Danielle Spicer, or by emailing dspicer@greenintl.com. Written comments should be sent to MassDEP, Attention Heidi Davis, 100 Cambridge Street Suite 900, Boston, MA 02114 within 21 days of this notice. Any group of ten persons, any aggrieved person, or any governmental body or private organization with a mandate to protect the environment who submits written comments may appeal the Department's Certification. Failure to submit written comments before the end of the public comment period may result in the waiver of any right to an adjudicatory hearing.

APPENDIX D – SPECIAL PROVISIONS

CONTRACTS:

- INCLUDE HERBICIDE REPORT FORM IN THE BOOK – SEE PROPOSAL DOCS FOLDER DOCUMENT A00810

REV. 2023.03.01 *(REV. DATE TO BE REMOVED BY CONTRACTS)*

ITEM 102.3 HERBICIDE TREATMENT OF INVASIVE PLANTS HOUR

This work must be performed by persons who meet the qualifications below and are approved by the Landscape Design Section.

Work under this item consists of herbicide treatment of invasive plants currently existing within the project limits and as directed. An Invasive Plant Management Strategy (IPMS) shall be submitted to the Engineer for review and approval and the IPMS shall be implemented on-site. The IPMS shall be measured and paid for under Item 102.33 Invasive Plant Management Strategy.

Work under this item shall be coordinated with work and schedule for Selective Clearing, Clearing and Grubbing, Mowing, Tree Removal, Planting, and Wetland Mitigation items.

Payment is per hour on-site and shall be compensation for a minimum crew of 2 licensed applicators, 2 back-pack sprayers and mist-blowers, a properly equipped spray truck with spray hoses, and a tank with sufficient capacity for a full day of work. If there is only one applicator, hourly payment shall be adjusted to 50 percent of the unit price. This item is not intended for manual removal of plants.

Management of plants determined to have been introduced to the site via imported loam, compost, mulch, plants, equipment, or other construction activities will be the Contractor's responsibility and at the Contractor's expense.

Herbicide shall be applied during daytime hours only.

Measures to prevent the introduction of invasive plant species to the site and to address introduction due to construction-related activities shall be covered under the Standard Specifications, Division I - Subsections 7.01(D) Plant Pest Control and 7.13 Protection and Restoration of Property as amended in these Special Provisions.

Plant species targeted for management under this item shall be as determined in the field per the site walk and as specified in the IPMS.

The definition of invasive plant species shall be as described by Massachusetts Invasive Plant Advisory Group (MIPAG): "non-native species that have spread into native or minimally managed plant systems in Massachusetts, causing economic or environmental harm by developing self-sustaining populations and becoming dominant and/or disruptive to those systems."

Control of invasive plants shall begin immediately with the initiation of construction activities and prior to any clearing or site disturbance. Treatment areas shall include stockpile locations and may, upon approval of the Engineer, extend outside the project limit. Treatment shall be done each consecutive year for the duration of the contract unless specified otherwise in the IMPS or unless directed otherwise by the MassDOT invasive species contact. Work shall be done during the growing season from May – October unless otherwise specified in the IPMS.

Areas identified for vegetation control measures shall be as shown on the plans and as determined in the field by the Engineer and a MassDOT Landscape Architect. Contact at MassDOT Landscape Design Section may be contacted at: Maxell.R.McNulty@dot.state.ma.us.

QUALIFICATIONS

The applicators shall submit and meet the qualifications outlined below. A list of contractors specializing in invasive management and approved by MassDOT Landscape Design Section is available on the following website: https://www.mass.gov/lists/landscape-design-and-roadside-maintenance under Invasive Plant Management.

Requirements

1. Company must provide proof of qualifications by providing the following:
    a. Narrative describing company, its expertise and experience with invasive plant control.
    b. Demonstrate experience with herbicide treatment as part of restorations and in sensitive areas.
    c. Describe company's technical qualifications and past performance.

2. Company must meet licensing requirements:
    a. All crew applicators must have a Massachusetts Commercial Applicator License (CORE).
    b. At least one or more applicator must have a ROW certification, if required for work.
    c. Company must provide name(s) of applicator(s) and Applicator License/Certification number for all contractor crew leaders working on the project.
    d. Company must provide documentation of any warnings, penalties or fines received in the last three (3) years.

3. Company must provide proof of experience with invasive plant control and include following:
    a. At least five (5) references from prior invasive plant control work completed in last five (5) years. Provide contact information including address, phone number and email.
    b. Provide a summary of each of these projects including nature of the problem, specific invasive vegetation treated, dates and period of treatment, methodologies used, and summary of success or not in terms of meeting performance objectives. Include summary of equipment used.
    c. Photo documentation of these projects.
    d. GPS coordinates of project locations, if available.

4. Crew leader must have expertise with invasive plant control and provide the following:
    a. Have held Core license for at least five (5) years.
    b. Resume listing five (5) or more years of experience applying pesticides with the company or with another company specializing in vegetation management.

SUBMITTALS

No work shall begin without approval of the submittals.

Submittals include the following items:

Invasive Plant Management Strategy (IPMS)

At least thirty (30) days prior to proposed treatment the IPMS shall be submitted for approval by the Engineer and MassDOT Landscape Architect. All chemicals, methods and work done under this item shall be consistent with the IPMS. The IPMS shall be as described under Item 102.33.

Herbicide Use Report

Within two (2) weeks after each application, the Contractor shall provide to the Engineer a completed and signed MassDOT Herbicide Use Report.

Photo Documentation

Digital photos with date and time of herbicide application work may be required and shall be submitted upon request.

MATERIALS

All proposed herbicides shall be as approved in the IPMS. Herbicides shall be labeled for the method of treatment and shall meet all federal, state and local regulation requirements. Application rates will depend on herbicide proposed and shall be per the manufacturer's label for specific application.

METHODS

All methods used shall be as approved in the IPMS which shall be determined during the Initial Site Walk as described under Item 102.33 Invasive Plant Management Strategy.

The Contractor shall be responsible for marking delineated areas and plants to be preserved, removed, or otherwise treated. Fencing or other materials needed for marking and delineating protected areas shall be incidental to this item.

The Contractor shall notify the Engineer a minimum of 3 days prior to date of expected herbicide application. Applicators shall notify the Engineer upon arriving on-site and upon leaving the site.

Herbicide Applications

All herbicide application shall conform to Massachusetts Pesticide Laws and Regulations per the Massachusetts Department of Agricultural Resources (MDAR) Pesticide Bureau.

Mixing, applying and/or disposing of herbicides shall always be in accordance with instructions on their labels and all applicable federal, state, and local regulations. Mixing shall not occur within sensitive areas, wetlands, or buffer zones.

Contractor shall not spray 2 hours prior to precipitation, during rain, or during windy conditions. The Contractor shall be responsible for monitoring weather conditions and adjusting the work schedule as appropriate for the herbicide and application method to be used.

Targeted vegetation shall be identified and marked prior to treatment. Plants treated by foliar spray, injection or glove application or other methods that leave standing vegetation, as opposed to cut-stump application, shall remain clearly marked for identification through the contract period.

Desirable vegetation shall be protected from both spray and other physical damage.

Contractor is responsible for any damage to vegetation not designated for removal or treatment. Vegetation damaged shall be restored. Cost of replacement plants and/or restoration shall be borne by the Contractor.

Contractor shall ensure that the public does not enter a work area while herbicide application or spraying is underway.

Disposal Of Invasive Plant Material

All material to be cleared shall become the property of the Contractor. The satisfactory disposal of all cleared plant material (seeds, roots, woody vegetation, associated soils, etc.) shall be the Contractor's responsibility.

The Contractor shall take measures to prevent viable plant material from leading to further infestations (seeds, roots, woody material, etc.) while stockpiled, in transit, or at final disposal locations. All precautions shall be taken to avoid contamination of natural landscapes with invasive plants or invasive plant material.

Chipping, shredding, or on-site burning of plant material must be approved by the Engineer and included in the IMPS.

For plant material taken to an incinerating facility per the IPMS, a receipt from that facility shall be submitted to the Engineer as proof of disposal.

Where feasible, it is preferable to dispose of plants on-site or to bury them on-site with on-going monitoring for re-sprouting. Disposal locations and methods must be approved and included in the IPMS. Site work such as grading and seeding to stabilize and restore disposal area shall be incidental to this item.

The Contractor shall be responsible for treating or otherwise managing areas of re-growth due to improper disposal. Treatment shall be at the Contractor's expense.

Follow-Up Treatment

Plants and areas shall be re-treated as necessary and as appropriate to the time of year. Treatment shall be for the duration of the contract and per the IPMS.

MEASURE OF SUCCESS

The expectation is a minimum of 85-95 percent control achieved after the first treatment, depending on plants targeted and extent of population, and based on the expectations laid out in the IPMS. The expectation for the contract duration is 95-100% eradication by the end of the treatment period, unless otherwise specified in the IPMS.

METHOD OF MEASUREMENT

Item 102.3 will be measured for payment by the Hour of crew time spent on the project doing actual herbicide application work. A crew shall be defined as a minimum of two licensed applicators each equipped with (at minimum) back-pack sprayer and mist blower. The crew shall also have a properly equipped spray truck with hoses and a tank with sufficient capacity for a full day of work.

BASIS OF PAYMENT

Item 102.3 will be paid at the contract unit price per Hour, which price shall include all labor, materials, equipment, tools, and all incidentals required to complete the work.

Payment will be based upon time spent on the project doing actual work and shall not include travel time to and from the Contractor's place of business and shall also not include time for investigative field trips.

If there is only one applicator, hourly payment shall be adjusted to 50 percent of the unit price.

The Invasive Plant Management Strategy will be paid for under Item 102.33.

ITEM 102.33 INVASIVE PLANT MANAGEMENT STRATEGY HOUR

REV. 2023.03.01 *(REV. DATE TO BE REMOVED BY CONTRACTS)*

This item consists of providing an Invasive Plant Management Strategy (IPMS) for the control of invasive plants currently existing on the project site and/or as directed and shall be coordinated with Item 102.3 Herbicide Treatment of Invasive Plants. The IPMS shall be submitted for review and approval and the IPMS shall be implemented on-site.

Herbicide treatment for invasive plants shall be as described under Item 102.3 Herbicide Treatment of Invasive Plants and shall be compensated per that Item.

Work under this item shall be coordinated with work and schedule for Selective Clearing, Clearing and Grubbing, Mowing, Tree Removal, Planting, and Wetland Mitigation as relevant to the project.

Individual attending the site walk and determining the Invasive Plant Management Strategy must demonstrate expertise with vegetation management and invasive plant control and submit qualifications as described below.

QUALIFICATIONS

Individual shall be from the same company as that providing services for Item 102.3 Herbicide Treatment of Invasive Plants and shall submit the following, if not submitted under Item 102.3:

- Submit copy of current Core license.
- Submit a resume listing five (5) or more years of experience managing invasive plants with a company specializing in vegetation management.
- References shall be submitted if requested.

SUBMITTALS

Task Summary & Reports

For measurement of payment, the contractor shall submit the total sum and a breakdown of hours for the tasks performed. At a minimum, the tasks shall include the Initial Site Walk, the IPMS Written Report, and if necessary to accommodate project or site changes, a Follow-up Site Inspection and accompanying IPMS Amendment.

Interim Site Monitoring Reports and/or a Final Report shall be submitted if requested by the MassDOT Landscape Design contact. The MassDOT Landscape Design contact must be notified to attend the final walk through when a Final Report has been requested.

Invasive Plant Management Strategy (IPMS)

At least thirty (30) days prior to construction activities and/or any proposed treatment, submit a written IPMS proposal for approval by the Engineer and MassDOT Landscape Architect. All

chemicals and methods proposed shall be consistent with applicable Massachusetts Wetlands Protection Act Order of Conditions.

The IPMS shall be completed in coordination with the Roadway Contractor and the Engineer and shall include the following as appropriate to the project:

I. Project Information

a. Company writing IPMS and performing herbicide application.
b. Date of site walk
c. Attendees at site walk
d. Expected end date of contract and expected last treatment (month/season)

II. Brief Description of Conditions

a. Provide a free-hand sketch on construction plans or aerial image showing species, location, and as relevant, show or note extent of population as relevant to Strategy (i.e., population extends off ROW preventing eradication, small population and eradication deemed feasible within contract schedule, etc.).

III. Coordination with Roadway Contractor regarding other work

a. Tree Work: Note coordination to be implemented with tree removal, clearing, and clearing and grubbing as applicable to the project.
b. Wetland Mitigation - Include management proposed for wetland mitigation areas in the IPMS, if and as required.
c. Planting: If there will be planting in areas proposed for treatment, propose treatment and schedule to avoid herbicide damage to plants.
d. Mowing: If coordination is required with state mowers, note need in IPMS.

IV. Soil Management

a. Provide specifics on how soil with invasive plant roots (in particular) or seeds will be handled (i.e., separate stockpiles, plant material will be buried on-site, re-used on-site, disposed off site and if so, where?).
b. Show stockpile locations on plan and include treatment schedule.
c. Note measures that will be implemented to avoid spread through equipment, including how and where equipment will be cleaned.
d. Soil to be removed from the project area shall not be assumed to be uncontaminated and must be evaluated prior to off-site management for potential contamination with hazardous materials. No soil may be disposed of off-site without proper assessment by the contractor and approval from the Resident Engineer (RE), District Environmental Engineer (DEE), or the project designee.
e. Any stockpiling of soil must be performed in compliance with Policy Directive P-22-001, Off-Site Stockpiling of Soil from MassDOT Construction Projects. This directive limits the allowable locations for off-site stockpiling of soil generated during MassDOT projects and includes various requirements that must be satisfied by the contractor prior to off-site stockpiling.

V. Invasive Plant Treatment & Management

a. Proposed chemical and methods of treatment for each species or area.
b. Time of treatment based on target plant species.
c. Submit product label including application methods and rates (entire MSDS information need not be submitted if available online).
d. Proposed performance metrics or measure of treatment success if different from that specified under Item 102.3.
e. Method for disposing invasive plant material. This includes material that may result in spread (i.e., seeds, roots) and material that has been treated and/or is not viable (foliage, dead wood, etc.). Methods may include grinding in place, stockpiling and treating, and incinerating offsite.
f. Expected follow-up treatment for duration of contract.

VI. Monitoring Schedule if requested by MassDOT.

Note: The IPMS is critical for identifying pre-construction conditions as well as strategies for minimizing import or spread of invasive plants. Failure to provide an approved IPMS may jeopardize this item, in which case, the contractor will be responsible for management of invasive plants found on-site at no cost to the contract.

Photo Documentation

Digital photos with date and time verification shall be provided with the IPMS and with any follow-up monitoring or reporting.

METHODS

Initial Site Walk

Prior to any construction activities and soil disturbance, the Contractor shall walk the site with the Engineer and the MassDOT Landscape Architect to determine the IPMS. During the site walk the Contractor shall identify limits of work and, as necessary, mark locations of areas designated for treatment and individual plants targeted for treatment or removal. The Contractor shall be responsible for marking delineated areas and plants to be preserved, removed, or otherwise treated. Fencing or other materials needed for marking and delineating protected areas shall be incidental to this item.

IPMS Follow-up Amendment

The IPMS may be amended to address additional concerns or adjust to conditions if required by the MassDOT Landscape Architect. The amended IPMS shall be submitted to the Engineer and MassDOT Landscape Architect for approval at least fourteen (14) days prior to any proposed treatment.

Interim Site Monitoring Inspection Reports

If required by the MassDOT Landscape Architect and Engineer, Interim Site Monitoring and an accompanying report shall be conducted.

Final Inspection

A final inspection and report documenting the status of the invasive control may be required for regulatory purposes or for instances where control will be continued by others. The report shall include photo documentation of pre-construction (existing) and post-treatment conditions, notations on a plan or aerial image of area treated, summary of treatment performed, and control achieved.

METHOD OF MEASUREMENT

Item 102.33 will be measured for payment by the Hour. The basis for measurement shall be per the completion of tasks as approved under the Task Summary submittal.

BASIS OF PAYMENT

Item 102.33 will be paid at the contract unit price per Hour, which price shall include all labor, materials, equipment, tools, and all incidentals required to complete the work.

Payment shall not include travel time to and from the Contractor's place of business.

ITEM 755.35 INLAND WETLAND REPLICATION AREA LUMP SUM

REV. 2022.01.01 (REV. DATE TO BE REMOVED BY MASSDOT CONTRACTS)

The work under this item shall conform to the relevant provisions of Sections 120, 770, 771 of the Standard Specifications and the following:

Work under this item shall include furnishing material and the construction and maintenance of inland wetland replication areas as shown on the drawings and as required by the Engineer. Inland Wetland Replication Area shall hereafter be referred to as Replication Area. All work shall be in coordination with an approved Wetland Specialist as specified under that item.

Wetland Restoration work shall be as specified and compensated under that item. Construction of tidal wetlands shall be as specified under the approprate item for tidal wetland mitigation.

The Replication Area shall be constructed prior to wetland impacts unless otherwise approved by the Engineer, specified herein, or specified in permit conditions and approvals. Construction schedule shall be appropriate to planting and seeding season (see below). Changes to this schedule will require written approval from the Engineer.

DESCRIPTION OF WORK

Construction of the Replication Area shall be completed as shown on the drawings at the following location(s):

Area/s A at Station: ***327*** Area = ***2,500***sf.

Replication Area shall be constructed to meet the requirements of all associated permits and certifications, including relevant performance standards of the Massachusetts Wetlands Protection Act (MGL C. 131, s40), Section 401 Water Quality Certification, and Section 404, U.S. Army Corps of Engineers Permit.

The Contractor is responsible for protection and preservation of natural areas adjacent to the Replication Area both within and outside the project limits and for the duration of the Contract; including but not limited to damage to soils or vegetation due to erosion, sedimentation, compaction, trampling, vehicles, storage of materials, or other negligence shall be repaired to the satisfaction of the Engineer and at the Contractor's expense.

The Wetland Specialist overseeing the Wetland Replication construction work shall not be from the same company as that which is performing planting, seeding, or participating in any aspect of the Wetland Replication construction.
-

SUBMITTALS - DOCUMENTS

Request for Conditional Acceptance: As specified below, a letter requesting Conditional Acceptance of the work and the site conditions shall be submitted to the Engineer.

Request for Certificate of Compliance (Partial or Full): As specified below, shall be submitted to the Engineer for distribution to appropriate regulatory agencies.

Request for Final Acceptance: As specified below, a letter requesting Final Acceptance of the work and the site conditions shall be submitted to the Engineer.

Monitoring Reports: Reports shall be submitted to the Engineer as specified below. Reports shall be compensated under Item 755.75 and 755.76.

SUBMITTALS - MATERIAL

Soil and Amendments

No soil, compost, or other soil amendment imported to the work site shall contain seeds, roots, stems, or other viable parts of invasive plants or other noxious plants.

At least sixty (60) days prior to installation and prior to ordering, the Contractor shall submit for approval sources of soil, compost, and amendments. Submittal shall include the supplier and location of the source. Off-site sources shall be identified and available for inspection by the Wetland Specialist prior to transport of material to the site to verify that they are likely to be free of invasive plant species, including all viable plant parts.

Samples of tested and approved wetland soil and soil amendments for soil texture, organic carbon content or other routine soil analysis parameters (e.g., pH, Cation Exchange Capacity, Percent Base Saturation) and Soil Organic Matter Analysis will be required if requested by the Engineer. The grab samples shall be collected by the Contractor or Wetland Specialist from multiple representative locations in the wetland topsoil mix following the "Umass Soil and Plant Tissue Testing Laboratory Sampling and Collection Protocols" (or equivalent certification paperwork provided by the soil supplier). The lab analysis shall be provided to the Engineer along with written certification from the Contractor or Wetland Specialist that the wetland topsoil was collected per the referenced protocol and meets the desired specification. The analysis and written certification of same shall be provided to the Engineer prior to placing the wetland topsoil in the Replication Area.

Seed Mix

Certificate of Materials from the supplier shall be submitted 30 days prior to seeding and must be approved prior to ordering materials. Seed species listed on the certificate shall include ecotype region (i.e., *Asclepias incarnata*, PA Ecotype).

Seed tag from the bag of seed used shall be submitted to the Engineer at the time of seeding. Seed tag shall include ecotype region and species, guaranteed percentages of purity, weed content and germination of the seed, and the net weight. Seed tag shall match the Certificate of Materials, include the name of the supplier, and date material was sent.

Bill of lading or notarized Certificate of Compliance from the Supplier serving as proof of purchase shall be submitted if requested by the Engineer. Document shall include date of sale,

quantity, lot number, and address of Supplier. This shall match the seed tag. Notary shall not work for either the contractor or seed supplier.

Plant Certification

Plant Certification shall be per the applicable requirements of Subsection 771, PLANTING TREES, SHRUBS AND GROUNDCOVER, of the Standard Specifications. The nursery source shall certify the provenance or origin of all plants.

MATERIALS

Sediment Control Barrier and Erosion Prevention Measures

Sediment control barriers shall be per Item 767.121.

Erosion prevention measures for disturbed areas adjacent to the Replication Area shall include but not necessarily be limited to compost blankets, jute mesh, seeding, and/or combinations thereof as approved by the Engineer.

Sediment controls and erosion prevention devices and measures shall be compensated under the respective items.

Wetland Soil

Soil appropriate for the Replication Area may be either hydric soil excavated from the impacted wetland, a manufactured mix of compost and on-site borrow, or a combination thereof, as approved by the Engineer.

Hydric soil from the impacted wetland area may be spread on the surface of the constructed Replication Area as an inoculant or can be placed in a bulk fashion in a roughly 1:1 ratio of area and depth. Soil shall be handled such that the original soil structure is preserved and shall not be compacted, screened, or otherwise processed.

Hydric soil from the impacted wetland that is infested with invasive plant species identified on the Massachusetts Invasive Plant Advisory Group (MIPAG) shall not be used in the Replication Area unless approved by the Wetland Specialist and Engineer. To the extent possible, infested soil shall be disposed of within the project limits in an upland area outside of regulated areas and as approved by the Invasive Plant Management Strategy item (if in the contract) or by the Engineer.

A manufactured mix suitable for wetlands shall consist of on-site borrow from the proposed Replication Area (if approved by the Wetland Specialist and Engineer) thoroughly mixed with compost to achieve a target organic carbon content of 10-12% (up to 21% percent organic matter) by dry weight. The organic material used for mixing shall be well or partially decomposed. Clean leaf compost is the preferred soil amendment to achieve these standards though other materials may be used if approved by the Wetland Specialist and Engineer. Note that “clean” refers both to a negligible amount (<1%) of physical contaminants such as plastic

and to the lack of chemical contaminants that might pose a hazard to plants or animals. Off-site borrow may be used for mixing if approved in advance by the Engineer.

No soil or soil amendment shall be brought on site without approval of the material source by the Wetland Specialist and the Engineer. Soils used in the replacement area shall be free of rocks greater than 4 inches in diameter.

Plants

Plant material shall conform to the applicable requirements of Section 771, PLANTING TREES, SHRUBS AND GROUNDCOVER, of the latest edition of the Standard Specifications and as amended below.

Plants shall be native species, not cultivars. To the extent possible, plants shall originate from the applicable EPA Level III Ecoregion.

Plant species and sizes to be included in the Replication Area shall be

- as specified on the plans.

Requests for substitutions shall be submitted in writing to the Engineer for review by the Wetland Specialist, MassDOT Landscape Architect, and, if required, the relevant regulatory agency at least thirty (30) days prior to planting. All proposed substitutes shall be in conformance with the requirements herein and suitable for the site conditions.

Transplanting and plant material collected from the wild is prohibited unless approved in writing by the Engineer. Plants shall be selected from certified nurseries that have been inspected by state and/or federal agencies.

Seed Mix

Seeding shall conform to the Standard Specifications Section M6, ROADSIDE DEVELOPMENT MATERIALS.

Wetland Seed mix shall be:

Mix 765.554 **Wetland – Seasonally Flooded Mix** **LB**

	Botanical Name	Common Name	% PLS By Weight
Grass

Seeding Rate: 15.0 lbs PLS/Acre

Fertilizers shall not be used.

Water

The Contractor shall provide water and all equipment required at no extra cost. Water shall be suitable for irrigation and free from ingredients harmful to plants and wildlife. Water from the adjacent water bodies or waterways shall not be utilized. It is the Contractor's responsibility to correct injury or damage due to the lack of water, too much water, or use of contaminated water.

Mulch/Compost Blanket for Seeding

Hydromulch shall be per the manufacturer's recommendations and shall be wood fiber or straw mulch only. Mulch shall be incidental to seeding.

Compost Blanket may be used in lieu of mulch for seeding. Compost Blanket shall meet the material and submittal requirements of that Item and shall be applied as specified below. Compost Blanket shall be compensated under that item.

CONSTRUCTION METHODS & SEQUENCE

SITE PROTECTION MEASURES

Minimizing Damage

The Contractor shall plan and execute operations in a manner minimizing the amount of excavated and exposed fill or other foreign materials that could be washed or otherwise carried into Replication Area and nearby resource areas.

Construction of and access to the Replication Area shall minimize damage to existing vegetation and soils as specified herein. Damage to soils or vegetation shall be repaired to the satisfaction of the Engineer and at the Contractor's expense. If required for soil remediation, tilling and the addition of compost shall be at the Contractor's expense.

Wetland topsoil shall be deposited and graded in the Replication Area in a manner that minimizes travel and subsequent compaction of the subgrade (including any specified pit and mound topography) to the extent practicable, including use of track mounted excavators as appropriate. Should soils be compacted, they shall be loosened by a method such as disking, spring-tooth harrowing and/or rototilling. The Contractor shall use boards, timber or composite mats, or other approved materials as necessary, to protect existing and/or new wetlands from compaction due to heavy foot traffic or if equipment is required to travel over wetland soil. All labor and materials required for protection and preservation of site shall be incidental to this item.

Stockpiling of Soil

Stockpiling of soil, including hydric soil for replication, shall be at least 100 feet from the edge of the bordering and isolated vegetated wetlands and inland banks, unless approved otherwise by the Engineer. Stockpiled soils shall be securely stabilized and contained. Any areas of exposed soil or stockpiles within and adjacent to the Replication Area that will remain inactive for more than 7 calendar days shall be sown with a mix of rapid germinating annual grasses (e.g., annual rye) covered with a layer of straw mulch applied at a rate of 90 pounds per 1,000 square feet. As

necessary, the mulch shall be anchored with a tacking coat (non-tar) applied by a hydro seeder or other method recommended by the Wetland Specialist in consultation with the Engineer. In the event that there is excess borrow, it shall be disposed of under Excavation, Item 120.1.

Sediment Barriers

Placement: Sediment barriers shall be installed along the downslope perimeter of the Replication Area beginning and ending in the surrounding upland so that no excavated material or disturbed soil can enter adjacent wetlands or waters. Where construction work is immediately upgradient of the wetland, barriers shall be located so as to protect the Replication Area until slopes are stabilized. Sediment barriers shall be in place and approved by the Engineer prior to excavation work. No work shall take place outside the barriers.

Maintenance: The Contractor shall ensure that all sediment barriers function as intended and at all times per the specifications of those respective items.

Existing Trees to Remain

Tree protection shall be per the relevant specifications and as shown on the plans or as required by the Engineer. To protect root systems of existing trees to remain, the limits of the Replication Area may be adjusted, but, the total area of replication required by the permits shall not be reduced. Access route may be adjusted as required.

Trees to be retained as snags (upright dead or dying trees left for wildlife habitat) within or adjacent to the Replication Area shall be as shown on the plans or as directed by the Wetland Specialist or Landscape Architect during the initial site walk. Trees to remain as snags shall be clearly marked prior to clearing. Trees that pose a potential fall hazard (i.e., are near a roadway) should have limbs and trunk cut such that the tree does not pose a fall hazard.

Coarse woody debris in the form of cut trees, stumps, logs, and brush shall be incorporated as shown on the plans or as directed by the Wetland Specialist or Landscape Architect. On site material shall be selected and marked by the Wetland Specialist, retained on the project site, and placed as specified below under Placement of Coarse Woody Debris.

All trees, stumps, or brush not specified to remain shall be removed and shall not be stockpiled in the wetland resource areas while awaiting disposal.

Work shall be coordinated with Clearing or Tree Removal Item and compensated under that Item.

PRE-WETLAND CONSTRUCTION SITE WALK

Delineating the Replication Area and Access Route. The Contractor shall stake out the Replication Area boundaries and the intended access route and set grade stakes for approval by the Wetland Specialist and Engineer. Following staking and demarcation of areas, the Engineer and Wetland Specialist shall approve or modify as necessary the limits of work, the access route, final location and configuration of replication, grade stake elevations, proposed location of sediment barriers, and review proposed construction methods.

As part of the delineation and approval process, the Wetland Specialist shall mark trees to be converted to snags, select course woody debris to be retained for re-use, and select rocks or other elements to be used for habitat features.

Invasive Plants: As part of the initial site walk, the wetland to be impacted and the proposed replication site shall be inspected for the presence of invasive plants. If invasive plants are found they shall be addressed as described herein under Invasive Plants.

SOIL WORK

Final grades in the Replication Area shall meet the target elevations as shown on the Plans or as adjusted by the Wetland Specialist to achieve the desired hydrology and micro-habitat. If adjustments are required, a Request for Information (RFI) shall be submitted to the Engineer for approval. Adjustments shall be documented and included in the As-Built plans (if required) and/or other applicable required documents.

Excavation & Grading

When required by permits, the Wetland Specialist shall notify MADEP and the ACOE (as applicable) at least 72 hours prior to excavation.

Soil in the proposed wetland areas that must be removed for grades to conform to the proposed elevations shall be stripped and disposed of, or, if suitable for reuse, be stockpiled in an approved location. Stockpiled soils shall be kept wet and not allowed to dry out. Procedures for maintaining appropriate moisture levels shall be documented by the Wetland Specialist and provided to the Engineer and the Contractor.

Replication area shall be excavated as shown on the drawings. Where replication area is adjacent to existing reference wetland, finish grade of replication shall generally match existing grades and micro-topography, notwithstanding any deviations that are necessary to achieve the desired hydrology and habitat in the Replication Area.

Prior to placement of backfill, scarify subgrade to a depth of 4 to 6 inches.

Placement of Wetland Soil

Following excavation, scarification, and grading of sub-grade, and after the sub-grade elevations are approved by the Wetland Specialist, suitable soil previously removed or an evenly mixed organic/mineral soil created on-site shall be spread to the design depth and thickness over the proposed wetland areas as shown on the plans and as directed by the Wetland Specialist.

Vehicles used to transport soil from offsite shall be washed or cleaned with air pressure to prevent exotic or invasive seeds or root fragments from contaminating the Replication Area.

Final Grading

The finished grade of the Replication Area shall be at an elevation that will provide an unrestricted hydrologic connection between the Replication Area and adjacent resource areas. The hydrologic connection should be in keeping with restoring the intended function of the replacement wetland relative to the impacted reference wetland. The Contractor shall verify that this elevation is not at a level that could negatively alter the hydrology of an adjacent wetland. Microtopography in the form of hummocks, pits and mounds shall be as shown on the plans or as adjusted by the Wetland Specialist. Final elevations and grading of wetland soil shall be approved by the Wetland Specialist and the Engineer.

To avoid compaction once soil has been placed, no heavy equipment shall travel across placed soil and no work shall occur in wet or moist soil. Soil that is compacted due to construction activities shall be replaced with soil as specified herein and at the Contractor's expense.

Installation of Monitoring Wells in Replication Area

For a constructed Replication Area over 1,000 square feet, a representative number of monitoring wells shall be installed in locations as shown on the Plans. Monitoring wells shall include data loggers. For purposes of this specification, a data logger refers to a battery powered device that records groundwater level. Data shall be collected by the Wetland Specialist and submitted with Monitoring Reports and as required by applicable permits. Wells shall be installed immediately following completion of construction of the Wetland Replication Area. Wells shall be installed in accordance with USDA/NRCS technical report entitled: "Sprecher, S.W. 2008. Installing monitoring wells in soils (Version 1.0). National Soil Survey Center, Natural Resources Conservation Service, USDA, Lincoln, NE." or equivalent methodology approved by Engineer.

RESTORING VEGETATION

Placement of Coarse Woody Material

If specified within this Contract or if directed by the Wetland Specialist or Landscape Architect during the initial site walk, woody debris shall be placed in the Replication Area and/or adjacent upland buffer. Material shall be placed as shown on the plans or as directed following placement of wetland soil and prior to application of compost and/or seed. Woody material shall cover a minimum of 5-20 percent of the Replication Area, depending on whether it is a meadow or woodland wetland and how much wood is available from construction clearing. Where trees are cut for construction purposes, logs of a minimum length of 8 feet must comprise a minimum of 50% of the woody material left on site. Brush shall be included along with logs and stumps as directed. Woody material shall be placed in a deliberate and naturalistic manner.

Planting

Following placement of wetland soil and approval of final grade and conditions, Replication Area shall be planted. Planting shall conform to SECTION 771 PLANTING TREES, SHRUBS AND GROUNDCOVER of the Division I Standard Specifications and as amended below.

Planting Season shall be May 15-June 15 and September 1-November 1 unless otherwise specified in applicable permit conditions.

Prior to planting, the Wetland Specialist shall approve the condition of the plant material and the method of installation and shall oversee the planting work. Replication Area shall be planted in the dry. Plants shall be placed according to the planting details and within the range of target elevations and at the spacing shown on the Plans or, if spacing is not indicated on the Plans, at the direction of the Wetland Specialist. Unless otherwise noted on the Plans, final plant locations shall be determined on site and located with regard to expected hydrology, plant growth characteristics, habitat desired, and water protection.

Plant material shall be installed as soon as possible after delivery. Plants stored on-site prior to installation shall be stored in the shade and watered twice daily up until time of installation. Plants showing signs of stress or compromised health may be rejected by the Engineer or Wetland Specialist and shall be replaced at the Contractor's expense.

Plant material shall be furnished and installed as indicated including all labor, materials, plants, equipment, incidentals, re-setting of plants (frost heaves, etc), irrigation, re-planting and clean up. If previously approved species are not available at the time of planting, the Wetland Specialist may propose substitutions relative to species, size, and quantities for review and approval by the MassDOT Landscape Architect. Upon approval by MassDOT, substitutions shall be approved by the regulating authority, if and as necessary. Provisions shall be made for a growth warranty of at least two (2) calendar years from the date of Conditional Acceptance as described below or as required by permits.

Seeding

Following placement of wetland soil and planting,the Replication Area shall be seeded using one of the following methods:

- Broadcast by hand or with a hand-held spreader followed by application of straw mulch. If necessary, seed shall be lightly raked to insure good seed-to-soil contact.
- Hydro-seeded with hydro mulch per the Standard Specifications and per the manufacturer's directions.
- Hand broadcast seed with Compost Blanket pneumatically applied at the same time to ensure light cover of soil topdressing over seed.

If spring conditions are drier than usual, supplemental watering may be required. If sowing during the summer months, supplemental watering will likely be required until germination.

If required, seeding limits for different seed mixes shall be determined by the Wetland Specialist.

PLANT ESTABLISHMENT AND INVASIVE MANAGEMENT

Plants shall be watered as necessary to maintain healthy establishment. Plants that fail by September 1 after spring planting or by May 15 after fall planting shall be replaced within the immediate or next planting period and at the Contractor's expense.

Seeding that fails to established according to the conditions of acceptance below shall be over-seeded as required by the Engineer. Washouts and channels shall be repaired and stabilized prior

to overseeding. Excessive weed growth shall be pulled out by the roots or, with approval from the Engineer, cut prior to over-seeding. Soil repair and weed control are incidental to this item.

Invasive Plants: Corrective measures shall be taken to remove or treat invasive plant species in the Replication Areas. Invasive plants shall include those listed as invasive by Massachusetts Invasive Plant Advisory Group (MIPAG) and the US Army Corp of Engineer's New England District's Compensatory Mitigation Guidance

The strategy for chemical and/or manual removal shall be as directed by the Wetland Specialist, shall continue for the duration of the monitoring period, and shall be incidental to this item.

CONDITIONAL ACCEPTANCE OF WORK

Conditional Acceptance shall indicate approval of the wetland construction work and agreement that work has been done according to plan or modified as approved.

Upon completion of construction, the Contractor shall submit a Request for Conditional Acceptance that includes a brief narrative from the Wetland Specialist demonstrating that the wetland replication construction work was done according to plans (or how modified) and meets required permit conditions. The narrative shall include, photo-documentation of pre-construction conditions as well as soil work, planting, and seeding. Seed tags shall be submitted as part of the Request for Conditional Acceptance.

Upon receipt of a Request for Conditional Acceptance, the Engineer, the Wetland Specialist, and regulatory representative (if required) shall assess the Replication Area and surrounding areas. At a minimum, the following conditions shall be included in the narrative and reviewed as part of the on-site assessment of whether:

- The final finished target elevations have been met and maintained relative to the approved plans and reference wetland. Areas that are too high or too low should be identified along with suggested corrective measures.
- Hydrology meets performance standards.
- Specified seed mix has been seeded. If inspected 30 or more days after seeding, seeded species in the wetland and adjacent upland shall show signs of good germination and healthy growth.
- Planted woody and herbaceous species meet specifications and are establishing well.
- Soils are stabilized and there is no sediment in the wetland and no channeling of slopes.
- There are no invasive plants visible in the replication area.

Upon approval that the work meets the above conditions, MassDOT will issue a letter of Conditional Acceptance. If the Wetland Replication work is not approved, MassDOT will issue a rejection letter requiring corrective actions. The Wetland Specialist shall recommend corrective actions. Work not approved shall be addressed by the Contractor at no extra cost.

Wetland Specialist shall be compensated under Item 755.75.

Erosion of adjacent slopes or the flow of sediments into the wetland between Conditional and Final Acceptance shall be immediately addressed by the Contractor.

REQUEST FOR CERTIFICATE OF COMPLIANCE

If required, a request for a Certificate of Compliance (Partial or Full) pursuant to the Massachusetts Wetlands Protection Act regulations shall be prepared and submitted to MassDOT within 30 days following Conditional Acceptance.

The Request for Certificate of Compliance shall include the following:

- A brief narrative of the work on company letterhead signed by the Wetland Specialist. Narrative shall be prepared as a MS Word document and shall include substantive explanation that demonstrates compliance with EACH relevant permit condition. Narrative shall note variations from the originally permitted design.
- As-built Drawings signed by the Contractor's PE registered in the Commonwealth of Massachusetts. As-built drawings shall show hydrologic conditions, status of plantings and seeding, and shall include a narrative and minimum of 4 photographs documenting site conditions. Plans should note variations from the originally permitted design.

  When required, drawings shall meet the Army Corp of Engineer's New England District's Compensatory Replication Guidance, including: scale in the range of 1"=20' to 1" = 100', contours at 1' intervals, spot elevations for intermediate elevations, and polygons outlining each Replication Area, and, as applicable, plant community types. The As-built Drawings shall be provided to the Engineer electronically in Portable Document Format (PDF). If requested by the Engineer, the Drawings shall be provided in printed paper format (11" x 17" sheets, unless otherwise directed). Drawings must be scalable.

- Other documents as required.

FINAL ACCEPTANCE OF WORK

Following one full growing season, the Contractor shall submit a Request for Final Acceptance. Submittal shall include a brief narrative of conditions. Upon receiving the Request, the Engineer, Contractor, Wetland Specialist and regulatory representative (if required) shall assess the Replication Area. Final Acceptance will initiate the start of the Wetland Monitoring Period.

The following conditions shall be inspected and approved for acceptance and payment.

- Hydrology is functioning as intended.
- The desired seeded species are establishing well and cover at least 95 percent of the Replication Area, excluding areas of open water areas or planned bare soil.
- No sediments have entered the wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- All planted species are living and establishing well.
- There are no visible invasive plants.
- Silt fence and non-biodegradable sediment barrier materials have been removed.

If the mitigation work does not meet the above condition and is not approved, MassDOT will issue a rejection letter requiring corrective action. The Wetland Specialist shall recommend corrective actions. Work not approved will be addressed by the Contractor at no extra cost.

Wetland Specialist shall be compensated under Item 755.75.

MONITORING REPORTS FOR REGULATORY COMPLIANCE

Post wetland construction Monitoring Reports shall be completed and submitted by the Wetland Specialist as specified and compensated under Item 755.76 Wetland Monitoring Reports.

Generally, the following conditions shall be met upon each inspection:

- Hydrology is functioning as intended.
- The desired seeded species are establishing well and cover 95 percent of the area, excluding areas of open water areas or planned bare soil.
- No sediments have entered into wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- All planted species (if included) are living and establishing well.
- There are no visible invasive plants.

If, at the end of the required monitoring period, the requirements have not been met and success of the wetland replication area has not been achieved as determined by the Monitoring Reports, the Contractor shall provide corrective measures. All costs associated with corrective measures and plant replacement shall be incidental to this item with no additional compensation.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 755.35 will be paid for at the Contract unit price per Lump Sum, which price shall include all labor, materials, equipment, submittals, maintenance, all required soil, site preparation, grading, wetland seeding, planting, mulching, watering, monitoring wells, registered surveyor, as-built plans, Request for Certificate of Compliance, and all incidental costs necessary to complete the work as required.

Payment shall be as follows:

- 60% upon Conditional Acceptance.
- 20% after receipt and acceptance of Certificate of Compliance by the Engineer and once all permit construction requirements have been met and approved.
- 20% upon Final Acceptance.

Excavation will be paid under Item 120.
Compost Blanket will be paid under Item 751.7
Sediment Control Barrier will be paid under Item 767.121
Wetland Specialist will be paid under Item 755.75
Wetland Monitoring Reports for follow-up monitoring will be paid under Item 755.76

ITEM 755.45 WETLAND RESTORATION SQUARE YARD

REV. 2022.01.01 (REV. DATE TO BE REMOVED BY MASSDOT CONTRACTS)

DESCRIPTION

The work under this item shall conform to the relevant provisions of Subsections 120, 751, 765, 767, and 771 of the Standard Specifications and the following:

The work under this item shall include all labor and furnishing of materials to complete the work specified herein to protect and restore existing inland wetland areas that will be temporarily impacted as shown on the drawings and as required by the Engineer.

Inland Wetland Replication work shall be as specified and compensated under that item. Tidal wetland mitigation shall be as specified under the appropriate item for tidal wetlands.

Restoration Area shall be constructed to meet the requirements of all associated permits and certifications, including relevant performance standards of the Massachusetts Wetlands Protection Act (MGL C. 131, s40), Section 401 Water Quality Certification, and Section 404, U.S. Army Corps of Engineers General Permit.

All work shall be in coordination with an approved Wetland Specialist. Wetland Specialist qualifications and requirements shall be per Item 755.75, Wetland Specialist.

SUBMITTALS – DOCUMENTS

Request for Conditional Acceptance: As specified below, a letter requesting Conditional Acceptance of the work and the site conditions shall be submitted to the Engineer.

Request for Final Acceptance: As specified below, a letter requesting Final Acceptance of the work and the site conditions shall be submitted to the Engineer.

Request for Certificate of Compliance (Partial or Full): If applicable, request for a Certificate of Compliance shall be submitted to the Engineer for distribution to appropriate regulatory agencies as specified below.

Monitoring Reports: Reports shall be submitted to the Engineer as specified below. Reports shall be compensated under Item 755.76 Wetland Monitoring Reports.

ASSOCIATED ITEMS AND MATERIALS

Timber Mat shall be as specified under that Item 767.91.

CONSTRUCTION METHODS & SEQUENCE

Site Protection Prior to Impacts

Prior to any land work, as part of the initial site-walk, the Wetland Specialist shall photo-document the site and provide a summary report of existing conditions as outlined under Item 755.75 Wetland Specialist.

Where and as required vegetation shall be cut flush and area surveyed to establish pre-construction elevations.

Following the cutting and surveying, timber matting shall be placed as required to protect soil and vegetation from compaction, contamination, and/or other damages. Timber mats shall be placed as specified under the respective items and the Engineer shall approval placement.

Restoration Upon Completion of Construction Work

Sediment Barriers

If required for sediment control during Restoration work (i.e, tilling is required to restore soil), sediment barriers shall be installed along the downslope perimeter of the Restoration Area beginning and ending in the surrounding upland so that no disturbed soil can enter adjacent wetlands or waters. Sediment barriers shall be in place and approved by the Engineer prior to any soil disturbance. No work shall take place outside the barriers.

Removal of Fill and Grading

Timber mats shall be removed and disposed of as specified under the respective items.

If required, grades shall be restored to pre-construction elevations as shown in the baseline survey or as required by the Engineer and Wetland Specialist to restore hydrologic functions. Final elevations shall be approved by the Engineer prior to soil preparation and seeding. Grading shall be incidental to this item.

CONDITIONAL ACCEPTANCE OF WORK

Conditional Acceptance shall indicate approval of the wetland restoration work and agreement that work has been done according to plan or modified as approved.

Upon completion of construction, the Contractor shall submit a Request for Conditional Acceptance that includes a brief narrative from the Wetland Specialist (if applicable to project) demonstrating that the wetland restoration work was done according to plans (or how modified) and meets required permit conditions (if applicable). The narrative shall include, photo-documentation of pre-construction conditions as well as soil work, planting, and seeding. Seed tags shall be submitted as part of the Request for Conditional Acceptance.

Upon receipt of a Request for Conditional Acceptance, the Engineer, the Wetland Specialist, and regulatory representative (if required) shall assess the Restoration Area and the surrounding areas. At a minimum, the following conditions shall be included in the narrative and reviewed as part of the on-site assessment of whether:

- The target elevations have been restored per the survey or adjusted per the Engineer. Areas that are too high or too low should be identified along with suggested corrective measures.
- Soil compaction has been mitigated.
- Soils are stabilized and there is no sediment in the wetland and no channeling of slopes.
- Hydrology meets performance standards and has been adequately restored.
- There are no invasive plants visible in the restored wetland area.
- Silt fence and non-biodegradable sediment barrier materials have been removed.

Upon approval that the work meets the above conditions, MassDOT will issue a letter of Conditional Acceptance. If the Wetland Restoration work is not approved, MassDOT will issue a rejection letter requiring corrective actions. Work not approved shall be addressed by the Contractor at no extra cost.

Erosion of adjacent slopes or the flow of sediments into the wetland between Conditional and Final Acceptance shall be immediately addressed by the Contractor.

FINAL ACCEPTANCE OF WORK

Following one full growing season, the Contractor shall submit a Request for Final Acceptance. Submittal shall include a brief narrative of conditions. Upon receiving the Request, the Engineer, Wetland Specialist and regulatory representative (if required) shall assess the Restoration Area. Final Acceptance will initiate the start of the Monitoring Period (if required).

The following conditions shall be inspected and approved for acceptance and payment:

- Hydrology is functioning as intended.
- No sediments have entered the wetland.
- Adjacent slopes are stabilized with desirable vegetation.
- There are no visible invasive plants.

If the restoration work is not approved, MassDOT will issue a rejection letter requiring corrective action. All costs associated with corrective measures and plant replacement shall be incidental to this item with no additional compensation. Work not approved shall be addressed by the Contractor at no extra cost.

MONITORING REPORTS FOR REGULATORY COMPLIANCE

Post wetland construction Monitoring Reports shall be completed and submitted by the Wetland Specialist as specified and compensated under Item 755.76 Wetland Monitoring Reports.

Generally, the following conditions shall be met upon each inspection:

- Hydrology is functioning as intended, relative to the preexisting condition of the restored wetland.
- No sediments have entered into wetland.

- Adjacent slopes are stabilized with desirable vegetation.
- There are no visible invasive plants.

If, at the end of the required monitoring period, the requirements have not been met and success of the wetland replication area has not been achieved as determined by the Monitoring Reports, the Contractor shall provide corrective measures. All costs associated with corrective measures and plant replacement shall be incidental to this item with no additional compensation.

METHOD OF MEASUREMENT AND BASIS OF PAYMENT

Item 755.45 will be paid for at the Contract unit price per Square Yard, which price shall include all labor, materials, compost and amendments, seed, mulch, equipment, submittals, maintenance, grading, and incidental costs necessary to complete the work as required.

Payment shall be as follows:

- 50% upon completion of removal of timber mats and any grading or soil modifications
- 25% upon Conditional Acceptance
- 25% upon Final Acceptance or approval of the Engineer

Sediment Control Barrier will be paid under Item 767.121
Timber Mat will be paid under Item 767.91
Wetland Specialist will be paid under Item 755.75
Wetland Monitoring Reports for follow-up monitoring will be paid under Item 755.76

ITEM 755.75 WETLAND SPECIALIST HOUR

REV. 2022.01.01 (REV. DATE TO BE REMOVED BY MASSDOT CONTRACTS)

Work under this Item shall be for services of a Wetland Scientist, Wetland Ecologist, Restoration Ecologist, or other professional with similar qualifications hereafter referred to as the "Wetland Specialist."

"Wetland Mitigation" shall be used herein for applicable wetland work. For this project, applicable wetland work is fo***r:*** **Item 755.35 Inland Wetland Replication Area and Item 755.45 Wetland Restoration Area.**

The Wetland Specialist shall demonstrate knowledge and expertise to coordinate and oversee all work associated with the Wetland Mitigation as defined herein, as shown on the Plans, as required by permits, and as specified under the relevant Wetland Mitigation items.

Regulatory monitoring reports following Final Acceptance of the Wetland Mitigation shall be per Item 755.76, Wetland Monitoring Reports.

For all onsite work, the Wetland Specialist shall sign in and sign out with the Engineer.

The Wetland Specialist shall not be from the same company as the company responsible for planting, seeding, and/or maintaining the wetland.

QUALIFICATIONS

The Wetland Specialist shall have a minimum of five (5) years of experience with construction and monitoring of wetland mitigation areas similar in size, type, and complexity to the Contract mitigation. When required by permits, at least ten (10) years of experience may be required. The Wetland Specialist shall be thoroughly versed in the Commonwealth of Massachusetts Wetlands Protection Act (MGL C.131, s.40), U.S. Army Corps of Engineers New England District Compensatory Mitigation Guidance, and all other relevant regulations of the Massachusetts Department of Environmental Protection and the U.S. Army Corps of Engineers New England District.

SUBMITTALS - QUALIFICATION

Within sixty (60) days following the Notice to Proceed, the Contractor shall provide proof of qualifications for the Wetland Specialist to the Engineer for approval. Submittals shall include, but not be limited to, the following:

- Resume of the individual on-site implementing the Wetland Specialist work. If the Wetland Specialist changes over the course of the project, the new individual shall submit resume and qualifications for approval 30 days prior to doing any work on-site.
- Resume of any personnel working on-site in place of the Wetland Specialist. Individual shall be approved prior to work on-site.
- Narrative describing the company, its expertise, technical qualifications and experience with wetland construction.
- At least three (3) references from prior work of a similar nature completed in the last five (5) years and by the individuals who will perform the work. Provide contact information for each reference including address, phone number and email.
- A summary of each reference project including nature of the work, project size, dates, and period of construction and monitoring, methodologies used, and summary of success (or not) in terms of meeting performance objectives. Summary shall include a minimum of one before and one after photo for each project.

SUBMITTALS – DOCUMENTATION AND REPORTS

<u>Wetland Construction Oversight</u>

Wetland Specialist shall provide documentation of pre-existing conditions and wetland construction as specified below and as part of fulfilling the Scope of Work described below. Documentation shall include photos that are clear and legible. Photos are incidental to this item.

- ***Site Walk Prior to Disturbance and Construction of Wetlands:*** Provide brief assessment with photos, including documentation of the existing wetlands to be impacted (both permanent and temporary), proposed wetland replication area, and reference/model wetland areas (typically an adjacent undisturbed wetland or the existing wetland to be impacted). Photos of existing wetlands that will be temporarily impacted shall include a view from at least 3 angles.

- ***Excavation and Grading:*** Documentation shall include minimum of two photos of the excavated wetland and two photos after final grading prior to planting and seeding. For restoration areas, photos shall show soil preparation (i.e, tilling and grading), if applicable.
- ***Approval of Subgrades****:* The Wetland Specialist shall inspect the sub-grade of the Replication Area to ensure that proper hydrology is likely to be established and shall provide the Engineer with written confirmation and photographs upon completion of subgrade excavation work. Written confirmation shall include recommended field adjustments, based on field observations, to achieve the desired hydrology and designed wetland system.
- ***Planting and Seeding:*** Provide assessment and photos of vegetation upon completion of planting and seeding work.
- ***Data logger output from Monitoring Wells*** shall be submitted with reports, if applicable and requested.

Wetland construction documentation and reports shall be submitted with Request for Conditional Acceptance and for the Order of Conditions, Water Quality Certifications, and other regulatory permits as required.

Requests for Acceptance of Work & Regulatory Compliance

The Wetland Specialist shall submit the following documents if and as specified herein and under Item the relevant Wetland Mitigation items:

- Request for Conditional Acceptance.
- Request for Certificate of Compliance (Partial or Full) when applicable.
- Request for Final Acceptance.

SCOPE OF WORK

In the event of discrepancies with the applicable permits, the Wetland Specialist shall submit a Request for Information (RFI) to the Engineer.

General

The Wetland Specialist shall be responsible for the following:

- Review and have a comprehensive knowledge of the environmental permits relevant to the specific mitigation work being done so as to ensure compliance throughout the duration of the contract.
- Identify and inform the Contractor and Engineer of unique site conditions which may require adjustments to the schedule, design, or construction methods. For example, wildlife nesting, illegal dumping, or rare species.
- Identify and inform the Contractor and Engineer of any sediment or erosion control problems observed within mitigation areas.
- Advise so as to avoid impacts to adjacent areas and regulated wetland resources.
- Participate in necessary meetings as required by permits and when requested by the Engineer.

Inspections & Construction Oversight

The Wetland Specialist shall be responsible for, but not limited to, the following:

- Pre-Construction Site Walk
    - Following surveying, flagging, and staking of all relevant boundaries and elevations by the Contractor, the Wetland Specialist shall walk the site with the Engineer and the Contractor to review existing and proposed conditions, recommend changes if necessary, and approve the following: location and boundaries of the Mitigation Area, target elevations and grades, location of tree protection associated with the Mitigation Area, and final layout and limits of clearing for access route.
    - Select and mark snags, logs, and woody material to be retained for placement in the Wetland Mitigation, as appropriate.
    - Note invasive plants in and adjacent to Wetland Mitigation.
    - Provide summary report if and as specified under Wetland Mitigation items.
- Excavation, Soil Placement, Grading for Replication Areas
    - Approve excavated depth and grading for appropriate wetland hydrology, subsoil preparation, and finished grade of placed wetland soil.
    - Adjust grades as required and approve microtopography. If grades need to be adjusted, submit an RFI to the Engineer.
    - If requested by the Engineer, the Wetland Specialist shall inspect stockpiled wetland soil for moisture content and signs of undesirable weeds.
- Soil Protection and Restoration Measures for Restoration Areas
    - Review and approve methods of soil protection and restoration if required.
    - Confirm decompaction will adequately restore appropriate wetland hydrology. If decompaction measures need to be adjusted, submit an RFI to the Engineer.
- Re-vegetation of Mitigation Area
    - Placement of woody material to be re-used.
    - Verify seed used complies with specifications and site conditions, determine limits for wetland seeding based on elevations, approve seeding and mulching methods, and collect seed tags to submit with Request for Conditional Acceptance.
    - Review planting methods (if applicable) prior to installation and oversee layout of wetland plants.

Conditional Acceptance

Upon completion of construction of the wetland, as part of the Request for Conditional Acceptance, the Wetland Specialist shall provide a brief narrative demonstrating that the wetland construction work was done according to plans (or how modified) and meets the conditions required for acceptance as specified under the Wetland Mitigation items. Submittal shall include a report and photo documention of pre-construction conditions, construction work, seeding, planting, and other work as specified under the Wetland Mitigation items. Photos of completed Wetland Restoration areas shall include the same views as the pre-construction reference photos.

Upon receipt of a Request for Conditional Acceptance, the Engineer, the Wetland Specialist and regulatory representative (if required) shall assess the Wetland Mitigation and surrounding area to ensure that it meets the conditions specified under the Wetland Mitigation items.

Upon approval, MassDOT will issue a letter of Conditional Acceptance. If the Wetland Mitigation work is not approved, MassDOT will issue a rejection letter requiring corrective action. The Wetland Specialist shall recommend corrective actions.

Request for Certificate of Compliance

If required, a Request for Certificate of Compliance shall be prepared and submitted to the Engineer immediately following Conditional Acceptance. Request shall be as specified under the relevant Wetland Mitigation items.

Request for Final Acceptance

Following one full growing season, the Wetland Specialist shall provide a brief narrative of the status of the Wetland Mitigation to be submitted with the Request for Final Acceptance.

Upon receipt of the Request, the Engineer, the Wetland Specialist and regulatory representative (if required) shall assess the Wetland Mitigation and surrounding area to ensure that it meets the conditions specified under the relevant Wetland Mitigation items.

If the Wetland Mitigation is not approved, MassDOT will issue a rejection letter requiring corrective action. The Wetland Specialist shall recommend corrective actions.

METHOD OF MEASUREMENT

Item 755.75 Wetland Specialist shall be measured per hour for on-site service provided by the Wetland Specialist.

Work shall include all inspections, photos, submittals, and associated tasks for construction and restoration oversight, narratives for Conditional and Final Acceptance, Request for Certificate of Compliance (Partial or Full) if required, documentation required for permits, and all other work specified above. Payment shall not include travel time or time spent off-site on reports. Decimal Pay Limits will be 0.25 hours.

BASIS OF PAYMENT

Item 755.75 Wetland Specialist shall be paid at the Contractor bid price for each hour, or fraction thereof, spent on-site to perform the work as described above. Reports and photo documentation are required for payment.

Post wetland construction reports shall be per Item 755.76, Wetland Monitoring Reports.

ITEM 755.76 WETLAND MONITORING REPORTS LUMP SUM

REV. 2022.01.01 (REV. DATE TO BE REMOVED BY MASSDOT CONTRACTS)

Work under this item shall be for the submittal of Wetland Monitoring Reports following the completion of wetland construction and shall include all inspections, photos, and other work required to complete those reports as specified herein.

"Wetland Mitigation" shall be used herein for applicable wetland work, whether Wetland Replication (creation of a new wetland) and/or Wetland Restoration (restoration after temporary impacts).

The Contractor shall retain the services of a Wetland Scientist, Wetland Ecologist, Restoration Ecologist, or other professional with similar qualifications, hereafter referred to as the "Wetland Specialist," to complete the Wetland Monitoring reports. Wetland Specialist shall meet requirements specified under Item 755.75 Wetland Specialist.

All on-site Wetland Specialist services required to complete the construction and revegetation of the wetland replication, including preparation and submission of monitoring reports during construction, shall be per Item 755.75 Wetland Specialist.

SCOPE OF WORK

Post-Construction Wetland Monitoring Reports

Final Acceptance of the wetland construction work as specified under item 755.35 and 755.45 shall initiate the beginning of the Monitoring Period.

Inspections and reports shall be performed to ensure compliance with mitigation requirements defined under the relevant Wetland Mitigation items and with all applicable environmental permits. Monitoring reports shall cover the following:

- Identification of all plant species present
- Percent cover for each plant species and overall percent surface area cover by indigenous wetland plant species for replication area and upland
- Description of the viability, health, and vigor of installed plants as well as volunteer plant species within the replication areas
- Description of remedial measures taken to ensure criteria are met
- Depth to apparent water table and/or depth of surface inundation, both as measured from the soil surface and data loggers, as appropriate.
- A conclusion regarding the success of the wetland mitigation area relative to the performance standards at 310 CMR 10.55(4)(b) (unless varied), the design plans, and performance criteria established by MADEP in the variance conditions (when applicable), and the reference wetland.
- Recommendation for a corrective plan of action if needed.

Reports shall be submitted to the Engineer as a digital copy in Portable Document Format (PDF) unless otherwise requested. Hard copies shall be provided as requested by the Engineer. All reports shall be marked with the applicable permit numbers and identifying information as required in the permits. Reports shall include photo documentation of the wetland/s being monitored and shall include a minimum of 3 views from different orientations. Views shall be labeled.

Spring Reports, when required, shall be submitted to the Engineer by July 1 for dispersal to the

appropriate permitting agencies.

End of Year Reports (which may serve as the Fall Report) shall be based on inspections that occur prior to October 15th. Reports shall be submitted to the Engineer no later than November 1 of each year.

Monitoring Reports shall be as follows for ***2*** years:

- *MassDEP: 1 Report - (1 end of year).*
- *ACOE: #1 Report (1 end of year).*
- *Conservation Commission: 4 Reports (1 spring and 1 end of year for two years).*

BASIS OF PAYMENT AND METHOD OF MEASUREMENT

Item 755.76 Wetland Monitoring Reports and associated inspections shall be at the Contract unit price per Lump Sum and shall include all labor, materials, equipment, and all incidental costs required to complete the work. Lump Sum will be paid in equal installments of the Lump Sum divided by the number of reports submitted. Payment shall be upon submittal and acceptance of each report, based on the following schedule:

- Year 1 = ***one spring and one end of year report***
- Year 2 = ***one spring and one end of year report***

ITEM 976.775 **LIVE STAKES** **EACH**

GENERAL

Live stakes shall be planted as shown on the Plans and shall be planted only during dormancy, prior to any growth or blooms.

Live stakes are placed after rip rap. If schedule doesn't allow for installation immediately following rip rap installation, they shall be installed at the next live stake planting window.

Planting Season

Live stakes shall be planted November 1 to December 15; and February 15 to March 31. Stakes shall not be planted in frozen ground.

Live stakes shall be a minimum of four feet in length and a minimum of three-quarter inch (3/4") in diameter. Stakes shall have been harvested locally, within the same physiographic ecoregion and plant hardiness zone. Stakes shall have side branches removed and bark shall be intact. Bottom ends shall be cut with a sharp blade at a 30 to 45-degree angle for insertion into the soil. Top ends of stakes shall be cut square. Stakes shall have at least two (2) bud scars near the top to facilitate branch development.
Stakes must be fresh when brought to site and shall be planted within two (2) weeks of arriving on site. If stored on site after arrival, the stakes shall be cool, moist, and shaded with the bottoms of the stakes soaked in water. Dried stakes shall be rejected. Stakes that have been stored in water shall have the bottom recut, as described above, prior to planting.

CONSTRUCTION METHODS

Care shall be taken to ensure the correct end of the stake is planted in the ground (buds facing upward). One foot of the live stake should be installed into the ground. Prior to planting, pilot holes should be made with a metal bar or re-bar. A rubber mallet should be used to drive the stakes in the ground. Tops that are damaged during insertion shall be cut. Stakes that split during insertion shall be removed and replaced.

Stakes shall be planted at 90-degrees to the slope.

The layout of species shall be as shown on the plans. If not shown, stakes shall be in groupings of three to five plants of the same species (depending on the species used) or shall be as required by the Landscape Architect or Wetland Specialist. Spacing shall be as directed by the Landscape Architect and/or Wetland Specialist, otherwise spacing shall be no farther than four (4) feet apart, and if planted in double rows, stakes shall be in a staggered pattern.

All stakes shall be watered as required for healthy growth.

COMPENSATION

Measurement and payment shall be at the Contract unit price for each stake planted. At a minimum, stakes shall have firmly established roots for acceptance at the time of the one-year warranty period.

ITEM 983.6 NATURAL STREAMBED MATERIAL SQUARE YARD

The work under this heading shall consist of installation of natural streambed material within the channel excavation portion and up to the excavated material to provide a natural streambed for aquatic organisms. The natural streambed construction material is to be placed within the bottom 12" of the channel as depicted on the plans.

The intent of this work is to ensure a natural streambed within the channel, to provide fisheries and wildlife habitat enhancement as part of the wetland replication area and natural wetlands. The natural streambed material shall be comprised of the stones 4 inches and under, that shall meet the following gradation:

Sieve opening	Percent by Mass Passing Through
4"	95
2"	55-65
¾"	30-45
#4	0-5

Partially angular rock is preferred over round and shall be able to lock together to prevent movement during high flows. Crushed stone will not be accepted for any components. The top of streambed elevations shall match existing streambed elevations.

Method of Measurement

Item 983.6 will be measured per Square Yard of natural streambed material, complete in place.

Basis of Payment

Item 983.6 will be paid for at the Contract unit price per Square Yard which price shall include all labor, materials, equipment, and incidentals necessary to complete the work.

ITEM 991.1 CONTROL OF WATER – STRUCTURE NO. P-03-020 (CAK) LUMP SUM

ITEM 991.2 CONTROL OF WATER – STRUCTURE NO. 2 (CULVERT NO. 1) LUMP SUM

ITEM 991.3 CONTROL OF WATER – STRUCTURE NO. 3 (CULVERT NO. 2) LUMP SUM

The work under these Items shall conform to the relevant provisions of Subsection 140.60, amended and/or supplemented as follows:

The work to be done under these Items shall consist of all work required for the control of water and siltation, if necessary, to ensure that all the proposed precast culverts and bridge abutments are installed in the dry as shown on the plans, or as directed by the Engineer. The work shall include all incidental dewatering, pumping, turbidity barriers, sandbagging, filtration or dewatering basins,

or other measures inclusive of sheeting, necessary for sufficient water control to accomplish the construction of the proposed substructure/culvert in the dry.

For demolition purposes, dewatering shall be conducted on an as needed basis as determined by the Contractor. It is the responsibility of the Contractor to assess the site and determine the need and extent of dewatering required and to submit complete working drawings and computations of his/her proposed dewatering scheme to the Engineer for approval in accordance with Subsection 5.02 and these Special Provisions. A Professional Engineer registered in the Commonwealth of Massachusetts shall certify both. The furnishing of such schemes shall not serve to relieve the Contractor of any of his responsibility for the safety of the work or the responsibility for the successful completion of the project. Submittals shall include, but are not limited to, a sequence plan with a timetable and details specific to each of the phases of construction. The submittals shall include working drawings and calculations. Detailing the methods and materials proposed to account for all anticipated loads and construction conditions necessary to permit the work while maintaining a safe work area and protecting property from damage.

Pumping from the interior of any foundation enclosure shall be done in such a manner as to preclude the possibility of transporting by water any part of the concrete materials being placed. No such pumping will be permitted during the placing of concrete or for a period of at least 24 hours thereafter, unless it is done by a method approved by the Engineer. During dewatering operations, water that is pumped from the interior of any foundation enclosure shall be conveyed into a sedimentation basin or other device or methodology which will cleanse the water before being discharged away from the site or into adjacent wetlands. The locations of any sedimentation basin will be determined by the Contractor based on the selected methods of construction. Placement of the basin shall be in an upland area that is within the existing right of way and temporary easements. At no time shall the Contractor discharge untreated water from the site or into the wetlands. The proposed plan shall include methods and equipment necessary to discharge water from the sedimentation treatment basins.

The Engineer has the right to order the Contractor to stop all excavation operations when in his judgment the Contractor’s water control operations are failing to produce adequate results or are posing a threat to the environment.

Under Items 991.11, 991.12 and 991.13 of the Contract, the Contractor will be paid the Contract Lump Sum price for Control of Water, which price shall include full compensation for the design of the water control schemes, all equipment, materials, tools and labor necessary for the installation, maintenance, operation, removal and disposal of the materials used for water control including placement and/or removal of temporary sheeting or other retaining structures all as outlined above.

The payment method for Item 991.1 is partial progressive payment of the LUMP SUM Contract Bid Price of this Item. The partial payment schedule will be as follows:

- The first payment of these Items (50% of the Lump Sum bid price) will be made upon complete installation of the water control system to the satisfaction and approval of the Engineer.
- The final payment of these Items (50% of the Lump Sum bid price) will be made upon the satisfactory removal of the water control system after bridge construction is complete.

All adjustments and repositioning of water control shall be considered as included under this Item. No separate payment will be made for the removal and disposal of the sediment material collected from the dewatering systems, but all costs in connection therewith shall be included in the Contract unit price bid.

Project Name:	Independence Greenway Extension, Peabody, MA MassDOT Project 609211
Project Number:	Green No. 17118.0244
Subject:	**Sediment Sampling Plan for WQC**

1.0 INTRODUCTION AND PURPOSE

Green International Affiliates (Green) has been retained to assist the City of Peabody and Massachusetts Department of Transportation (MassDOT) with the proposed Independence Greenway Extension transportation improvement project in the City of Peabody.

As part of the project, Green has been tasked with obtaining a Water Quality Certification (WQC) for the sediments expected to be disturbed. Green will be tasked with collecting up to three (3) sediment samples via hand-auguring. **Figure 1** depicts the locations of the three (3) proposed exploratory sediment coring locations. Green will utilize TG&B Marine Services (TG&B) to characterize the soil, record field screening, and collect sediment samples at the bottom of exploration. Samples will be submitted to a Massachusetts Certified Laboratory to test for:

- Metals (Arsenic, Cadmium, Chromium, Copper, Lead, Nickel, Mercury, Zinc)
- Polychlorinated Biphenyls (PCB's) Pesticides
- Extractable Petroleum Hydrocarbons (EPH)
- Polycyclic Aromatic Hydrocarbons (PAHs)
- Semi-Volatile Organic Compounds (SVOCs)
- Total Organic Compounds (TOCs)
- Percent Water
- Grain Size

A Due Diligence Review has been conducted on the site and surrounding area. According to the Massachusetts Hazardous Waste Look-Up Site, there are two closed sites within 500 feet of the project area, RTN 3-0026559 and RTN 3-0023464. Since these are both closed sites and are not located directly within any of the sampling areas, it is not anticipated that these will have any impact on the sampling. The purpose of this plan is to provide the scope of work for the environmental sampling and guidance to the field staff regarding proper sediment sampling and observation and notification procedures in the event of "suspect" contamination.

2.0 SAMPLING PROCEDURE

The work will be done using a coring platform, 3 coring operators, and a petite ponar sampler.

3.0 SITE CONTACTS

TG&B Marine Services
Mark Avakian – (508) 326-3686
mark@tgandbmarine.com

Green International Affiliates
Danielle Spicer – (978) 843-5218
dspicer@greenintl.com

4.0 HEALTH AND SAFETY

The Site is located within an abandoned railroad bed and within a body of water. TG&B Marine Services will take all necessary precautionary measures to assure safety during the duration of work.

The site is located within the Proctor Brook in Peabody, MA.

5.0 SEDIMENT SAMPLING OVERSIGHT

The following is the proposed scope of work for the environmental assessment:

- Three (3) sediment cores will be progressed. The sediment cores will be advanced via hand augur down to the anticipated depth of dredging, a depth of four (4) feet below ground surface (fbgs) as shown on **Figure 1**. When the bottom of exploration is reached, the sediment cores will be terminated. There will be a uniform amount of dredging occurring on the upstream and downstream sides of each stream crossing, therefore only one sample is needed at each of the following sampling locations. The bottom of exploration for sediment coring locations is as follows:
    - "SS-1" (Culvert No. 1 at Sta. 329+85 – North) at 4 fbgs
    - "SS-2" (Culvert No. 2 at Sta. 346+20 – North) at 4 fbgs
    - "SS-3" (Boardwalk Crossing at Sta 358+51 - North) at 4 fbgs
- A TG&B Marine Services engineer will oversee the sediment coring and:
    - Photo-document the sediment conditions for each sample location
    - Prepare field notes documenting the sediment coring activities, sediment descriptions, visual/olfactory observations, and any instances of "suspect" contamination.
    - Observe and screen sediment with a PID at 1-ft intervals

5.1 "Suspect" Contamination Observation Procedures

Considering the nature of the work and limited exposure duration during sediment coring activities, the risk to non-construction and professional personnel is low. However, not all parts of the Site are sampled, and it is crucial for all personnel to be aware of "suspect" contamination.

If "suspect" contamination is observed, TG&B will notify Green/H&H and MassDOT immediately to determine appropriate steps moving forward.

6.0 SAMPLING PLAN

The following sampling procedures are guidelines to be followed during the sediment sampling program to assist with determining where (location and depth) to collect sediment samples for analyses. **Please discuss any changes to the sampling procedures with the MassDOT PM before proceeding with the change.**

6.1 Sampling Procedure

At **each** location, samples will be collected and submitted for analysis of EPHs, PCBs, SVOCs, Metals, Pesticides, TOC, Percent water and grain size.

Augur will be advanced to depths of four (4) fbgs. Sampling will be performed in the following manner.

6.1.1 *Composite Samples (Metals, SVOCs, EPH, PCBs, Pesticides, TOC, % Water, and Grain Size)*

Composite samples will consist of no more than three (3) grab samples, either vertically or horizontally. Composite sampling shall be completed in the following manner:

- At each location, place soils from similar strata into baggies or jars noting location and depth on the container.
- If no "suspect" material is present, collect a composite sample of the suspect material using three (3) grab samples from the same boring, as applicable.
- Composite samples will not to be submitted for VOCs.

RE: Peabody Bikeway (01.0174019.00)
ESS Laboratory Work Order Number: 1901077

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED
By ESS Laboratory at 4:12 pm, Jan 15, 2019

Analytical Summary
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

SAMPLE RECEIPT

The following samples were received on January 04, 2019 for the analyses specified on the enclosed Chain of Custody Record.

To achieve CAM compliance for MCP data, ESS Laboratory has reviewed all QA/QC Requirements and Performance Standards listed in each method. Holding times and preservation have also been reviewed. All CAM requirements have been performed and achieved unless noted in the project narrative.

Each method has been set-up in the laboratory to reach required MCP standards. The methods for aqueous VOA and Soil Methanol VOA have known limitations for certain analytes. The regulatory standards may not be achieved due to these limitations. In addition, for all methods, matrix interferences, dilutions, and %Solids may elevate method reporting limits above regulatory standards. ESS Laboratory can provide, upon request, a Limit Checker (regulatory standard comparison spreadsheet) electronic deliverable which will highlight these exceedances.

Low Level VOA vials were frozen by ESS Laboratory on January 04, 2019 at 17:30.

Question I: All samples for EPH and Metals were analyzed for a subset of the required MCP list per the client's request.

Volatile Analysis: The low level run for sample Boring B6-Culvert 0-2FT (1901077-04) had an internal standard outside of QC criteria. The laboratory could not re-analysis at low-level due to a cracked vial. The sample was re-analyzed using the methanol vial. Both the low-level and Methanol have been reported.

Lab Number	Sample Name	Matrix	Analysis

Affirmative responses to questions A through F are required for "Presumptive Certainty" status

A	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	Yes (X) No ( )
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	Yes (X) No ( )
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	Yes (X) No ( )
D	Does the laboratory report comply with all the reporting requirements specified in the CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?	Yes (X) No ( )
E	VPH, EPH, APH and TO-15 only: a. Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications).	Yes (X) No ( )
	b. APH and TO-15 Methods only: Was the complete analyte list reported for each method?	Yes ( ) No ( )
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	Yes (X) No ( )

Responses to Questions G, H and I below are required for "'Presumptive Certainty" status

G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocols(s)?	Yes (X) No ( )*
	***Data User Note:* Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.**	
H	Were **all** QC performance standards specified in the CAM protocol(s) achieved?	Yes ( ) No (X)*
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	Yes ( ) No (X)*

All negative responses must be addressed in an attached laboratory narrative.

I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, accurate and complete.

Client Project ID: Peabody Bikeway ESS Laboratory Work Order: 1901077

Notes and Definitions

SM	Surrogate recovery(ies) outside of criteria due to matrix (UCM/coelution/matrix is present) (SM).
>	Greater than.
B-	Blank Spike recovery is below lower control limit (B-).
CD-	Continuing Calibration %Diff/Drift is below control limit (CD-).
CD+	Continuing Calibration %Diff/Drift is above control limit (CD+).
D	Diluted.
D+	Relative percent difference for duplicate is outside of criteria (D+).
I	Internal Standard(s) outside of criteria (I).
LC	Lower value is used due to matrix interferences (LC).
P	Percent difference between primary and confirmation results exceeds 40% (P).
#	Modified result
S+	Surrogate recovery(ies) above upper control limit (S+).
Z18	Temperature is not within 23 +/-2 ºC.
U	Analyte included in the analysis, but not detected
WL	Results obtained from a deionized water leach of the sample.
XH	Peaks found in the retention time window for MCPP did not confirm by GC/MS.
Z-08	See Attached
Z-09	ND
Z-10	Soil pH measured in water at 19 ºC.
Z-10a	Soil pH measured in water at 19.2 ºC.
Z-10b	Soil pH measured in water at 19.5 ºC.
Z-10c	Soil pH measured in water at 19.6 ºC.
Q	Calibration required quadratic regression (Q).
ND	Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
MDL	Method Detection Limit
MRL	Method Reporting Limit
LOD	Limit of Detection
LOQ	Limit of Quantitation
DL	Detection Limit
I/V	Initial Volume
F/V	Final Volume
§	Subcontracted analysis; see attached report
1	Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
2	Range result excludes concentrations of target analytes eluting in that range.
3	Range result excludes the concentration of the C9-C10 aromatic range.
Avg	Results reported as a mathematical average.
NR	No Recovery
[CALC]	Calculated Analyte
SUB	Subcontracted analysis; see attached report
RL	Reporting Limit

Introduction

This Stormwater Management Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00). Appendix A includes a completed Massachusetts Department of Environmental Protection (MassDEP) Checklist for Stormwater Report, stamped by a professional engineer.

The project follows the guidance presented in the MassDOT Stormwater Handbook (the Handbook), and stormwater management systems are designed in accordance with MassDEP Standards.

Project Summary

Project Description

The Applicant, MassDOT, is proposing Project 609211 to construct the Independence Greenway extension in Peabody, MA. The project consists of an approximately 1.3-mile extension of the Independence Greenway from its current eastern terminus at Essex Center Drive to Endicott Street. The Independence Greenway currently consists of two discontinuous segments separated by Interstate 95 and Route 1. The west section of the existing Independence Greenway runs 2.9 miles between Russell Street near the Ipswich River and Lt. Ross Park. It opened in 2008. The east section is 1.7 miles long and runs from Peabody Road at Proctor Brook and ends at the Northshore Mall near Lahey Medical Center. The trail was built on the route of the former Boston and Maine (B&M) Railroad right-of-way (ROW) north of Lowell Street. The existing Greenway is owned and maintained by the City of Peabody.

This project transforms the former railroad bed into a shared use pedestrian pathway. As the proposed project is a pathway for pedestrian and/or nonmotorized vehicle access, it is therefore categorized as a “Redevelopment Project” under the Massachusetts Stormwater Management Standards. The project is required to meet only Standards 2 & 3 and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5 & 6 to the maximum extent practicable.

This project provides an opportunity to improve the existing drainage system and improve the quality of stormwater runoff discharged to adjacent wetlands. This project will incorporate the installation of practical Stormwater Control Measures (SCMs). The goal of the proposed stormwater improvements is to improve the quality of discharged stormwater to the maximum extent that it is practical.

The following report was created in accordance with the “Massachusetts Stormwater Handbook” last revised in January 2008. The report is organized into sections that correspond to the categories listed in the “Massachusetts Stormwater Report Checklist”. The checklist is included in Appendix A of this report along with a “Redevelopment Checklist”. The following is a more detailed description of the existing and proposed drainage areas and the design methodology for this project.

See Figure 1 for the Project Locus Map and Figure 2 for the Aerial Map.

Existing Conditions

The existing site can be analyzed as ten (10) watershed areas that contribute runoff to ten (10) discharge points. The existing drainage areas are delineated in Figure 6 - Existing Watershed Plan. For the purpose of this hydrologic analysis, the following assumptions were made:
When the watershed boundary fell outside of the limit of work an arbitrary line was delineated as the watershed boundary.

The total watershed area for the existing conditions is used as the comparison base for the watershed area in the proposed conditions.

There are protected wetland resource areas that exist surrounding Proctor Brook which runs adjacent to North Shore Road. The Riverfront Area associated with Proctor Brook, Buffer Zones, as well as 100-year floodplain extend into the project limits along the Independence Greenway Extension. The upstream and downstream side of Proctor brook are hydraulically connected by existing culverts which cross North Shore Road and Endicott Street. Wetland “A” is also in close proximity to the project limits north of Essex Center Drive.

Some areas of the existing drainage system on the roadways within the project limits and the entirety of the Independence Greenway Extension includes “country drainage” (i.e. no curb), where the runoff sheet flows into the pervious shoulder, roadside ditches, wetlands, or private front yards. These watershed areas include EDA-1, -3, and -6 through -10.

There are separate closed drainage systems spread throughout the project, servicing existing watershed areas via catch basin curb inlets and at low points. Where stormwater does not sheet flow off the roadway via country drainage, it travels via curb along the roadway into these closed drainage systems.

There are ten discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. These locations were analyzed as Discharge Points during the hydrologic analysis, as indicated on the attached Existing Watershed Plan. Brief descriptions of each contributing area are below.

DRAINAGE AREA EDA-1
This area consists mostly of a pervious median adjacent to Essex Center Drive and the start of the Independence Greenway. This area also includes approximately 400’ of the impervious path. Stormwater runoff travels via overland flow into a ditch on the south side of Essex Center Drive and discharges to the north through a culvert beyond the project limits to Wetland “A” at DP-1.

DRAINAGE AREA EDA-2
This area consists mostly of impervious roadway and sidewalk along Essex Center Drive, as well as portions of several parking lots and driveways abutting the roadway to the north. This area also includes one half of the bridge that connects Essex Center Drive with North Shore Road at the eastern project limit. Portions of grass medians and a gravel shoulder are also included in this area. Stormwater runoff travels via gutter flow along the curb into a closed drainage system. The closed drainage system discharges beyond the project limits to the north through a culvert to Wetland “A” at DP-2.

DRAINAGE AREA EDA-3
This area consists of the impervious westbound lane of North Shore Road, as well as one half of the bridge that connects North Shore Road with Essex Center Drive (STA. 303+20 to 306+57). This area also includes pervious grass area within the median on the bridge and the area between North Shore Road and Route 128 to the north. Stormwater runoff from the roadway travels via country drainage and discharges into a ditch on the south side of the roadway at DP-3. Stormwater runoff from the grass area adjacent to the roadway travels via overland flow into a culvert, which discharges to the ditch at DP-3.

DRAINAGE AREA EDA-4
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 306+57 to 314+97). Stormwater runoff from the road travels via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a culvert at DP-4.

DRAINAGE AREA EDA-5
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 314+97 to the project limit approximately 500 feet west). Stormwater runoff from the road travels via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a culvert at DP-5.

DRAINAGE AREA EDA-6
This area consists entirely of woods starting perpendicular to the eastbound lane of North Shore Road that extends southwest (STA. 318+45 to 329+88). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north through a culvert at DP-6.

DRAINAGE AREA EDA-7
This area consists entirely of woods that extends southwest (STA. 329+88 to 340+31). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-7.

DRAINAGE AREA EDA-8
This area consists entirely of woods that extends southwest (STA. 340+31 to 346+35). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-8.

DRAINAGE AREA EDA-9
This area consists mostly of woods and a portion of Proctor Brook that extends southwest (STA. 346+35 to 351+77). This section of woods is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs

parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north at DP-9.

DRAINAGE AREA EDA-10
This area consists of woods and a portion of Proctor Brook that extends southwest (STA. 351+77 to 359+02). This section of woods is approximately 15 to 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges southwest through a culvert that crosses under Endicott Street at DP-10.

Table 1 presents the existing drainage areas and their characteristics. Figure shows existing drainage patterns and delineations by design point.

Table 1: Existing Drainage Areas

The Project is located within the 100-year floodplain as shown on the FIRM community panel 25009C0412F, dated 07/03/2012 included in Appendix B.

Review of the NRCS Soil Survey map of the Project area identified the following soils within the project limits:

- 38A - “Pipestone loamy fine sand, 0 to 3 percent slopes” (HSG A/D)
- 43A - “Scarboro mucky fine sandy loam, 0 to 3” (HSG A/D)
- 51A - “Swansea muck, 0 to 1 percent slopes” (HSG B/D)
- 52A - “Freetown muck, 0 to 1 percent slopes” (HSG B/D)
- 71B - “Ridgebury fine sandy loam, 3 to 8 percent slopes, extremely stony” (HSG D)
- 73A - “Whitman fine sandy loam 0 to 3 percent slopes, extremely stony” (HSG D)
- 102E - “Chatfield-Hollis-Rock outcrop complex, 15 to 35 percent slopes” (HSG D)
- 254A - “Merrimac fine sandy loam, 0 to 3 percent slopes” (HSG A)
- 301B - “Montauk fine sandy loam, 0 to 8 percent slopes, very stony” (HSG C)
- 301C - “Montauk fine sandy loam, 8 to 15 percent slopes, very stony” (HSG C)
- 305B - “Paxton fine sandy loam, 3 to 8 percent slopes” (HSG C)
- 305C - “Paxton fine sandy loam 8 to 15 percent slopes” (HSG C)
- 305D - “Paxton fine sandy loam, 15 to 25 percent slopes” (HSG C)
- 311B - “Woodbridge fine sandy loam, 0 to 8 percent slopes, very stony” (HSG C/D)
- 616A - “Fluvaquents, frequently flooded, 0 to 3 percent slopes” (HSG B/D)
- 622C - “Paxton-Urban land complex, 3 to 15 percent slopes” (HSG C)
- 626B - “Merrimac-Urban land complex, 0 to 8 percent slopes” (HSG A)
- 628C – “Canton-Urban land complex, sloping” (No Designation)
- 651 – “Udorthents, smoothed” (No Designation)
- 724C – “Hollis-Urban land-Rock outcrop complex, sloping” (No Designation)

On-site subsurface investigations were performed within the Project area by GZA in 2019. Appendix B provides detailed soils information, including the NRCS soil survey data for the Project area and results of on-site subsurface investigations.

Proposed Conditions

The proposed stormwater management analysis can be summarized as ten (10) watershed areas that contribute runoff to ten (10) discharge points. The overall watershed area and discharge points of analysis are the same in the proposed condition as in the existing condition. The proposed drainage areas are delineated in Figure 7 - Proposed Watershed Plan.

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is 1.3 miles.

The proposed project is located along the abandoned railroad right-of-way that has not seen any improvements since the rails were removed. Existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed will be replaced with new culverts designed to address, to the maximum extent possible, the Massachusetts State Stream Crossings Standards.

In place of the former railroad bridge over Proctor Brook that has been washed away, a new light duty timber boardwalk on helical piles structure is proposed in order to make the abandoned railroad right-of-way usable for a bicycle/pedestrian path. The proposed 56-span light duty timber boardwalk structure will be approximately 437’- 9” long with an out-to-out width of 13’-0” and will provide a clear width of 12’- 1” to accommodate two 5’- 0” wide travel lanes, one in each direction, and two 1’-0” shoulders on each side.

The proposed bituminous shared-use trail pavement will match the dimensions of the existing discontinued railroad structure. This will include 10’-0” wide hot mix asphalt pavement carrying two 5’-0” wide travel lanes, one in each direction, and two 2’-0” wide crushed stone shoulders on both sides. Bike traffic on the existing Independence Greenway has not been formally quantified, but users report that the facility is heavily utilized by bicyclists and pedestrians.

The proposed shared-use trail will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Guide for the Development of Bicycle Facilities (Fourth Edition, 2012) and the MassDOT Separated Bike Lane Planning & Design Guide 2015. The proposed bridge will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) Standard Specifications for Highway Bridges and the most recent supplemental Specifications, Standard Nomenclature and Engineering Directives.

New catch basins have been proposed to replace existing catch basins at certain locations where proposed roadway geometry differs from existing conditions. New catch basins are also proposed where the new Independence Greenway Extension proposes a higher ground elevation than existing conditions and existing headwalls/culverts will no longer be utilized along North Shore Road. A stormwater SCM (infiltration trench) will be installed to help with peak rate attenuation at PDA-4. This project also includes the replacement of the existing culverts that convey Proctor Brook or its tributaries beneath the former track bed. All proposed

drainage systems will maintain the historic drainage patterns, distributing runoff to the existing discharge points.

There are ten discharge points within the limit of work where stormwater leaves the project by overland flow or closed drainage along the roadway. These locations are the same in both Existing & Proposed Conditions and were analyzed as Discharge Points during the hydrologic analysis, as indicated on the attached Proposed Watershed Plan. Brief descriptions of each contributing area are below.

DRAINAGE AREA PDA-1
This area consists mostly of a pervious median adjacent to Essex Center Drive and the start of the Independence Greenway. This area also includes approximately 400' of the impervious path. Stormwater runoff travels the same as existing conditions via overland flow into a ditch on the south side of Essex Center Drive and discharges to the north through a culvert beyond the project limits to Wetland "A" at DP-1.

DRAINAGE AREA PDA-2
This area consists mostly of impervious roadway and sidewalk along Essex Center Drive, as well as portions of several parking lots and driveways abutting the roadway to the north. This area also includes one half of the bridge that connects Essex Center Drive with North Shore Road at the eastern project limit. Portions of grass medians and a gravel shoulder are also included in this area. Stormwater runoff travels the same as existing conditions via gutter flow along the curb into a closed drainage system. The closed drainage system discharges beyond the project limits to the north through a culvert to Wetland "A" at DP-2.

DRAINAGE AREA PDA-3
This area consists of the impervious westbound lane of North Shore Road, as well one half of the bridge that connects North Shore Road with Essex Center Drive (STA. 303+20 to 306+57). This area also includes pervious grass area within the median on the bridge and the area between North Shore Road and Route 128 to the north. The Independence Greenway extension is also proposed through this PDA. Stormwater runoff from the roadway travels the same as existing conditions via country drainage and discharges into a ditch on the south side of the roadway at DP-3. Stormwater runoff from the grass area adjacent to the roadway travels via overland flow into a proposed catch basin, which discharges to the ditch at DP-3.

DRAINAGE AREA PDA-4
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 306+57 to 314+97). The Independence Greenway extension is also proposed through this PDA. Stormwater runoff from the road travels the same as existing conditions via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a proposed infiltration trench SCM that discharges to a catch basin connected to the existing culvert at DP-4.

DRAINAGE AREA PDA-5
This area mostly consists of pervious grass area between North Shore Road and Route 128 and the impervious westbound lane of North Shore Road (STA. 314+97 to the project limit approximately 500 feet west). The Independence Greenway extension is also proposed through

this PDA. Stormwater runoff from the road travels the same as existing conditions via gutter flow along a curb into catch basins that discharge north into the grass area directly adjacent to the roadway. Stormwater runoff from the grass area travels via overland flow into a culvert at DP-5.

DRAINAGE AREA PDA-6
This area consists of the Independence Greenway extension starting perpendicular to the eastbound lane of North Shore Road that extends southwest (STA. 318+45 to 329+88). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. The area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north through a culvert at DP-6.

DRAINAGE AREA PDA-7
This area consists of the Independence Greenway extension that extends southwest (STA. 329+88 to 340+31). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. This area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-7.

DRAINAGE AREA PDA-8
This area consists of the Independence Greenway extension that extends southwest (STA. 340+31 to 346+35). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. The area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges south through a culvert at DP-8.

DRAINAGE AREA PDA-9
This area consists of the Independence Greenway extension that extends southwest (STA. 346+35 to 351+77). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, and loam & seed grass area. The area is approximately 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges north at DP-9.

DRAINAGE AREA PDA-10
This area consists of the Independence Greenway extension that extends southwest (STA. 351+77 to 359+02). This area includes the proposed path, a 2-foot crushed stone shoulder on either side of the path, loam & seed grass area, and a boardwalk over Proctor Brook that is approximately 440 feet in length. The area is approximately 15 to 20 feet wide along its entire length. Stormwater runoff from this area travels the same as existing conditions via overland flow into Proctor Brook which runs parallel to the drainage area. Stormwater that flows through Proctor Brook in this area discharges southwest through a culvert that crosses under Endicott Street at DP-10.

Table 4 presents the proposed drainage areas and their characteristics under proposed conditions. Figure 7 shows proposed drainage patterns and drainage area delineations by design point.

Impaired Waters and TMDLs

As described under the Proposed Conditions section, the Project will discharge to Proctor Brook (Segment ID MA93-39). Proctor Brook is impaired based on the MassDEP Year 2016 Integrated List of Waters, also known as the 303(d) list. The WQDF assists in the identification of impaired waters and TMDL requirements and quantifies the pollutant reduction provided by the Project's SCMs.

Table 6 lists the receiving water bodies that are impaired, if the water body is covered by a TMDL, and the TMDL's Waste Load Allocation (WLA) for MassDOT property.

Table 6: Impaired Waters and TMDL Information

Water Body	*MassDEP Category*	*303(d) list Impairments*	*TMDL*	*TMDL Pollutant*	*TMDL Name*	*Waste Load Allocation for MassDOT (lbs/yr)*
Proctor Brook	*5*	*E.coli, Fecal Coliform*	*Yes*	*227*	*E. Coli and Trash/Debris*	*N/A*

The proposed infiltration trench has been designed to meet the required water quality volume and TSS removal rates; however, it does not discharge to Proctor Brook. E. Coli is not a stormwater caused pollutant; therefore, TMDL removal calculations were not performed. See Standard 4 for more detailed water quality calculations and discussions.

Stormwater Management Standards

As demonstrated below, the proposed Project complies with the MassDEP Stormwater Management Standards (the Standards). The Project is considered a redevelopment project and only meets standards 2, 3, and 4 to the maximum extent practicable.

Standard 1: No New Untreated Discharges

No new stormwater conveyances may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

The Massachusetts Stormwater Handbook, Standard 1, requires that the project demonstrates that there are no new untreated discharges and that new discharges will not cause erosion or scour to downstream wetlands.

Existing runoff discharges to adjacent wetlands and properties via overland flow or by an existing outfall that can be approximated as ten (10) discharge points, as shown on Figure 6 - Existing Watershed Plan. The runoff is conveyed by a combination of overland flow (country drainage), piped networks to outfalls, and culverts that cross the roadway and track bed. The proposed design adds catch basins in some areas to collect runoff, designed based on MassDOT standards, to increase drainage efficiency. Under proposed conditions, runoff will be conveyed through a combination of overland flow, a closed drainage system, and one infiltration trench.

To improve upon existing conditions, stormwater runoff contributing to one of the existing discharge points (DP-4) will have a portion of the catchment area routed to a treatment SCM prior to discharge. The SCM that discharges to DP-4 is an infiltration trench. The proposed catch basins will have deep sumps and hoods to provide additional treatment. The proposed outfalls are located at or near existing outfalls where there is an existing point source discharge.

All new culverts are designed with rip rap protection to prevent erosion to Proctor Brook. Appendix C provides supporting calculations for the outlet protection design.

Stormwater runoff will be treated by deep sump catch basins with hoods at DP-2, -3, and -4, as well as an infiltration trench at DP-4 before discharging. See Standard 4 for the water quality treatment provided by the Project.

There are no new untreated point source discharges created as a result of this project. This standard is fully met.

Standard 2: Peak Rate/Flood Control

Stormwater management systems shall be designed so that post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for discharges to land subject to coastal storm flowage as defined in 310 CMR 10.04.

Standard 2 requires that the rates of flow be attenuated for the proposed development condition. This project is a redevelopment project and is required to meet Standard 2 to the maximum extent practicable. The Independence Greenway Extension will result in a net increase in impervious area.

The peak flow rates were calculated for the 2-, 10-, 25- and 100-year storm events under proposed conditions and compared to the existing peak flow rates. The proposed Independence Greenway Extension and minor geometry improvements result in an overall increase of 44,910 square feet in impervious area within the project limits. The increase in impervious area correlates to a minor overall increase in peak flow rates for the 2-, 10-, 25-, and 100-year storms.

There is an increase in peak flow rates for DP-2, DP-6, DP-7, DP-8, and DP-9 for all storm events due to the proposed increase in impervious area. The increase in peak rates for DP-2, which is the start of the Independence Greenway extension, ranges from 0.17 to 1.38 cfs (cubic feet per second), is minor and considered negligible. The other increases (DP-6,-7,-8, and -9) all occur due to the replacement of track bed with a paved shared use path. The increase of peak rates for DP-6 ranges from 0.96 to 3.21 cfs. The increase of peak rates for DP-7 ranges from 0.84 to 3.07 cfs. The increase of peak rates for DP-8 ranges from 0.41 to 1.77 cfs. The increase of peak rates for DP-9 ranges from 0.42 to 0.63 cfs. These four discharge points correspond to the four cross culverts under the track bed. DP-6 is where two twin 42” culverts that are obstructed are located. DP-7 is where the existing 6.4’ x 4’ box culvert has been washed away. Both areas have resulted in degraded track bed and overtopping of Proctor Brook. The proposed improvements will not only restore what was previously installed but also will enlarge the culverts to allow additional flow through the culverts rather than over the shared use pathway. DP-8 and DP-9 represent existing failed smaller culverts that will be replaced in kind that convey intermittent streams.

When the drainage areas (DP-6, -7, -8, and -9) that discharge to Proctor Brook are combined and compared to the overall peak rates of the Proctor Brook watershed, the increases are negligible. The project drainage area that directly discharges to Proctor Brook is 1.08 acres, with a net increase discharge rate of 8.71 cfs for the 100-year storm event under proposed conditions. Because the project site is located on the lower end of the watershed, the stormwater runoff from the path will reach its peak, prior to Proctor Brook (the combination of DP-6, 7, 8, 9, and 10) reaching its peak at DP-10, resulting in no increase in flood elevations for any storm event. This is demonstrated by adding the net increase in peak rates for the 100-year storm event from the HydroCAD model for DP-6,-7,-8,-9, and -10 (8.71 cfs), to the effective FEMA FIS 100-year peak discharge of 420 cfs for Proctor Brook for a total of 428.71 cfs. The hydraulic model resulted in no increase to the base flood elevation; thereby, demonstrating that the minor increase in peak rates from the project will not result in downstream flooding. A copy of the hydraulic study is included in Appendix D.

Therefore, no adverse impacts are anticipated by the increase in peak rates as a result of the project. The results of this analysis are presented in Appendix D of this report.

Per MassDOT Requirements, a proposed stormwater SCM must hold peak volumes up to the 10-year storm event. The proposed infiltration trench stormwater SCM fully meets this requirement.

Table 7 provides a summary of peak rates for each design point under existing and proposed conditions. Appendix D provides computations and supporting information regarding the hydraulic and hydrologic modeling.

Table 7: Peak Discharge Rates (cfs)

	Existing				*Proposed*

Standard 3: Recharge

Loss of annual recharge to ground water shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the MassDEP Massachusetts Stormwater Handbook.

Standard 3 requires that three computations or demonstrations be fulfilled in order to satisfy the stormwater recharge requirements. They are as follows:

- Impervious Area
- Required Recharge Volume
- Bottom Area Sizing for Subsurface Infiltration Systems and Porous Pavement

As stated previously, this project is a redevelopment project and is required to meet Standard 3 to the maximum extent practicable. This project has 119,834 square feet of total existing impervious area within the limit of work and results in an increase in impervious area by approximately 46,907 square feet due to the Independence Greenway extension and minor roadway geometry improvements. The required recharge volume for the total impervious area within the limit of work is 8,000 CF. The required recharge volume for the net increase in impervious area within the limit of work is 2,348 CF. The required recharge volume for the proposed SCM is 926 CF.

The project considered implementation of SCM's that would provide recharge throughout the project limits; however, there was only one feasible location within the project, which is close to DP-4. Given the limited space within the ROW, existing utilities, the crisscrossing of Proctor Brook under the track bed, close proximity to waterbodies and high groundwater throughout the majority of the project, it was not feasible to propose additional SCMs in all the drainage areas in the project.

The Soil Survey Analysis is included in Section 1.1 of this report, Figure 3 Soils Map, and Appendix B Soil Information. The infiltration trench is located near borings B-3 and B-4 taken by GZA. Boring B-3 did not encounter groundwater and boring B-4 encountered groundwater at 9.5' below the existing surface. The bottom of the proposed infiltration trench will have more than 2-feet of separation to ledge and/or seasonal high groundwater. The NRCS soil report for this area demonstrates that the soil type is 602, Urban Land, within the infiltration trench, which does not have a hydrologic soil group associated with it. The closest NRCS identified soil group to this area is 626, Merrimac urban land with HSG A. In addition, the Geotechnical Report developed by GZA in Appendix B describes the soils closest to the infiltration trench (borings B-3 and B-4) as fine to coarse sand, some silt, trace gravel, and trace ash, which is consistent with HSG A. Therefore, the SCM is determined to be comprised of HSG A soils and the required recharge calculations were made using HSG A soils. See Appendix C of this report for required recharge calculations.

For the infiltration trench SCM, the contributing impervious areas and its underlying Hydrologic Soil Group were used to estimate the recharge volume lost by the addition of impervious area, which was used as its required recharge volume. The combined storage provided by the proposed

infiltration trench is 1,415 CF. While the infiltration trench does not provide storage for the total proposed impervious area within the project limits, the storage volume meets the required volume determined by the impervious area that is routed to the SCM. Therefore, Standard 3 is met to the maximum extent practicable.

The SCM was designed using the static method, so that the storage available below the first overflow is equivalent or larger than the required recharge volume. Drawdown calculations were performed to show that the infiltration trench will drain within 72 hours. For this calculation, the RAWLs infiltration rates were used to estimate the recharge potential of each of the SCMs.

Table 8 provides the required recharge volume for the project, and Table 9 provides the provided recharge volumes for each design point.

Table 8: Required Recharge Volume for Project

	HSG A	*HSG B*	*HSG C*	*HSG D*	*Total*
Existing Impervious (sq. ft.)	119,834	-	-	-	119,834
Proposed Impervious (sq. ft.)	150,450	16,291	-	-	164,744

Table 9: Provided Recharge Volumes by Design Point

	HSG A	*HSB B*	*HSG C*	*HSG D*	*Total*
DP-4 (Drainage Area PDA-4)					
Provided Recharge Volume (cf)	1,415	-	-	-	1,415

Appendix B provides soil evaluation information (including the geotechnical report), and Appendix C provides computations, drawdown calculations, and supporting information regarding recharge.

Infiltration SCMs were considered for the project, but only one location was feasible due to limited space in the ROW, seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. Drywells were considered but provide very little stormwater treatment volume, require 2’ separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points.

Standard 4: Water Quality Treatment

Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This Standard is met when:

- *Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained;*
- *Structural stormwater best management practices are sized to capture the required water quality volume determined in accordance with the MassDEP Massachusetts Stormwater Handbook; and*
- *Pretreatment is provided in accordance with the MassDEP Massachusetts Stormwater Handbook.*

Standard 4 requires that all stormwater management systems be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). The Massachusetts Stormwater Handbook states that this standard is met when:

- Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained;
- Structural stormwater best management practices are sized to capture the required water quality volume as determined in accordance with the Massachusetts Stormwater Handbook; and
- Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.

As stated previously, this project is a redevelopment project and is required to meet Standard 3 to the maximum extent practicable. As mentioned in Section 5, there is an increase in impervious area and one (1) SCM is proposed as part of this project. It has been designed to provide water quality treatment for the area of impervious surface that it captures. The treatment practice is:

- (1) Infiltration Trench

The combination of an infiltration trench and deep sump catch basins with hoods provides 85% TSS removal for DP-4 only. This standard is met to the maximum extent practicable.

The project is not located within a stormwater critical area; therefore, Massachusetts Stormwater Regulations require a “Water Quality Depth” of half (1/2) inch. This project is considered a redevelopment project; one of the objectives of the proposed stormwater improvements is to improve upon the quality of discharged stormwater.

The proposed design aims to improve the water quality by installing a new infiltration SCM and catch basins with deep sumps and hoods where feasible. The required water quality volume for the total impervious area within the limit of work is 6,864 CF. The required water quality volume for the net increase in impervious area within the limit of work is 1,954 CF. The required water quality volume for the impervious area that the SCM receives is 772 CF. Though the proposed infiltration trench does not provide enough volume for the total or net increase of impervious area, it exceeds the water quality volume requirement for the area it was designed to hold, by providing 1,415 CF of storage. As a result, this standard will be met to the maximum extent practicable. See Appendix C for required water quality volume calculations.

The Project has been designed to comply with Standard 4. Stormwater control measures have been sized to treat the required water quality volume and remove required pollutant load to the maximum extent practicable.

The Project used the SCM WQ Curves, as provided by the WQDF, to determine the treatment depth based on the required TSS and/or TP removal percentage for each SCM. Table 10 shows the SCMs organized by design point with each SCM's corresponding treatment depth and TSS and/or TP treatment removal.

Table 10: Water Quality Treatment Required and Provided by Design Point

Appendix C provides the MassDEP TSS Removal Calculation Worksheets.
The City of Peabody has an active MS4 permit which includes long term operation and maintenance. The project will be maintained by the City's current O&M plan. Appendix E includes the LTPPP for this project.

Infiltration SCMs were considered for the project, but only one location was feasible due to limited space in the ROW, seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. Drywells were considered but provide very little stormwater treatment volume, require 2' separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points. Another option was to use proprietary devices at each discharge point for stormwater treatment volume, but due to the majority of the site discharging runoff via overland flow, these systems are not practical for this project.

The project's water quality treatment provides a minimum of 25% removal where closed drainage only was provided, and up to 85% of removal where the infiltration trench is proposed. The shared-use pathway that will replace the former railroad bed will sheet flow runoff to vegetated/wooded areas. Standard 4 is met to the maximum extent practicable.

Standard 5: Land Uses with Higher Potential Pollutant Loads

For Land Uses with Higher Potential Pollutant Loads (LUHPPLs), source control and pollution prevention shall be implemented in accordance with the MassDEP Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If through source control and/or pollution prevention all LHPPLs cannot be completely protected from exposure to rain, snow, snow melt, and stormwater runoff, the proponent shall use the specific structural stormwater BMPs determined by the Department to be suitable for such uses as provided in the MassDEP Massachusetts Stormwater Handbook. Stormwater discharges from LUHPPLs shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26-53 and the regulations promulgated thereunder at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.

Standard 5 does not apply to the Project. There are no land uses with higher potential pollutant loads within the Project area.

Standard 6: Critical Areas

Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of the specific source control and pollution prevention measures and the specific structural stormwater best management practices determined by the Department to be suitable for managing discharges to such areas as provided in the MassDEP Massachusetts Stormwater Handbook. A discharge is near a critical area, if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters and Special Resource Waters shall be removed and set back from the receiving water or wetland and receive the highest and best practical method of treatment. A "storm water discharge" as defined in 314 CMR 3.04(2)(a)1 or (b) to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00. Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of a public water supply.

Standard 6 does not apply to this Project. There are no critical areas within the Project limits.

Standard 7: Redevelopment

A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

The Independence Greenway extension is considered Redevelopment; therefore, Standard 7 is applicable to this project. Standard 7 requires a redevelopment project to meet Standards 2, 3 and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5 and 6 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

This project provides an opportunity to improve the quality of stormwater runoff discharged to adjacent wetlands. The proposed stormwater enhancements are summarized below:

There is one SCM proposed as part of this project. A portion of the proposed drainage system has been designed to convey runoff to this SCM for water quality treatment, and attenuation prior to discharge to the surrounding environment. The proposed SCM is an infiltration trench.

Cath basins with sumps and hoods are also installed within the project where feasible, which provide additional treatment.

The reconstructed drainage system will utilize existing outfall locations and invert elevations where feasible.

A Redevelopment Stormwater Checklist is provided in Appendix A of this report which illustrates which standards have been met to the maximum extent practicable. The standards are listed below:

Standard 1: Fully Met

Standard 2: Maximum Extent Practicable

Standard 3: Maximum Extent Practicable

Standard 4: Maximum Extent Practicable

Standard 5: Fully Met

Standard 6: Not Applicable

Standard 7: Fully Met

Standard 8: Fully Met

Standard 9: Fully Met

Standard 10: Fully Met

Standard 8: Erosion and Sediment Control

A plan to control construction related impacts, including erosion, sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan) shall be developed and implemented.

The implementation of erosion and sediment controls (ESC) during construction is considered a standard practice for all MassDOT projects. ESC will be installed before any land disturbance begins for the Project and will remain in place for the duration of the project. Construction period pollution prevention and erosion and sedimentation control measures will be implemented at the project site to control construction related impacts during construction and land disturbance activities. The General Contractor for the project will be responsible for implementation of the construction period controls.

The project will disturb more than one acre of land during the construction process and will require a NPDES Construction General Permit issued by the Environmental Protection Agency. As a result, the General Contractor will be required to prepare a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP document will satisfy the requirements of the Construction General Permit and the construction period erosion, sedimentation and pollution prevention plan requirements outlined in Standard 8 of the Massachusetts Stormwater Handbook. A SWPPP has not been prepared for inclusion with this stormwater report; however, one will be prepared prior to any construction activities at the site by the General Contractor.

Without proper erosion and sediment control measures, grading, filling and installing new structures may cause erosion and sedimentation, resulting in temporarily increased turbidity and suspended solid loads. Runoff from construction sites may also transport sediment to downstream watercourses, where sediment deposition and accumulation will occur as flow velocities decrease.

Erosion and sedimentation controls will be employed to prevent the erosion and transport of sediment into resource areas during the earthwork and construction phases of the project. Erosion and sedimentation control measures will be installed prior to site excavation or disturbance and will be maintained throughout the construction period.

Below is a description of some of the erosion and sediment control measures that will be employed at the project and that will be included in the SWPPP.

Minimize Disturbed Area and Protect Natural Features and Soil

The most important aspects of controlling erosion and sedimentation are limiting the extent of disturbance and limiting the size and length of the tributary drainage areas to the worksite and drainage structures. These fundamental principles will be the key factors in the Contractor's control of erosion on the project site. If appropriate, the Contractor will construct temporary diversion swales and settling basins or use a settling tank. If additional drainage or erosion control measures are needed, they will be located up-gradient from the compost filter tubes and sedimentation fences when possible.

The Contractor is responsible for the maintenance and repair of all on-site erosion control devices. All erosion control devices will be regularly inspected. At no time will silt-laden water be allowed to enter sensitive areas (wetlands, streams, and drainage systems). Any runoff from disturbed surfaces

will be directed through a sedimentation process prior to being discharged to the existing on-site drainage system.

The contractor will establish a staging area(s) on areas to be disturbed for the overnight storage of equipment and stockpiling of materials.

In the staging area, the Contractor will have a stockpile of materials required to control erosion on-site to be used to supplement or repair erosion control devices. These materials will include, but are not limited to, compost filter tubes, sedimentation fence, erosion control matting and crushed stone. As mentioned previously, erosion and sedimentation controls will be employed to minimize the erosion and transport of sediment into resource areas during the earthwork and construction phases of the project. Erosion and sedimentation control measures will be installed prior to site excavation or disturbance and will be maintained throughout the construction period.

The Contractor is responsible for erosion control on the site and will utilize erosion control measures where needed, regardless of whether the measures are specified on the construction plans or in supplemental plans prepared for the Stormwater Pollution Prevention Plan (SWPPP).

Primary erosion control techniques proposed include compost filter tubes, sedimentation fence barriers, and a stabilized construction entrance. A detailed description of each technique is discussed below.

Best Management Practices (BMPs)

COMPOST FILTER TUBES AND SEDIMENTATION FENCE

Erosion control barriers such as compost filter tubes and/or sedimentation fence or similar will be installed where required prior to the start of construction. These barriers will remain in place until all tributary surfaces have been fully stabilized.

DRAINAGE SYSTEM PROTECTION

Sediment filters (silt sacks) will be installed at all existing and proposed drainage structures and maintained and cleaned as required to maintain their effectiveness. Catch basins, drainage manholes and storm drain pipes will be cleaned of sediment and debris after the completion of construction. Sediment collected in structures will be disposed of properly and covered, if stored on-site. The following construction measures will be implemented to prevent the transport of sediment through the drainage system.

The Project disturbs one or more acres of land; therefore, the project contractor will request coverage under the NPDES Construction General Permit (CGP) and develop a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP follows the requirements of this standard and will be in compliance with the latest NPDES CGP.

Standard 9: O&M Plan

A long-term operation and maintenance plan shall be developed and implemented to ensure that stormwater management systems function as designed.

The City of Peabody is responsible for implementing the O&M Plan within their jurisdiction. Appendix E includes the O&M Plan for this project.

Standard 10: Illicit Discharges

All illicit discharges to the stormwater management system are prohibited.

Standard 10 of the Massachusetts Stormwater Handbook prohibits illicit discharges to stormwater management systems. As stated in the handbook, "The stormwater management system is the system for conveying, treating, and infiltrating stormwater on-site, including stormwater best management practices and any pipes intended to transport stormwater to the groundwater, a surface water, or municipal separate storm sewer system. Illicit discharges to the stormwater management system are discharges that are not entirely comprised of stormwater."

Proponents of projects within Wetlands jurisdiction must demonstrate compliance with this requirement by submitting to the issuing authority an Illicit Discharge Compliance Statement verifying that no illicit discharges exist on the site and by including in the pollution prevention plan measures to prevent illicit discharges to the stormwater management system.

Standard 10 also states that "The Illicit Discharge Compliance Statement must be accompanied by a site map that is drawn to scale and that identifies the location of any systems for conveying stormwater on the site and shows that these systems do not allow the entry of any illicit discharges into the stormwater management system. The site map shall identify the location of any systems for conveying wastewater and/or groundwater on the site and show that there are no connections between the stormwater and wastewater management systems and the location of any measures taken to prevent the entry of illicit discharges into the stormwater management system." Included with the Notice of Intent Submission are construction plans that displays the location of all of the stormwater management components as well as other utilities (existing and proposed) on the project site and conforms to requirements of a "site map" to accompany the Illicit Discharge Compliance Statement.

An Illicit Discharge Compliance Statement is included in Appendix E – Illicit Discharge Compliance Statement of this Report.

Where a new, closed drainage system will be constructed, there will be no connections to sanitary sewer. In other areas, stormwater runoff discharges via overland flow.

The design plans submitted with this report have been designed in full compliance with Standard 10. The project area does not have any known illicit connections.

Appendix A: MassDEP Checklist for Stormwater Report

- Massachusetts Stormwater Report Checklist
- Redevelopment Checklist

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.

A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☒ Redevelopment

☐ Mix of New Development and Redevelopment

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

☐ No disturbance to any Wetland Resource Areas

☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)

☐ Reduced Impervious Area (Redevelopment Only)

☒ Minimizing disturbance to existing trees and shrubs

☐ LID Site Design Credit Requested:

- ☐ Credit 1
- ☐ Credit 2
- ☐ Credit 3

☒ Use of "country drainage" versus curb and gutter conveyance and pipe

☐ Bioretention Cells (includes Rain Gardens)

☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)

☐ Treebox Filter

☐ Water Quality Swale

☐ Grass Channel

☐ Green Roof

☒ Other (describe): Infiltration Trench

Standard 1: No New Untreated Discharges

☒ No new untreated discharges

☒ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth

☒ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☒ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☐ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☒ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☐ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☒ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☒ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☒ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☐ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☐ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☒ Bike Path and/or Foot Path
- ☒ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☒ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☒ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☒ Name of the stormwater management system owners;
- ☒ Party responsible for operation and maintenance;
- ☒ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☒ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Checklist for Redevelopment Projects

Redevelopment Location:
The entire work within the limit of disturbance is considered redevelopment.

Standard 7: A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions. Standards that are fully met are checked and do not require additional explanation.

☒ Standard 1: (Untreated discharges)
No new stormwater conveyances (e.g., outfalls) may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

☐ Standard 2: (Peak rate control and flood prevention)
Stormwater management systems must be designed so that post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for land subject to coastal storm flowage.

The peak flow rates were calculated for the 2-, 10-, 25- and 100-year storm events under proposed conditions and compared to the existing peak flow rates. The proposed Independence Greenway extension and minor geometry improvements result in an overall increase in square feet of impervious area within the project limits.

Though there is an increase in peak flow rates for DP -2, -6, -7, -8, and -9 for all storm events, additional studies were done to demonstrate there will be no adverse impacts. See page 16 in the Stormwater Report for additional information.

Implementations of Stormwater Control Measures (SCMs) for peak rate attenuation were used for one discharge point, but are not feasible for all discharge points due to the limited space within the existing Right-Of-Way (ROW), high groundwater, close proximity to resource areas and existing utilities.

☐ Standard 3: (Recharge to Ground water)
Loss of annual recharge to ground water shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from the pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The project considered implementation of SCM's that would provide recharge throughout the project limits; however, there was only one feasible location in the project close to DP-4. Given the limited space within the ROW, existing utilities, the crisscrossing of Proctor Brook under the track

bed, close proximity to waterbodies and high groundwater throughout the majority of the project, it was not feasible to propose SCMs in all the drainage areas in the project.

For the SCM, the contributing impervious areas and their underlying Hydrologic Soil Groups were used to estimate the recharge volume lost by the paved shared use path, which was used as the required recharge volume for the given SCM. The recharge volume provided by the SCM is 1,415 CF. While the infiltration trench does not provide storage for the total proposed impervious area within the project limits, the storage volume meets the required volume determined by the impervious area that is routed to the SCM. Therefore, Standard 3 is met to the maximum extent practicable.

☐ Standard 4: (80% TSS Removal)

Stormwater management systems must be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This standard is met when:

a. *Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan and thereafter are implemented and maintained;*
b. *Stormwater BMPs are sized to capture the required water quality volume determined in accordance with the Massachusetts Stormwater Handbook; and*
c. *Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.*

Infiltration SCMs were considered for the project, but only one location was feasible due to limited space in the ROW, seasonal high groundwater elevation, existing utilities, and close proximity to wetlands. Drywells were considered but provide very little stormwater treatment volume, require 2' separation from the bottom of the drywell to groundwater, which in most cases is infeasible, and the large number of drywells required would be impractical for all design points. Another option was to use proprietary devices at each discharge point for stormwater treatment volume, but due to the majority of the site discharging runoff via overland flow, these systems are not practical for this project.

The infiltration trench at DP-4 will be able to achieve 85% TSS removal with the crushed stone shoulder forebay and the catch basins with deep sump and hood providing pretreatment.

The project's water quality treatment provides a minimum of 25% removal where closed drainage only was provided, and up to 85% of removal where the infiltration trench is proposed. The shared-use pathway that will replace the former railroad bed will sheet flow runoff to vegetated/wooded areas. Standard 4 is met to the maximum extent practicable.

☒ Standard 5 (Higher Potential Pollutant Loads (HPPL)

For land uses with higher potential pollutant loads, source control and pollution prevention shall be implemented in accordance with the Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If through source control and/or pollution prevention, all land uses with higher potential pollutant loads cannot be completely protected from exposure to rain, snow, snow melt and stormwater runoff, the proponent shall use the specific stormwater BMPs determined by the Department to be suitable for such use as provided in the Massachusetts Stormwater Handbook. Stormwater discharges from land uses with higher potential pollutant loads shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26-53, and the regulations promulgated thereunder at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.

Not Applicable.

☒ Standard 6 (Critical Areas)

Stormwater discharges to a Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or any other critical area require the use of the specific source control and pollution prevention measures and the specific stormwater best management practices determined by the Department to be suitable for managing discharges to such area, as provided in the Massachusetts Stormwater Handbook. A discharge is near a critical area if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters or Special Resource Waters shall be set back from the receiving water and receive the highest and best practical method of treatment. A "stormwater discharge," as defined in 314 CMR 3.04(2)(a)1. or (b), to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00. Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of the public water supply.

Not Applicable.

☒ Standard 8: (Erosion, Sediment Control)

A plan to control construction-related impacts, including erosion sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan), must be developed and implemented.

☒ Standard 9: (Operation and Maintenance)

A long-term operation and maintenance plan must be developed and implemented to ensure that stormwater management systems function as designed.

☒ Standard 10 (Illicit Discharges)

All illicit discharges to the stormwater management system are prohibited.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Essex County, Massachusetts, Southern Part
Survey Area Data: Version 19, Sep 9, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 22, 2022—Jun 5, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Re: Geotechnical Engineering Report
Proposed Peabody Bikeway – Phase II
Peabody, Massachusetts

Dear Adel:

In accordance with our Agreement dated December 20, 2018, GZA GeoEnvironmental, Inc. (GZA) is pleased to submit this geotechnical engineering report for the proposed Peabody Bikeway project located in Peabody, Massachusetts. The objectives of our services were to evaluate subsurface conditions and develop geotechnical design and construction recommendations to support the 25% design of proposed structural features of the project.

The proposed Peabody Bikeway Phase II project is part of the overall 5.3-mile Independence Greenway that extends from the Ipswich River Trailhead in Middleton, MA to the North Shore Mall Trailhead in Peabody, MA. The Peabody Bikeway Phase II Segment is an approximately 1.3-mile-long segment of trail that extends from the North Shore Mall Trailhead (STA 290+00) to Endicott Street in Peabody (STA 359+43).

This report supersedes our Preliminary Geotechnical Engineering Report dated April 22, 2019. The report was updated to reflect changes to the structural design and structural elements to the project. Specifically, the two retaining walls previously proposed between the Route 128 northbound highway embankment and the existing sidewalk of North Shore Road have been eliminated from the project. In addition, we understand that the proposed stream crossing structure located off Warren Street extension crossing Proctor Brook will consist of an approximately 438-foot-long elevated boardwalk rather than an 80-foot-long prefabricated steel truss bridge.

Elevations herein are in feet and referenced to the National American Vertical Datum of 1988 (NAVD 88). This report is subject to the Limitations set forth in **Appendix A** and the Terms and Conditions of our Agreement.

BACKGROUND

Our understanding of the project is based on:

- Discussions and email correspondence with Green International Affiliates Inc. (Green);
- Aerial photograph with proposed boring locations selected by Green at each structural feature;

- Construction Plans and Profiles along the Bikeway, Sheets 32 through 39, prepared by Green dated "fiscal year 2005";
- Site visits and observations of subsurface explorations at the site;
- CAD file of project base map provided by Green on January 15, 2019;
- MassDOT 25% Submittal Plan and Profile of Independence Greenway Extension, provided by Green on January 23, 2019;
- In-progress Sketch Plans entitled "Proposed Bridge Peabody Independence Greenway Extension over Proctor Brook", prepared by Green, with print date April 9, 2021.
- In-progress Construction Plans and Profiles, with print date April 5, 2021 and Bikeway Cross Sections, with print date April 7, 2021, prepared by Green.
- Readily available on-line surficial geology information, as well as on-line aerial photographs and topographic maps.

Existing Conditions

The Peabody Bikeway Phase II site starts from a previously completed portion of the Independence Greenway located near the southbound Route128 roadway and the North Shore Shopping Mall in Peabody, MA (Begin Bikeway STA 289+66). The bikeway extends east about 1,200 feet roughly parallel to the Route 128 roadway, then crosses under the southbound and northbound Route 128 roadways (at the existing Route 128 bridge over the entrance to the shopping mall), extends west about 1,400 feet along North Shore Road, crosses North Shore Road, and then follows an existing abandoned railroad right-of-way in an easterly direction roughly following Proctor Brook and terminating at about Endicott Street (End Bikeway STA 369+30) for about 4,100 feet. A site Locus is presented as **Figure 1**.

<u>Route 128 Southbound Roadway Embankment Segment</u>

The segment of the bikeway along the southbound Route 128 roadway (shopping mall side of the bikeway) will consist of an approximately 4-foot-wide trail. There are no structural features required to support the bikeway along this portion of the alignment.

<u>North Shore Road Segment</u>

The North Shore Road segment of the bikeway alignment is the existing highway embankment along the northbound side of Route 128. The embankment is grass covered with vegetation, overgrown bushes and small-diameter trees. There are several drainage basins and culverts within the embankment.

Photograph A: Embankment Slope looking Southwest at Route 128 Northbound Roadway adjacent to North Shore Road.

The embankment slope is approximately 1.5 horizontal to 1 vertical (1.5H:1V) at the northern end underpass and becomes flatter towards the west (**Photograph A**). The existing grade ranges from approximately elevation (El.) 53 to El. 68 feet along North Shore Road to about El. 52 to El. 75 at Route 128 - Northbound. The segment of the bikeway along the North Shore Road will consist of an approximately 10-foot-wide trail. There are no structural features required to support the bikeway along this portion of the alignment. However, earthwork with cuts up to about 5 feet at a maximum 2H:1V side slope and fills up to about 5 feet at a maximum 4H:1V side slope will be required to construct the bikeway along the existing embankment.

Existing Abandoned Railroad Right-of-Way Segment

The proposed bikeway alignment extends east from North Shore Road along an existing railroad right-of-way through a wooded area located between and roughly parallel to Lowell Street to the south and Warren Street Extension to the north. The railroad alignment approximately follows Proctor Brook. This portion of the site is heavily wooded with wetland vegetation. Existing site grades range from approximately El. 50 to El. 38.

There are four existing culvert crossings along the existing rail bed:

- a 36-inch and a 42-inch-diameter culvert at about STA 329+85
- a 30-inch-diameter culvert at about STA 340+10
- a 24-inch-diameter culvert at about STA 342+25
- a stone culvert of unknown size at about STA. 346+20.

There is also a former stream crossing over Proctor Brook at about STA. 351+60 (**Photograph B**).

Photograph B: Former Stream Crossing at Proctor Brook. Also, location of proposed pedestrian boardwalk.

An existing 42-inch-diameter sewer main also crosses through the right-of-way between Warren Street Extension and Endicott Street. The sewer main is reported to be about 12 feet below grade.

Proposed Construction

Proposed structural features for the bikeway include two box culverts and a stream crossing structure consisting of an elevated boardwalk.

Culverts

Two precast concrete, single-cell box culverts will be constructed to replace two of the existing culverts along Proctor Brook. One culvert is located at about STA 329+85 and is proposed to be 2.5-feet high by 6-feet wide by 24-feet long and the other culvert is located at about STA. 346+20 and is proposed to be 3-feet high by 7-feet wide and 18-feet long. Each culvert will include precast wing walls set at 45 degrees at both ends of the box culvert.

Stream Crossing Structure

The proposed stream crossing structure will consist of an elevated boardwalk located off the west end of Warren Street Extension that crosses over Proctor Brook and extends through wetland areas adjacent to the brook between approximately STA. 351+09 and STA. 355+47, terminating about 300 feet west of Endicott Street. The boardwalk will consist of composite wood decking with a clear width of 12 feet and piers (bents) generally spaced at 8-feet on-center. Helical piles are proposed for support of the boardwalk. The Sketch Plans show a timber wingwall at the abutments at the west and east ends of the boardwalk. The height of the boardwalk is generally within about 3 feet above existing

grade and extends locally up to about 3.75 feet above existing grade. The stream crossing structure will be designed to accommodate light-duty H-5 truck loading conditions.

SUBSURFACE EXPLORATIONS

Subsurface explorations included geotechnical test borings at each of the proposed structural features along the proposed bikeway alignment and sediment sampling for laboratory testing to provide data for scour analyses and completion of a 401 Water Quality Certification by others for the stream crossing structure.

Geotechnical Test Borings

GZA engaged New England Boring Contractors, Inc. (NEBC) of Derry, New Hampshire to perform eight test borings, including four borings (B-1 through B-4) along the highway embankment adjacent to North Shore Road for the previously proposed retaining walls (which are now planned to be a cut/fill slopes); two borings (B-5 and B-6) at the proposed culvert replacement locations, and two borings (B-7 and B-8) at the proposed pedestrian crossing as planned in 2018. It is noted that test boring B-5 was not performed due to accessibility issues but may be drilled at a later date as a confirmation boring during construction. The locations of several of the other borings had to be relocated from the originally proposed locations due to lack of access or the presence of overhead electrical wires. Approximate locations of the completed borings are shown on **Figure 2**. The original proposed boring locations were located in the field with a Trimble GPS unit and relocated borings using tape measurements from existing topographic features. Exploration locations should be considered accurate to the degree implied by the method used.

The test borings were performed between January 2 and 15, 2019 with an ATV-mounted drill rig using either 2-¾-inch inner diameter (I.D.) hollow stem augers or drive-and-wash drilling techniques to depths ranging from about 10 to 36 feet below ground surface (bgs). Split-spoon samples were collected and Standard Penetration Tests (SPTs) were generally taken continuously through the fill, and then at approximate 5-foot intervals thereafter. The samples were obtained in general accordance with ASTM D1586. The SPT method consists of driving a 1-⅜ I.D. split-spoon sampler 24 inches with a 140-pound hammer falling 30 inches. The number of blows required to drive the sampler from 6 to 18 inches is the SPT blow count (N-value), which is a commonly used indicator of soil density and consistency. An NX-sized, 10-foot-long rock core was obtained at borings B-7 and B-8 to confirm the type and quality of bedrock. Water levels were recorded at the completion of drilling, however, may not represent stabilized groundwater levels due to the introduction of drilling fluids. Upon completion of drilling, all borings were backfilled with drill cuttings and surficial soils.

A GZA representative was present during drilling to observe the borings and visually classify the soil samples using the Modified Burmister Soil Classification System and rock cores using the International Society of Rock Mechanics (ISRM) System. Boring logs prepared by GZA are attached in **Appendix B**. Photographs of the rock cores obtained from the borings are presented in **Appendix C**.

Sediment Sampling

GZA collected ten (10) shallow soil samples to a depth of up to 2 feet below the bottom of the brook for laboratory gradation testing for use in scour analysis by others and the 401 Water Quality Certification.

Six shallow soil/sediment samples were collected at the pedestrian bridge (as previously proposed in 2018) at locations specified by Green including, three samples approximately 72 feet upstream of the bridge (distance from the bridge equal to the length of the bridge crossing over the brook): one sample from the left bank on land, one sample from the right bank

on land, and one in the channel; and three samples at the bridge: one sample at the left abutment on land in front of the abutment, one sample at the right abutment on land in front of the abutment, and one in the channel.

Two (2) shallow sediment samples were also collected at each of the two proposed box culverts (total of 4 samples). The samples were obtained at the upstream opening of the existing culvert and at a distance upstream from the culvert equal to the length of the box culvert spanning over the brook; in this case one culvert is 24 feet wide and the other 18 feet wide.

The samples were collected using a hand shovel and a hand auger. The sediment material submitted for laboratory testing was a composite of material collected over the depth of sampling. Locations of the samples were made using tape measurements to existing topographical features.

LABORATORY TESTING

Geotechnical Laboratory Testing

Four soil samples from the geotechnical borings were submitted to Thielsch Laboratories in Cranston, Rhode Island for sieve analyses (ASTM D 422) to confirm field classifications, evaluate soil properties across the site, and evaluate the potential for soil re-use. Geotechnical laboratory test results are attached as **Appendix D**.

The ten (10) sediment samples obtained from the pedestrian bridge and replacement culvert locations were submitted to Thielsch Laboratories for sieve analyses for use in scour analyses by others and for 401 Water Quality Certification. Geotechnical laboratory test results of the sediment are attached as **Appendix D**.

Environmental 401 Water Quality Certification Testing

Four sediment samples were submitted to ESS Laboratory in Cranston, Rhode Island for environmental laboratory testing to evaluate parameters specified in the MassDEP BRP WW 08 Dredging Application and in accordance with MassDEP Policy No. Comm 97-001 Reuse and Disposal of Contaminated Soil at Massachusetts Landfills. Soil that is generated during the removal of sediment form the bottom of the brook and during excavation for the bridge abutments which is considered to be excess to the project must be managed in accordance with the MassDEP Massachusetts Contingency Plan (MCP) regulations and to evaluate whether the excavated material can meet the criteria for disposal at a Massachusetts landfill, if required. The testing also included analytes to satisfy criteria listed in 314 CMR 9.07 Criteria for Evaluation of Applications for Dredging and Dredged Materials Management. Analyses included:

<u>BRP WW 08 (assuming minor dredging):</u>

- Metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, zinc)
- EPA Method 8100 Polycyclic Aromatic Hydrocarbons (PAHs)
- EPA Method 8080 Polychlorinated Biphenyls (PCBs)
- MassDEP Extractable Petroleum Hydrocarbons (EPH) ranges
- Total Petroleum Hydrocarbons (TPH)
- Volatile Solids (percent)
- Water (percent)
- Grain Size (performed as part of geotechnical laboratory testing above)

Additional testing performed not covered by BRP WW 08, but needed for MassDEP and Massachusetts dredging, included:

MassDEP Policy No. Comm 97-001:

- EPA Method 8270 Semi-Volatile Organic Compounds (SVOCs)
- EPA Method 8260 Conductivity

314 CMR 9.07(2):

- EPA Method 8240 Volatile Organic Compound (VOCs)
- Total Organic Carbon

In addition, testing was performed for pesticides and herbicides, reactive sulfide and cyanide, pH, and flashpoint, since these tests are often required for certain disposal facilities.

Results of the environmental laboratory testing are summarized on **Table 1** and contained in **Appendix E**. As indicated on **Table 1**, the laboratory test results indicate levels for chromium in two samples (one at the bridge from boring B-7 and one at a culvert from boring B-6 exceeds the MassDEP MCP CMR 40.1600 Reportable Concentration (RC) S-1 standards. Reporting Category RC S-1 means "the category of criteria listed in CMR 40.1600 applicable to soil samples obtained at or within 500 feet of a residential dwelling, a residentially-zoned property, school, playground, recreational area or park; or within the geographic boundaries of a groundwater resource area categorized as RC GW-1". Excess soils generated during construction may be disposed at a Massachusetts landfill, but additional sampling and testing may be required by the disposal facility at the time of construction.

SUBSURFACE CONDITIONS

Subsurface conditions encountered in the borings generally consisted of fill underlain by natural granular soil deposits and bedrock. The strata encountered in the borings are described below in order of increasing depth and are summarized on **Table 2**. The depths, thicknesses, and elevations referenced herein should be considered approximate. Refer to the borings logs for more detailed subsurface conditions at specific exploration locations. A general description of the subsurface conditions encountered in the borings from the ground surface down follows:

North Shore Road Embankment Segment (B-1 through B-4)

This section provides a general description of the primary stratigraphic units encountered in the borings along the North Shore Road embankment segment.

Fill – Underlying approximately 6 to 12 inches of topsoil, granular fill was encountered to depths ranging from about 3 to 8 feet bgs. The fill generally consisted of dark brown to brown, fine to coarse sand with up to 30 percent silt and up to 15 percent gravel, root fibers, and ash particles. SPT N-values within the fill varied between 4 and greater than 100 blows per foot (bpf). The higher SPT N-values are likely due to the presence of gravel.

Natural Granular Soil Deposits – Natural granular soil/glacial deposits were encountered below the fill in borings B-1 through B-4 and ranged from about 6.5 to 13.5 feet in thickness before the split-spoon sampling was terminated on refusal within this deposit. The glacial deposits generally consisted of medium dense to very dense, brown to gray, fine to coarse sand with up to 50 percent gravel and up to 30 percent silt. The SPT N-values within the glacial deposits layer ranged from 15 to greater than 100 bpf. The higher SPT N-values are likely due to the presence of gravel or possibly, refusal on the top of bedrock.

Bedrock – Borings B-1 through B-4 were terminated upon reaching refusal to either or both advancement of the split-spoon and/or auger on possible top of bedrock at depths ranging from about 10.5 to 17 feet bgs. The refusal on bedrock was not confirmed by coring.

Existing Abandoned Railroad Right-of-Way Segment (B-6 through B-8)

This section provides a general description of the primary stratigraphic units encountered in the borings along the existing abandoned railroad right-of-way and elevated boardwalk segment. A generalized subsurface profile along the alignment of the proposed is presented on **Figure 3**. It should be noted that the borings along the Proctor Brook stream crossing were located based on the previous 80-foot-long prefabricated steel truss bridge crossing rather than the 438-foot-long elevated boardwalk, which is why there were no borings taken at the east end of the boardwalk.

Fill – Underlying topsoil, fill was encountered to depths ranging from about 2 to 4 feet bgs. The fill generally consisted of dark brown to brown, fine to medium sand with up to 35 percent silt and up to 20 percent gravel, root fibers, and wood fragments. The fill in boring B-8 was predominantly dark brown, organic Clay & Silt with up to 35 percent sand and up to 20 percent gravel. SPT N-values within the fill varied between 5 and 32 bpf.

Natural Granular Soil Deposits – The natural granular soil deposit in boring B-6 was predominantly fine to coarse sand with SPT N-values ranging from 11 to 36 bpf. The natural granular soil deposit in boring B-6 was encountered at a depth of about 2 feet bgs and extended to a depth of about 26 feet where the split-spoon sampling was terminated on possible bedrock. "Blow-in" was observed while drilling boring B-6 at around 10 to 12 feet bgs.

The natural granular soil deposits in borings B-7 and B-8 performed for the proposed pedestrian crossing differed from the other borings drilled for the bikeway. The natural granular soil deposits were further classified into sand and gravel, silt & clay, and a glacial deposit, each layer generally described as follows:

Sand and Gravel: encountered underlying the fill at approximately 4 feet bgs. The Sand and Gravel layer ranged from about 13.5 feet thick (B-7) to 15 feet thick (B-8) and generally consisted of medium dense to dense, brown to light brown fine to medium sand with up to 35 percent gravel and up to 15 percent silt. The SPT N-values within the Sand and Gravel layer ranged from 6 to 33 bpf. The SPT N-values in boring B-7 appeared to generally be lower than in boring B-8.

Silt & Clay – A relatively thin (approximately 2 to 3 feet thick) layer of Silt & Clay was observed in borings B-7 and B-8 at depths ranging from 17 to 22 feet bgs and generally consisted of brown to gray, Silt & Clay with up to 10 percent sand and gravel. One SPT N-value obtained in this layer indicated 12 bpf indicating stiff consistency.

Glacial Deposits – Glacial deposits were encountered underlying the Silt & Clay in borings B-7 and B-8 ranging from about 19 to 22 feet bgs. The glacial deposits generally consisted of dense to very dense, brown to gray, fine to coarse sand with up to 30 percent silt and up to 30 percent gravel. The SPT N-values based on two samples obtained from this layer were 40 bpf (B-8) and 44 bpf B-7).

Bedrock – It appears that the top of bedrock may include a relatively thin layer of weathered bedrock overlying more competent rock. In each boring, a layer of gravel and refusal to the split-spoon was encountered. The weathered rock appears to range from about 6 to 12 inches thick. Bedrock was not confirmed by coring in boring B-6, however, bedrock was confirmed with rock coring in borings B-7 and B-8 starting at 26 feet and 31 feet bgs, respectively. These depths correspond to approximately El. 13 and El. 8, respectively. Less than 100 feet north of Proctor Brook on the opposite side of Warren Street Extension bedrock outcrops are present.

The bedrock, based on the cores obtained from borings B-7 and B-8, generally consists of gray, hard, slightly weathered, medium to coarse grained GRANITE. **Table A** summarizes the rock recovery percentages and the Rock Quality Designation (RQD) values (the sum of the lengths of NX-sized core pieces that are greater than 4 inches in length divided by the length of the core run) for each core run. As noted in the table, the RQD values in boring B-8 were very poor. The rock core barrel jammed during coring the rock in boring B-8.

Table A: Summary of Rock Core Data

Boring Number	Core Run	Core Depth Below Ground Surface (ft)	Approximate Elevation (ft)	Recovery (%)	RQD (%)
B-7	C-1	26 – 31	13.5 – 8.5	93	20
	C-2	31 – 36	8.5 – 2.5	100	35
B-8	C-1	31 – 36	7.8 – 2.8	70	0
	C-2	36 – 41	2.8 – -3.2	100	0

GROUNDWATER

Groundwater levels were measured in the borings after completion of drilling, prior to backfilling and therefore, are not considered to be representative of stabilized groundwater levels. Measured levels are indicated on **Table 2** and summarized below:

- The groundwater levels along the Northshore Road segment ranged from approximately 6 to 10 feet bgs, corresponding to elevations ranging from 42 to 62.
- The groundwater level at the culvert at STA 346+20 (boring B-6) was encountered at about 3.5 feet bgs, corresponding to about El. 37.
- The groundwater levels at the elevated boardwalk ranged from 3 to 6 feet bgs, corresponding to about El. 32 to El. 36.

Note that fluctuations in groundwater levels are expected to occur due to variations in season, rainfall, site features and other factors different from those existing at the time of the explorations and measurements.

The bikeway is located within the 100-year flood zone based on FEMA FIRM 25009C0412F dated July 3, 2012. The 100-year base flood ranges from about El. 47 at North Shore Road to El. 39.5 feet at Endicott Street. We understand that the stream level within Proctor Brook is relatively shallow and runs west to east. A summary of stream levels based on the hydraulic study performed by others for the project site is provided in **Table B**.

Table B: Summary of Stream Levels at the Proctor Brook Stream Crossing Structure

Return Period	Elevation (ft)
Ordinary High Water	37.88
10-year Design Flood	39.33
25-year Scour Design Flood	39.53
50-year Scour Check Flood	39.82
100-year Base Flood	40.19

KEY GEOTECHNICAL ISSUES

The primary geotechnical issues associated with the design and construction of the proposed culverts and elevated boardwalk include:

- Relatively Shallow Groundwater Within the Existing Abandoned Railroad Segment. Being that the Proctor Brook is a wetland area, groundwater is shallow, and significant portions of the proposed bikeway are prone to flooding. Construction dewatering and possibly temporary cofferdams will likely be required during excavations for the culvert and approach embankments for the elevated boardwalk.

- Working within the Wetland to Construct the Culverts and Stream Crossing Structure. Limiting disturbance to the wetland areas surrounding the rail alignment associated with excavation in the wetlands needs to be considered when selecting foundation types to limit excavation quantities and access for construction equipment. In addition, construction equipment will only be able to access the bikeway from limited locations. Therefore, tracked and/or small- to medium-sized construction equipment would allow for installation of foundations that limit disturbance. Also, contractors will need to be aware of restrictions from the Conservation Commission with regard to removal of brush.

- Existing Granular Soils at the Elevated Boardwalk. The soils at the elevated boardwalk structure are relatively "clean" and are susceptible to scour during the design scour flood event and the check scour flood event due to water velocity. Based on hydraulic analyses by others, the scour depth at the abutments is 1.95 feet and at the piers is 1.17 feet during the Design Scour (25-year flood) event and scour depth at the abutments is 2.28 feet and at the piers is 1.22 feet during the Check Scour (50-year flood) event.

- Existing Cobbles/Boulders at Ground Surface. Clearing of the existing surficial cobbles/boulders will be required prior to installation of foundations for the elevated boardwalk structure.

- Existing Sewer Line. The existing sewer line extends between Warren Street Extension and Endicott Street and is close to the elevated boardwalk. The closest point occurs at the west side of the boardwalk, where the sewer line is located within less than 5 feet laterally of the proposed foundations. In order to avoid imposing load on the existing sewer, foundations for the stream crossing will need to extend into the natural soils below the bottom elevation of the sewer. Construction methods used to install foundations for the stream crossing will need to consider and mitigate potential construction impacts (i.e., ground movement and vibrations) to the existing sewer line.

GEOTECHNICAL RECOMMENDATIONS

This section presents the geotechnical recommendations for the proposed culverts and elevated boardwalk structure. These recommendations are subject to the limitations contained in **Appendix A**. Recommendations for the culverts and wing walls for the elevated boardwalk are based on foundation design provisions of the AASHTO LRFD Bridge Design Specifications, 8th Edition (2017 AASHTO LRFD), 2011 AASHTO Guide Specifications for LRFD Seismic Bridge Design, 2nd Edition, with 2015 Interim Revisions (2015 AASHTO LRFD Seismic), and the MassDOT LRFD Bridge Manual, 2020. Recommendations for the foundations for the elevated boardwalk are based on helical piles and allowable stress design and the International Code Council Evaluation Services (ICC-ES) Acceptance Criteria AC358 for Helical Systems and Devices.

1. CULVERTS AND CULVERT WING WALLS

Type of Culvert

The proposed box culverts specified by Green for this project are single-cell, precast box sections and the wing walls at the ends of the culverts will also be precast sections. Criteria for loads and live load distributions should be in accordance with Section 3.3.4.4 of the MassDOT LRFD Bridge Manual. As specified in that section of the Manual, earth pressure should be based on a minimum and maximum equivalent fluid pressure of 30 pcf and 60 pcf, respectively. Lateral earth pressure from weight of earth above and adjacent to a box section should be taken as 0.5 times the vertical pressure. Load factors on the lateral earth pressures should follow the recommendations in Section 3.3.4.4.

We anticipate that the box culverts and wing walls can be installed by cut and cover methods in excavated trenches. The length of the trenches may need to be limited to help control in-flow of groundwater but will need to be long enough to accommodate the lengths of the precast box sections.

Based on the subsurface conditions indicated in boring B-6 (boring B-5 is pending), the box culvert will bear on relatively clean granular soil consisting of medium dense to dense fine to medium or fine to coarse sand with up to 10 percent silt and up to 10 percent gravel. These natural granular soil deposits are considered suitable for support of the box culverts provided the subgrade can be adequately dewatered to allow the subgrade to be recompacted and remain firm and stable when proof compacted.

If organic soils, loose or otherwise unstable or disturbed soils are encountered at subgrade level, those soils should be excavated and replaced with Gravel Borrow or ¾" crushed stone wrapped in non-woven filter fabric to the top of the naturally deposited inorganic soils below, or to a maximum depth of 3 ft below the bottom of culvert. Where compacted Gravel Borrow or ¾" crushed stone is placed for support of the box culvert, the lateral limits of the fill should be defined as a line extending horizontally outward and downward at a 1H:1V slope from the bottom of the culvert. Controlled density fill may be used in lieu of Gravel Borrow or crushed stone.

Culvert Bedding

The box culvert sections should be placed on a bedding of at least 12 inches of Gravel Borrow or ¾" crushed stone wrapped in Mirafi 180N, or equivalent, non-woven filter fabric.

Trench Backfill

Material placed against the culverts should consist of Gravel Borrow, Type C. Sidesway of the structure may be ignored in the design of the culverts provided that the fill placed around the structure is placed on both sides to approximately the same elevations at the same time.

2. ELEVATED BOARDWALK STRUCTURE

Boardwalk – Helical Pile Foundations

We recommend the boardwalk be supported on helical piles deriving their support in the natural granular soil deposits below the existing fill. Helical piles are a steel foundation system consisting of a central shaft with one or more helix-shaped bearing plates, welded to a lead section. Extension shafts are used to extend the pile into competent load-bearing soils. Helical piles will derive their support primarily in bearing of the helices within the

natural granular soil deposits. Helical piles are advanced by rotating the pile into the ground with the application of torque.

Helical piles are available as both round and square shafts with a range of shaft diameters and helix configurations (number of helices, helix diameters and helix spacing), depending on the design loads and installation considerations and vary by the manufacturer

Due to special requirements for installation of helical piles and the requirements for proper performance of the structural system, helical piles, including bracket assemblies should be designed and installed by a specialized helical pile Contractor. In addition, each Contractor typically works with a specific manufacturer and engineer. Thus, the size of the helical pile shaft, the number and diameter of the helices, and the overall design will vary depending on the manufacturer selected by the Contractor. Therefore, performance design criteria need to be specified on the Contract Bid Drawings and Specifications in sufficient detail to enable a Contractor to design and install piles for support of the proposed boardwalk.

To evaluate the feasibility of using helical piles to support the elevated boardwalk, a preliminary helical pile design was performed using geometry and the design loads provided by Green on April 6, 2021, which are summarized in **Table C**. Based on our evaluation, Chance™ RS2875.276 helical piles with a 10-, 12-, and 14-inch diameter helix lead section is considered a feasible helical pile option. The estimated pile embedment of the top helix is 11 feet below existing ground surface, or about 9 feet below the scoured ground surface. The preliminary helical pile calculations are provided in **Appendix F**.

Table C: Helical Pile Loads for Proposed Elevated Boardwalk

Load Type	Design Load (kips)
Vertical – Compression	25.0
Vertical – Tension	10.0
Lateral – Transverse (every bent)	7.5
Lateral – Longitudinal (every third bent)	5.0 (each way)

Note: The design compression, tension and lateral design loads are the ultimate load divided by a factor or safety of 2.0.

The following design criteria are presented for the helical pile foundation system:

- The structural design of the decking is based on 8-foot bent (longitudinal) spacing.
- Two vertical helical piles and one inclined (battered) pile are specified at each bent to resist axial compression/tension and horizontal (transverse direction) loads in compression/tension. The inclined helical anchor at each bent should alternate lateral directions from bent to bent.
- Two inclined piles are specified at every third bent of the boardwalk to resist longitudinal loading.
- The Contractor should determine the required angle of inclination for inclined piles so that the angle is no greater than 45 degrees and no less than 25 degrees from vertical.
- Design of the helical piles should be based on Allowable Stress Design (ASD) and should use a factor of safety of 2.0.

- Helical piles should be designed to provide allowable geotechnical capacity greater than the design loads presented in **Table C**.
- Static load testing should be performed in accordance with ASTM D1143 for compression and ASTM D3689 for tension.
- Helical piles should be designed so that the helices derive support entirely in the natural sand and gravel deposits underlying the existing fill stratum.
- The helical piles should be designed for tension during the design scour (25-year) flood. The maximum scour occurs at the abutments, therefore the piles should be designed for 1.95 feet of scour.
- The top helix should extend at least 11 feet below ground surface to provide sufficient overburden weight for the tension load (note that this will also provide more than the 4 feet of embedment required for frost protection).
- Helical piles in close proximity to the existing sewer line will need to be installed such that the top helix is located below the zone of influence on the pipe. The zone influence for the purpose of loading is defined as a 1H:1V plane from the springline of the pipe. The utility plans should be reviewed to confirm the sewer location and minimum depth to the top helix during final design.
- Design and installation of helical piles should conform to the manufacturer's recommendations.

These design criteria, as well as further specifics for design and installation of the helical piles should be provided in the Helical Pile performance specification. Further requirements regarding connection details will be presented on the structural drawings to be prepared by Green. Also, refer to the Construction Recommendations presented herein for additional requirements.

Abutments and Wingwalls

The Sketch Plans show timber abutments and wingwalls. In order to protect the existing sewer line, we have assumed the abutment and wingwalls will consist of crib walls constructed using pressured treated timber. Additional types of retaining walls should be considered for design and construction of the abutment and wing walls including mechanically stabilized earth, cast-in-place concrete, precast concrete, and other proprietary walls types such as Redi-Rock or similar. Selection of the final wall type should consider type of equipment that can readily access the wall locations and using construction methods that result in the least amount of disturbance to the wetland.

Bearing Resistance & Settlement

The factored geotechnical bearing resistance for the new abutment and wingwalls were evaluated using the following parameters and assumptions based on the methodology of 2017 AASHTO LRFD Section 10.6.3.1.2a:

- Effective footing widths (B') ranging from 2 to 6 feet
- Eccentricity (e) is less than or equal to 1/3 of the footing width
- Estimated footing lengths (L) of 10, 15, and 20 feet

- Minimum footing embedment depth (Df) of 4 feet below check scoured ground surface which will provide a minimum of 4 feet of embedment for frost protection even after the scour check event.
- Design groundwater elevation at proposed scoured streambed
- Footings are assumed to bear in the existing fill or natural granular soils. The presence of the Crushed Stone stabilization layer is neglected.
- Estimated friction angle (ϕ) of the footing bearing soils of 32 degrees
- Unit weight of the bearing soils of 120 pounds per cubic foot (pcf)
- Resistance factor for bearing resistance (ϕb) of 0.45 in accordance with 2017 AASHTO LRFD Table 10.5.5.2.2-1.

As required by MassDOT LRFD Section 3.2.10, the stability and bearing resistance of the footings under scour conditions is required to be considered.

Bearing resistance design charts to facilitate the selection of a footing size for the abutment and wingwalls based on factored bearing pressures (strength limit state) and tolerable settlement (service limit state) are provided in **Appendix F**. The charts are based on the effective footing width, B', where B'=B-2e (B is the footing width and e is the eccentricity of the loading on the footing). The factored bearing pressures shown in the charts in **Appendix F** are based on a resistance factor of 0.45, which is conservative for the wingwalls. The net bearing pressure for service limit state should be used to estimate footing settlement on the chart. Settlement is anticipated to be elastic and the majority of settlement will occur during construction (i.e., from the bridge dead loads).

Sliding and Overturning

The abutments and wingwalls need to be designed for sliding and overturning. The overturning analyses should be based on limiting the eccentricity to no more than one-third the footing dimension, B/3 (2017 AASHTO LRFD Section 10.6.3.3). Sliding analyses should be performed in accordance with Section 10.6.3.4 of 2017 AASHTO LRFD utilizing a resistance factor of 0.9 (Table 10.5.5.2.2-1) and a friction factor (tan δ) of 0.625 for soil-to-soil contact assuming the crib walls are filled with granular material.

We recommend that the passive soil resistance on the front side of the wingwalls and abutments be ignored when evaluating sliding.

Lateral Earth Pressure

The following backfill parameters/assumptions are recommended for the design of the abutment and wingwalls backfilled using compacted Gravel Borrow:

- Estimated soil friction angle (ϕ) of 34 degrees.
- A moist soil unit weight of 125 pounds per cubic foot (pcf) above the groundwater level and a saturated unit weight of 130 pcf below the groundwater level.
- Horizontal backfill slope behind the wall (walkway grade).
- Design groundwater at the top of the abutment assuming the area is prone to flooding.

- Based on Section 3.1.6 of the 2013 MassDOT LRFD Bridge Manual, for walls greater than 5 feet, the lateral earth pressure should be based on active earth pressure (K_a) conditions. Walls should be designed an active earth pressure coefficient of 0.26 for Gravel Borrow.

Additional lateral pressures due to traffic surcharge loads should be applied as required by 2017 AASHTO LRFD. However, based on Section 3.3.1.3 of the 2013 MassDOT LRFD Bridge Manual, if approach slabs are used, the AASHTO live load surcharge load on the abutment can be ignored.

The ends of the elevated boardwalk will be relatively hard points in comparison to the adjacent at-grade trail. We recommend an approach slab similar to that used for a bridge abutment or a cantilever end segment of boardwalk be used. The approach slab or cantilever segment should be structurally tied to the abutment or last pier and be free to rotate. The intent is to avoid any abrupt differential settlement between the boardwalk and approach embankment, which could cause a tripping hazard.

When considering fill in front of the wall, passive resistance should be neglected in determining wall stability in accordance with the 2013 MassDOT LRFD Bridge Manual.

3. ELEVATED BOARDWALK APPROACH EMBANKMENTS

Approach embankments up to about 5 feet above the current grade will be required at the ends of the elevated boardwalk. The approach embankments will be graded to a 3.1% slope or less. The approach embankments will be 14-feet wide with 2H:1V side slopes down to existing grade. The approach embankment fill should consist of Gravel Borrow (M.1.03.0, Type B) compacted to 95% of the maximum dry density. If project hydraulic studies indicate that erosion of the side slopes of the approach embankment is a concern, protection of the slope surface by armoring with stones (such as a modified rock fill underlain by non-woven filter fabric), a permanent turf reinforcement mat (TRM), or other material acceptable to the conservation agency will need to be constructed.

The approach embankment, including base course should be constructed as soon as practical and at least 2 months prior to binder course construction. Placement of the final wearing course of pavement should be held off to the degree practical to allow for any settlement of the new embankment to occur during construction.

Prior to placement of embankment fill, the subgrade embankment areas should be prepared and proof-compacted as recommended herein.

4. GEOTECHNICAL SEISMIC DESIGN PARAMETERS

Seismic Site Class

A Seismic Site Class analysis was performed using SPT N-values from the borings in accordance with Section 3.10.3.1 of 2017 AASHTO. Based on the results of our analysis we recommend Site Class D be used for design.

The design response spectrum parameters are based on the 1,000-year return period, corresponding to a non-critical, non-essential structure. In accordance with 2011 AASHTO Guide Specifications for LRFD Seismic Bridge Design, 2nd Edition, with 2015 Interim Revisions (AASHTO 2015 Seismic), for Site Class D, we recommend the following design response spectra parameters:

A_s = 0.133g S_{DS} = 0.263g S_{D1} = 0.096g

where:

A_s is the short period acceleration based on Site Class D
S_{DS} is the design spectral acceleration coefficient at 0.2-second period
S_{D1} is the design spectral acceleration coefficient at 1.0-second period

Seismic Design Category

Based on the 1-second period design spectral acceleration for this site and in accordance with Table 3.5-1 of AASHTO Guide Specifications for LRFD Seismic Bridge Design, the elevated boardwalk structure may be assigned to Seismic Design Category (SDC) A.

Liquefaction

In accordance with Section 3.5 of the 2011 AASHTO Guide Specifications for LRFD Seismic Bridge Design, no liquefaction evaluation is required for bridges assigned to SDC A. Furthermore, based on the SPT N-values obtained from the borings, the soils are judged to be not considered susceptible to liquefaction.

5. ADDITIONAL SUBSURFACE EXPLORATIONS

During design development, the length of the stream crossing structure presented in the Bridge Type Selection Worksheet was increased from about 70 feet to about 438 feet. Thus, we recommend that additional explorations be performed prior to final design for the elevated boardwalk. Four borings should be performed between boring B-8 and the east abutment/transition ramp. The borings should be advanced to a depth of 25 feet bgs, or refusal, whichever is shallower. Split-spoon samples and SPTs are recommended to be taken continuously from 10 to 20 feet bgs and at standard 5-foot intervals to complete the boring to the specified depth. The borings will provide confirmatory information for the east end of the alignment where there is currently no subsurface information available.

CONSTRUCTION CONSIDERATIONS

1. HELICAL PILES

Contractor Qualifications

A specialty contractor should be engaged by the Contractor to install the helical piles who is capable of demonstrating successful completion of design, installation, and testing of helical piles with similar load capacity and similar subsurface conditions. The design of the helical piles and load tests should be prepared and stamped by a Professional Engineer Registered in the Commonwealth of Massachusetts. In addition to the design calculations, the Contractor's submittal should include a description of the load test set-up, equipment, and procedures.

Helical Pile Load Testing

The helical pile geotechnical capacity should be confirmed with load tests. We recommend performing a compression and tension load test on at least two piles. Load testing should be in accordance with ASTM D1143 for compression testing, and ASTM D3689 for tension testing. Locations of the load test piles should be agreed upon by the Contractor and geotechnical engineer. Tension load testing may be performed on the same pile that compression testing is performed.

QA/QC During Installation of Helical Piles

Observation of helical pile testing and production helical pile installation should be made by experienced geotechnical personnel. The depth, final installation torque, advancement rate, number and diameter of helices, diameter of extension shafts, and alignment should be verified and documented for each helical pile.

Obstructions

Removal of surficial cobble/boulders along the will be required prior to helical pile installation. Pre-drilling may be required to penetrate the cobbles and boulders. If, after pre-drilling, foundations are not able to be installed at anticipated locations, the structural engineer should be prepared to relocate and/or add additional helical piles to provide the required geotechnical resistance to support the proposed structures.

2. SUBGRADE PREPARATION FOR EMBANKMENTS

Remove all existing topsoil/subsoil within proposed fill areas to construct embankments (e.g., along North Shore Road and for the approaches to the elevated boardwalk). Perform final excavation using a smooth-edged bucket to limit disturbance to the exposed final subgrade. Proof-roll final subgrade areas prior to placement fill with at least ten (10) passes of a large vibratory plate compactor or walk-behind vibratory drum roller. If work is performed during periods of wet weather and groundwater is near the subgrade proof-rolling should be performed at the discretion of the Geotechnical Engineer and should be performed using static (non-vibratory) equipment. Weak, unstable or saturated areas that are observed during proof-rolling should be overexcavated and replaced with compacted Gravel Borrow (or crushed stone wrapped in non-woven geotextile fabric if greater than 4 inches in thickness).

Subgrade preparation for the culverts and culvert wing walls was described in Design Section 2 above.

Fill for embankments, footings for the culvert wingwalls as well as bedding for the culverts and culvert wingwalls should not be placed in water or on frozen ground.

3. GROUNDWATER AND SURFACE WATER CONTROL

Proctor Brook is a wetland and it is prone to flooding. The Contractor should be prepared to divert, manage, and control infiltrating groundwater during excavations for foundations and culverts, as well as control surface water from entering excavations to provide a dry and stable subgrade. The method of diverting water and dewatering excavations will depend on several factors, including localized soil conditions encountered, time of year performed, size of the open excavation and the length of time the excavation is left open. The Contractor should be responsible for selecting diversion, management and dewatering methods based on his proposed methods and equipment used for excavation in order to achieve the desired objectives (that is, maintaining a dry condition at the bottom of the excavation during installation of structures, preparation of stable subgrades, etc.). Temporary portable cofferdams, sandbags, supersacks or berms with bypass culverts or pumps may be required to mitigate surface water inflow. If utilized, local sump pumps should be surrounded by ¾-inch Crushed Stone wrapped in non-woven

filter fabric and well points should utilize properly graded filter material to limit migration of fines. Dewatering discharge must satisfy requirements of local, state and federal environmental and conservation authorities.

4. EXCAVATIONS / PROTECTION OF EXISTING UTILITIES

We anticipate that the excavations can be made using conventional earthmoving equipment. Most excavations are expected to be less than about 5 feet deep and should not require excavation support systems but will likely require dewatering to maintain stable side slopes and bottom subgrade. Where open excavations are constructed, the side slopes should be designed and sloped in accordance with OSHA regulations. Where excavation support is used, the Contractor's engineer should design the excavation support system.

Excavations should not extend into the zone of influence of any utility or structure. The zone of influence is defined as a line extending 2 feet beyond the bottom exterior edge of the foundation or springline of the utility then down and away at a one horizontal to one vertical (1H:1V) slope. Undermining of existing foundations or utilities must not occur.

5. BACKFILL AND COMPACTION

Embankment fill and fill placed behind the abutments should be in accordance with Sections 150 and M of MassDOT Standard Specifications for Highways and Bridges. Reference is also made to **Table F**.

Table F: Backfill Material Specification & Recommended Use

Borrow Material	MassDOT Spec. No.	Use
Ordinary Borrow	M1.01.0	General Fill
Special Borrow	M1.02.0	Drainage, Stabilization Fill
Gravel Borrow	M1.03.0, Type B	Behind abutments and wingwalls and as embankment fill
Crushed Stone	M2.01.4	Drainage

Fill should be placed in loose layers not more than 12 inches thick and compacted to at least 95 percent of the maximum dry density as determined by the Modified Proctor Test (ASTM D-1557). In confined areas, place only 6-inch layers and compact with manually operated, powered vibratory compactor acceptable to the geotechnical engineer. Crushed Stone should be placed in lifts no greater than 12-inches-thick with each lift compacted to an unyielding surface. Crushed Stone placed in layers greater than 4 inches should be wrapped all-around in non-woven geotextile fabric. Fill should be free of frost and not be placed over frozen soil. Subgrades should be protected against frost during and after construction.

6. REUSE OF EXCAVATED MATERIALS

Based on the soil descriptions on the boring logs, it is not expected that the existing on-site soils will meet the gradation requirements for the borrow materials presented in **Table F**, except ordinary borrow. Excavated soil that cannot be reused on-site or on other portions of the project should be removed from the site in accordance with applicable local, state and federal regulations.

FINAL DESIGN, CONTRACT DOCUMENTS AND CONSTRUCTION MONITORING

GZA will continue to support you with preparation of specifications and review of near final plans for conformance with our geotechnical recommendations. We also recommend that during construction GZA provide review of contractor submittals related to foundations and earthwork, and construction QA/QC observation and testing services during the earthwork and helical pile installation phases of the project. Construction services may include verification of subgrade soils, observation of proof-rolling operations and placement of fill, performance of field density tests, observation of helical pile testing and production installation, and in general, observe compliance with recommendations in this report and the Contract Documents. This construction oversight is considered an important part of obtaining quality site improvements.

CLOSING

We trust the information presented herein is sufficient for your use in preliminary design of the proposed Peabody Bikeway structures. We look forward to working with you as you advance the project through Final Design. Please contact the undersigned with any questions.

Very truly yours,

GZA GEOENVIRONMENTAL, INC.

Michael P. Smith, P.E.
Senior Project Manager

Andrew R. Blaisdell, P.E.

Notes:

1. Samples collected on January 4, 2019 by GZA personnel. Analyses performed by ESS Laboratory in Cranston, RI except for Grain Size Analysis which was subcontracted to Thielsch Engineering in Cranston, RI.
2. ND = Not Detected, NS = Not Sampled, NA = Not Applicable.
3. Massachusetts Contingency Plan (MCP) RC S-1 standards as per MCP CMR 40.1600; MA Lined & Unlined Landfill Criteria per Massachusetts State DEP Policy # COMM-97-001; Asphalt Batch Criteria per Massachusetts State DEP Policy # WSC 94-400.
4. Where RCS-1, MA Landfills, and Asphalt Batch Facility columns are blank, no limiting criteria has been established.
5. VOC and SVOC constituents that were not detected were omitted from this table.
6. TPH taken as sum of EPH fractions, in accordance with MassDEP guidance.
7. § = reported concentration exceeds the Massachusetts Contingency Plan (MCP) RC S-1 standards as per MCP CMR 40.1600
8. Bold text indicates that the reported concentration exceeds the disposal criteria for a MA Unlined Landfill.
9. Bold italicized text indicates that the reported concentration exceeds the disposal criteria for a MA Lined Landfill.
10. Asphalt batching facility criteria will vary, especially at out-of-state locations.

Peabody Bikeway - Phase II
Peabody, Massachusetts

TABLE 2
SUMMARY OF SUBSURFACE CONDITIONS

Boring No.	Boring Location[7]	Approximate Ground Surface Elevation[1,2] (ft)	Thickness of Fill/Topsoil (ft)	Depth / El. Top of Naturally Deposited Soil (ft)		Depth / El. Top of Bedrock[3] (ft)		Depth / El. Bottom of Boring (ft)		Depth / El. of Groundwater[4,5] (ft)	
B-1	North Shore Road Segment	68.6	5.3	5.3	63.3	15.3	53.3	15	53	6.5	62.1
B-2		68.4	4.0	4.0	64.4	10.5	57.9	11	58	10.0	58.4

B-4		51.8	3.5	3.5	48.3	17.0	34.8	17	35	9.5	42.3
B-5	Box Culverts	Not Yet Drilled									
B-6		40.5	2.0	2.0	38.5	25.9	14.6	26	15	3.5	37.0
B-7	Pedestrian Bridge	38.5	4.0	4.0	34.5	23.8	14.7	36	3	2.8	35.7
B-8		37.8	4.0	4.0	33.8	31.0	6.8	41	-3	5.8	32.0

Notes:

1. Ground surface elevation estimated from electronic plan entitled Peabody Bike Path 2018 Merge Basempap-Final.DWG", provided by Green on 1/16/2019.
2. Elevations are referenced to the North American Vertical Datum of 1988 (NAVD 88).
3. Depth to top of bedrock for borings B-1 through B-6 is based on refusal to the split-spoon or auger. Rock coring not performed in these borings. Depth to bedrock for borings B-7 and B-8 was confirmed by rock coring. Top of rock noted in boring B-7 is top of competent rock. An approximate 1.2 feet of weathered rock was encountered prior to the start of rock coring.
4. NE = Not Encountered.
5. Refer to the boring logs for additional notes and stabilization times at the time of the measurement.

NOTES:

1. THE BASEMAP WAS DEVELOPED FROM ELECTRONIC CAD FILE PLANS "Peabody Bike Path 2018 Merge Basemap-Final.DWG" PROVIDED BY GREEN INTERNATIONAL INC., ON 01/16/2019.
2. BORINGS WERE PERFORMED BY NEW ENGLAND BORING COMPANY OF DERRY, NEW HAMPSHIRE BETWEEN JANUARY 2 AND 15, 2019.
3. LOCATIONS OF BORINGS WERE LOCATED IN THE FIELD USING A TRIMBLE GPS UNIT. SEVERAL BORING LOCATIONS WERE MOVED IN THE FIELD DURING THE DRILLING PROGRAM BASED ON SITE ACCESS. REVISED LOCATIONS WERE BASED ON TAPED MEASUREMENTS FROM MARKED LOCATIONS. EXPLORATION LOCATIONS SHOULD BE CONSIDERED ACCURATE TO THE DEGREE IMPLIED BY THE METHOD USED.
4. TEST BORING B-5 WAS NOT PERFORMED DUE TO ACCESSIBILITY ISSUES BUT MAY BE DRILLED AT A LATER DATE AS A CONFIRMATION BORING DURING CONSTRUCTION.

Appendix A – Limitations

USE OF REPORT

1. GZA GeoEnvironmental, Inc. (GZA) prepared this report on behalf of, and for the exclusive use of Green International Affiliates, Inc. (Green) for the stated purpose(s) and location(s) identified in the Proposal for Services and/or Report. Use of this report, in whole or in part, at other locations, or for other purposes, may lead to inappropriate conclusions; and we do not accept any responsibility for the consequences of such use(s). Further, reliance by any party not expressly identified in the agreement, for any use, without our prior written permission, shall be at that party's sole risk, and without any liability to GZA.

STANDARD OF CARE

2. GZA's findings and conclusions are based on the work conducted as part of the Scope of Services set forth in Proposal for Services and/or Report, and reflect our professional judgment. These findings and conclusions must be considered not as scientific or engineering certainties, but rather as our professional opinions concerning the limited data gathered during the course of our work. If conditions other than those described in this report are found at the subject location(s), or the design has been altered in any way, GZA shall be so notified and afforded the opportunity to revise the report,as appropriate, to reflect the unanticipated changed conditions.

3. GZA's services were performed using the degree of skill and care ordinarily exercised by qualified professionals performing the same type of services, at the same time, under similar conditions, at the same or a similar property. No warranty, expressed or implied, is made.

4. In conducting our work, GZA relied upon certain information made available by public agencies, Client and/or others. GZA did not attempt to independently verify the accuracy or completeness of that information. Inconsistencies in this information which we have noted, if any, are discussed in the Report

SUBSURFACE CONDITIONS

5. The generalized soil profile(s) provided in our Report are based on widely-spaced subsurface explorations and are intended only to convey trends in subsurface conditions. The boundaries between strata are approximate and idealized, and were based on our assessment of subsurface conditions. The composition of strata, and the transitions between strata, may be more variable and more complex than indicated. For more specific information on soil conditions at a specific location refer to the exploration logs. The nature and extent of variations between these explorations may not become evident until further exploration or construction. If variations or other latent conditions then become evident, it will be necessary to reevaluate the conclusions and recommendations of this report.

6. In preparing this report, GZA relied on certain information provided by the Client, state and local officials, and other parties referenced therein which were made available to GZA at the time of our evaluation. GZA did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this evaluation.

7. Water level readings have been made in test holes (as described in the Report) at the specified times and under the stated conditions. These data have been reviewed and interpretations have been made in this Report. Fluctuations in the level of the groundwater however occur due to temporal or spatial variations in areal recharge rates, soil heterogeneities, the presence of subsurface utilities, and/or natural or artificially induced perturbations. The water table encountered in the course of the work may differ from that indicated in the Report.

8. GZA's services did not include an assessment of the presence of oil or hazardous materials at the property. Consequently, we did not consider the potential impacts (if any) that contaminants in soil or groundwater may have on construction activities, or the use of structures on the property.

COMPLIANCE WITH CODES AND REGULATIONS

9. We used reasonable care in identifying and interpreting applicable codes and regulations. These codes and regulations are subject to various, and possibly contradictory, interpretations. Compliance with codes and regulations by other parties is beyond our control.

ADDITIONAL SERVICES

10. GZA recommends that we be retained to provide services during any future: site observations, design, implementation activities, construction and/or property development/redevelopment. This will allow us the opportunity to: i) observe conditions and compliance with our design concepts and opinions; ii) allow for changes in the event that conditions are other than anticipated; iii) provide modifications to our design; and iv) assess the consequences of changes in technologies and/or regulations.

Appendix B – GZA Boring Logs

Modified Burmister Soil Classification

Soil samples are visually classified by the Modified Burmister System using the following format and order:

1. Density or Consistency
2. Color
3. MAJOR SOIL TYPE
4. Minor Components
5. Special Components

Density or Consistency – Density or consistency estimates are based on the measured N-Values obtained from the Standard Penetration Test (SPT). For granular soils (sand, gravel, silt), density is reported. For plastic soils, consistency is reported. Broken gravel, if encountered at the tip of the spoon, is indicated on the log and will affect the measured SPT N-Value.

Table A-1: Density and Consistency of Soils

Granular Soils		Plastic Soils	
SPT N-Value	Relative Density	SPT N-Value	Consistency
0-4	Very Loose	<2	Very Soft
4-10	Loose	2-4	Soft
10-30	Medium Dense	4-8	Medium Stiff
30-50	Dense	8-15	Stiff
>50	Very Dense	15-30	Very Stiff
		>30	Hard

Color - The color of the soil matrix is estimated in the field by the engineer or geologist observing the borehole.

Major Soil Type - The soil type is determined by the major component of the soil that comprises 50% or more of the sample by weight. The major component in the description is capitalized (e.g. SAND, GRAVEL, SILT).

Table A-2: Soil Types/Components

Sieve Size	Description	Visual Description
Passing No. 200	SILT	No grains, cannot roll into thread
	Clayey SILT	Can roll into 1/4" thread*
	SILT & CLAY	Can roll into 1/8" thread*
	CLAY & SILT	Can roll into 1/16" thread*
	Silty CLAY	Can roll into 1/32" thread*
	CLAY	Can roll into 1/64" thread*
No. 200 – No. 40	Fine SAND	Finest Visible Particles
No. 40 – No. 10	Medium SAND	1/64 to 1/16"
No. 10 – No. 4	Coarse SAND	1/16 to 1/4"
No. 4 – 3/4 Inch	Fine GRAVEL	1/4 to 3/4"
3/4 Inch – 3 Inch	Coarse GRAVEL	
3 Inch – 6 Inch	Cobbles	
>6 Inch	Boulders	

* May need to moisten sample to determine thread diameter

Table A-3: Expanded Sand/Gravel Soil Descriptions

Granular Description	Proportions of Component
Fine	Less than 10% coarse and medium
Medium	Less than 10% coarse and fine
Fine to Medium	Less than 10% coarse
Medium to Coarse	Less than 10% fine
Fine to Coarse	All greater than 10%

Minor Components – Minor components are described after the major component in order of decreasing percentages. Only the first letter of the minor component is capitalized, except if "and" is used (e.g. trace Silt).

Table A-4: Definition of Proportional Terms

Proportional Term	Percent by Weight of Total Sample
and	35-50
some	20-35
little	10-20
trace	<10

Special Components – anthropogenic materials encountered in the fill such as Glass, Brick fragments, etc. Proportional terms used are occasional (<15% by weight) and frequent (15% or more by weight).

Modified ISRM Rock Classification

Rock cores are visually classified by the Modified ISRM System using the following format and order: Field hardness, weathering, grain size, color, ROCK TYPE, foliation thickness, foliation dip angle, foliation joint/fracture shape and roughness, foliation joint/fracture spacing, dip angle of other joints and fractures, condition of joint surfaces, other features such as minerals.

FIELD HARDNESS:
Very Hard – Cannot be scratched with knife or sharp pick. Breaking of hand specimens requires several hard blows of geologists pick.
Hard – Can be scratched with knife or pick only with difficulty. Hard blow of hammer required to detach hand specimen.
Medium – Can be grooved or gouged 1/16 in. deep by firm pressure on knife or pick point. Can be excavated in small chips to pieces about 1 in. maximum size by hard blows from the point of a geologist's pick.
Soft – Can be gouged or grooved readily with knife or pick point. Can be excavated in chips to pieces several inches in size by moderate blows of a pick point. Small thin pieces can be broken by finger pressure.
Very Soft – Can be carved with knife. Can be excavated readily with point of pick. Pieces 1 in. or more in thickness can be broken with finger pressure. Can be scratched readily by fingernail.

WEATHERING:
Fresh – Rock fresh, crystals bright, few joints may show slight staining. Rock rings under hammer if crystalline.
Slight – Rock generally fresh, joints stained, and discoloration and weathering effects. In granitoid rocks some occasional feldspar crystals are dull and discolored. Crystalline rocks ring under hammer.
Moderate – Significant portions of rock show discoloration and weathering effects. In granitoid rock, most feldspars are dull and discolored; some show clayey. Rock has dull sound under hammer and shows significant loss of strength as compared with fresh rock.
Severe – All rock except quartz discolored or stained. Rock "fabric" clear and evident, but reduced in strength to strong soil. In granitoid rocks, all feldspars kaolinized to some extent. Some fragments of strong rock usually left.
Complete – Rock reduced to "soil". Rock "fabric" not discernible or discernible only in small scattered locations. Quartz may be present as dikes or Stringers.

GRAIN SIZE:
Fine Grained – Barely seen with naked eye.
Coarse Grained: 1/8 in. to 1/4 in.
Amorphous: Too small to be seen with naked eye.
Medium Grained: Barely seen with naked eye to 1/8 in.
Very Coarse Grained: >1/4 in.

DISCONTINUITIES:
Healed Joint – A partial or incomplete fracture.
Joint/Fracture – A simple fracture along which no shear displacement has occurred. May form sets.
Shear – A zone of fractures along which differential movement has taken place parallel to the surface sufficient to produce slickensides, striations, or polishing. May be accompanied by a zone of fractured rock up to a few inches wide.
Fault – A fracture along which there has been displacement and accompanying slickensides, striations, or polishing by gouge and/or severely fractured adjacent zone.
Shear or Fault Zone – A band or zone of parallel, closely spaced shears or faults accompanied by gouge, maylonite, and breccia.

Table A-5: Fractures and Foliation Spacing and Attitude

Fractures	Foliation	Spacing	Attitude	Angle
Very close	Very thin	Less than 2 in.	Horizontal	0° - 5°
Close	Thin	2 in. - 1 ft.	Subhorizontal	5° - 35°
Moderately close	Medium	1 ft. - 3 ft.	Moderately dipping	35° - 55°
Wide	Thick	3 ft. - 10 ft.	Subvertical	55° - 85°
Very Wide	Very thick	More than 10 ft.	Vertical	85° - 90°

Table A-6: Condition of Joint/Fracture Surfaces

Descriptive Term	Conditions
Planar	A flat surface
Curved	A curved surface
Irregular	Multi-curved surface
Slick	A polished and striated surface indicating sliding along a plane; also referred to as slickensided.
Smooth	Few irregularities, but no obvious indication of sliding; adjacent pieces of core can be slid past on another with relative ease.
Rough	Many irregularities; difficult to slide adjacent pieces of core by each other.

GZA reports the total core recovery and rock quality designation for each core run* on the boring logs. The definitions of these terms are as follows:

TOTAL CORE RECOVERY (REC)

$$\textbf{REC (\%)} = \frac{\text{Sum of Recovered Core}}{\text{Length of Core Run}} \times 100$$

ROCK QUALITY DESIGNATION (RQD)

$$\textbf{RQD (\%)} = \frac{\text{Sum of Lengths of intact Core with Full Diameter in Pieces 4 in. and Longer}}{\text{Length of Core Run}} \times 100$$

The RQD is in general accordance with methodology described by Deere and Deere (1988). In addition, significant vertical to sub-vertical foliation/cross-foliation joints/fractures occur within the rock mass and influence ground behavior. The length of core exhibiting the vertical to sub-vertical joints/fractures has been deducted from the RQD, which is consistent with the "pieces of intact rock core" criteria. The vertical to sub-vertical joints/fractures have been identified on the rock core or the upside divider in the core box with permanent "dots" spaced every 0.1 feet apart. These dots have been counted and entered in the fractures per foot column on the boring log.

* - RQD not reported for severely and/or completely weathered rock or core runs with length of 2.0 feet or less.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Borehole relocated approximately 25 feet from staked location due to access.
3. Driller noted increased drilling resistance at 6.5 feet below ground surface (bgs).
4. Gravel and Cobbles (less than 6 inches) observed in drill spoils at approximately 11 feet bgs.
5. Auger refusal at 15.3 feet bgs on possible bedrock. Borehole terminated.
6. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Boring relocated 5.5 feet south of staked location due to restricted access and overhead wires.
3. Continuous sampling performed from sampling depths 0 to 10 feet below ground surface (bgs). Driller advanced 4-inch casing down as sampling advanced. The casing was advanced to 14 feet bgs following sampling of S-5.
4. Standard sampling performed from sample depths 14 to 24.2 feet bgs.
5. Driller advanced 4-inch casing from 14 to 24 feet bgs.
6. Clayey Silt observed in drill cuttings from 17.5 to 19 feet bgs.
7. Weathered Bedrock fragments and increased drill effort observed at 23.8 feet bgs.
8. Cored bedrock with a downward pressure of 500 psi at 1,350 rpm in 3rd gear using an NX core barrel.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

Proposal No. 609211-132091

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) Report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS Report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study Report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study Report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study Report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Massachusetts State Plane Mainland Zone (FIPS zone 2001). The **horizontal datum** was NAD 83, GRS 1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713- 3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was derived from digital orthophotography provided by the Massachusetts Geographic Information System. This information was created from photography dated 2005.

The **profile baselines** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the **profile baseline**, in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

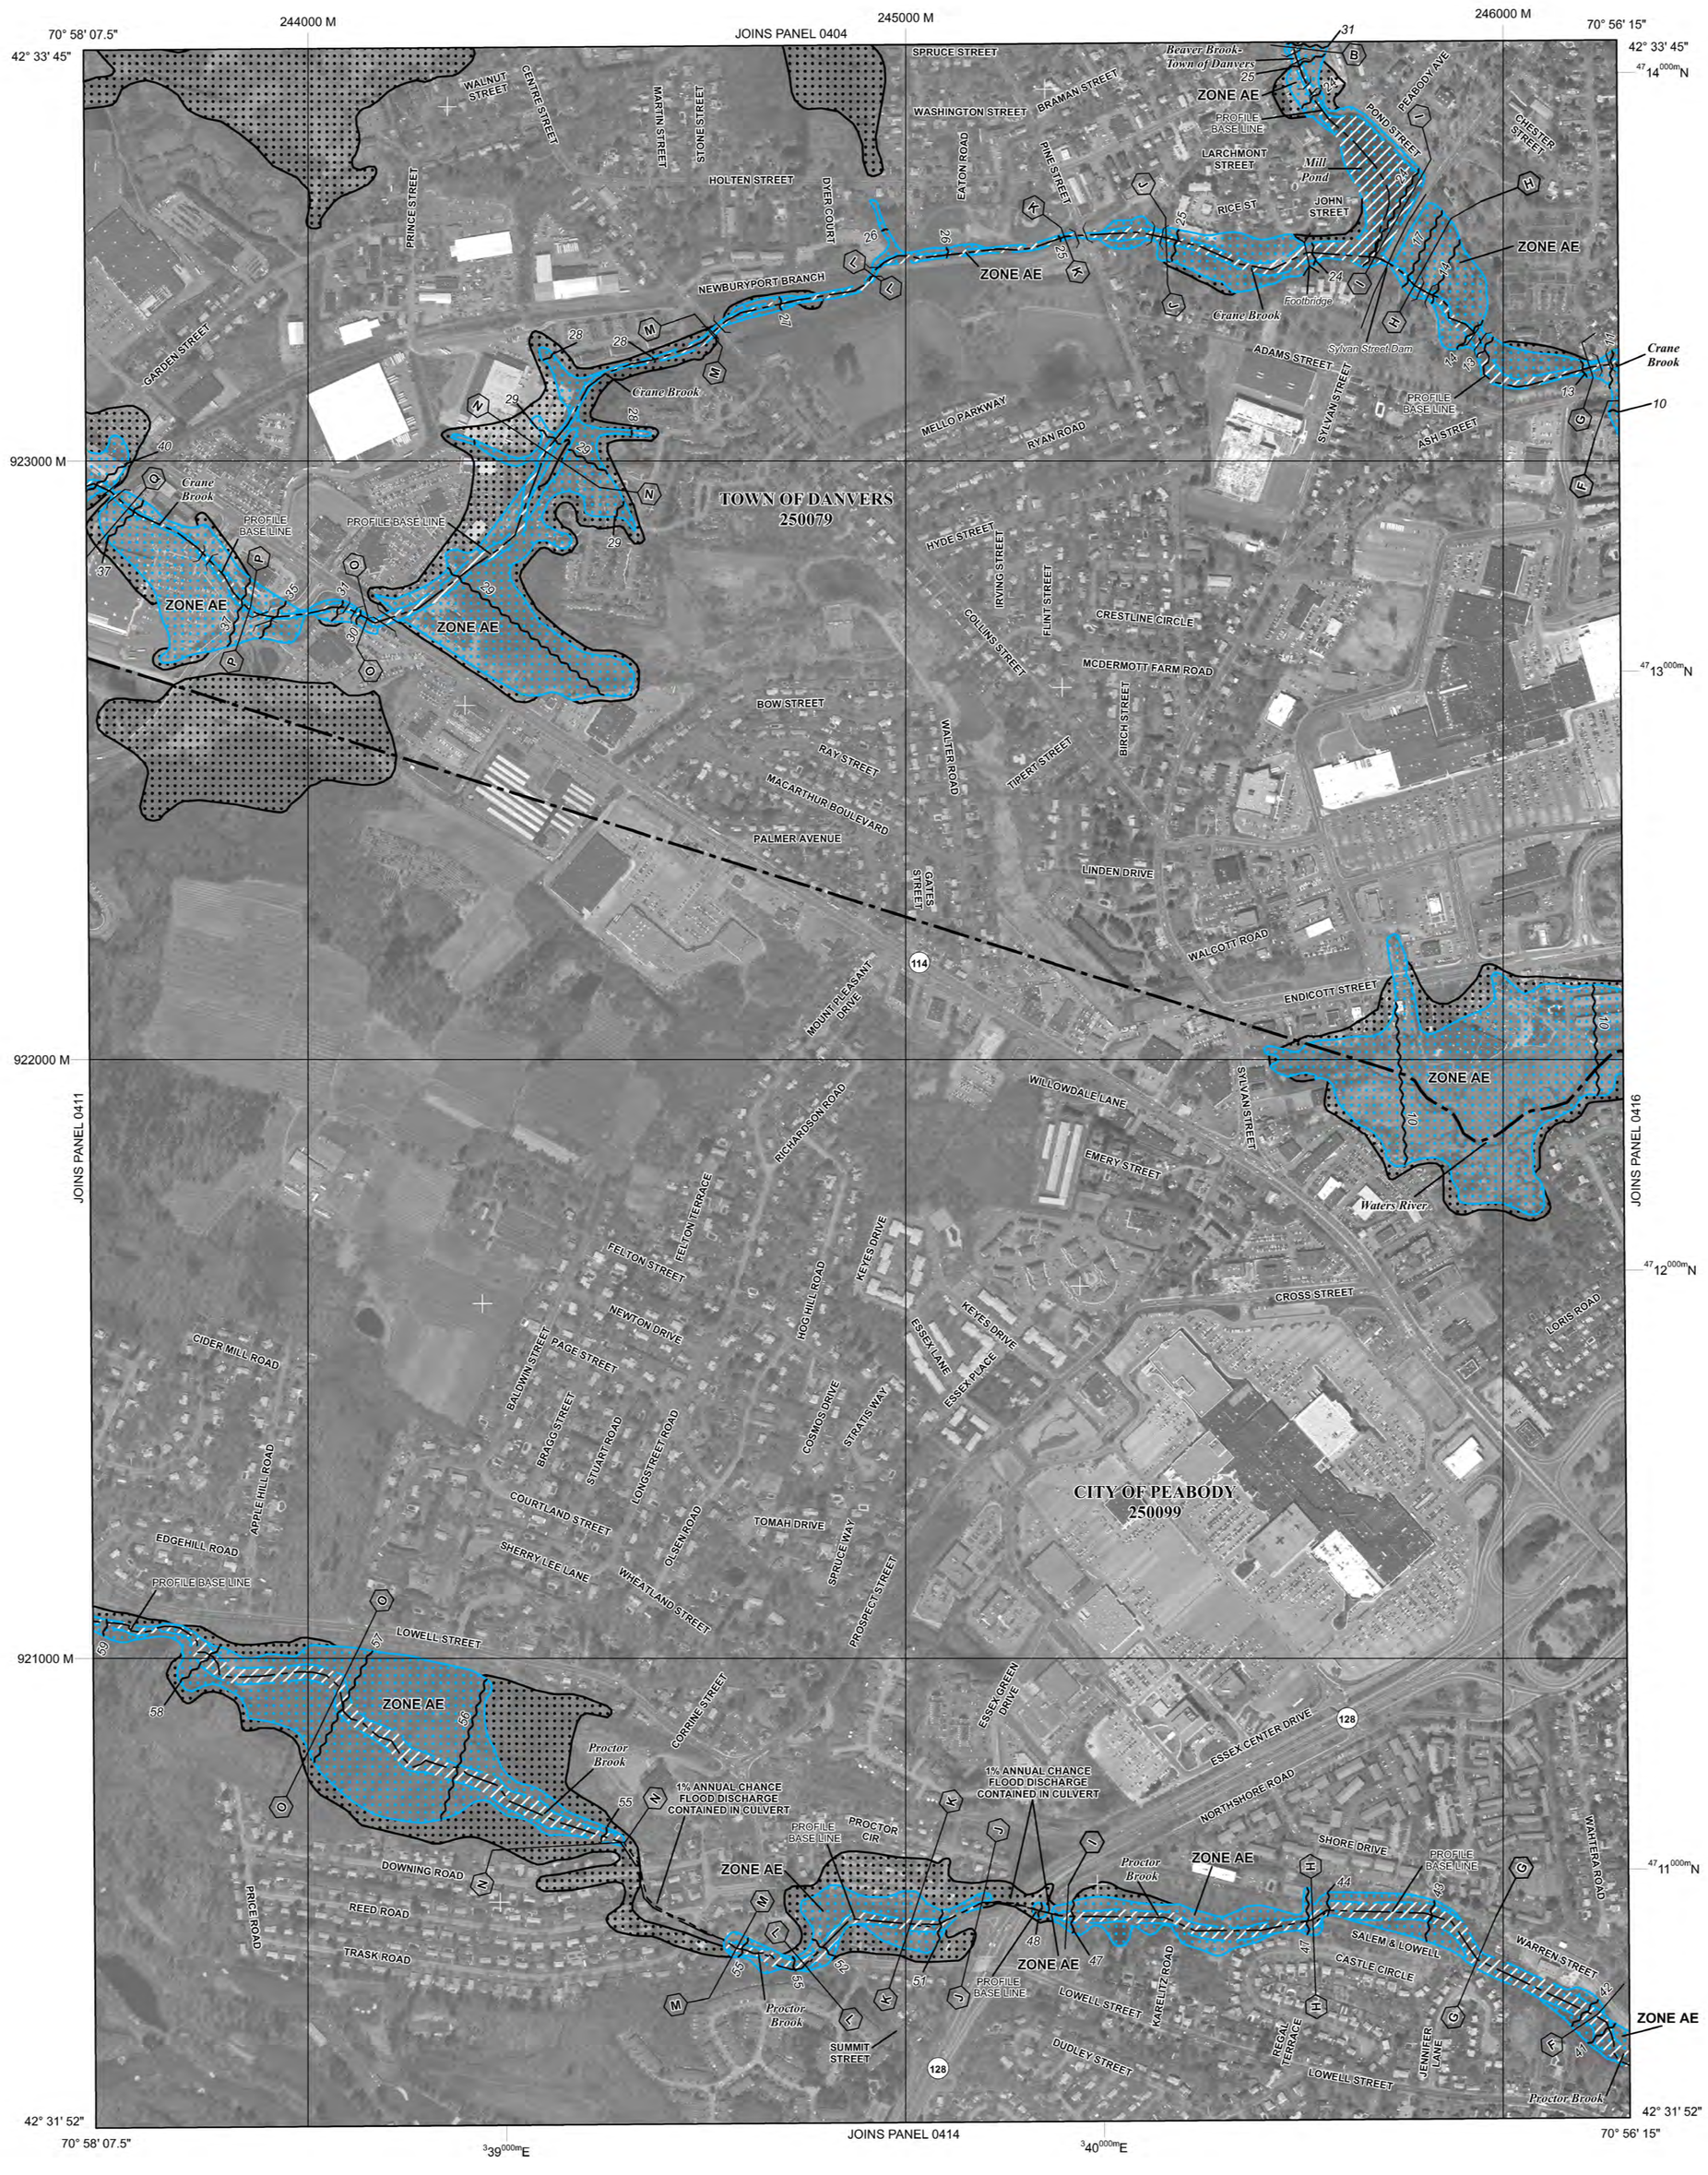
Based on updated topographic information, this map reflects more detailed and up-to-date **stream channel configurations and floodplain delineations** than those shown on the previous FIRM for this jurisdiction. As a result, the Flood Profiles and Floodway Data tables for multiple streams in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on the map. Also, the road to floodplain relationships for unrevised streams may differ from what is shown on previous maps.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map,** how to order products, or the National Flood Insurance Program in general, please call the **FEMA Map Information eXchange (FMIX)** at **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.



LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

RECHARGE VOLUME CALCULATIONS

Date: October 11, 2023
Revised:
Project: Peabody - Independence Greenway Extension
Project No: 17118
Location: Peabody, MA

Prepared By: BV
Checked By: DHS

Recharge Volume Design

Objective: Size infiltration BMPs that will approximate the annual recharge from the existing conditions.

Methodology: MA Department of Environmental Protection (DEP) Massachusetts Stormwater Handbook (Vol.3, Ch.1)

Design Criteria: Required recharge volume equals a depth of runoff corresponding to the soil type times the increase in impervious areas covering that soil type at the post-development site.

Based on the Site Hydrologic Soil Group:

Hydrologic Soil Grou	Soil Texture	Target Depth Factor (F)
A	Sand	0.60 inches
B	Loam	0.35 inches
C	Silty Loam	0.25 inches
D	Clay	0.10 inches

The soils are defined by the Soil Conservation Services (SCS) Soil Survey of Essex County of Massachusetts. The site is comprised of 'A' and 'B' soils.

Required Drawdown Time: Maximum of 72 Hours using the following equation:

$$\text{Drawdown Time} = \frac{R_v}{(KxA_{Bot})}$$

R_v = Required Recharge Volume
K = Permeability
A_{Bot} = Bottom area of trench

Calculation Results:

Designation	Total Volume Required (cf)	Net Increase Volume Required (cf)	Receiving Volume Required (cf)	Volume Provided (cf)
Infiltration Trench 1	**8,000**	**2,348**	**926**	**1,415**

WATER QUALITY CALCULATIONS

Date: October 11, 2023
Revised:
Project: Peabody - Independence Greenway Extension
Project No: 17118
Location: Peabody, MA

Prepared By: BV
Checked By: DHS

Objective: To determine the required Water Quality Volume (WQV) for adequate stormwater treatment

Methodology: MA Department of Environmental Protection (DEP) Stormwater Management (Vol. 3, Ch. 1)

Design Criteria: Volume to be treated =0.5" x Post Development Impervious Area

Critical Areas (include ORW, ACEC, recharge areas for public water supplies (Zone Is, Zone IIs and Interim Wellhead Protection Areas for ground water sources and Zone As for surface water sources), bathing beaches, cold water fisheries, shellfish growing areas and LUHPPL's

The project is not within a critical area; therefore,

Volume to be treated = 0.5" x Receiving Impervious Area

Calculation results:

Designation	Volume Required (cf)	Volume Provided (cf)
Infiltration Trench 1	**6,864**	**1,415**

Volume to be Treated:

Total proposed receiving impervious area including outside of LOW: **164,744** sf
Total Treatment volume required: **6,864 cf**

WQv = storage provided below lowest outlet = **1,415 cf**

PRETREATMENT CALCULATION

Date: February 2, 2023
Revised:
Project: Peabody - Independence Greenway Extension
Project No: 17118
Location: Peabody, MA

Prepared By: BV
Checked By: DHS

Objective: To determine the required pretreatment Volume for adaqute stormwater treatment. This project is a redevelopment and is required to meet this Standard (4) to the maximum extent practicable.

Methodology: MA Department of Environmental Protection (DEP) Stormwater Management (Vol. 2, Ch. 2)

Design Criteria: Volume to be treated = (0.1" x Required Water Quality Volume)

Calculation results:

Designation	Volume Required (cf)	Volume Provided (cf)
Impervious Area to Infiltration Trench 1	**154**	**251**

Volume to be Treated:

Impervious Area to Infiltration Trench 1

Total Proposed Impervious Area: 18,524 sf
Total Treatment Volume: **154 cf**

Volume Provided:

Pretreatment volume of Crushed Stone Shoulder

Top Elevation = 51.52 Area of contour = 1,670 sf
Bottom Elev = 51.02 Area of contour = 1,670 sf Storage Volume*: **251**

Dewatering check:

Volume cf	K in/hr	A_{Bot} sf	Time Hours		
251	2.41	1,670	**0.75**	<	**72 Hours**

*Assumes 30% voids within crushed stone shoulder for pretreatment

Hydraulic Engineering Circular No. 14, Third Edition

Several relationships have been proposed for riprap sizing for culvert aprons and several of these are discussed in greater detail in Appendix D. The independent variables in these relationships include one or more of the following variables: outlet velocity, rock specific gravity, pipe dimension (e.g. diameter), outlet Froude number, and tailwater. The following equation (Fletcher and Grace, 1972) is recommended for circular culverts:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right) \qquad (10.4)$$

where,

- D_{50} = riprap size, m (ft)
- Q = design discharge, m^3/s (ft^3/s)
- D = culvert diameter (circular), m (ft)
- TW = tailwater depth, m (ft)
- g = acceleration due to gravity, 9.81 m/s^2 (32.2 ft/s^2)

Tailwater depth for Equation 10.4 should be limited to between 0.4D and 1.0D. If tailwater is unknown, use 0.4D.

D=	5.97	ft		
g=	32.2	ft/s^2		
Q=	277	cfs		
TW=	0.9	ft		
D_{50}=	0.61	ft		
	7.36	in		
	186.90	mm	Use Class 2	Dumped RipRap

Table 10.1. Example Riprap Classes and Apron Dimensions

HYDRAULIC AND SCOUR ANALYSIS SUMMARY REPORT

Independence Greenway Extension
Over Proctor Brook
Peabody, Massachusetts

Prepared for

Massachusetts Department of Transportation

February 2023

Prepared by

GREEN INTERNATIONAL AFFILIATES, INC.
Civil and Structural Engineers

Building Strong Client Relationships Through Engineering Excellence

1.0 EXECUTIVE SUMMARY

1.1 Purpose

The purpose of this report is to present the results of a Hydraulic and Scour Study performed by Green International Affiliates, Inc. (Green) for MassDOT for Proctor Brook along the Independence Greenway Extension. The proposed bikeway crosses Proctor Brook at three (3) locations. The Hydraulic Report submitted to MassDOT in February 2021 described the proposed bridge located approximated 800' west of Endicott Street. This study evaluates the hydraulic performance of the existing and proposed conditions for the remaining project area upstream of this proposed bridge, including the two (2) crossing locations that weren't discussed in the previous report.

This study was conducted in a manner consistent with the American Association of State Highway Officials (AASHTO), Federal Highway Administration (FHWA), and Massachusetts Highway Department of Transportation (MassDOT) guidelines for preparation of hydraulic studies at brook crossing sites.

1.2 Scope of Work

The Scope of Work for this study included a review of available hydrologic and hydraulic data for Proctor Brook from the City of Peabody Flood Insurance Study (FIS) dated November 1978, a detailed hydraulic analysis for the brook; and a scour/stability analysis. Pertinent data and the hydraulic computer modeling output are contained in the attachments of this report.

Section 2 of this report contains a project description. Section 3 outlines the data collected and applications used in the study. Section 4 describes the Engineering methods used in the hydrologic and hydraulic analyses, as well as the scour/stability analysis. Section 5 contains conclusions and recommendations.

This project involves the construction of two (2) new culverts that will cross over Proctor Brook in the City of Peabody, Massachusetts. There were previous culvert structures that used to carry railroad over Proctor Brook, the railroad was abandoned, along with the culverts, and the culvert structures have been washed away over time. The purpose of this report is to present the results of a study conducted for the subject culvert sites to evaluate the hydraulic performance of the proposed structures for these crossings.

The scope of this investigation consists of a review of pertinent hydrologic analysis data for the Proctor Brook at the project site and a detailed hydraulic analysis. Data collected, hydraulic model input/output and scour calculations are presented in the appendices of this report. A project description, engineering methods, as well as conclusions of the hydraulic study follows.

2.0 PROJECT DESCRIPTION

The existing Independence Greenway bike path is proposed to be extended from its present terminus at the Northshore Mall eastwards into central districts of the City of Peabody. The project limits start at the intersection of Northshore Road and Northshore Mall South Driveway Entrance, and end at the intersection of Boston & Maine Railroad right-of-way (ROW)/Endicott Street. The proposed length of the extension is 1.45 miles.

The proposed project is located along the abandoned railroad right-of-way that has not seen any

improvements since the rails were removed. Existing culverts that convey Proctor Brook or its tributaries beneath the abandoned track bed will be replaced with new culverts designed to address, to the maximum extent possible, the Massachusetts State Stream Crossings Standards.

In place of the former railroad bridge over Proctor Brook that has been washed away, a new light duty timber boardwalk on helical piles structure is proposed in order to make the abandoned railroad right-of-way usable for a bicycle/pedestrian path. The proposed 8-span structure will be approximately 60'-0" long with an out-to-out width of 12'-0" and will provide a clear width of 11'-0" to accommodate two 5-0" wide travel lanes, one in each direction.

2.1 Existing Conditions

Proctor Brook originates in western Peabody, Massachusetts and flows southeast until it joins Goldthwait Brook to form the North River. Historical flood data is not available for this waterway. The subject locations are within NFIP SFHA Zone AE and spans a section of the river's NFIP regulatory floodway.

Refer to Figure 1 for a locus map of the project area.

The remnants of two (2) culverts remain in the channel. There are no existing trail, roadway, or railroad tracks at the crossing location. The area surrounding the remains of the culverts are currently wooded and includes Bordering Vegetated Wetlands.

The existing culverts were studied during FEMA's 1978 FIS study. At the time of the study the culverts had not been washed out and were functioning as hydraulic connections to convey Proctor Brook under the railroad bed. More detailed description of the culverts are as follows:

Culvert at Station 329+85

This culvert is located at cross section H of the FEMA FIS study. The existing culvert is a 25' long double 42" barrel RCP culvert. The culvert hasn't been maintained and the railbed above the culvert has been washed away. The culvert piping has remained in place. Remnants of granite guidebanks remain at the upstream entrance to the culvert and remnants of a granite headwall remain on the downstream end of the culvert

Culvert at Station 346+20

This culvert is located at cross section F of the FEMA FIS study. Review of the FEMA's HEC-2 hydraulic model indicates that the culvert was originally a 6'-5" box culvert. Due to a lack of maintenance along the abandoned railroad bed, the culvert has collapsed, and the remnants remain in the channel.

2.2 Proposed Conditions

Although the culvert crossings have failed to varying degrees, the horizontal alignment of Proctor Brook has remained. The culverts are being replaced at the same locations as the original structures in order to maintain the alignment of Proctor Brook at these crossings. The channel elevation will remain although some sediment will be removed to facilitate construction.

Both of the culverts will be replaced with 8'x4' concrete box culverts. The bottom 1' of each culvert will be filled with streambed material to provide a more natural wildlife habitat. This hydraulic study examines the impact of providing an 8'x3' hydraulic opening at both of these crossings.

3.0 DATA COLLECTION

The following data and reports on the study area were available and were used as guidance during the hydraulic and hydrologic model development and Analysis:

4.0 ENGINEERING METHODS

Proctor Brook was studied for its entire length within the City of Peabody, MA by FEMA using detailed methods as part of the FIS for the City of Peabody. To ensure compliance with FEMA requirements (44 CFR 60.3) and the requirements of the Massachusetts Wetlands Protection Act (310 CMR 10.0), the proposed conditions of the culverts have been analyzed to ensure that existing flood elevations will not increase underproposed conditions. In addition, a hydraulic analysis was also performed to calculate the potential for scour.

Figure 2 shows the project location in the flood insurance rate map.

In this hydraulic and scour summary report, peak flow rates from the effective FEMA FIS were used in the analysis.

4.1 Hydrologic Analysis

Peak 10-, 50-, 100- and 500-year flood discharges for Proctor Brook were adopted from Table 6, Essex County FIS, and are presented below in Table 4.1. Please consult the Essex County Effective FIS, last revised July 2018, for information regarding hydrologic computational procedures. As further described in the Stormwater Water prepared for this project, the peak flow rates have been adjusted to account for the proposed increase in impervious area. Table 4.1 also presents the proposed flow projections for the project area.

Table 4.1 – Summary of Discharges

Description	Alternative	10% Annual Chance [10-yr] (CFS)	4% Annual Chance [25-yr] (CFS)	2% Annual Chance [50-yr] (CFS)	1% Annual Chance [100-yr] (CFS)	0.2% Annual Chance [500-yr] (CFS)
North River andProctor Brook Upstream of Goldthwait Brook	FEMA FIS	240	285	360	420	610
	Proposed Conditions	243	290	366	428	618

4.2 Hydraulic Analysis

Green used a combination of the topographical survey and the proposed design of the brook crossings to create a proposed conditions hydraulic model in HEC-RAS. Cross sections were cut approximately every 100 to 200 ft and then imported into HEC-RAS. Backwater analyses using the USACE HEC-RAS computer program were performed for the 10-, 50-, and 100-, and 500-year return events in a manner consistent with the standards used to develop water surface profiles under the National Flood Insurance Program (NFIP).

The computed water surface elevations of this HEC-RAS analysis were compared to water surface elevations listed on the HEC-2 output received from FEMA.

Table 4.2 shows a comparison between the results of the HEC-2 data received from FEMA and Green's proposed model.

Table 4.2 – Comparison of FEMA and Proposed Base Flood Elevations (BFE - referenced to NAVD88) at several cross sections near the Proposed Structures

Adjusted datum to NAVD 88

As shown in Table 4.2, Proctor Brook will not have an increase in the Water Surface Elevation (WSEL) for the FEMA Base Flood Elevation.

Attachment A includes the 1977 HEC-2 model input/output report received from FEMA Headquarters. Attachment B includes the output of Green's Proposed Conditions HEC-RAS analyses for the proposed Independence Greenway Extension boardwalkover Proctor Brook with the new crossing culverts.

4.3 Scour Safety/Stability Analyses

We calculated the scour hole dimensions (length, width, and depth) using the Hydraulic Engineering Circular (HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 5: "Estimating Scour at Culvert Outlets" and using equation 5.1 for cohesionless soils shown below:

$$\left[\frac{h_s}{R_c}, \frac{W_s}{R_c}, \frac{L_s}{R_c}, \frac{V_s}{R_c^3}\right] = C_s C_h \left(\frac{\alpha}{\sigma^{1/3}}\right) \left(\frac{Q}{\sqrt{g}(R_c^{2.5})}\right)^{\beta} \left(\frac{t}{316}\right)^{\theta}$$

We used the river's 100-year flood as the scour design in this analysis. No scour potential under current conditions was assessed, as one of the structures has washed away and based on evidence, there are no indications of vertical or horizontal instability.

Peak 100-year flood proposed discharge used in this analysis was taken from Table 4.1.

Soil samples were taken at points within the brook, upstream of the culverts and the banks of the brook. These samples were analyzed, and the results are included in Attachment C. The grain size (D_x) was estimated for each soil sample. The D_x results of the samples were used in the scour analysis.

The results of the scour analyses are shown on Table 4.3.

Table 4.3 – Summary of Calculated Scour at Proposed Culverts

Alternative	Return Frequency (year)	Scour Hole Depth (Feet)	Scour Hole Width (Feet)	Scour Hole Length (Feet)	Scour Hole Volume (Cubic Feet)	Location of Maximum Scour (Feet)
Sta 329+85	Incipient	5.89	32.00	57.82	8,133.98	23.13
Sta 346+20	Incipient	4.69	23.64	44.11	3,527.78	17.65

Scour Countermeasures

The scour/stability analyses were performed using Hydraulic Engineering Circular (HEC) No. 14; "Hydraulic Design of Energy Dissipators for Culverts and Channels" Chapter 10: "Riprap Basins and Aprons" and using equation 10.4 shown below:

$$D_{50} = 0.2\,D\left(\frac{Q}{\sqrt{g}D^{2.5}}\right)^{4/3}\left(\frac{D}{TW}\right)$$

Table 4.4 displays dimensions for riprap apron at the proposed culverts.

Table 4.4 – Summary of Scour Countermeasure Design at Proposed Culverts

Alternative	Riprap Size D_{50} (Inches)	Riprap Class	Riprap Apron Length (Feet)	Riprap Apron Depth (Feet)	Riprap Apron Width (Feet)
Sta 329+85	6	2	24	2	34
Sta 346+20	5	1	22	1	31

Attachment D includes the scour analyses, and computations.

5.0 CONCLUSIONS

A. The HEC-RAS model under proposed conditions resulted in lower elevations than the effective FEMA FIS. Therefore, the project implementation will result in no increase to the waterway's Base (100-year) Flood Elevation (BFE) profile, and it will not necessitate alteration of the waterway's floodway delineation, anywhere within the affected community.

B. The natural stream bed will result in a scour depth at culvert at Station 329+85 of 5.89' during incipient flow.

C. The natural stream bed will result in a scour depth at culvert at Station 340+26 of 4.69' during incipient flow.

D. Riprap Countermeasures are proposed to mitigate against the risk of scour. The countermeasures have been designed in accordance with HEC-14 and HEC-23.

E. By placing riprap revetment at the ends of the culvert, it is anticipated that the scour depth will be negligible.

Appendix E: O&M Plan, LTPPP, and IDCS

- Stormwater Management System Operation and Maintenance (O&M) Plan
- Long Term Pollution Prevention Plan (LTPPP)
- Illicit Discharge Compliance Statement (IDCS)

To:	Brendan Callahan, City of Peabody, Assistant Director of Planning
Cc:	
From:	Danielle Spicer, P.E. Green International Affiliates, Inc. (Green)
Date:	February 2, 2023
Revised:	
Project:	Independence Greenway Extension – Peabody, MA (Green No. 17118)
Subject:	Stormwater Operation and Maintenance Plan & Long-Term Pollution Prevention Plan

Operation & Maintenance Plan

All Operation and Maintenance shall be done in accordance with the relevant O&M plan per the Department of Public Services for the City of Peabody, in addition to the items noted below.

OPERATION & MAINTENANCE PLAN – OUTFALLS

Level spreaders are required at the point of discharge to limit erosion. Outfalls should be inspected every six months during the first year and annually thereafter for sediment buildup, bare spots and vegetation health. Any erosion or low spots in the level spreader must be repaired.

OPERATION & MAINTENANCE PLAN – CATCH BASINS

Catch basins require regular cleaning. Inspect the catch basins at least four times per year, including at the end of foliage- and snow removal-season. Sediment must also be removed when the depth of deposits is greater than or equal to half of the depth from the bottom of the invert of the lowest pipe in the catch basin. More frequent cleaning may be necessary in critical areas or areas with higher potential pollutant loads. Vacuum trucks are preferable to clamshell buckets for cleaning, as vacuuming is faster and removes more sediment and supernatant.

OPERATION & MAINTENANCE PLAN – INFILTRATION TRENCH

Infiltration trenches shall be inspected after the first several rainfall events, after all major storms, and on regularly scheduled dates every six months once established. Routinely remove leaves and accumulated sediment from the surface of the trench.

When inspecting infiltration trenches look for ponded water. If there is ponded water at the surface of the trench, it is likely that the trench surface is clogged. To address surface clogging, remove and replace the first 6” layer of stone aggregate. If water is ponded inside the trench, it may indicate that the bottom of the trench has failed. To rehabilitate a failed trench, all accumulated sediment must be stripped from the bottom, the bottom of the trench must be scarified and tilled to induce infiltration, and all of the stone aggregate and filter fabric or media must be removed and replaced.

Long-Term Pollution Prevention Plan

In general, long-term pollution prevention and related maintenance activities will be conducted consistent with the City of Peabody's National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) Permit.

This LTPPP satisfies the requirements related to pollution prevention under Massachusetts Stormwater Standards 4, 5, 6, and 10.

Practices for Long-Term Pollution Prevention

For the facilities covered, long-term pollution prevention includes the following measures:

Litter Pick-up

The City of Peabody will conduct litter pick-up from the stormwater management facilities in conjunction with routine road maintenance activities.

Routine Inspection and Maintenance of SCMs

The City of Peabody will conduct inspection and maintenance of the stormwater control measures in accordance with the Project's O&M plan and Peabody's Department of Public Services (DPS) O&M for the City.

Maintenance of Landscaped Areas

Routine mowing will be conducted according to standard DPS practices. Embankments designed to impound water should be mowed as required to prevent establishment of woody vegetation.

Except in rare circumstances, the City does not use fertilizers, herbicides, and pesticides for the maintenance of facilities. Exceptions include using fertilizer to ensure the survival of new plantings and herbicides to control invasive plants. Use of fertilizers and herbicides shall be reviewed and approved by DPS prior to application. Local Conservation Commission review may also be required.

Snow and Ice Management

Snow and Ice Management will be conducted consistent with the practices outlined in the City's Snow and Ice Control Program.

Street Sweeping

Routine highway cleaning, with a brush-type street sweeper, will be conducted in accordance with standard DPS practices. Sweeping will occur annually in the Spring.

Prohibition of Illicit Discharges

The MassDEP Stormwater Management Standards prohibit illicit discharges to the stormwater management system. Illicit discharges are discharges that do not consist entirely of stormwater, except for certain specified non-stormwater discharges.

Examples of discharges from the following sources are not considered illicit discharges:

- Firefighting activities*
- Foundation drains
- Water line flushing
- Footing drains
- Landscape irrigation
- Residential car washing
- Uncontaminated groundwater
- Rising groundwater
- Riparian habitats/wetlands
- Potable water sources
- Dechlorinated swimming pool water
- Street sweeping
- Wash water from buildings (without detergents)
- Condensation from air conditioning units
- Run-on from private driveways caused by precipitation
- Lawn watering

*Water from firefighting activities is allowed under this permit and need only be addressed where they are identified as significant sources of pollutants to waters of the United States.

There are no known or proposed illicit connections associated with the project limits.

Spill Prevention and Response

This project does not discharge to a Zone I, Zone II or Zone A surface water supply protection area.

Response procedures will be implemented at the proposed infiltration trench for any significant release of hazardous materials such as fuels, oils, or chemical materials that have the potential of discharging to Proctor Brook.

Reportable quantities will immediately be reported to the applicable Federal, State, and local agencies as required by law. Reportable quantities of chemical, fuels, or oils are established under the Clean Water Act and enforced through MassDEP. The MassDEP Emergency Response Program shall be immediately notified in accordance with required procedures for the report of a release (telephone 888-304-1133).

In the case of a spill, applicable containment and clean-up procedures will be performed immediately. The Peabody Fire Department will be the first responders. Spill material collected during the response will be promptly removed and disposed of in accordance with Federal, State, and local requirements. If necessary, a licensed emergency response contractor will assist in cleanup of releases depending on the amount of the release and the ability of the responsible party to perform the required response.

Illicit Discharge Compliance Statement

Per Standard 10 of the Massachusetts Stormwater Handbook, the following is an Illicit Discharge Compliance Statement:

The design plans submitted for the Notice of Intent have been designed in full compliance with current standards.

The Long-Term Pollution Prevention Plan is part of the Operation and Maintenance Plan and includes measures to prevent illicit discharges. There are no known combined sewer outfalls and to the best of our knowledge all closed stormwater systems discharge per Massachusetts DEP requirements. Based on observations during a site visit in November 2022 the site does not contain any known existing illicit discharges.

GENERAL NOTES

1. ALL UTILITY POLES REQUIRING RELOCATION ARE TO BE RELOCATED BY OTHERS.
2. THE CONTRACTOR SHALL MAINTAIN COMPLIANCE WITH THE AMERICANS WITH DISABILITIES ACT AND MASSACHUSETTS ARCHITECTURAL ACCESS BOARD AT ALL OBSTRUCTIONS.
3. PEDESTRIAN CURB RAMPS SHALL CONFORM TO THE CURRENT MASSDOT STANDARDS.
4. TRANSITION GRANITE CURB SHALL BE INSTALLED AT PROJECT LIMITS TO MATCH EXISTING ELEVATIONS (PAVEMENT OR EXISTING CURB).
5. THE CONTRACTOR SHALL RETAIN ALL CURBS, FENCES, WALLS, TREES, SHRUBS, POSTS, LANDSCAPE FEATURES, AND OTHER MISCELLANEOUS ITEMS WITHIN ABUTTING PROPERTIES, UNLESS OTHERWISE NOTED. WHEN RETAINING THOSE ITEMS IS NOT PRACTICAL IN THE OPINION OF THE ENGINEER, THE CONTRACTOR SHALL REMOVE, STOCKPILE, PROTECT AND RESET THE ITEMS. THE CONTRACTOR SHALL REPLACE ITEMS DAMAGED DURING REMOVAL, STOCKPILING, OR RESETTING DUE TO NEGLIGENCE, CARELESSNESS, OR MISHANDLING WITH EQUIVALENT NEW ITEMS AT NO COST TO THE OWNER.
6. ALL TREES WITHIN THE SLOPE LIMIT SHALL BE RETAINED AND PROTECTED UNLESS OTHERWISE NOTED.
7. ALL TREES CALLED OUT TO BE RETAINED SHALL BE PROTECTED USING ITEM NO. 102.511 TREE PROTECTION - ARMORING AND PRUNING AND ITEM NO. 102.521 TREE AND PLANT PROTECTION FENCE.
8. CONTRACTOR SHALL PROTECT ALL PROPERTY MARKERS OF ABUTTERS.
9. TREATMENT OF SLOPE AREAS SHALL BE REPLACED IN KIND UNLESS OTHERWISE NOTED.
10. THE CONTRACTOR SHALL EXERCISE CAUTION WHEN EXCAVATING ALONG THE ABUTMENT FOR THE SHARED-USE PATH AT THE ROUTE 128 UNDERPASS.

UTILITY NOTES:

1. THE LOCATION OF ALL UNDERGROUND UTILITIES ARE SHOWN APPROXIMATE AND WERE COMPILED USING FIELD SURVEY INFORMATION AND AVAILABLE RECORD INFORMATION. THE LOCATION OF EXISTING PIPES OR OTHER UNDERGROUND STRUCTURES OR PROPERTY LINES ARE NOT WARRANTED TO BE EXACT, NOR IS IT WARRANTED THAT ALL UNDERGROUND PIPES OR STRUCTURES ARE SHOWN. THE CONTRACTOR SHALL CALL "DIG SAFE" (1-888-344-7233) AND NOTIFY THE CITY OF PEABODY AND MASSDOT AT LEAST 72 HOURS (EXCLUDING SATURDAYS, SUNDAYS AND HOLIDAYS) PRIOR TO ANY EXCAVATION TO OBTAIN ACCURATE UTILITY LOCATIONS.
2. RECORD UTILITY INFORMATION FROM THE VARIOUS UTILITY COMPANIES AND PUBLIC AGENCIES ARE APPROXIMATE ONLY AND ACTUAL LOCATIONS MUST BE DETERMINED IN THE FIELD.
3. THE COMPLETION AND ACCURACY OF LATERAL UTILITY SERVICES IS NOT GUARANTEED AND MUST BE VERIFIED BY THE CONTRACTOR IN THE FIELD.
4. ALL UTILITY COMPANIES, PUBLIC AND PRIVATE MUST BE NOTIFIED, INCLUDING THOSE IN CONTROL OF UTILITIES NOT SHOWN ON THIS PLAN, (SEE CHAPTER 370, ACTS OF 1963, MASSACHUSETTS) PRIOR TO DESIGNING, EXCAVATING, BLASTING, INSTALLING, BACKFILLING, GRADING, PAVEMENT RESTORING OR REPAVING.
5. SUBSURFACE UTILITY LOCATIONS HAVE BEEN PLOTTED TO MEET UTILITY QUALITY LEVEL "C" AS DESCRIBED IN ASCE STANDARD 38-02 AND SUMMARIZED ON THIS SHEET. THE UNDERGROUND UTILITIES ARE SHOWN IN APPROXIMATE LOCATIONS BASED ON ABOVE-GROUND FIELD OBSERVATION AND EXISTING RECORD INFORMATION RECEIVED FROM UTILITY STAKE-HOLDERS.
6. INVERTS SHOWN ON PLAN ARE NOT GUARANTEED TO BE ACCURATE. DUE TO THE LIMITATIONS OF FIELD OBSERVATION AND SURVEY TECHNIQUES THE INVERTS ARE SHOWN AS APPROXIMATE ONLY AND SHALL NOT BE WARRANTED TO BE CORRECT. ADDITIONAL FIELD INVESTIGATION IS NECESSARY WHERE ACCURATE MEASUREMENTS ARE REQUIRED FOR DESIGN OF CRITICAL AREAS.
7. WHERE AN EXISTING UTILITY IS FOUND TO BE IN CONFLICT WITH THE PROPOSED WORK, THE CONTRACTOR SHALL ACCURATELY DETERMINE THE LOCATION, ELEVATION AND SIZE OF THE UTILITY AND FURNISH THE INFORMATION TO THE ENGINEER FOR RESOLUTION OF THE CONFLICT.
8. THE CONTRACTOR SHALL EXERCISE EXTREME CARE WHEN EXCAVATING NEAR AND BACKFILLING IN THE VICINITY OF EXISTING UTILITIES. THE CONTRACTOR SHALL USE HAND EXCAVATION WHERE APPROPRIATE TO PROTECT EXISTING UTILITIES.
9. THE CONTRACTOR SHALL MAINTAIN ALL EXISTING UTILITIES IN SERVICE AT ALL TIMES UNLESS NOTED ON THE PLANS OR APPROVED BY THE ENGINEER.
10. THE CONTRACTOR SHALL SUPPORT AND PROTECT EXISTING UTILITIES IN AND AROUND EXCAVATIONS, AND IN PARTICULAR, WHEN CROSSING OVER OR UNDER ANY DUCT OR PIPE. ALL PROTECTIVE MEASURES SHALL BE CONSIDERED INCIDENTAL WORK.
11. IF THE CONTRACTOR DAMAGES ANY UTILITY SYSTEM, HE OR SHE SHALL IMMEDIATELY NOTIFY THE RESPECTIVE UTILITY COMPANY AND SHALL REPAIR/REPLACE THE AFFECTED SYSTEM AT HIS OR HER OWN EXPENSE.
12. THE CONTRACTOR SHALL COORDINATE WITH PRIVATE UTILITY COMPANIES AND MAKE ARRANGEMENTS FOR ADJUSTMENTS, ALTERATIONS AND REPLACEMENT OF PRIVATE UTILITIES.
13. BELOW GROUND STRUCTURES ARE SHOWN SYMBOLIC UNLESS DIMENSIONED.
14. THE EXISTING CONDITIONS PLAN IS TO BE USED FOR THE SPECIFIED PROJECT ONLY AND IS NOT WARRANTED TO BE COMPLETE FOR ANY OTHER FUTURE PROJECTS.
15. THE EXISTING SEWER LINE WITHIN THE PROJECT LIMITS SHALL BE INSPECTED USING CLOSED CIRCUIT TV (CCTV) AT THE BEGINNING OF THE PROJECT, PRIOR TO ANY MAJOR WORK ACTIVITIES OR LARGE EQUIPMENT MOBILIZING ON SITE. A CCTV INSPECTION OF THE EXISTING SEWER LINE FOR THE SAME LIMITS SHALL ALSO BE PERFORMED AT THE END OF CONSTRUCTION TO CONFIRM ITS CONDITION HAS NOT CHANGED OVER THE COURSE OF THE PROJECT.
IN ADDITION TO THE PRE AND POST CONSTRUCTION CCTV INSPECTION OF THE EXISTING SEWER LINE FOR THE PROJECT LIMITS, INTERIM CCTV INSPECTION OF CERTAIN SEGMENTS OF THE SEWER LINE SHALL BE PERFORMED FOR SPECIFIC VIBRATION GENERATING ACTIVITIES. CCTV INSPECTION SHALL BE PERFORMED AT THE FOLLOWING LOCATIONS AND PROPOSED CONSTRUCTION ITEMS FOR EXCAVATION AND STONE INSTALLATION ACTIVITIES:

- STA 329+85 BOX CULVERT NO. 1
- STA 340+05 36" DIP PIPE CULVERT
- STA 342+25 24" DIP PIPE CULVERT
- STA 346+20 BOX CULVERT NO. 2
- STA 351+10 BOARDWALK WEST ABUTMENT
- STA 355+48 BOARDWALK EAST ABUTMENT
- STA 358+50 16" DUCTILE IRON PIPE

SUMMARY OF UTILITY MAPPING QUALITY LEVELS:

THE FOLLOWING IS A SUMMARY OF THE SURVEY MAPPING LEVELS FOR UTILITIES AS DESCRIBED IN ASCE STANDARD 38-02, "STANDARD GUIDELINE FOR THE DEPICTION OF EXISTING SUBSURFACE UTILITY DATA". THESE GUIDELINES ARE MORE FULLY DESCRIBED IN THE ASCE STANDARD.

UTILITY QUALITY LEVEL A:
PRECISE HORIZONTAL AND VERTICAL LOCATION OF UTILITIES OBTAINED BY THE ACTUAL EXPOSURE (OR VERIFICATION OF PREVIOUSLY EXPOSED AND SURVEYED UTILITIES) AND SUBSEQUENT MEASUREMENT OF SUBSURFACE UTILITIES, USUALLY AT A SPECIFIC POINT. MINIMALLY INTRUSIVE EXCAVATION EQUIPMENT IS TYPICALLY USED TO MINIMIZE THE POTENTIAL FOR UTILITY DAMAGE. A PRECISE HORIZONTAL AND VERTICAL LOCATION, AS WELL AS OTHER UTILITY ATTRIBUTES, IS SHOWN ON PLAN DOCUMENTS. ACCURACY IS TYPICALLY SET TO 15-MM VERTICAL AND TO APPLICABLE HORIZONTAL SURVEY AND MAPPING ACCURACY AS DEFINED OR EXPECTED BY THE PROJECT OWNER.

UTILITY QUALITY LEVEL B:
INFORMATION OBTAINED THROUGH THE APPLICATION OF APPROPRIATE SURFACE GEOPHYSICAL METHODS TO DETERMINE THE EXISTENCE AND APPROXIMATE HORIZONTAL POSITION OF SUBSURFACE UTILITIES. QUALITY LEVEL B DATA SHOULD BE REPRODUCIBLE BY SURFACE GEOPHYSICS AT ANY POINT OF THEIR DEPICTION. THIS INFORMATION IS SURVEYED TO APPLICABLE TOLERANCES DEFINED BY THE PROJECT AND REDUCED ONTO PLAN DOCUMENTS.

UTILITY QUALITY LEVEL C:
INFORMATION OBTAINED BY SURVEYING AND PLOTTING VISIBLE ABOVE-GROUND UTILITY FEATURES AND BY USING PROFESSIONAL JUDGMENT IN CORRELATING THIS INFORMATION TO QUALITY LEVEL D INFORMATION.

UTILITY QUALITY LEVEL D:
INFORMATION DERIVED FROM EXISTING RECORDS OR ORAL RECOLLECTIONS.

SURVEY NOTES

1. THE EXISTING CONDITIONS SHOWN ON THIS BASEMAP ARE THE RESULT OF AN ARIAL SURVEY PERFORMED BY SANBORN COMPANY IN JUNE, 2004 SUPPLEMENTED BY AN ON THE GROUND INSTRUMENT SURVEY PERFORMED IN SEPTEMBER, 2004 BY GREEN INTERNATIONAL AFFILIATES, INC. (GREEN). ADDITIONAL GROUND SURVEY WAS PERFORMED BETWEEN 2017 AND 2022 BY GREEN TO SUPPLEMENT EXISTING GROUND SURVEY.
2. HORIZONTAL DATUM IS BASED ON THE MASSACHUSETTS STATE PLANE COORDINATE SYSTEM, VERTICAL DATUM IS NAVD88. THE UNIT OF MEASUREMENTS IS US SURVEY FEET.
3. WETLANDS WERE DELINEATED BY GREEN ON 2/15/2018 AND REFLAGGED BY ECOSYSTEMS-SOLUTIONS IN 2022 ACCORDANCE WITH THE MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION AND FIELD LOCATED BY GREEN ON 2/20/2018. REFLAGGING DETERMINED BOUNDARIES HAD NOT CHANGED.
4. THE RIGHT OF WAY LINES SHOWN ON THIS PLAN ARE THE DIRECT RESULT OF AN INSTRUMENT SURVEY PERFORMED ON THE GROUND BY GREEN INTERNATIONAL AFFILIATES, INC. WITH AN ERROR OF CLOSURE LESS THAN 1:15,000, AND FROM PLANS AND DEEDS OF RECORD. PRIVATE PROPERTY LINES ARE COMPILED FROM DEEDS AND PLANS AND SHOULD BE CONSIDERED APPROXIMATE.
5. THE SAID PARCELS SHOWN HERE ARE SUBJECT TO RIGHTS AND EASEMENTS AS CONTAINED IN THE VARIOUS DEEDS OF RECORD DESCRIBING SAID PREMISES. THE LOCATIONS AND EXTENT OF SAID RIGHTS AND EASEMENTS ARE NOT THE SUBJECT OF THIS SURVEY.

EROSION AND SEDIMENT CONTROL

1. ALL EROSION CONTROL MEASURES SHALL BE INSTALLED PRIOR TO THE START OF ANY LAND DISTURBANCE/EARTHWORK ACTIVITIES.
2. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE MAINTENANCE, REPAIR AND REPLACEMENT OF ALL SEDIMENTATION/EROSION CONTROL MEASURES UNTIL ALL DISTURBED AREAS ARE STABILIZED.

25													
30													

REMARKS
1. Ground surface elevation estimated from electronic AutoCAD file entitled "Peabody Bike Path 2018 Merge Basemap-Final.DWG", provided by Green International, Inc. on 1/16/2019.
2. Borehole relocated approximately 25 feet from staked location due to access.
3. Driller noted increased drilling resistance at 6.5 feet below ground surface (bgs).
4. Gravel and Cobbles (less than 6 inches) observed in drill spoils at approximately 11 feet bgs.
5. Auger refusal at 15.3 feet bgs on possible bedrock. Borehole terminated.
6. Borehole backfilled to approximate ground surface with drill cuttings and surficial soils.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

BORING NOTES

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: ⊗ B-1
2. BORINGS TAKEN FOR THE PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES TO THE LEFT OF COLUMNS INDICATE DEPTH BELOW SURFACE AT BORING POINT.
5. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS PRODUCED BY A 30" FALL OF 140 POUND MASS HAMMER REQUIRED TO DRIVE 2" I.D. SPOON 1 FOOT.
6. BORING SAMPLE TAKEN 1/2/2019 - 1/3/2019.
7. BORING CONTRACTOR - NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH 03038
8. BORING SAMPLES WERE STORED AT A STORAGE FACILITY ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.

174019 PROPOSED PEABODY BIKEWAY.GPJ; STRATUM ONLY; 3/18/2019

BORING NOTES

1. LOCATION OF BORINGS SHOWN ON THE PLAN THUS: B-1
2. BORINGS TAKEN FOR THE PURPOSE OF DESIGN AND SHOW CONDITIONS AT BORING POINTS ONLY, BUT DO NOT NECESSARILY SHOW THE NATURE OF THE MATERIALS TO BE ENCOUNTERED DURING CONSTRUCTION.
3. WATER LEVELS SHOWN ON THE BORING LOGS WERE OBSERVED AT THE TIME OF TAKING BORINGS AND DO NOT NECESSARILY SHOW THE TRUE GROUND WATER LEVEL.
4. FIGURES TO THE LEFT OF COLUMNS INDICATE DEPTH BELOW SURFACE AT BORING POINT.
5. FIGURES IN COLUMNS INDICATE NUMBER OF BLOWS PRODUCED BY A 30" FALL OF 140 POUND MASS HAMMER REQUIRED TO DRIVE 2" I.D. SPOON 1 FOOT.
6. BORING SAMPLE TAKEN 1/2/2019 - 1/3/2019.
7. BORING CONTRACTOR - NEW ENGLAND BORING CONTRACTORS, 40 FORDWAY STREET, DERRY, NH 03038
8. BORING SAMPLES WERE STORED AT A STORAGE FACILITY ON ROUTE 114 (219 WINTHROP AVE.) IN LAWRENCE, MA. THE CONTRACTOR MAY EXAMINE THE SOIL AND ROCK SAMPLES BY CONTACTING THE MASSDOT GEOTECHNICAL SECTION AT 10 PARK PLAZA, BOSTON, MA.

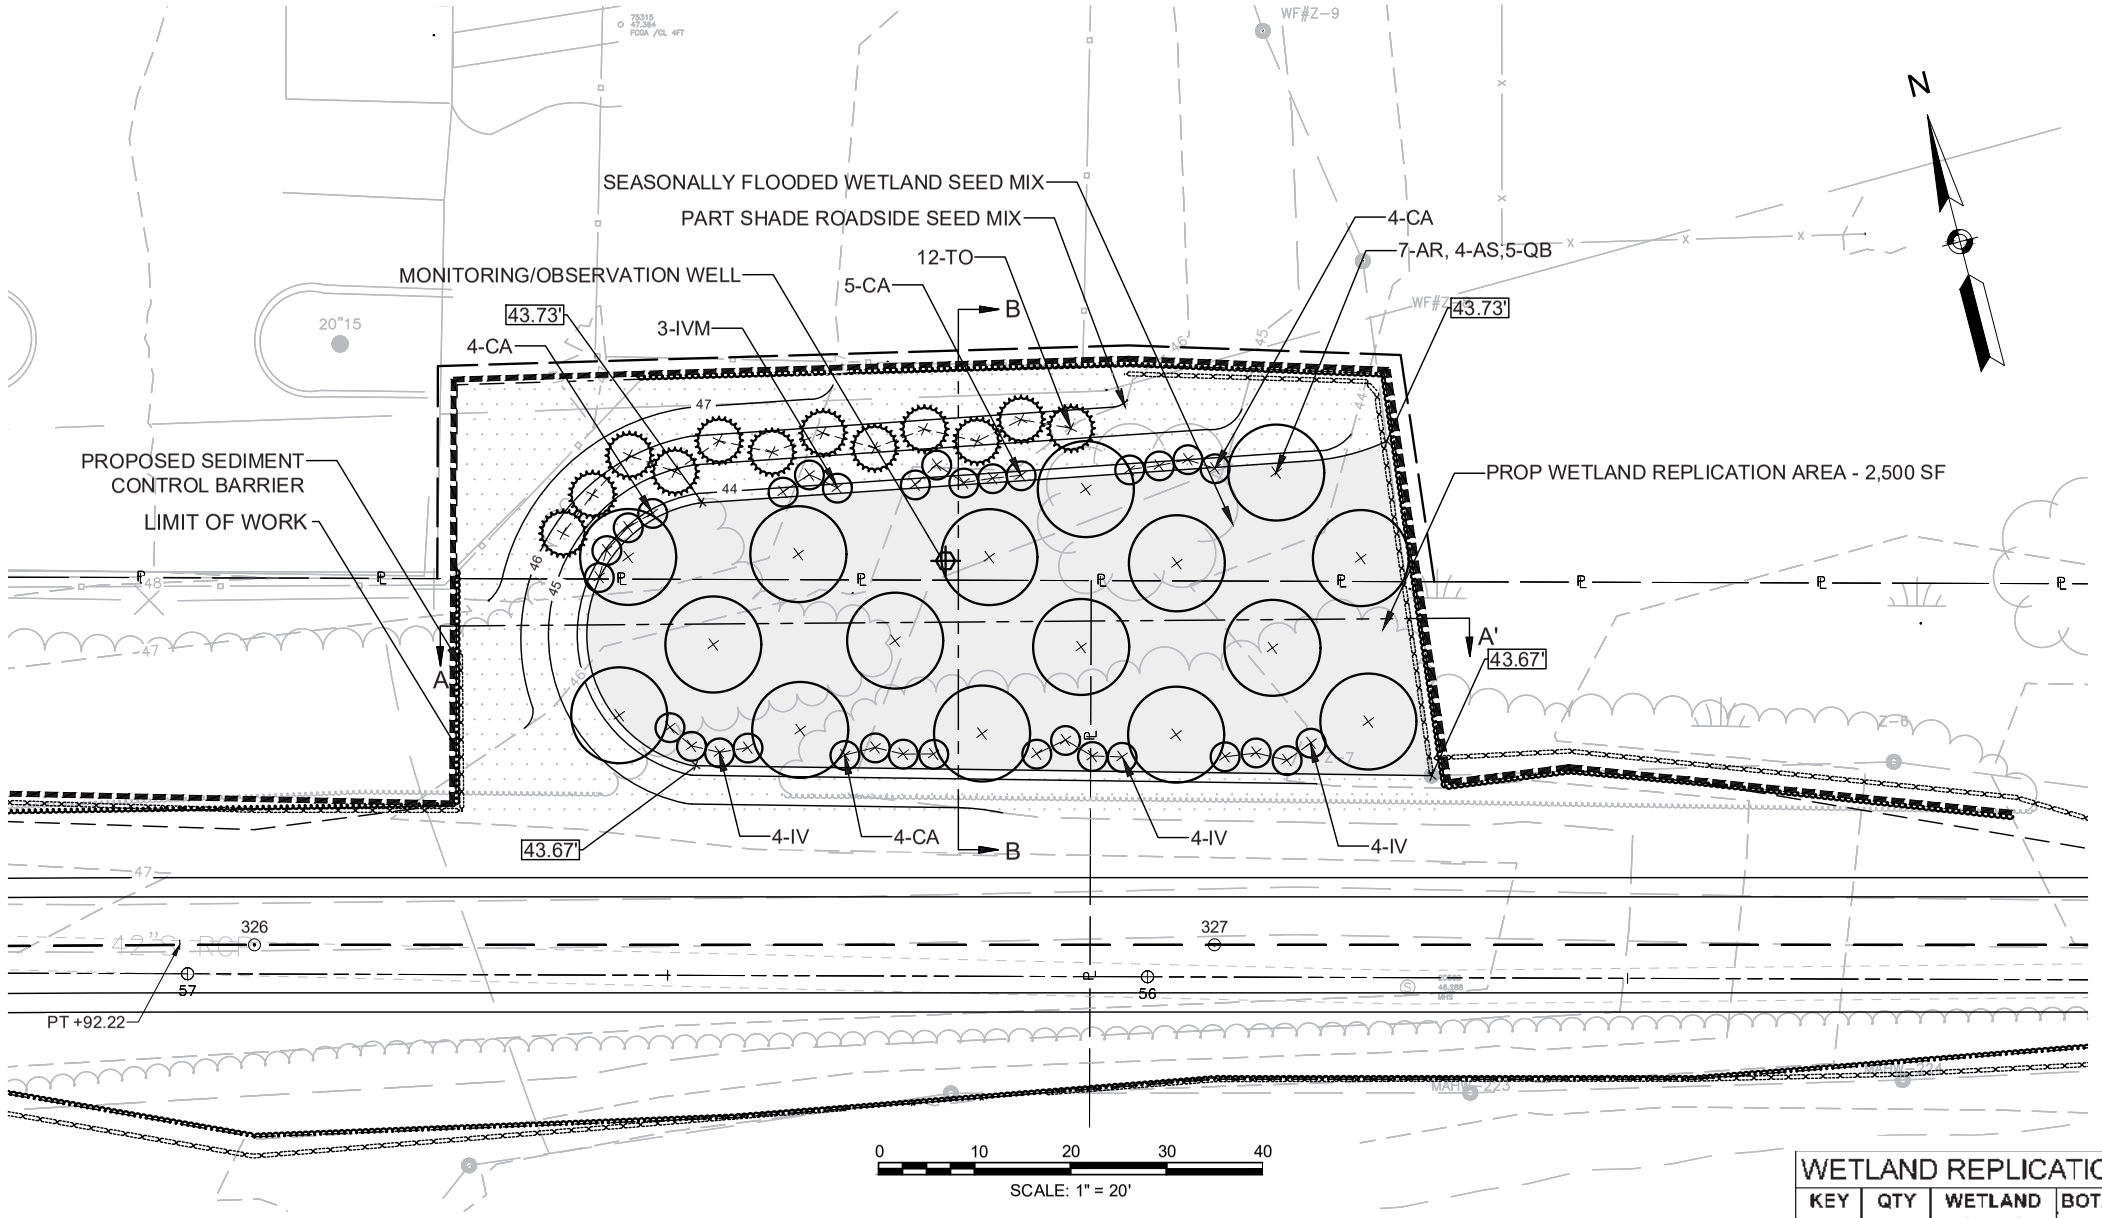
WETLAND REPLICATION PLAN



NOTES:

1. IMPACTS TO EXISTING TREES AND SOILS SHALL BE MINIMIZED TO THE EXTENT POSSIBLE.
2. CONTACT THE REPRESENTATIVE FROM MASSDOT LANDSCAPE DESIGN SECTION PRIOR TO THE START OF CONSTRUCTION. THE REPRESENTATIVE FOR THIS PROJECT IS MAXWELL R. MCNULTY MAXWELL.R.MCNULTY@DOT.STATE.MA.US.
3. FINAL GRADES TO BE TO MATCH ADJACENT WETLAND. MINOR ADJUSTMENTS IN FINAL GRADES SHALL BE MADE IN THE FIELD BY THE WETLAND SPECIALIST.
4. REPLICATION AREA SHALL BE EXCAVATED BELOW PROPOSED GRADES TO ALLOW FOR THE PLACEMENT OF WETLAND SOILS. THE DEPTH OF WETLAND SOILS SHALL BE 18" MAXIMUM AND SHALL MATCH THE DEPTH OF WETLAND SOIL IN THE ADJACENT WETLAND. DEPTH OF WETLAND SOIL SHALL BE DETERMINED BY THE WETLAND SPECIALIST. THE SALVAGED TOPSOIL MATERIAL AND B-HORIZON SUBSOIL MATERIAL EXCAVATED FROM THE WETLAND IMPACT AREAS SHALL BE PLACED IN SEPARATE STOCKPILES TO BE REUSED IN THE PROPOSED REPLICATION AREA IF SUITABLE.
5. REPLICATION AREA GRADES SHALL MATCH THE ELEVATIONS OF THE ABUTTING WETLAND TO MAINTAIN A HYDROLOGIC CONNECTION. WETLAND SPECIALIST SHALL INSPECT THE SUB-GRADE OF THE REPLICATION AREA TO ENSURE THAT THE PROPER HYDROLOGY HAS BEEN ESTABLISHED. MINOR MODIFICATIONS TO THIS GRADING PLAN MAY BE MADE IN THE FIELD BY THE QUALIFIED WETLAND SPECIALIST IN RESPONSE TO SUBSURFACE HYDROLOGIC CONDITIONS.
6. TREES AND SHRUBS IN THE REPLICATION AREA AND ADJACENT UPLAND AREA SHALL BE FIELD LOCATED BY THE WETLAND SPECIALIST.

PLANTING & SEEDING NOTES:

1. SEED SHALL BE MANUALLY BROADCAST. LIMITS SHOWN ARE APPROXIMATE. ACTUAL LIMITS SHALL BE AS DIRECTED BY THE WETLAND SPECIALIST.
