# ESS Laboratory Sample and Cooler Receipt Checklist

Client: CEC - Civil & Envtal Consultants - TB

Shipped/Delivered Via: ESS Courier

ESS Project ID: 24F0027
Date Received: 6/3/2024
Project Due Date: 6/10/2024
Days for Project: 5 Day

1. Air bill manifest present? No
   Air No.: NA
2. Were custody seals present? No
3. Is radiation count <100 CPM? Yes
4. Is a Cooler Present? Yes
   Temp: 3.4 Iced with: Ice
5. Was COC signed and dated by client? Yes
6. Does COC match bottles? Yes
7. Is COC complete and correct? Yes
8. Were samples received intact? Yes
9. **Were labs informed about short holds & rushes?** (Yes) / No / NA
10. Were any analyses received outside of hold time? Yes / (No)

11. Any Subcontracting needed? Yes / (No)
    ESS Sample IDs:
    Analysis:
    TAT:
12. Were VOAs received? (Yes) / No
    a. Air bubbles in aqueous VOAs? Yes / (No)
    b. Does methanol cover soil completely? (Yes) / No / NA
13. Are the samples properly preserved? (Yes) / No
    a. If metals preserved upon receipt: Date: Time: By/Acid Lot#:
    b. If dissolved metals are requested, are they: Yes / No Field Filtered
    c. Low Level VOA vials frozen: Date: N/A Time: N/A By: Client
       Yes / No To Be Lab Filtered

Sample Receiving Notes:

14. Was there a need to contact Project Manager? Yes / (No)
    a. Was there a need to contact the client? Yes / (No)
    Who was contacted? Date: Time: By:

Resolution:

| Sample Number | Container ID | Proper Container | Air Bubbles Present | Sufficient Volume | Container Type | Preservative | Record pH (Cyanide and 608 Pesticides) |
|---|---|---|---|---|---|---|---|
| 1 | 555646 | Yes | N/A | Yes | VOA Vial | MeOH | |
| 1 | 555647 | Yes | N/A | Yes | VOA Vial | DI Water | |
| 1 | 555648 | Yes | N/A | Yes | VOA Vial | DI Water | |
| 2 | 555638 | Yes | N/A | Yes | 4 oz. Jar | NP | |
| 2 | 555649 | Yes | N/A | Yes | 8 oz jar | NP | |
| 2 | 555650 | Yes | N/A | Yes | 8 oz jar | NP | |

**2nd Review**
**Were all containers scanned into storage/lab?** Initials BB (Yes / No)
Are barcode labels on correct containers? Yes / No / NA
Are all Flashpoint stickers attached/container ID # circled? Yes / No / NA
Are all Hex Chrome stickers attached? Yes / No / NA
Are all QC stickers attached? Yes / No / NA
Are VOA stickers attached if bubbles noted? Yes / No / NA

**ESS Laboratory Work Order Number: 24F0072**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

**REVIEWED**
**By ESS Laboratory at 4:23 pm, Jun 11, 2024**

**Analytical Summary**
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

## SAMPLE RECEIPT

The following samples were received on June 04, 2024 for the analyses specified on the enclosed Chain of Custody Record.

To achieve CAM compliance for MCP data, ESS Laboratory has reviewed all QA/QC Requirements and Performance Standards listed in each method. Holding times and preservation have also been reviewed. All CAM requirements have been performed and achieved unless noted in the project narrative.

Each method has been set-up in the laboratory to reach required MCP standards. The methods for aqueous VOA and Soil Methanol VOA have known limitations for certain analytes. The regulatory standards may not be achieved due to these limitations. In addition, for all methods, matrix interferences, dilutions, and %Solids may elevate method reporting limits above regulatory standards. ESS Laboratory can provide, upon request, a Limit Checker (regulatory standard comparison spreadsheet) electronic deliverable which will highlight these exceedances.

**Low Level VOA vials were frozen by ESS Laboratory on 6/04/24 at 16:13.**
**Tetrahydrofuran is reported above the MA CAM reporting limit of 0.010 mg/kg.**

**Question I: All samples for EPH and Metals were analyzed for a subset of the required MCP list per the client's request.**

|---|---|---|
| A | Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times? | Yes (x) No ( ) |
| B | Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed? | Yes (x) No ( ) |
| C | Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances? | Yes (x) No ( ) |
| D | Does the laboratory report comply with all the reporting requirements specified in the CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"? | Yes (x) No ( ) |
| E | VPH, EPH, APH and TO-15 only: a. Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications). | Yes (x) No ( ) |
| | b. APH and TO-15 Methods only: Was the complete analyte list reported for each method? | Yes ( ) No ( ) |
| F | Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)? | Yes (x) No ( ) |

***Responses to Questions G, H and I below are required for '"Presumptive Certainty" status***

| | | |
|---|---|---|
| G | Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocols(s)? ***Data User Note:** Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.* | Yes ( ) No (x)* |
| H | Were **all** QC performance standards specified in the CAM protocol(s) achieved? | Yes ( ) No (x)* |
| I | Were results reported for the complete analyte list specified in the selected CAM protocol(s)? | Yes ( ) No (x)* |

***All negative responses must be addressed in an attached laboratory narrative.***

***I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, accurate and complete.***

**Notes and Definitions**

| | |
|---|---|
| WL | Results obtained from a deionized water leach of the sample. |
| U | Analyte included in the analysis, but not detected |
| S+ | Surrogate recovery(ies) above upper control limit (S+). |
| RRF | Analyte does not meet the Relative Response Factor (RRF) criteria in the calibration |
| Q | Calibration required quadratic regression (Q). |
| EL | Elevated Method Reporting Limits due to sample matrix (EL). |
| D | Diluted. |
| CD- | Continuing Calibration %Diff/Drift is below control limit (CD-). |
| > | Greater than. |
| ND | Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |
| MDL | Method Detection Limit |
| MRL | Method Reporting Limit |
| LOD | Limit of Detection |
| LOQ | Limit of Quantitation |
| DL | Detection Limit |
| I/V | Initial Volume |
| F/V | Final Volume |
| § | Subcontracted analysis; see attached report |
| 1 | Range result excludes concentrations of surrogates and/or internal standards eluting in that range. |
| 2 | Range result excludes concentrations of target analytes eluting in that range. |
| 3 | Range result excludes the concentration of the C9-C10 aromatic range. |
| Avg | Results reported as a mathematical average. |
| NR | No Recovery |
| [CALC] | Calculated Analyte |
| SUB | Subcontracted analysis; see attached report |
| RL | Reporting Limit |
| EDL | Estimated Detection Limit |
| MF | Membrane Filtration |
| MPN | Most Probable Number |
| TNTC | Too numerous to Count |
| CFU | Colony Forming Units |

## ESS Laboratory Sample and Cooler Receipt Checklist

Client: CEC - Civil & Envtal Consultants - TB

Shipped/Delivered Via: ESS Courier

ESS Project ID: 24F0072
Date Received: 6/4/2024
Project Due Date: 6/11/2024
Days for Project: 5 Day

1. Air bill manifest present? No
   Air No.: NA
2. Were custody seals present? No
3. Is radiation count <100 CPM? Yes
4. Is a Cooler Present? Yes
   Temp: 3.5 Iced with: Ice
5. Was COC signed and dated by client? Yes
6. Does COC match bottles? Yes
7. Is COC complete and correct? Yes
8. Were samples received intact? Yes
9. **Were labs informed about short holds & rushes?** (Yes) / No / NA
10. Were any analyses received outside of hold time? Yes / (No)

11. Any Subcontracting needed? Yes / (No)
    ESS Sample IDs:
    Analysis:
    TAT:
12. Were VOAs received? (Yes) / No
    a. Air bubbles in aqueous VOAs? Yes / No
    b. Does methanol cover soil completely? (Yes) / No / NA
13. Are the samples properly preserved? (Yes) / No
    a. If metals preserved upon receipt: Date: Time: By/Acid Lot#:
    b. If dissolved metals are requested, are they: Yes / No Field Filtered Yes / No To Be Lab Filtered
    c. Low Level VOA vials frozen: Date: 6/4/24 Time: 1013 By: TO

Sample Receiving Notes:

14. Was there a need to contact Project Manager? Yes / (No)
    a. Was there a need to contact the client? Yes / (No)
    Who was contacted: Date: Time: By:

Resolution:

**RE: MassCEC Phase III - Site 4 (332-344)**
**ESS Laboratory Work Order Number: 24F0229**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

**REVIEWED**
**By ESS Laboratory at 5:08 pm, Jun 13, 2024**

**Analytical Summary**
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

## SAMPLE RECEIPT

The following samples were received on June 06, 2024 for the analyses specified on the enclosed Chain of Custody Record.

To achieve CAM compliance for MCP data, ESS Laboratory has reviewed all QA/QC Requirements and Performance Standards listed in each method. Holding times and preservation have also been reviewed. All CAM requirements have been performed and achieved unless noted in the project narrative.

Each method has been set-up in the laboratory to reach required MCP standards. The methods for aqueous VOA and Soil Methanol VOA have known limitations for certain analytes. The regulatory standards may not be achieved due to these limitations. In addition, for all methods, matrix interferences, dilutions, and %Solids may elevate method reporting limits above regulatory standards. ESS Laboratory can provide, upon request, a Limit Checker (regulatory standard comparison spreadsheet) electronic deliverable which will highlight these exceedances.

**Low Level VOA vials were frozen by ESS Laboratory on 6/06/24 at 17:23.**
**Tetrahydrofuran is reported above the MA CAM reporting limit of 0.010 mg/kg.**

**Question I: All samples for EPH and Metals were analyzed for a subset of the required MCP list per the client's request.**

**Notes and Definitions**

| | |
|---|---|
| X* | RSD of replicate analysis > 20%. Reanalysis produced similar results. |
| WL | Results obtained from a deionized water leach of the sample. |
| U | Analyte included in the analysis, but not detected |
| Q | Calibration required quadratic regression (Q). |
| EL | Elevated Method Reporting Limits due to sample matrix (EL). |
| D+ | Relative percent difference for duplicate is outside of criteria (D+). |
| D | Diluted. |
| CD+ | Continuing Calibration %Diff/Drift is above control limit (CD+). |
| CD- | Continuing Calibration %Diff/Drift is below control limit (CD-). |
| B- | Blank Spike recovery is below lower control limit (B-). |
| > | Greater than. |
| ND | Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |
| MDL | Method Detection Limit |
| MRL | Method Reporting Limit |
| LOD | Limit of Detection |
| LOQ | Limit of Quantitation |
| DL | Detection Limit |
| I/V | Initial Volume |
| F/V | Final Volume |
| § | Subcontracted analysis; see attached report |
| 1 | Range result excludes concentrations of surrogates and/or internal standards eluting in that range. |
| 2 | Range result excludes concentrations of target analytes eluting in that range. |
| 3 | Range result excludes the concentration of the C9-C10 aromatic range. |
| Avg | Results reported as a mathematical average. |
| NR | No Recovery |
| [CALC] | Calculated Analyte |
| SUB | Subcontracted analysis; see attached report |
| RL | Reporting Limit |
| EDL | Estimated Detection Limit |
| MF | Membrane Filtration |
| MPN | Most Probable Number |
| TNTC | Too numerous to Count |
| CFU | Colony Forming Units |

# ESS Laboratory Sample and Cooler Receipt Checklist

Client: CEC - Civil & Envtal Consultants - TB

Shipped/Delivered Via: ESS Courier

ESS Project ID: 24F0229
Date Received: 6/6/2024
Project Due Date: 6/13/2024
Days for Project: 5 Day

1. Air bill manifest present? No
   Air No.: NA
2. Were custody seals present? No
3. Is radiation count <100 CPM? Yes
4. Is a Cooler Present? Yes
   Temp: 3.7 Iced with: Ice
5. Was COC signed and dated by client? Yes
6. Does COC match bottles? Yes
7. Is COC complete and correct? Yes
8. Were samples received intact? Yes
9. **Were labs informed about short holds & rushes?** (Yes) / No / NA
10. Were any analyses received outside of hold time? Yes / (No)

11. Any Subcontracting needed? Yes / (No)
    ESS Sample IDs:
    Analysis:
    TAT:
12. Were VOAs received? (Yes) / No
    a. Air bubbles in aqueous VOAs? Yes / (No)
    b. Does methanol cover soil completely? (Yes) / No / NA
13. Are the samples properly preserved? (Yes) / No
    a. If metals preserved upon receipt: Date: _____ Time: _____ By/Acid Lot#: _____
    b. If dissolved metals are requested, are they: Yes / No Field Filtered
    c. Low Level VOA vials frozen: Date: 6/6/24 Yes / No To Be Lab Filtered Time: 1723 By: TD

Sample Receiving Notes:

14. Was there a need to contact Project Manager? Yes / (No)
    a. Was there a need to contact the client? Yes / (No)
    Who was contacted: _____ Date: _____ Time: _____ By: _____

Resolution:

| Sample Number | Container ID | Proper Container | Air Bubbles Present | Sufficient Volume | Container Type | Preservative | Record pH (Cyanide and 608 Pesticides) |
|---|---|---|---|---|---|---|---|

**RE: Shuster Bulkhead Improvements (332.344)**
**ESS Laboratory Work Order Number: 24F1174**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

**REVIEWED**
**By ESS Laboratory at 8:42 pm, Jul 08, 2024**

**Analytical Summary**
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

## CURRENT SW-846 METHODOLOGY VERSIONS

### Analytical Methods

1010A - Flashpoint
6010D - ICP
6020B - ICP MS
7010 - Graphite Furnace
7196A - Hexavalent Chromium
7470A - Aqueous Mercury
7471B - Solid Mercury
8011 - EDB/DBCP/TCP
8015C - GRO/DRO
8081B - Pesticides
8082A - PCB
8100M - TPH
8151A - Herbicides
8260D - VOA
8270E - SVOA
8270E SIM - SVOA Low Level
9014 - Cyanide
9038 - Sulfate
9040C - Aqueous pH
9045D - Solid pH (Corrosivity)
9050A - Specific Conductance
9056A - Anions (IC)
9060A - TOC
9095B - Paint Filter
MADEP 19-2.1 - EPH
MADEP 18-2.1 - VPH

### Prep Methods

3005A - Aqueous ICP Digestion
3020A - Aqueous Graphite Furnace / ICP MS Digestion
3050B - Solid ICP / Graphite Furnace / ICP MS Digestion
3060A - Solid Hexavalent Chromium Digestion
3510C - Separatory Funnel Extraction
3520C - Liquid / Liquid Extraction
3540C - Manual Soxhlet Extraction
3546 - Microwave Extraction
3580A - Waste Dilution
5030B - Aqueous Purge and Trap
5030C - Aqueous Purge and Trap
5035A - Solid Purge and Trap

SW846 Reactivity Methods 7.3.3.2 (Reactive Cyanide) and 7.3.4.1 (Reactive Sulfide) have been withdrawn by EPA. These methods are reported per client request and are not NELAP accredited.

# 1.0 INTRODUCTION

Civil & Environmental Consultants, Inc. (CEC) has prepared this Soil Management Plan (SMP) to address earthwork activities related to the redevelopment of the properties associated with the New Bedford Marine Commerce Terminal (NBMCT) in New Bedford, Massachusetts (the Property). A Locus Map and a Site Overview map, and AUL Overview map are provided as Figures 1 through 3, respectively. This Soil Management Plan was prepared on behalf of the Massachusetts Clean Energy Technology Center of Boston, Massachusetts (MassCEC) and is intended to broadly apply to construction activities that are conducted by or on behalf of MassCEC on the Property.

## 1.1 PURPOSE

The purpose of this SMP is to present the planned procedures for the handling, managing, and relocation of soil during earthwork activities associated with the construction project. The specific objectives of the SMP are to:

- Describe general Site-wide excavation/earthwork activities and activities where the excavation extends into potentially OHM-impacted soils and/or fill material;
- Describe the on-Site re-use of soil/fill during the earthwork;
- Describe general site controls and soil erosion mitigation procedures.
- Describe the segregation of soil and stockpiling procedures;
- Describe the procedures for off-Site transport and disposal, reuse, or recycling of soils; and
- Describe the controls for dust, odor, and vapor mitigation and monitoring.

This SMP is applicable to two distinct types of soil; 1) General fill (dense grade aggregate, granular fill, etc..) that has been imported onto the Disposal Site(s) are part of the protective cap and/or as an improved surface and 2) Urban fill and native soils which may include ash, peat, sand, debris and may contain contaminants such as polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), or metals.

## 1.2 ROLES AND RESPONSIBILITIES

MassCEC is responsible for implementation of projects at the Property conducted under this SMP. the earthwork will be performed by a qualified contractor (the Contractor) and environmental services will be provided by a Licensed Site Professional (LSP). The following identifies the typical roles and responsibilities of each organization involved in the proposed earthwork. However, some responsibilities may vary based upon the specific project:

DRAFT

- The Contractor will typically perform all earthwork activities, including excavation; soil management; off-Site transportation and appropriate disposal, re-use, or recycling of any materials not to be re-used on-Site; and, import/placement of fill/backfill required to achieve necessary grades for the project.

- The Contractor will typically be prepared and responsible for enacting mitigating measures of dust, odor, and vapor suppression as appropriate and in accordance with section 4.0 of this SMP.

- The LSP will prepare a Health and Safety Plan (HASP) for its employees, as required by 310 CMR 40.0871(e). The Contractor is typically responsible for their own employee's health and safety and for conformance with Occupational Health and Safety Administration (OSHA) standards and regulations.

- The LSP's firm will typically provide environmental consulting services including LSP services, as necessary, related to the earthwork activities.

- MassCEC or the Contractor will inform the LSP of any new (currently undetected), or significantly different circumstances relating to soil conditions and/or potential contamination discovered during the performance of the work.

With the existence of known reportable conditions within Disposal Site Boundaries and as defined in the Massachusetts Contingency Plan, 310 CMR 40.0000 (the MCP), handling of the soils located on the Property requires best management practices (BMPs) to ensure that a condition of significant risk is not created as a result of the earthwork activities. Reportable conditions existing on the Property include OHM-impacted materials at the expansion parcels and OHM-impacted materials underlying the existing imported protective cap within the NBMCT.

DRAFT

## 2.0 SITE AND SURROUNDING AREA DESCRIPTION

The NBMCT is situated within an industrial area along the coast of New Bedford, Massachusetts. The NBMCT is comprised of a 30-acre facility between JFK Memorial Highway and the New Bedford Harbor and ~8 acres of recently acquired commercial property that is proposed to be a redeveloped as part of an expanded facility (expansion Sites); The 30-acre facility is predominately structurally undeveloped but includes an approximately 27,500 square foot single story building on 4 Wright Street. The existing main terminal portion of the NBMCT is subject to multiple Activity and Use Limitations (AULs. The Property includes the following sites with the associated Release Tracking Numbers (RTNs) listed if applicable:

**Shuster Property (former RIST, LLC)**
Address: Front Street
Parcel ID/Lot Size: 31- 288 / ~7.74 acres
Current Owner: MassCEC
RTN: 4-23736
Compliance Status/Date: Tier1D / 12/27/2012

**Shuster "Jog"**
Address: South of Wright Street
Parcel ID/Lot Size: 31- 289 / ~0.39 acres
Current Owner: MassCEC
It is unclear if this is part of any mapped Disposal Site, but CEC understands it will be covered by a pending Permanent Solution Statement (PSS) and AUL.

**New Bedford Radio, Inc., (Hall Comm)**
Address: South Front Street Lot 1 & 2
Parcel ID / Lot Size: 31-234 (~4.17 acres) / 31- 291 (~0.23 acres)
Current Owners: MassCEC / NB Radio, Inc.
RTN: 4-25350
Compliance Status/Date: Tier1D / 10/08/2015

**(Former) DMF Parcel 1**
Address: North of 16 Blackmer Street
Parcel ID/Lot Size: 25A-53 / ~1.2 acres
Current Owner: City of New Bedford
RTN: 4-24296
Compliance Status/Date: Tier1D / 12/03/2013

DRAFT

**DMF Parcel 2**
Address: 16 Blackmer Street
Parcel ID/Lot Size: 25A-49 / ~2.2 acres
Current Owner: City of New Bedford
RTN: 4-15490
Compliance Status/Date: RAO (i.e. a Permanent Solution was achieved) / 3/27/2009

**New Bedford Redevelopment Authority**
Address: Southeast Blackmer Street
Parcel ID/Lot Size: 25A- 48 / ~9.23 acres
Current Owner: City of New Bedford
It is unclear if this is part of any mapped Disposal Site, but CEC understands it will be covered by a pending Permanent Solution Statement (PSS) and AUL.

**Former Dartmouth Finishing Site**
Address: 45 Cove Street
Parcel ID/Lot Size: 21- 45 / ~4.3 acres
Current Owner: City of New Bedford
RTN: 4-23616
Compliance Status/Date: Tier Classified / 10/03/2012

**Expansion Site 1**
Addresses: 54 Wright Street & 18 Wright Street
Parcel ID/Lot Size: 31-265 & 31-249 / ~2.1 acres
Current Owner: MassCEC
RTN 4-50261
Compliance Status/Date: 120-day notification / 5/24/2024 & 1/17/2025

**Expansion Site 2**
Addresses: 350 South Front Street /0 SS MacArthur Boulevard & 360-382 South Front Street
Parcel ID/Lot Size: 31-218 & 31-237 & 31-144 / ~2.15 acres
Current Owner: MassCEC
RTN 4-50261
Compliance Status/Date: 120-day notification / 5/24/2024 & 1/17/2025

DRAFT

**Expansion Site 3**
Addresses: 4 Wright Street /portion of R ES South Front Street
Parcel ID/Lot Size: 31- 263 & 31-288 / ~2.2 acres
Current Owner: MassCEC
RTN 4-50261
Compliance Status/Date: 120-day notification / 5/24/2024 & 1/17/2025

The Property structures include the following:

| Property | Approximate Building Size (square feet) | Structure |
|---|---|---|
| 4 Wright Street | 27,500 | Single-story concrete building |
| 18 Wright Street | 10,000 | Single-story metal building |
| 54 Wright Street | 3,750 | Commercial warehouse |
| 350 South Front Street & 0 SS Macarthur Boulevard | 6,400 | Single-story metal building |
| 360-382 South Front Street | 21,500 | Single-story metal building |

Currently, greater than 21-acres of the NBMCT have been engineered and constructed to accommodate a heavy-lift capacity and consists of a surficial dense grade aggregate pavement. Adjacent properties primarily include seafood and seafood related commercial properties. Additionally, there are abutting commercial retailers to the 45 Cove Street property.

## 2.1 SITE HISTORY

Historically, situated within the footprint of Shuster and DMF parcels was the former Potomska Mills complex which operated from the late 1800s until it was demolished in 1936. Since the early 1940s, these parcels have been vacant of industrial activities and remain structurally undeveloped lots.

The Former Dartmouth Finishing Site was the location of a fabric finishing and dyeing business that discontinued operations after its bankruptcy in 1994. Prior to the Dartmouth Finishing companies' occupancy included The Hathaway Manufacturing Company (textiles) in the 1950s; and Dartmouth Mills (textiles) in the early 1900s. The property was structurally improved upon with a 120,000 square foot single-story building that was demolished between 1999 and 2001. Also on the property were two underground storage tanks (USTs). The USTs are associated with an RTN (4-23616) and were removed in 2004 as part of remedial actions.

DRAFT

54 Wright Street (Site 1) was historically occupied by a boat builder and for the storage of fisherman's lockers between 1888 and 1950. The current building at the property was erected around 1978 for use as a shop for auto repairs and marine electronics.

18 Wright Street (Site 1) was undeveloped prior to 1950, then historically used for the storage of fisherman's lockers as of 1950. The current building at the property was erected around 1984 for use as a fish processing plant.

350 South Front Street (Site 2) was historically occupied by Potomska Mill beginning in 1888 through 1936 when it was demolished. A building was originally erected at the property around 1950 for use as a fish processing facility, followed by the re-development of the property in 1996 with the existing building for use by fish processing companies.

360-382 South Front Street (Site 2) was historically occupied by Potomska Mill beginning in 1888 through 1936 when it was demolished. The property remained undeveloped until approximately 2000 when the current building was erected for use as a fish processing facility.

Sites 1 through 3 and the surrounding area was located near or in the Acushnet River until it was filled in the 1960s and 1970s. The United States Environmental Protection Agency (USEPA) has been and continues to assess and remediate the Acushnet Estuary Superfund Site which encompasses the river and estuaries is impacted with PCBs and metals. The source of the fill material used to create the land at the Subject Property and surrounding area is unknown, nor if the sediment in the river was removed prior to emplacing the fill material.

## 2.2 RELEASE HISTORY

**Shuster Property (former RIST, LLC)**
**RTN: 4-23736**

In August 2011, a subsurface and groundwater investigation was conducted that included soil borings and monitoring well installation, test pit excavation, and soil and groundwater sampling. Contaminants were detected in soils above reportable concentrations (RCS-2) identified in the MCP (310 CMR 40.1600) that included:

- PCBs;
- total lead;
- total petroleum hydrocarbons (TPH);
- extractable petroleum hydrocarbons (EPH) fractions;
- polycyclic aromatic hydrocarbons (PAH); and
- volatile petroleum hydrocarbon (VPH) fractions and several target volatile organic compounds (VOC).

DRAFT

Naphthalene was also detected in groundwater above the applicable MassDEP reportable concentration (RCGW-2).

An initial RAM Plan was submitted to MassDEP on July 3, 2013 that outlined RAM activities associated with the improvements to the main terminal on this parcel. Construction activities occurring under the RAM Plan included soils management and excavation. Excavated OHM-impacted soils were removed to off-site facilities if PCB concentrations were greater than 50 parts per million (ppm) and/or if EPH/TPH concentrations were greater than 10,000 ppm. A protective cap of clean dense grade aggregate was installed to a depth of three feet as an acceptable alternative to an asphalt cap. As discussed above, the status of this Disposal Site is currently on record with MassDEP as a Tier 1D, but it is CEC's understanding that the Disposal Site is considered adequately regulated (Exhibit A).

**New Bedford Radio, Inc., (Hall Comm)**
**RTN: 4-25350**

Extensive surficial soil sampling was completed on this parcel and involved over 1,000 surficial soil samples. Additionally, in January 2014 eight test pits were excavated and six soil borings were advanced. Test pits were advanced to a depth of 6 feet below grade surface (bgs) and soil borings were advanced to 11 feet bgs.

A release was reported to MassDEP on October 1, 2014, due to exceedances of MCP RCS-2 values for the following contaminants:

- PCB;
- lead;
- naphthalene; and
- cadmium.

A RAM Plan was filed on October 20, 2014, related to the New Bedford Marine Commerce Terminal (NBMCT) construction activities that required soils management within the Disposal Site for off-site disposal and onsite reuse. PCB-impacted soils with concentrations greater than 50 ppm were sent to off-site facilities for disposal. A protective cap of clean dense grade aggregate was installed to a depth of three feet as an acceptable alternative to an asphalt cap

A RAM Status Report was filed with MassDEP on May 17, 2016, and an AUL was filed for this Disposal Site on September 16, 2019. The AUL applies to both "Lot 1" and "Lot 2" of Map 31 parcels 234 and 291. The AUL conditions for each of these parcels vary. As discussed above, the status of this Disposal Site is currently on record with MassDEP as a Tier 1D, but it is CEC's understanding that the Disposal Site is considered adequately regulated (Exhibit A).

DRAFT

**DMF Parcel 1**
**RTN: 4-24296**

A release was reported to MassDEP in November 2012 after Phase I investigations performed for the NBMCT identified PCB concentrations in soils greater than applicable RCS-2 standard.

The initial RAM Plan submitted to MassDEP on July 3, 2013, outlined RAM activities for the Shuster Property and three abutting RTNs, including DMF Parcels 1 and 2 and the Former Dartmouth Finishing Site. Construction activities occurring under the RAM plan included soils management and soils excavation. Excavated OHM-impacted soils were removed to offsite facilities if PCB concentrations were greater than 50 ppm and/or if EPH/TPH concentrations were greater than 10,000 ppm. A protective cap of clean dense grade aggregate was installed to a depth of three feet as an acceptable alternative to an asphalt cap. As discussed above, the status of this Disposal Site is currently on record with MassDEP as a Tier 1D, but it is CEC's understanding that the Disposal Site is considered adequately regulated (Exhibit A).

**DMF Parcel 2**
**RTN: 4-15490**

Phase I investigations in January 2000, were limited in scope to the perceived high-risk areas and the Disposal Site assessment included several test pits, discrete soil sampling locations, and installation and sampling of one groundwater monitoring well. There were observed exceedances within soils of MCP RCS-1/RCS-2 criteria for PAHs and lead.

Phase II investigations in May 2006 were performed to verify and delineate the presence of contaminants in soil and groundwater identified in the Phase I investigations. Soil samples were assessed from three borings and six test pits. Borings were advanced to a depth of 2.5 feet bgs and the test pits were sampled in intervals at 0-3 feet bgs and 3–6 feet bgs. Consistent with the results of the Phase I investigations, exceedances of the MCP RCS-1/RCS-2 criteria for PAHs and lead were observed in soil samples collected across the Disposal Site as part of the Phase II investigation.

In 2009, a Method 3 Risk Characterization was completed and a Class A-3 Response Action Outcome (RAO) Statement was submitted. The RAO concluded that an asphalt cap and an AUL would be necessary to ensure soil exposure pathways remained incomplete. The AUL was filed February 3, 2010.

RAM activities performed in 2013 included the removal of OHM-impacted soils and the installation of an acceptable protective cap in areas where the existing asphalt cap would be replaced. Three feet of dense grade aggregate was installed as an acceptable and protective

DRAFT

alternative to the asphalt cap. A SMP was prepared as part of the prior RAM plan. This current SMP is intended as an alternative SMP that can be utilized on any portion of the Property.

A Permanent Solution has been achieved for this Disposal Site.

**Former Dartmouth Finishing Site**
**RTN: 4-23616**

A subsurface investigation in August 2004 included the removal of two 10,000-gallon Underground Storage Tanks (USTs) and approximately 80 cubic yards of petroleum-impacted soil. Petroleum odors and staining were reportedly confined to the northeast portion of each tank footprint.

In October 2011, Phase II investigations identified contaminant concentrations both in soil and groundwater that were greater than the applicable RCS-1/RCGW-2 concentrations. Contaminant concentrations that exceeded the RCS-1 standard included:

- EPH fractions;
- VPH fractions;
- PAHs;
- barium, cadmium, total chromium, and lead.

Dissolved silver was also detected in four monitoring wells greater than the RCGW-2 standard.

A Tier Classification was submitted on October 3, 2012 which classified the site as Tier II.

The initial RAM Plan submitted to MassDEP on July 3, 2013 outlined RAM activities for the Shuster Property and three abutting RTNs including the Former Dartmouth Finishing Site. Construction activities occurring under the RAM Plan included soils management and soils excavation. Excavated OHM-impacted soils were removed (76 tons) to offsite facilities if PCB concentrations were greater than 50 ppm and/or if EPH/TPH concentrations were greater than 10,000 ppm. A protective cap of clean dense grade aggregate (approximately one foot thick) and imported dredge materials (approximately two feet thick) were installed to a depth of three feet as an acceptable alternative to an asphalt cap.

A RAM Completion Report was filed in November of 2015 and an AUL was recorded on April 14, 2016 for this Disposal Site.

DRAFT

**Expansion Sites 1, 2, & 3**
**RTN: 4-50261**

Beginning in November 2023, an initial subsurface investigation was conducted at these Sites after the completion of multiple ASTM Phase I Environmental Site Assessments (ESAs). The subsurface investigation included soil borings across all the Sites with hundreds of samples submitted for various parameters. A release was reported to MassDEP in May 2024 and again in January 2025 for contaminants that were detected in soils above reportable concentrations (RCS-1 and/or RCS-2 depending upon location) identified in the MCP (310 CMR 40.1600) which included:

- PCBs;
- total lead;
- semi-volatile organic compounds (SVOCs);
- volatile petroleum hydrocarbon (VPH) fractions; and
- extractable petroleum hydrocarbons (EPH) fractions.

Additionally, concentrations of PCBs were detected on the Property triggering the Toxic Substances Control Act (TSCA), the regulations for which are listed in Title 40 of the Code of Federal Regulations (CFR) Part 761 (40 CFR Part 761).

An initial RAM plan will be submitted in early 2025, concurrent with this SMP, and will outline RAM activities associated with the expansion of the main terminal at these Sites. The construction will occur in phases between 2025 and 2027, beginning with Site 1. Construction activities occurring under this RAM Plan will include site preparation and demolition, fencing installation, water and electric utility installation, drainage utility installation, installation of foundations for lighting, and any associated excavation of subgrade soils within the Property. Excavated OHM-impacted soils will be removed to off-site facilities if PCB concentrations are greater than 25 milligrams per kilogram (mg/kg). As part of the NBMCT Terminal Expansion, a heavy lift "cap" or surface, similar to the current engineered barrier, is proposed for portions of the Property. The proposed "cap" will consist of two layers of geogrid and select gravel fill, totaling a thickness of approximately 18".

## 2.3 SUBSURFACE CONDITIONS

Based on historical subsurface investigations, generally the top 6 feet of subsurface (prior to capping) consisted of fine to medium sandy fill. Ash, brick, and other debris defined by the MassDEP as "urban fill" have been observed throughout the existing NBMCT at different intervals in both test pits and borings (Exhibit D). A layer of organic soils or peat, likely the native ground surface, has been observed at approximately 3-4 feet bgs, underlying imported fill materials. Post-excavation activities across the existing NBMCT have involved importing dense grade aggregate

DRAFT

and granular fill materials to create a protective cap that limits exposure to potentially OHM-impacted soils and provides an engineered surface for heavy lifting. The thickness of the cap is approximately three-feet across much of the NBMCT. The average groundwater elevation throughout the NBMCT is approximately 5-6 feet bgs, with groundwater elevations ranging from 7-8 feet bgs to as shallow as 3.5 feet bgs.

At the expansion Sites, and based on subsurface investigations completed at these Sites, the top 6 feet of subsurface soils consisted of fine to medium sandy fill. Ash, brick, and other debris defined by the MassDEP as "urban fill" have been observed throughout the parcels at different intervals in the soil borings. A layer of organic soils or peat, likely the native ground surface, has been observed at approximately 8-12 feet bgs, underlying the fill materials, primarily at Site 1. Groundwater was not investigated at this property; however, groundwater elevations are estimated to be similar to the existing NBMCT, ranging from 7-8 feet bgs to as shallow as 3.5 feet bgs.

## 2.4 TYPE OF HAZARD ANTICIPATED

Site workers could potentially be exposed to soils contaminated with volatile petroleum hydrocarbons (VPH), extractable petroleum hydrocarbons (EPH), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), lead, and other metals. The primary hazard will be exposure to soil via inhalation, direct/dermal contact, or incidental ingestion of dust generated during soil management activities.

DRAFT

# 3.0 SOIL MANAGEMENT

## 3.1 OVERVIEW

Impacted soil and fill materials are present at the Property within the boundaries of various Disposal Sites (see Exhibit B). Individuals engaged in activities at the Property may be exposed to contaminants through incidental ingestion, dermal contact, or inhalation of soil particles if proper precautions are not taken. Due to the potential to encounter waste materials, CEC recommends the appropriate level of training per OSHA and industry standards.

Regardless of the soil type, the following procedures will be performed when soils are disturbed to minimize or eliminate the potential of exposure.

- During soil disturbance activity, dust suppression (i.e. watering, etc.) techniques must be employed as necessary.

- In the event that an unexpected observation or situation arises during work (i.e. encounter buried drums, metals/construction debris, contaminated soil, etc.), earthwork activities will immediately stop. Workers will not attempt to handle the situation themselves but will contact the appropriate supervisor/personnel for further direction.

- Soil that is exposed or excavated is anticipated to be re-used within the Disposal Site Boundary of origin.

- If soil is encountered that is not structurally suitable for reuse on the Property, it should be characterized through sampling and laboratory analysis to determine the appropriate management of the soil. Soil should not transfer between Disposal Site Boundaries or removed from the Property unless, based on additional characterization, an LSP deems it suitable for a specific on-site reuse or off-Site reuse, recycling or disposal at an appropriately permitted location.

- Significant volumes of groundwater are not expected to enter excavations and/or require management. The management of groundwater is outside of the scope of this document. If dewatering is required, a groundwater management plan should be developed.

- All regrading at the property shall be reviewed to ensure that it maintains the adequate thickness of the protective cap.

- All work shall conform with the attached AUL(s) (Exhibit C).

DRAFT

## 3.2 EXCAVATED MATERIAL CATEGORIES

CEC has developed the following categories to distinguish the soils to be managed under this SMP.

Category A (General fill suitable for reuse): The soil/fill material that is located on the Property that is assumed to be ***suitable*** for reuse on the Property as part of the construction project. An example of this type of material would be dense grade aggregate originating from a depth of less than 3 feet below grade.

Category B (General fill not suitable for reuse): The soil/fill material that is located on the Property outside of a Disposal Site Boundary and that is assumed *unsuitable* for reuse on the Property as part of the construction project. This is typically soil that is unsuitable for reuse from a geotechnical perspective, but this soil may also contain contaminants and should be assumed to contain contaminants until laboratory testing proves otherwise. An example of this type of material would be organic soils from portion of 80 Wright Street outside of any Disposal Site area.

Category C: OHM-impacted soil that is located within a Disposal Site Boundary on the Property that has been analyzed and determined to be ***unsuitable*** for reuse on the Property as part of the construction project. This soil may be unsuitable for reuse either due to geotechnical characteristics or concentrations of OHM-related contaminants. This soil will require management under a RAM Plan.

## 3.3 TEMPORARY STOCKPILING OF SOIL

The Contractor should perform the excavation and soil management activities in a manner that minimizes the need to stockpile excavated soil on the Property, to the extent feasible.

In general, Category B and C excavated materials stockpiles should not exceed 500 cubic yards, shall be located at least 100 feet from any wetlands or other tributaries, and shall be surrounded by appropriate siltation controls to prevent potential run-off. Larger stockpiles may be approved after consultation with the LSP-of-record. The stockpile shall not be placed on or directly upgradient of any drainage catch-basins, manholes, drainage swales, or other potential discharge pathways. The siltation control measures shall be secured at all times and shall be adequately monitored until the soil is removed from the Site and transported to at an approved facility. Category B and C soil shall be stockpiled on a minimum of two (2) layers of 6-mil polyethylene sheeting and covered with a minimum of one (1) layer of 6-mil polyethylene sheeting at the end of the workday. No regulated soils will be stockpiled on-Site for greater than 120 days without prior approval from the LSP-of -Record.

DRAFT

The following are the stockpiling procedures for each soil Category:

- Category A: This category broadly includes previously imported fill materials comprising the installed protective cap. This material should not be removed from the Property without consultation with an LSP. Stockpiles of this material may exceed 500 cubic yards and no polyethene sheeting is required to encapsulate the stockpile.

- Category B: This soil is not regulated under the MCP so long as it remains on-site but is intended for potential off-site disposal/reuse due to some other factor. This soil requires proper management to ensure that a reportable condition, as defined in the MCP, is not created. This soil may include urban fill, ash, peat, and sand. Any of this soil that is stockpiled shall be covered with 6-mil poly at the end of each day and remain covered until it has been properly characterized for disposal parameters. This material should not be removed from the Property without consultation with an LSP.

- Category C: This soil is regulated under the MCP and requires proper management. This is the soil that originates within a Disposal Site boundary and may be subject an AUL. This soil may not be reused at another Disposal Site on the Property without characterization and not within three feet of a final grade. Any of this soil that is stockpiled shall be covered with 6-mil poly at the end of each day and remain covered until it has been properly characterized for disposal parameters. This material should not be removed from the Property or reused without consultation with an LSP.

### 3.4 Field Screening

Soil being excavated from within a Disposal Site Boundary on the Property should be screened utilizing a photoionization detector (PID) for total organic vapors (TOVs). The PID should be calibrated to an isobutylene standard, and the frequency of screening should be no less than 1 sample for every 50 cubic yards of soil. Soil exhibiting PID readings of greater than or equal to 5 parts per million by volume (ppmv), and/or exhibiting visual or olfactory signs of contamination (staining/odors), should be segregated and should not be reused on the Property.

Soils will also be visually screened for other evidence of contamination (staining, sheens, free product).

In the event that excavated or sampled material has visible stains or unnatural odor, or if potentially contaminated and/or hazardous material is encountered, work will be stopped until the LSP and/or LSP representative has been notified.

DRAFT

## 3.5 SOIL CHARACTERIZATION

Should it be determined that any soils from the Property (regardless of disposal category) are to be removed from the Property, the soil must be characterized for disposal by collecting representative soil samples. The soil will be sampled and analyzed under the direction of the LSP. The sampling procedures and analytical parameters will be based upon the requirements of the facility to which it will be transported to for reuse, recycling, treatment and/or disposed. The number of samples and analyses will depend on the facility. The soil samples will be placed in the appropriate glassware with preservative (if applicable) and then submitted to a laboratory, on ice and under a chain of custody for analyses. The selected facility shall be contacted prior to characterizing the soil to ensure the adequate number of samples are collected and the appropriate analyses are performed.

Soil characterization samples may be collected and screened from excavated stockpiles or in-situ. Sample depth intervals and location(s) will be included in the field notes. A minimum of five representative grab samples may be composited for appropriate analyses. However, volatile organic compounds (VOCs) will be grab samples and taken from biased-high soils exhibited from field screening results using a PID. Stockpile characterization samples will be typically collected for at least every 500 cubic yards of excavated materials designated for off-site disposal or Category B soil designated for reuse. However, the sampling frequency may be adjusted by the LSP, based upon professional judgement, regulatory guidance, and the requirements of the disposal facility.

Soil characterization methodology will require the samples will be a minimum 5-point composite and the top 12-inches of the sampling location will be removed prior to sampling. Waste characterization samples may be analyzed for total petroleum hydrocarbons (TPH), VOCs, semi-volatile VOCs (SVOCs), polycyclic aromatic hydrocarbons (PAHs), conductivity, flashpoint, pH, reactive sulfide, reactive cyanide, polychlorinated biphenyls (PCBs), and/or Resource Conservation and Recovery Act (RCRA) 8 metals with/without toxicity characteristic leaching procedure (TCLP) analysis to accommodate analytical disposal criteria of the utilized offsite facilities.

DRAFT

## 4.0 DUST, ODOR, VAPOR CONTROLS

Significant odors, vapors, and/or dust are not anticipated. The Contractor will be responsible for evaluating conditions at the Property during soil management activity. The LSP may not be continuously present during soil management, but the LSP and/or his designee will conduct periodic inspections throughout the duration of the work.

During the construction activities, evaluation will be performed to identify conditions where dust becomes visible at the perimeter of the area of work. Throughout the duration of the work, dust control shall be performed as necessary to ensure that no visible or nuisance dust is allowed to migrate from the work area, areas of exposed soils, and/or stockpiles. Dust monitoring will consist of visual monitoring on an on-going basis. If dust is generated by the excavation activities and dust control is warranted, it will consist of spraying water, wetting the soils and/or the excavator bucket, or other feasible means. Spraying shall not introduce excessive moisture to the soils or produce runoff. Water supplied will be free of any contaminants. For excavation of soils with known concentrations of PCBs, the LSP should be consulted to determine if quantitative dust monitoring is required.

If these mitigating actions are inadequate to control airborne particulates, alternative control measure will be evaluated by the LSP and/or LSP's representative for implementation across the Property.

DRAFT

## 5.0 DECONTAMINATION

Prior to exiting the Property, vehicles and equipment will be brushed of visible soils and tires will be adequately cleaned to prevent tracking materials offsite, where appropriate.

Additional decontamination efforts at the Property may be deemed necessary by the LSP and/or LSP representative if OHM-impacted soils are exposed during excavation activities. Decontamination procedures will vary based upon the location and nature of the activity and must comply with state and federal regulations.

Re: Adequately Regulated Determination for New Bedford Marine Commerce Terminal

Dear Mr. White:

I write in response to your June 24, 2013 letter requesting that the Massachusetts Department of Environmental Protection (MassDEP) determine that certain aspects of the New Bedford Marine Commerce Terminal project, also called the South Terminal project (the Project), be deemed "adequately regulated" under the provisions set forth in 310 CMR 40.0110 of the Massachusetts Contingency Plan (MCP).

310 CMR 40.0111 states, in pertinent part:

> The Department shall deem response actions at a disposal site subject to CERCLA adequately regulated for purposes of compliance with [the MCP], provided:
> (a) the Department concurs with the ROD and/or other EPA decisions for remedial actions at such site in accordance with 40 CFR 300.515(e); or,
> (b) if the Department requests that EPA change or expand the EPA-selected remedial action, EPA agrees to integrate the Department's proposed changes or expansions into the planned CERCLA remedial action in accordance with 40 CFR 300.515(f) [the State Enhanced Remedy provisions]….

Upon request by MassDEP, in its November 16, 2012 "Final Determination for the South Terminal Project" (Final Determination), EPA expanded the State Enhanced Remedy (SER), which is incorporated into the 1998 Record of Decision for the Upper and Lower Harbor at the New Bedford Harbor Superfund Site ("1998 ROD") so that it includes the South Terminal Project. MassDEP concurred with the 1998 ROD, as amended, and with the Final Determination.

Therefore, MassDEP determines that the Project is "adequately regulated" pursuant to 310 CMR 40.0111(a) and (b).

Also noted in your June 24, 2013 letter is EPA's requirement that remediation of the upland portion of the Project be conducted in accordance with M.G.L. Chapter 21E and the MCP. MassDEP acknowledges that certain investigation, remediation, and public involvement activities, apart from MCP requirements, are also specified in the Final Determination. Therefore, in the case of the upland portion of the Project, the "adequately regulated" status will eliminate the need to comply with MCP requirements that are duplicative of work already being required by EPA. However, MassDEP believes that the following activities are necessary to meet the requirements of Chapter 21E and the MCP for the upland portion of the Project, and that these activities would not be duplicative of other requirements contained in EPA's Final Determination:

- Use of the Bill of Lading Process (when Hazardous Waste Manifests are not required) in accordance with 310 CMR 40.0034;
- Reporting of any new or additional release conditions to MassDEP under the guidelines and timetables under Subpart C of the MCP;
- Meeting the Response Action Performance Standard as outlined within 310 CMR 40.0191;
- Utilizing MCP cleanup standards and/or risk-based cleanup standards generated via a Method 3 risk assessment to determine compliance with MCP performance standards under Subpart I of the MCP;
- Submittal of Release Abatement Measure (RAM) Plan, status reports and completion report pursuant to 310 CMR 40.0440;
- Preparation of a risk assessment for the Site(s) under Subpart I of the MCP;
- Preparation of Activity and Use Limitations under Subpart J of the MCP; and
- Preparation of Class A or Class B Response Action Outcomes for outstanding Release Tracking Numbers (RTNs) under Subpart J of the MCP.

Please let me know if you have any questions about this. You may reach me at (617) 556-1121 or Benjamin.Ericson@state.ma.us.

Sincerely,

Benjamin J. Ericson
Assistant Commissioner for Waste Site Cleanup

Mr. Benjamin J. Ericson
Assistant Commissioner for Waste Site Cleanup
Massachusetts Department of Environmental Protection
One Winter Street
Boston, MA 02108

Re: Adequately Regulated Determination

Dear Assistant Commissioner Ericson,

I write this letter on behalf of the Massachusetts Clean Energy Center ("CEC"), the project proponent for the development of the New Bedford Marine Commerce Terminal ("Terminal"), requesting that the Massachusetts Department of Environmental Protection ("DEP") issue a determination that certain aspects of the environmental investigation, remediation, and public involvement activities associated with the Terminal project be deemed adequately regulated under the Adequately Regulated provisions set forth in the Massachusetts Contingency Plan ("MCP") at 310 CMR 40.0110. As you know, the Terminal project is being constructed under the direction of the USEPA, by virtue of the State Enhanced Remedy provision of the New Bedford Harbor Superfund Site Record of Decision, and the Final Determination for the South Terminal Project, dated November 16, 2012.[1] While crafting the Final Determination, EPA:

- reviewed historic data associated with previous uses of some of the properties involved in the project;
- reviewed historic environmental investigations conducted to date on some of the properties involved in the project;
- directed the Commonwealth to conduct environmental investigations on certain properties associated with the project;
- requested proposals for environmental remediation on certain properties associated with the project, and reviewed and accepted those proposals;
- requested commitments from the Commonwealth with regard to future maintenance of existing asphalt surfaces on certain properties associated with the project; and

[1] The Final Determination can be found on the Executive Office of Energy and Environmental Affairs website at http://www.mass.gov/eea/ocean-coastal-management/serth/.

DRAFT

- required the commitment of the Commonwealth to conduct a public involvement process to ensure communication with the public regarding EPA's decisions and actions, as well as the progress of work in association with the project.

According to the Adequately Regulated provisions set forth at 310 CMR 40.0110, DEP shall deem response actions at a disposal site subject to CERCLA adequately regulated for purposes of compliance with 310 CMR 40.0000, if DEP concurs with the ROD and/or other EPA decisions for remedial actions at such site in accordance with 40 CFR 300.515(e). CEC maintains that DEP's issuance of its Applicable or Relevant and Appropriate Requirements ("ARAR) in connection with the Terminal project constitutes the requisite concurrence of the Final Determination issued by EPA on November 12, 2012, so as to constitute "other EPA decision[] for remedial action" under 310 CMR 40.0111(1)(a).

Notwithstanding the foregoing, CEC recognizes that EPA has indicated that sampling and remediation are to take place as part of the 21E/MCP process. CEC also concedes that the Final Determination does not clearly identify a cleanup standard for the work proposed for the Terminal; and that, DEP's ARAR that it submitted in relation to the Final Determination contemplated that CEC would undertake a detailed site assessment and implement an appropriate response action under the MCP.

However, it is equally important to note that EPA has directly regulated environmental investigation and proposed remediation for this project to date. EPA has also taken an active role in regulating the investigation and proposed remediation for the project, and that some aspects of the 21E/MCP process have already been reviewed and regulated by EPA. More importantly, various elements of CEC's appropriate response actions are already contemplated in the Final Determination. In light of these considerations, CEC requests that MassDEP specifically deem the following actions taken to date (or specifically approved by EPA to date) as Adequately Regulated:

- Onsite investigation conducted to date (unless previously conducted under the MCP by others);

- Onsite investigations as outlined within the Commonwealth's Sampling and Analysis Plan submitted to EPA, dated March 21, 2013 (or the final revision of such plan);

- Remediation as currently outlined within the Commonwealth's January 18, 2012 submission to USEPA and approved by EPA within its Final Determination for the South Terminal Project, dated November 16, 2012 (which has been publicly available since July of 2012 on the EEA website);

- Mitigation measures as currently outlined within the USEPA Final Determination for the South Terminal Project, dated November 16, 2012;

- Intensive public engagement, including 9 public meetings and numerous meeting with local environmental groups, in association with the project; and

- Timetables for document submission MCP compliance.

DRAFT

Implementation of ARARs associated with 21E/MCP compliance would involve:

- Use of the Bill of Lading Process (when Hazardous Waste Manifests are not required) in accordance with 310 CMR 40.0034;
- Reporting of any new or additional release conditions to MassDEP under the guidelines and timetables under Subpart C of the MCP;
- Meeting the Response Action Performance Standard as outlined within 310 CMR 40.0191;
- Utilizing MCP cleanup standards and/or risk-based cleanup standards generated via a Method 3 risk assessment to determine compliance with MCP performance standards under Subpart I of the MCP;
- Submittal of Release Abatement Measure (RAM) Plan, status updates and completion report pursuant to 310 CMR 40.0440;
- Preparation of a risk assessment for the Site(s) under Subpart I of the MCP;
- Preparation of Activity and Use Limitations under Subpart J of the MCP; and
- Preparation of Class A or Class B Response Action Outcomes for outstanding RTNs under Subpart J of the MCP.

Finally, CEC commits to completing and submitting the associated paperwork for the above-referenced activities within 120 days of the completion of the construction of the Terminal.

MassCEC sincerely appreciates your consideration of this very important matter. If you have any questions, please do not hesitate to contact me at 617-315-9330.

Sincerely,

*Bill White*

## LEGEND

- AA-0 — SOIL BORING LOCATION – PCB ANALYSIS – DECEMBER 2023 THROUGH MAY 2024
- ⊕ AA-0 — SOIL BORING LOCATION – WASTE CHARACTERIZATION ANALYSIS – APRIL 2024 THROUGH MAY 2024
- CEC-0-0 — SOIL BORING LOCATION PCB, MCP METALS, & SVOC ANALYSIS – NOVEMBER 2024 THROUGH DECEMBER 2024
- EXISTING PROPERTY LINE
- 50'x50' GRID SPACING
- 25'x25' GRID SPACING

DISCRETE SAMPLE DEPTH (FEET BELOW GROUND SURFACE)

| | RESULT |
|---|---|
| 0-1 | PCB RESULT <1MG/KG |
| 1-2 | PCB RESULT 1 ≤ 25MG/KG |
| 2-3 | PCB RESULT >25MG/KG |
| 3-4 | NO SAMPLE ANALYZED |
| 4-5 | |
| 5-10 | |

## LEGEND

- PCBS > 25MG/KG – DISPOSE OF AS HAZARDOUS MATERIAL
- PCBS > 1MG/KG AND ≤ 25MG/KG – DISPOSE OF AT AN OUT OF STATE LANDFILL OR REUSE ON SITE
- PCBS < 1MG/KG – DISPOSE OF AT A COMM-97 LANDFILL OR REUSE ON SITE

COMPOSITE SAMPLE DEPTH (FEET BELOW GROUND SURFACE)

| | RESULT |
|---|---|
| 0-5 | PCB COMPOSITE SAMPLE WITHIN THIS DEPTH RANGE |
| 5-10 | PCB COMPOSITE SAMPLE WITHIN THIS DEPTH RANGE |

Notes:
Laboratory analytical results compared to RCS-1 and RCS-2 Massachusetts Contingency Plan Standards.
SVOCs = Semi-Volatile Organic Carbons; PCBs = Polychlorinated Biphenyls
D = identified in an analysis that has been diluted
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard
Exceeds MassDEP MCP RCS-1
Exceeds MassDEP MCP RCS-1 and RCS-2

Laboratory analytical results compared to RCS-1 and RCS-2 Massachusetts Contingency Plan Standards.
PCBs = Polychlorinated Biphenyls
All data reported in mg/kg = milligrams per kilogram.
D = identified in an analysis that has been diluted
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard
Exceeds MassDEP MCP RCS-1
Exceeds MassDEP MCP RCS-1 and RCS-2

Laboratory analytical results compared to RCS-1 and RCS-2 Massachusetts Contingency Plan Standards.
PCBs = Polychlorinated Biphenyls
All data reported in mg/kg = milligrams per kilogram.
D = identified in an analysis that has been diluted
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard
Exceeds MassDEP MCP RCS-1
Exceeds MassDEP MCP RCS-1 and RCS-2

Notes:
Laboratory analytical results compared to RCS-2, S3 GW-2, and S3 GW-3 Massachusetts Contingency Plan Standards.
SVOCs = Semi-Volatile Organic Carbons; PCBs = Polychlorinated Biphenyls
All data reported in mg/kg = milligrams per kilogram.
D = identified in an analysis that has been diluted
< = not detected above laboratory reporting limit
-- = Not Tested
Exceeds MassDEP MCP RCS-2

Notes:
Laboratory analytical results compared to RCS-1, RCS-2, Massachusetts Contingency Plan Standards and Massachusetts COMM-97 Landfill standards.
VOCs = Volatile Organic Carbons; SVOCs = Semi-Volatile Organic Carbons; PCBs = Polychlorinated Biphenyls
D = identified in an analysis that has been diluted
P = pesticide target analyte had a % difference > 25% between 2 GC columns
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard
Exceedance of MassDEP MCP RCS-1
Exceedance of MassDEP MCP RCS-1 & RCS-2
Exceedance of COMM-97 - Lined Landfill criteria
Exceedance of COMM-97 - Unlined Landfill criteria

Notes:
Laboratory analytical results compared to RCS-1, RCS-2,
VOCs = Volatile Organic Carbons; SVOCs = Semi-Volat
D = identified in an analysis that has been diluted
P = pesticide target analyte had a % difference > 25% bet
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard
Exceedance of MassDEP MCP RCS-1
Exceedance of MassDEP MCP RCS-1 & RCS-2
Exceedance of COMM-97 - Lined Landfill criteria
Exceedance of COMM-97 - Unlined Landfill criteria

Notes:
Laboratory analytical results compared to RCS-1, RCS-2,
VOCs = Volatile Organic Carbons; SVOCs = Semi-Volat
D = identified in an analysis that has been diluted
P = pesticide target analyte had a % difference > 25% bet
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard
Exceedance of MassDEP MCP RCS-1
Exceedance of MassDEP MCP RCS-1 & RCS-2
Exceedance of COMM-97 - Lined Landfill criteria
Exceedance of COMM-97 - Unlined Landfill criteria

| **Physical Conditions** | | | | | | | | | | | | | | |
| Flashpoint ($^{o}$F) | > 200 | > 200 | > 200 | > 200 | > 200 | > 200 | > 200 | > 200 | > 200 | > 200 | -- | -- | -- | -- |
| Reactivity - Cyanide (mg/kg) | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | -- | -- | -- | -- |
| Reactivity - Sulfide (mg/kg) | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | < 2 | -- | -- | -- | -- |
| Specific Conductance @ 25$^{o}$C (µmhos/cm) | 92 | 156 | 269 | 730 | 306 | 50 | 7 | 9 | 68 | 39 | -- | -- | 8000 | 4000 |

Notes:
Laboratory analytical results compared to RCS-1, RCS-2,
VOCs = Volatile Organic Carbons; SVOCs = Semi-Volat
D = identified in an analysis that has been diluted
P = pesticide target analyte had a % difference > 25% bet
< = not detected above laboratory reporting limit
-- = Not Tested
NS = No Standard

Exceedance of MassDEP MCP RCS-1
Exceedance of MassDEP MCP RCS-1 & RCS-2
Exceedance of COMM-97 - Lined Landfill criteria
Exceedance of COMM-97 - Unlined Landfill criteria

LEGEND

- PCB SAMPLE LOCATION
- AA3 — BLUE TEXT DENOTES SAMPLE WAS COLLECTED AS A BLIND DUPLICATE
- APPROXIMATE LIMITS OF HOTSPOT EXCAVATION TO 2' BGS.
- APPROXIMATE LIMITS OF HOTSPOT EXCAVATION TO 3' BGS.
- DENOTES SOIL BORING LOCATION
- (1.0) — 25'x25' GRID SURFICIAL SAMPLE LOCATION (CONCENTRATION SHOWN IN PARENTHESIS)

NOTE:

1. BORING LOCATIONS HAVE THE PREFIX "DGA-10" WHICH HAVE BEEN OMITTED FROM THIS FIGURE FOR BREVITY.
2. LABORATORY DETERMINED PCB CONCENTRATIONS (PPM) ARE SHOWN IN PARENTHESIS. GREEN SHADING INDICATES A RESULT BELOW 1PPM, YELLOW SHADING INDICATES A RESULT BETWEEN 1 AND 50PPM, AND RED SHADING INDICATES A RESULTS ABOVE 50PPM. CONCENTRATIONS OF ADDITIONAL LABORATORY ANALYSIS ARE NOT SHOWN.

**Notes:**

U = Concentration is below the laboratory's method detection limit. One half of the method detection limit is utilized in the summation.

*Duplicate 1 is a duplicate sample of sample TP-3.

**Duplicate 2 is a duplicate sample of sample TP-6.

NP = Not Promulgated

ND = Analyzed Aroclors were non-detected.

J = Estimated value.

Exceedance of MCP Reporting Category and/or Standard, which also exceeds EPA's unrestricted use standard of 1 ppm.

Exceedance of EPA's unrestricted use Standard in High Occupancy Use Areas (e.g., residential) of 1 ppm, but not its respective MCP Reporting Category and/or Standard.

NOTE: EPA Standard for Low Occupancy Use Areas (e.g., commercial) is less than or equal to 25 ppm (and greater than 1 ppm).

A = Shallow Sample

M = Middle Sample

B = Bottom

**Notes:**
Only detected compounds are reported in the table. Please refer to Appendix _ for a complete listing of analytes.
U = Concentration is below the laboratory's method detection limit.
NP = Not Promulgated
*Duplicate 1 is a duplicate sample of sample TP-3.
**Duplicate 2 is a duplicate sample of sample TP-6.
- Exceedance of Reporting Category and/or Standard
Testing results for trip blanks analyzed during the testing program were all non-detect (ND).
Acetone and Carbon disulfide detected in TP6-N-B at low ppb levels considered an artifact of laboratory.

**TABLE 13**
**SOIL HANDLING AND DISPOSAL ESTIMATE**
**South Terminal CDF, New Bedford, Massachusetts**

| TEST PIT/EXCAVATION AREA | MAIN CONTAMINANT | AREA (SF) | EXCAVATION THICKNESS (ft) | VOLUME (CY) | TONS | DISPOSAL PER TON | MA TRANSPORT FEE | TOTAL DISPOSAL COST PER TON | DISPOSAL COST PER AREA | EXCAVATION COST PER TON | EXCAVATION COST | HANDLING & DISPOSAL |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TP-4 | PCBs | 4,000 | 4 | 593 | 948 | $258.8 | $63.9 | $322.7 | $305,958 | $13.3 | $12,610 | $318,568 |
| TP-2 | PCBs | 3,100 | 4 | 459 | 735 | $258.8 | $63.9 | $322.7 | $237,117 | $13.3 | $9,773 | $246,890 |
| ***PCBs - Estimated Cost Range*** | | | | | | | | | | | | ***$565,459*** |
| TP-6 | Petroleum | 4,500 | 3 | 500 | 800 | $77.6 | NA | $78 | $62,080 | $13.3 | $10,640 | $72,720 |
| ***Petroleum-Related Estimated Cost*** | | | | | | | | | | | | ***$72,720*** |
| ***Total Estimated Costs - PCBs & Petroleum Related*** | | | | | | | | | | | | ***$638,179*** |

Notes:

***PCB Soils: Includes 15% markup.***

1. $225.00 / ton Transportation and Disposal plus Massachusetts Transport Fee of $55.60. Transport Fee is cost to transfer soils from Site to railcars for transport to disposal facility.
2. Soils are proposed for a Subtitle C landfill and EPA must approve the facility under the "Mega Rule" (approval is not an issue but must be stated in soil management plan to EPA).
3. Assumptions:

(a) Disposal at Heritage Environmental's Subtitle C landfill in Indiana
(b) <10% debris and should not contain debris larger than 3 ft x 1 ft x 1 ft.
(c) Facility can accept larger debris but special arrangements will need to be made prior to shipping.
(d) Waste must pass paint filter as received at the landfill.
(e) Waste must be the minimum of 1000 lbs / sq ft shear strength or 2000 lbs / sq ft unconfined compressive strength.
(f) Samples, profile and EPA approval letter required

***Petroleum Soils: Includes 15% markup.***

1. $67.50 / ton Transportation and Disposal. (Massachusetts Transport Fee does not apply)
2. Soils are proposed for asphalt batch in Massachusetts.
3. Assumptions

(a) Disposal at Aggregate Industries in Stoughton MA.
(b) <15% debris and cannot contain large quantities of clay.
(c) Waste must pass paint filter test.
(d) Data, profile, site map and LSP opinion Letter required.

***REGULATORY COSTS***

| | |
|---|---|
| Preparation (field and office) | $7,500.00 |
| RAM Related | $10,000.00 |
| TSCA Related | $20,000.00 |
| LSP Services (disposal) | $5,000.00 |
| Verification Sampling | $12,500.00 |
| Apex Oversight/Documentation & Equipment | $17,250.00 |
| Closure Reports (RAM/TSCA) | $20,000.00 |
| Response Action Outcome | $30,000.00 |
| includes M3 Risk Characterization | |
| Deed Restrictions** | $20,500.00 |
| Project Mgt (10%) | $13,775.00 |
| ***Estimated Regulatory Costs*** | ***$156,525.00*** |
| ***Estimated Cleanup Costs (Total)*** | ***$794,704*** |

**Survey (metes & Bounds added to cost)

**Abbreviations:**
SVOCs = Semi-Volatile Organic Compounds
EPH = Extractable Petroleum Hydrocarbons
VPH = Volatile Petroleum Hydrocarbons
VOCs = Volatile Organic Compounds
PCBs = Polychlorinated Biphenyls
mg/kg = milligrams per kilogram
NS = No Standard
NA = Not Analyzed

**Notes:**
Lab ID: 141086 & 141430
Standards are from the Massachusetts Contingency Plan (MCP),
310 CMR 40.0000, revised February 14, 2008.
< = indicates parameter not detected above laboratory method reporting limit, shown

QA/QC by LEM 6/7/12; JRS 8/22/12

**Abbreviations:**
EPH = Extractable Petroleum Hydrocarbons
TPH = Total Petroleum Hydrocarbons
VPH = Volatile Petroleum Hydrocarbons
mg/kg = milligrams per kilogram
mV = millivolts
NS = No Standard
NA = Not Analyzed
RC = Reportable Concentration
ORP = Oxidation/Reduction Potential

**Notes:**
* = Reported result is an estimated concentration.
< = indicates parameter not detected above laboratory method reporting limit, shown
1 = Standards are from the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000, revised June 26, 2009
2 = Total Chromium standard applies only in the absence of chromium speciation
3 = Laboratory results for hexavalent chromium are considered invalid due to holding time non-conformances; therefore, results are compared to the Total Chromium standard
4 = Standard is for mixed isomers, MassDEP does not publish standards for individual isomers
5 = Standards are from the MassDEP website updated February 2008
6 = Reporting limits exceed the RC S-1 standard
7 = Reporting limits exceed the applicable Method 1 standard and the RC S-1 standard

QA/QC by LEM 6/7/12; JRS 8/22/12

**Abbreviations:**
EPH = Extractable Petroleum Hydrocarbons
TPH = Total Petroleum Hydrocarbons
VPH = Volatile Petroleum Hydrocarbons
mg/kg = milligrams per kilogram
mV = millivolts
NS = No Standard
NA = Not Analyzed
RC = Reportable Concentration
ORP = Oxidation/Reduction Potential

**Notes:**
* = Reported result is an estimated concentration.
< = indicates parameter not detected above laboratory method reporting limit, shown
1 = Standards are from the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000, revised June 26, 2009
2 = Total Chromium standard applies only in the absence of chromium speciation
3 = Laboratory results for hexavalent chromium are considered invalid due to holding time non-conformances; therefore, results are compared to the Total Chromium standard
4 = Standard is for mixed isomers, MassDEP does not publish standards for individual isomers
5 = Standards are from the MassDEP website updated February 2008
6 = Reporting limits exceed the RC S-1 standard
7 = Reporting limits exceed the applicable Method 1 standard and the RC S-1 standard

DRAFT

Form 1075

NOTICE OF ACTIVITY AND USE LIMITATION
M.G.L. c. 21E, § 6 and 310 CMR 40.0000

Disposal Site Names: RIST Property (former RIST, LLC) RTN 4-23736
DMF Parcel 1, RTN 4-24296
DMF Parcel 2, RTN 4-15490
Riverfront Parcel

This Notice of Activity and Use Limitation ("Notice") is made as of this _____ day of _____, 2021, by The Massachusetts Clean Energy Technology Center, with a mailing address of 63 Franklin Street, 3rd Floor Boston, Massachusetts, 02110 and The City of New Bedford Massachusetts, with a mailing address of 133 Williams Street, New Bedford, Massachusetts 02740 together with his/her/its/their successors and assigns (collectively "Owners").

WITNESSETH:

WHEREAS, the Massachusetts Clean Energy Technology Center is the owner in fee simple of certain parcels of land depicted as:

**Parcel Name:** **RIST Property (former RIST, LLC), RTN 4-23736**
Address: North of Blackmer Street
Parcel ID/Size: Map 31 Parcel 288 / 7.75 acres

And, WHEREAS, the City of New Bedford, Massachusetts is the owner in fee simple of certain parcels of land, under lease to the Massachusetts Clean Energy Technology Center, and depicted as:

**Parcel Name:** **DMF Parcel 1, RTN 4-24296**
Address: North of 16 Blackmer Street
Parcel ID/Size: Map 25A, Parcel 53 / 1.2 acres

**Parcel Name:** **DMF Parcel 2, RTN 4-15490**
Address: 16 Blackmer Street
Parcel ID/Size: Map 25A, Parcel 49 / 2.2 acres

**Parcel Name:** **Riverfront Parcel**
Address: SE Blackmer Street
Parcel ID/Size: Map 25A, Parcel 48 / 9.227 acres
Area of Parcel Subject to AUL: 6.32 acres

WHEREAS, said four parcels of land, which are more particularly bounded and described in **Exhibit A**, attached hereto and made a part hereof ("Property"), are subject to this Notice of Activity and Use Limitation.

DRAFT

WHEREAS, the Properties together comprise all of a disposal site as the result of releases of oil and/or hazardous material. **Exhibit B** is a sketch plan showing the relationship of the Properties subject to this Notice of Activity and Use Limitation to the boundaries of said disposal site existing within the limits of the Properties and to the extent such boundaries have been established. **Exhibit B** is attached hereto and made a part hereof; and,

WHEREAS, one or more response actions have been selected for the Disposal Site in accordance with M.G.L. c. 21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 ("MCP"). Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil and/or (b) the restriction of certain activities occurring in, on, through, over or under the Properties. A description of the basis for such restrictions, and the oil and/or hazardous material release event(s) or site history that resulted in the contaminated media subject to the Activity and Use Limitation Opinion which is attached hereto as **Exhibit C** and made a part hereof;

NOW, THEREFORE, notice is hereby given that the activity and use limitations set forth in this Notice of Activity and Use Limitation are as follows:

1. Activities and Uses Consistent with Maintaining No Significant Risk Conditions. The following Activities and Uses are consistent with maintaining a Permanent Solution and a condition of No Significant Risk and, as such, may occur on the Properties pursuant to 310 CMR 40.0000:

   (i) Commercial and industrial activities and uses which do not involve the disturbance of soil located greater than 3 feet below the ground surface within the AUL area within the RIST property, DMF Parcel 1 and DMF Parcel 2 and Riverfront Parcel properties described above, as long as the Obligations and Conditions specified herein are followed;
   (ii) Any non-residential uses of all of the Properties, including those that are currently conducted, in which a child's presence (other than incidental) is not likely;
   (iii) Short-term (6 months or less) underground utility and/or construction activities which are likely to disturb soil as described in Paragraph 1(i), provided that such activities are conducted in accordance with the soil management provisions of the Massachusetts Contingency Plan (MCP) cited at 310 CMR 40.0030 and all applicable worker health and safety practices pursuant to 310 CMR 40.0018;
   (iv) Construction or excavation activities are allowed, except as prohibited in Paragraph 2 (ii);
   (v) Such other activities or uses which, in the Opinion of a Massachusetts Licensed Site Professional ("LSP"), shall present no greater risk of harm to human health, safety, public welfare or the environment than the activities and uses set forth in this paragraph; and,
   (vi) Other activities or uses of the Properties not identified in Paragraph 2 as Activities and Uses Inconsistent with the AUL.

2. Activities and Uses Inconsistent Maintaining No Significant Risk Conditions. The following Activities and Uses are inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk pursuant to 310 CMR 40.0000, and, as such, may not occur on the Properties:

DRAFT

(i) Use of the Properties (all) as a residence or for growing fruits or vegetables for human consumption, as a school, daycare, nursery, recreational area (such as a park or athletic field), and/or any other use in which a child's presence (other than incidental) is likely;

(ii) Any long-term (greater than 6 months) activity at the Properties that is reasonably likely to result in an excavation greater than 3 feet below grade within the RIST property, DMF Parcel 1, DMF Parcel 2 and Riverfront Parcel properties and excavation of soil at or below the ground surface within the Shuster Bulkhead Parcel, relocation or removal of contaminated soil, unless such activity is first evaluated by an LSP who renders an Opinion stating that such activity is consistent with maintaining a condition of No Significant Risk and that such activity is conducted in accordance with Obligations (i) and (ii), set forth below; and,

(iii) Any excavation activity which may disturb the soil located at a depth greater than 3 feet below ground surface within the AUL area associated with the RIST property, DMF Parcel 1, DMF Parcel 2 and Riverfront Parcel properties without prior development and implementation of a Soil Management Plan and a Health and Safety Plan in accordance with Obligations (i) and (ii) of this Notice.

3. Obligations and Conditions. The following obligations and/or conditions are necessary and shall be undertaken and/or maintained at the Properties to maintain a Permanent Solution and a condition of No Significant Risk:

(i) Any long-term (greater than 6 months) activity at or use of the Properties that is reasonably likely to result in the excavation, relocation, or removal of contaminated soil requires preparation and implementation of a Health and Safety Plan under the guidance of an LSP. At a minimum, the Health and Safety Plan must inform underground utility workers and other workers who may come into contact with soil in the AUL area of (1) the nature and hazards of the contaminants identified in the soil, (2) potential exposure routes, (3) measures to prevent exposure, (4) protective clothing requirements, and (5) any other health and safety measures appropriate for the activity or use;

(ii) Any long-term (greater than 6 months) activity at or use of the Properties that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a written Soil Management Plan under the guidance of an LSP. At a minimum, the Soil Management Plan must (1) describe the soil excavation and stockpile storage methods that will be used to prevent accidental exposure to the excavated soil, including indirect exposure via surface water runoff or fugitive dust emissions, (2) contain procedures to limit access to the excavated soil and the excavation area by Property workers not covered by the Health and Safety Plan, children, Property abutters, or accidental trespassers, (3) contain procedures for characterizing, transporting and recycling/disposing excavated soil, and (4) provide for the restoration of the excavated area as soon as practicable; and,

(iii) Any soil removed from the Properties must be characterized and disposed of in accordance with federal, state and local regulations, including the MCP, 310 CMR 40.0000.

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Properties which may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by a Licensed Site Professional who shall render an Opinion,

DRAFT

in accordance with 310 CMR 40.1080, as to whether the proposed changes are inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of a Permanent or Temporary Solution. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by a Licensed Site Professional in accordance with 310 CMR 40.1080, and without additional response actions, if necessary, to maintain a condition of No Significant Risk. If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by a Licensed Site Professional in accordance with 310 CMR 40.1080, the owner or operator of the Properties subject to this Notice at the time that the activities, uses and/or exposures change, shall comply with the requirements set forth in 310 CMR 40.0020.

6. Incorporation into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Properties or a portion thereof is conveyed in accordance with 310 CMR 40.1074(5).

Owner hereby authorizes and consents to the filing and recordation and/or registration of this Notice, said Notice to become effective when executed under seal by the undersigned Licensed Site Professional, and recorded and/or registered with the appropriate Registry of Deeds and/or Land Registration Office(s).

NOTICE OF ACTIVITY AND USE LIMITATION

M.G.L. c. 21E, § 6 and 310 CMR 40.0000
Disposal Site Name: New Bedford Radio, Inc. (Hall Comm.)
DEP Release Tracking No.: 4-25350

This Notice of Activity and Use Limitation ("Notice") is made as of this 16th day of September 2019, by The Massachusetts Clean Energy Center, with a mailing address of 63 Franklin Street, 3rd Floor Boston, New Bedford, Massachusetts, 02110, and Hall Communications, Inc. with a mailing address of 1996 Auction Road, Manheim, Pennsylvania, 17545 together with his/her/its/their successors and assigns (each an "Owner", and collectively "Owners").

WITNESSETH:

WHEREAS, the Massachusetts Clean Energy Center is the owner in fee simple of a certain parcel of land depicted as "Lot 1" on a that certain *Plan of Land, MacArthur Boulevard, Assessor's Map 31 Lot 234, New Bedford, Massachusetts,* dated March 18, 2015 (with revisions through July 13, 2016), and prepared by Thompson Farland with certification date August 8, 2016, and recorded in the Bristol County Registry of Deeds in Plan Book 174, Page 73 (the "Survey"), and Hall Communications, Inc. is the owner in fee simple of a certain parcel of land depicted as "Lot 2" on the Survey. Said "Lot 1" and said "Lot 2", having been created in a subdivision of land owned by Hall Communications, Inc. for the purpose of the sale of Lot 1 to the Massachusetts Clean Energy Center, and for Hall Communications, Inc. to retain Lot 2. For title information see deed recorded with the Bristol County Registry of Deeds in Book 11982, page 152.

WHEREAS, said parcels of land, which are more particularly bounded and described in **Exhibit A**, attached hereto and made a part hereof ("Property"), are subject to this Notice.

WHEREAS, the Property comprises all of a disposal site (the "AUL Area") as the result of releases of oil and/or hazardous material. **Exhibit B,** which is attached hereto and made a part hereof, is a copy of the Survey showing the Property subject to this Notice; and

WHEREAS, one or more response actions have been selected for the AUL Area in accordance with M.G.L. c. 21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 *et seq.* ("MCP"). Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil at the Property, and/or (b) the restriction of certain activities occurring in, on, through, over or under the Property. A description of the basis for such restrictions, and the oil and/or hazardous material release event(s) or site history that resulted in the contaminated media subject to this Notice, are set forth in the Activity and Use Limitation Opinion, which is attached hereto as **Exhibit C** and made a part hereof;

NOW, THEREFORE, notice is hereby given that the activity and use limitations ("AULs") for the Property are as follows:

1. Activities and Uses Consistent with Maintaining No Significant Risk Conditions. The following Activities and Uses are consistent with maintaining a Permanent Solution and a condition of No Significant Risk and, as such, may occur on the Property pursuant to the MCP:

   (i) Commercial and industrial activities and uses which do not involve the disturbance of soil located greater than 3 feet below the ground surface within Lot 1 and

APEX COMPANIES LLC
Attn: DAVID SHERMAN
58 H Connecticut Ave
South Windsor, CT 06074

disturbance of soil at or below the ground surface within Lot 2, as long as the Obligations and Conditions specified herein are followed;

(ii) Any non-residential uses of the Property (both Lot 1 and Lot 2), including those that are currently conducted, in which a child's presence (other than incidental) is not likely;

(iii) Short-term (6 months or less) underground utility and/or construction activities which are likely to disturb soil more than permitted in Paragraph 1(i), provided that such activities are conducted in accordance with the soil management provisions of the MCP cited at 310 CMR 40.0030 and all applicable worker health and safety practices pursuant to 310 CMR 40.0018;

(iv) Construction or excavation activities are allowed, except as prohibited in Paragraph 2 (ii);

(v) Such other activities or uses which, in the Opinion of a Massachusetts Licensed Site Professional ("LSP"), shall present no greater risk of harm to human health, safety, public welfare or the environment than the activities and uses set forth in this Paragraph 1; and

(vi) Other activities or uses of the Property not identified in Paragraph 2 as Activities and Uses Inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk.

2. Activities and Uses Inconsistent with Maintaining No Significant Risk Conditions. The following Activities and Uses are inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk pursuant to the MCP, and, as such, may not occur on the Property:

(i) Use of the Property (Lot 1 and Lot 2) as a residence, for growing fruits or vegetables for human consumption, as a school, daycare, nursery, recreational area (such as a park or athletic field), and/or for any other use in which a child's presence (other than incidental) is likely;

(ii) Any long-term (greater than 6 months) activity at the Property that is reasonably likely to result in the excavation greater than 3 feet below grade in Lot 1 and at or below surface grade in Lot 2, relocation or removal of the contaminated soil, unless such activity is first evaluated by an LSP who renders an Opinion stating that such activity is consistent with maintaining a condition of No Significant Risk and that such activity is conducted in accordance with Obligations set forth in paragraph 3 (i) and (ii) of this Notice; and

(iii) Any excavation activity which may disturb the soil located at a depth greater than 3 feet below ground surface within Lot 1 and at or below surface grade in Lot 2, without prior development and implementation of a Soil Management Plan and a Health and Safety Plan in accordance with Obligations set forth in paragraph 3 (i) and (ii) of this Notice.

3. Obligations and Conditions. The following obligations and/or conditions are necessary and shall be undertaken and/or maintained at the Property by the Owner of either Lot 1 or Lot 2, or both, as applicable, to maintain a Permanent Solution and a condition of No Significant Risk:

(i) Any long-term (greater than 6 months) activity at or use of either Lot 1 or Lot 2 of the Property that is reasonably likely to result in the excavation, relocation, or removal of contaminated soil requires preparation and implementation of a Health and Safety Plan under the guidance of an LSP. At a minimum, the Health and Safety Plan must

DRAFT

inform underground utility workers and other workers who may come into contact with soil in the AUL Area of (1) the nature and hazards of the contaminants identified in the soil, (2) potential exposure routes, (3) measures to prevent exposure, (4) protective clothing requirements, and (5) any other health and safety measures appropriate for the activity or use;

(ii) Any long-term (greater than 6 months) activity at or use of either Lot 1 or Lot 2 of the Property that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a written Soil Management Plan under the guidance of an LSP. At a minimum, the Soil Management Plan must (1) describe the soil excavation and stockpile storage methods that will be used to prevent accidental exposure to the excavated soil, including indirect exposure via surface water runoff or fugitive dust emissions, (2) contain procedures to limit access to the excavated soil and the excavation area by Property workers not covered by the Health and Safety Plan, children, Property abutters, or accidental trespassers, (3) contain procedures for characterizing, transporting and recycling/disposing excavated soil, and (4) provide for the restoration of the excavated area as soon as practicable; and

(iii) Any soil removed from either Lot 1 or Lot 2 of the Property must be characterized and disposed of in accordance with federal, state and local regulations, including the MCP.

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Property which may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by a LSP who shall render an Opinion, in accordance with 310 CMR 40.1080, as to whether the proposed changes are inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of a Permanent or Temporary Solution. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by a LSP in accordance with 310 CMR 40.1080, and without additional response actions, if necessary, to maintain a condition of No Significant Risk. If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by a LSP in accordance with 310 CMR 40.1080, the Owner of either Lot 1 or Lot 2 within the Property subject to this Notice at the time that the applicable activities, uses and/or exposures change on that particular Lot, shall comply with the requirements set forth in 310 CMR 40.0020.

6. Incorporation into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed in accordance with 310 CMR 40.1074(5).

Owners hereby authorize and consent to the filing and recordation and/or registration of this Notice, said Notice to become effective when executed under seal by the undersigned LSP, and recorded and/or registered with the appropriate Registry of Deeds and/or Land Registration Office(s).

Metes and Bounds Description of Parcel of Land Containing Area Subject to AUL

A certain parcel of land situated on the southeasterly side of Macarthur Drive in New Bedford, Massachusetts, being shown as Lots 1 and 2 on a plan entitled "Plan of Land, Macarthur Boulevard, Assessors Map 31 Lot 234, New Bedford, Massachusetts, Prepared for Apex Companies, LLC, revised July 13, 2016" prepared by Thompson Farland, Inc, being further bounded and described as follows:

Beginning at a point on the southeasterly side of Macarthur Drive, said point being the northeasterly corner of land now or formerly belonging to Carlos and Conceicao Rafael and the northwesterly corner of the herein describer parcel;

Thence running along said Macarthur Drive by a curve deflecting to the left, having a radius of 155.00 feet and an arc length of 182.67 feet to a corner and land now or formerly belonging to C P Brodeur, Inc;

Thence turning and running by said C P Brodeur, Inc land, S11°43'37"E, 148.08 feet to a corner;

Thence turning and running still by said C P Brodeur, Inc land and land now or formerly belong to R C P Realty LLC and Dennis Saluti "Trustee", Michael St. Ours "Trustee", N75°39'17"E, 440.37 feet to a corner and land now or formerly belonging to Rist LLC;

Thence turning and running along said Rist LLC land, S14°20'43"E, 389.25 feet to a corner and land now or formerly belonging to Fargo Realty Trust;

Thence turning and running along said Fargo Realty Trust land and land now or formerly belonging to DeCosta Realty Trust, S76°40'51"W, 504.23 feet to a corner and land now or formerly belonging to Gregory G. White and David R. Belzer, Trustees;

Thence turning and running along said Gregory G.White and David R. Belzer, Trustees land and land now or formerly belonging to Carlos and Conceicao Rafael, N07°51'03"W, 314.29 feet to a corner;

Thence running still by said Rafael land, N46°24'07"W, 81.49 feet to a point of curvature;

Thence running still by said Rafael land by a curve deflecting to the left, having a radius of 20.00 feet and an arc length of 27.37 feet to Macarthur Drive and the point of beginning.

Said Lots 1 (MassCEC; Map 31 Lot 234) and Lot 2 (Hall Communications, Inc.; Map 31 Lot 234) contain a total area of 4.40 Acres more or less.

## ACTIVITY AND USE LIMITATION OPINION

RTN 4-25350

### 1.0 Introduction

This Licensed Site Professional (LSP) Opinion for the Notice of Activity and Use Limitation (AUL) was prepared by David B. Sherman (LSP No. 8904) on behalf of the Massachusetts Clean Energy Center (MassCEC) and N B Radio, Inc. c/o Hall Communications, for release conditions at the parcel of land located at ES R S Front Street, in New Bedford, Bristol County, Massachusetts (the Property). The MassDEP has assigned Release Tracking Number (RTN) 4-25350 to this site. The Disposal Site is comprised of 2 lots (Lot 1 and Lot 2). Lot 1 is currently owned by the MassCEC and Lot 2 is currently owned by Hall Communications and is also the location of the new radio tower. This LSP Opinion was prepared in accordance with 310 CMR 40.1074 and (1) explains why implementation of the AUL is appropriate to maintain a level of No Significant Risk at the Property (as defined in the AUL), (2) describes activities and uses prohibited in the area of the Property to be subject to the AUL, (3) identifies permitted activities and uses in the AUL area, and (4) identifies conditions or obligations for the AUL area in order to maintain a level of No Significant Risk.

The referenced parcel is part of the New Bedford Marine Commerce Terminal (Terminal) project constructed under the direction of the USEPA, by virtue of a State Enhanced Remedy provision (dated July 1, 2013) of the New Bedford Harbor Superfund Site Record of Decision, and the Final Determination for the South Terminal Project, dated November 16, 2012 and its subsequent modifications. While crafting the Final Determination, EPA:

- reviewed historic data associated with previous uses of some of the properties involved in the project;
- reviewed historic environmental investigations conducted to date on some of the properties involved in the project;
- directed the Commonwealth to conduct environmental investigations on certain properties associated with the project;
- requested proposals for environmental remediation on certain properties associated with the project, and reviewed and accepted those proposals;
- requested commitments from the MassCEC with regard to future maintenance of the existing, 3-foot engineered environmental cap on certain properties associated with the project.

EPA directly regulated the environmental investigations and proposed remediation for the New Bedford Marine Commerce Terminal project as completed by the Massachusetts Clean Energy Center (MassCEC). EPA also had an active role in regulating the investigations and proposed remediation for the project, and some aspects of the 21E/MCP process were reviewed and regulated by EPA. Additionally, various elements of MassCEC's appropriate response actions were listed in the Final Determination. The MassDEP provided an Adequately Regulated Determination for the Marine Commerce Terminal Project in a letter dated July 1, 2013, under 310 CMR 40.0110 of the Massachusetts Contingency Plan.

### 2.0 Property Background

Multiple environmental investigations on the property have identified elevated levels of polychlorinated biphenyls, metals (lead and cadmium) and polycyclic aromatic hydrocarbons (PAHs) in soil, likely attributed to the presence of historic urban fill emplaced along the New Bedford waterfront area. As the

DRAFT

northeastern portion of the site was found to contain the most elevated concentrations of contaminants in soil, an environmental engineered cap consisting of 3 feet of imported, clean engineered fill was placed over the entire footprint to Lot 1 with the upper twelve-inches comprised of an engineered dense aggregate substrate. Based on the presence of substantially lower contaminant concentrations and federal restrictions regarding the height of the new radio tower located on Lot 2, this portion of the property did not receive the 3 feet of imported clean engineered fill. The construction activity was completed as detailed in the Release Abatement Measure Plan submitted to the MassDEP in October 20, 2014.

The Terminal project involved the construction of a multi-purpose facility designed to support the construction, assembly and deployment of offshore wind projects, as well as handle bulk, break-bulk, container and large specialty marine cargo. The Terminal is a 26-acre property that was designed to serve as a staging area for various cargoes associated with the Terminal operations. From 2013 to 2015 the entire Terminal property was remediated and backfilled with a minimum of 3 feet of clean imported engineered fill. The fill material for preparing the subgrade beneath the site was either generated during the associated Terminal channel dredging or imported fill from landside aggregate facilities. The fill material was placed in lifts and compacted to bring the final grade of the Terminal property to existing street level. An eight-foot tall security fence has been installed around the perimeter of the main Terminal property. Extensive site assessment activities and remedial actions involving localized soil excavation and removal have been conducted on the property to characterize and abate impacts to underlying subsurface media. These areas were subsequently backfilled and capped with clean materials.

The Property is relatively square in shape with maximum dimensions of 390 feet by 420 feet, encompassing an area of approximately 4.40 acres. The Property is bordered by Seatrade International to the west, North Coast Seafood to the south, the former RIST, LLC parcel to the east and C.P. Brodeur, Inc. to the north. This parcel was recently subdivided in accordance with the ANR plan dated March 18, 2015. Lot 1 of Parcel A is currently owned by the Massachusetts Clean Energy Center (MassCEC). Lot 2 of Parcel A is currently owned by NB Radio, Inc.

Current site features and parcel descriptions are depicted on **Exhibit B** to this AUL.

**2.1 Disposal Site Description**

| | |
|---|---|
| **Parcel Name:** | **Former Hall Radio Tower - RTN 4-25350** |
| Address: | ES R S Front Street |
| Parcel ID/Size: | Book 1536 Page 1120/ 4.40 acres (total) |
| Current Owner: | MassCEC Lot 1, NB Radio, Inc. Lot 2 |
| Date Reported: | October 1, 2014 |
| MCP Status: | Permanent Solution with Conditions |

This property is currently a portion of the New Bedford Marine Commerce Terminal and is situated between Potomska Street to the north and South Front Street to the west. During subsurface investigations conducted between October 2014 and May 2016, concentrations of polychlorinated biphenyls, lead, cadmium and select PAH compounds were identified above reportable concentrations. The majority of this impact was found in the northeastern portion of Lot 1. Soil impacts in this area were excavated and

DRAFT

removed and 3 feet of clean, imported engineered fill was placed throughout the entire foot print of Lot 1 as an engineered environmental cap. The AUL area encompasses the entire site (Lot 1 and Lot 2) to prevent exposure to the soils.

In addition to the subsurface investigations and Release Abatement Measure (RAM) activities conducted between October 2014 and August 2016, additional remedial activities were completed over the entire New Bedford Marine Commerce Terminal Property. The remedial (RAM) activities completed at this subject property included:

- Removal of 1,876 tons of PCB, metals, total petroleum hydrocarbons and PAH impacted soil to out of state landfills under a Hazardous Waste Manifest to the Heritage Environmental Services in Roachdale, Indiana facilities;
- In accordance with the EPA's Final Determination for the South Terminal Project, soils containing concentrations of PCBs up to 50ppm were allowed to be left in place and capped as described below;
- General grading of the Disposal Site; and
- Construction of an environmental engineered cap over Lot 1 consisting of 3 feet of clean, imported engineered fill, the upper twelve-inches of which was comprised of a mixed, dense aggregate engineered layer.

**3.0 Summary of the Risk Characterization**

A Method 3 Risk Characterization has been prepared by Apex in anticipation of regulatory (MCP) site closure. The results of the risk characterization are the basis for the decision regarding the Permanent Solution with Conditions (PSC) for the release at the Site pursuant to 310 CMR 40.1000. A summary of the Risk Characterization is presented below.

The contaminants of concern identified at the site included, polychlorinated biphenyls (PCBs); certain polyaromatic hydrocarbons (PAHs) and certain metals (lead and cadmium).

The Terminal Property is currently a marine cargo facility that acts as a storage and staging area for marine vessels and cargo operations. Under foreseeable future conditions, receptors reasonably likely to be present on site include workers, security personnel, escorted visitors, vessel crews, trespassers, landscapers, utility workers, and construction workers. Lot 2, currently owned by Hall Communications, is occupied by a new, 600-foot tall radio tower used for transmission services for FM broadcasting. The Method 3 Risk Characterization determined that "No Significant Risk" of harm to human health exists at the Site for each receptor type considered in the risk characterization based on current and foreseeable uses. It also determined that "No Significant Risk" of harm to safety, public welfare and the environment exists at all portions of the Site. As a result of the risk characterization, an AUL is required to limit residential, and certain other construction uses of the property. In addition, due to the presence of elevated concentrations of compounds of concern in soil, the AUL includes requirements for soil management if soil intrusive work is planned to be conducted. The property is included in its entirety (Lot 1 and Lot 2) within the Disposal Site Boundary for RTN 4-25350.

**4.0 Use of the AUL to Maintain a Level of No Significant Risk**

As described in the Risk Characterization, a condition of No Significant Risk to human health, safety, public welfare and the environment currently exists at the Site. However, this conclusion is based on the assumption that the Property will not be used for residential purposes or for the growing of fruits or

DRAFT

vegetables for human consumption. This restriction is extended to limit the use of the Property as a school, daycare, nursery, recreational area (such as a park or athletic field) and/or any other use in which a child's presence is likely to be more than incidental. All other reasonably foreseeable site uses were considered. In addition, because residual contamination is present at the site, this AUL will also provide appropriate notice to future Site users to exercise appropriate caution when encountering or handling soil, and ensure that unnecessary exposures do not occur and that contaminated soils are managed appropriately.

**5.0 Acceptable Activities and Uses**

The AUL Opinion provides that a condition of No Significant Risk to health, safety, or public welfare exists for any foreseeable period of time (pursuant to 310 CMR 40.0000) as long as any of the following activities and uses occur on the Property:

(i) Commercial and industrial activities and uses which do not involve the disturbance of soil located greater than 3 feet below the ground surface within the entire footprint of Lot 1 and at or below surface grade within the entire footprint of Lot 2, as long as the Obligations and Conditions specified herein are followed;

(ii) Any non-residential uses of the Property, including those that are currently conducted, in which a child's presence (other than incidental) is not likely;

(iii) Short-term (6 months or less) underground utility and/or construction activities which are likely to disturb soil, provided that such activities are conducted in accordance with the soil management provisions of the Massachusetts Contingency Plan (MCP) cited at 310 CMR 40.0030 and all applicable worker health and safety practices pursuant to 310 CMR 40.0018;

(iv) Construction or excavation activities are allowed, except as prohibited in Paragraph 6 (ii);

(v) Such other activities or uses which, in the Opinion of a Massachusetts Licensed Site Professional ("LSP"), shall present no greater risk of harm to human health, safety, public welfare or the environment than the activities and uses set forth in this paragraph; and

(vi) Other activities or uses of the Property not identified in Paragraph 6 as Activities and Uses Inconsistent with the AUL.

**6.0 Restricted Activities and Uses**

Activities and uses that are inconsistent with the objectives of this Notice of AUL, and that, if implemented at the Site, may result in a significant risk of harm to human health, safety, or public welfare, are as follows:

(i) Use of the Property as a residence or for growing fruits or vegetables for human consumption, as a school, daycare, nursery, recreational area (such as a park or athletic field), and/or any other use in which a child's presence (other than incidental) is likely;

(ii) Any long-term (greater than 6 months) activity at the Property that is reasonably likely to result in the excavation greater than 3 feet below grade within the entire footprint of Lot 1 or excavation at or below surface grade within the entire footprint of Lot 2, relocation or removal of the contaminated soil, unless such activity is first evaluated by an LSP who renders an Opinion stating that such activity is consistent

DRAFT

with maintaining a condition of No Significant Risk and that such activity is conducted in accordance with Obligations (1) and (2), set forth below; and

(iii) Any excavation activity which may disturb the soil located at a depth greater than 3 feet below ground surface within the entire footprint of Lot 1 and/or disturbance of soil located at or below surface grade within the entire footprint of Lot 2 AUL area, without prior development and implementation of a Soil Management Plan and a Health and Safety Plan in accordance with Obligations (i) and (ii) of this Notice.

**7.0 Obligations for the AUL Area**

If applicable, obligations and/or conditions to be undertaken and/or maintained at the Site to maintain a condition of No Significant Risk, as set forth in the AUL Opinion, shall include the following:

1. Any long-term (greater than 6 months) activity at or use of the Property that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a **Health and Safety Plan** under the guidance of an LSP. At a minimum, the Health and Safety Plan must inform underground utility workers and other workers who may come into contact with soil in the AUL area of (1) the nature and hazards of the contaminants identified in the soil, (2) potential exposure routes, (3) measures to prevent exposure, (4) protective clothing requirements, and (5) any other health and safety measures appropriate for the activity or use;

2. Any long-term (greater than 6 months) activity at or use of the Property that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a written **Soil Management Plan** under the guidance of an LSP. At a minimum, the Soil Management Plan must (1) describe the soil excavation and stockpile storage methods that will be used to prevent accidental exposure to the excavated soil, including indirect exposure via surface water runoff or fugitive dust emissions, (2) contain procedures to limit access to the excavated soil and the excavation area by Property workers not covered by the Health and Safety Plan, children, Property abutters, or accidental trespassers, (3) contain procedures for characterizing, transporting and recycling/disposing excavated soil, and (4) provide for the restoration of the excavated area as soon as practicable; and

3. Any soil removed from the Property, other than the clean overburden and backfill, must be characterized and disposed of in accordance with federal, state and local regulations, including the MCP 310 CMR 40.0000.

4. The engineered environmental cap constructed within the entire footprint of Lot 1 must be regularly inspected, maintained, repaired and/or replaced with a comparable cap to prevent future exposure to underlying contaminated soil immediately following the completion of any activity that involves its removal and/or disturbance.

5. The engineered environmental cap constructed over Lot 1 shall consist of at least 3 feet of clean engineered fill material such as Dense Graded Aggregate or an engineer and LSP approved equal, or 6 inches of pavement or a building.

DRAFT

## 8.0 Summary and Conclusions

This LSP Opinion has been prepared for implementation of a Notice of AUL for a release at the ES R S Front Street Property, (Registry of Deeds Book 1536, Page 1120) in New Bedford, Bristol County, Massachusetts. A Method 3 Risk Characterization indicates that restrictions on activities and uses of this Property are required to maintain a condition of No Significant Risk to human health, safety or public welfare. In general, use of the Property for residential purposes, growing fruits or vegetables for human consumption, or any other use in which a child 's presence (other than incidental) is likely, are to be limited as set forth in Section 6.0. In addition, activities and uses that may result in the excavation, relocation, or removal of contaminated soil at the Property may be permitted with certain precautions.

CONFIRMATORY NOTICE OF ACTIVITY AND USE LIMITATION
M.G.L. c. 21E, § 6 and 310 CMR 40.0000

Disposal Site Name: Former Standard Times Site - Lot 3, 16 Blackmer Street, New Bedford, MA
DEP Release Tracking No.(s): 4-15490

This Confirmatory Notice of Activity and Use Limitation ("Notice") is made as of this 2nd day of February, 2010, by the Commonwealth of Massachusetts Department of Fish and Game located at 251 Causeway Street, Suite 400, Boston, Massachusetts 02114, together with his/her/its/their successors and assigns (collectively "Owner").

W I T N E S S E T H:

WHEREAS, the Commonwealth of Massachusetts Department of Fish and Game, is the owner in fee simple of that certain parcel of vacant land located in New Bedford, Bristol County, Massachusetts, pursuant to a deed recorded with the Bristol County Registry of Deeds (Southern District) in Book 7642, Page 344;

WHEREAS, said parcel of land, which is more particularly bounded and described in Exhibit A, attached hereto and made a part hereof ("Property") is subject to this Notice of Activity and Use Limitation. The Property is shown on a plan recorded in the Bristol County Registry of Deeds (Southern District) in Plan Book 148, Plan 92,

WHEREAS, a portion of the Property ("Portion of the Property") is subject to this Notice of Activity and Use Limitation. The Portion of the Property is more particularly bounded and described in Exhibit A-1, attached hereto and made a part hereof. The Portion of the Property is shown on a plan recorded with the Bristol County Registry of Deeds (Southern District) in Plan Book 163, Plan 106, and/or on a sketch plan attached hereto and filed herewith for registration;

WHEREAS, the Portion of the Property comprises part of a disposal site as the result of a release of oil and/or hazardous material. Exhibit B is a sketch plan showing the relationship of the Portion of the Property subject to this Notice of Activity and Use Limitation to the boundaries of said disposal site existing within the limits of the Property and to the extent such boundaries have been established. Exhibit B is attached hereto and made a part hereof; and

WHEREAS, one or more response actions have been selected for the Portion of the Disposal Site in accordance with M.G.L. c. 21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 ("MCP"). Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil and/or (b) the restriction of certain activities occurring in, on, through, over or under the Portion of the Property. The basis for such restrictions is set forth in an Activity and Use Limitation Opinion ("AUL Opinion"), dated March 5, 2009 (which is

DRAFT

attached as Exhibit C of the original Notice of Activity and Use Limitation dated March 9, 2009, and recorded with the Registry of Deeds in Book 9289, Page 7.

NOW, THEREFORE, notice is hereby given that the activity and use limitations set forth in said AUL Opinion are as follows:

1. Activities and Uses Consistent with the AUL Opinion. The AUL Opinion provides that a condition of No Significant Risk to health, safety, public welfare or the environment exists for any foreseeable period of time (pursuant to 310 CMR 40.0000) so long as any of the following activities and uses occur on the Portion of the Property:

(i) Commercial and industrial activities and uses including, but not limited to, vehicular parking, pedestrian and vehicular traffic, passive recreation, landscaping, routine maintenance or any other use that does not compromise the structural integrity of the protective barrier, as defined in 3.(iv) and/or disturb contaminated soil located directly beneath the barrier;

(ii) Excavation associated with emergency or short term (three months or less) underground utility and/or construction work, provided it is conducted in accordance with a Soil Management Plan and a Health and Safety Plan in accordance with Obligations (i) and (ii) of this Notice; and involves the repair and/or replacement of the protective barrier with a comparable barrier immediately following the completion of the project;

(iii) Activities and uses that are not identified by this Notice as being inconsistent with maintaining a condition of No Significant Risk; and

(iv) Such other activities and uses which, in the Opinion of an LSP, shall present no greater risk of harm to health, safety, public welfare, or the environment than the activities and uses set forth in this paragraph.

2. Activities and Uses Inconsistent with the AUL Opinion. Activities and uses that are inconsistent with the objectives of this Notice of Activity and Use Limitation, and which, if implemented at the Portion of the Property, may result in a significant risk of harm to health, safety, public welfare or the environment or in a substantial hazard, are as follows:

(i) Use of the Property as a residence, school, nursery, daycare, recreational area and/or other such use at which a child's regular presence is likely

DRAFT

(ii) Activities and/or uses which are likely to involve the removal and/or disturbance of the protective barrier in the AUL Area and/or the disturbance of the contaminated soil located beneath the protective barrier without prior development of a Soil Management Plan and a Health and Safety Plan in accordance with Obligations (i) and (ii) of the LSP Opinion;

(iii) Relocation of the contaminated soil from beneath the protective barrier in the AUL Area unless an LSP renders an Opinion that states such relocation is consistent with maintaining a condition of No Significant Risk; and

(iv) Activities and/or uses that may cause physical or chemical deterioration, breakage, or structural damage to the protective barrier.

3. Obligations and Conditions Set Forth in the AUL Opinion. If applicable, obligations and/or conditions to be undertaken and/or maintained at the Portion of the Property to maintain a condition of No Significant Risk as set forth in the AUL Opinion shall include the following:

(i) A Soil Management Plan must be prepared by an LSP and implemented prior to the commencement of any activity that is likely to disturb the contaminated soil located immediately beneath the protective barrier. The Soil Management Plan must be prepared in accordance with the guidelines discussed in the Activity and Use Limitation opinion attached hereto as Exhibit C of the original Notice of Activity and Use Limitation;

(ii) A Health and Safety Plan must be prepared and implemented in accordance with the guidelines discussed in the Activity and Use Limitation Opinion attached hereto as Exhibit C of the original Notice of Activity and Use Limitation prior to the commencement of any activity that involves the removal and/or disturbance of the protective barrier and/or is likely to disturb the underlying contaminated soil within the AUL Area;.

(iii) The protective barrier within the AUL Area must be repaired and/or replaced with a comparable barrier to prevent future exposures to underlying contaminated soil immediately following the completion of any activity that involves its removal and/or disturbance;

(iv) The protective barrier shall consist of either a minimum of 3-inches of asphalt pavement (or concrete), 3-feet of clean soil or a building

DRAFT

(v) The protective barrier must be maintained within the designated AUL area to ensure that the contaminated soil located beneath the barrier remains inaccessible; and

(vi) Annual inspections and associated record-keeping activities must be performed to confirm that the barrier is being properly maintained to prevent exposure(s) to contaminated soil located immediately beneath the protective barrier.

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Portion of the Property that may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by an LSP who shall render an Opinion, in accordance with 310 CMR 40.1080 *et seq.*, as to whether the proposed changes will present a significant risk of harm to health, safety, public welfare or the environment. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of a Response Action Outcome. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by an LSP in accordance with 310 CMR 40.1080 *et seq.*, and without additional response actions, if necessary, to achieve or maintain a condition of No Significant Risk or to eliminate substantial hazards.

If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by an LSP in accordance with 310 CMR 40.1080 *et seq.*, the owner or operator of the Portion of the Property subject to this Notice at the time that the activities, uses and/or exposures change, shall comply with the requirements set forth in 310 CMR 40.0020.

6. Incorporation Into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed.

Owner hereby authorizes and consents to the filing and recordation and/or registration of this Confirmatory Notice, said Confirmatory Notice to become effective when executed under seal by the undersigned LSP, and recorded and/or registered with the appropriate Registry(ies) of Deeds and/or Land Registration Office(s).

This Confirmatory Notice of Activity and Use Limitation is given to correct

DRAFT

the inadvertent error(s) made in the Notice of Activity and Use Limitation dated March 9, 2009, and recorded with the Registry of Deeds in Book 9289, Page 7, said error(s) being as follows:

(i) Exhibit B of the recorded Notice of Activity and Use Limitation did not properly depict AUL limits relative to the defined Site boundaries.

The corrected Site Sketch has been provided and attached hereto as Exhibit B. In all other respects, the terms of the Notice of Activity and Use Limitation remain unchanged.

WITNESS the execution hereof under seal this 20th day of January, 2010.

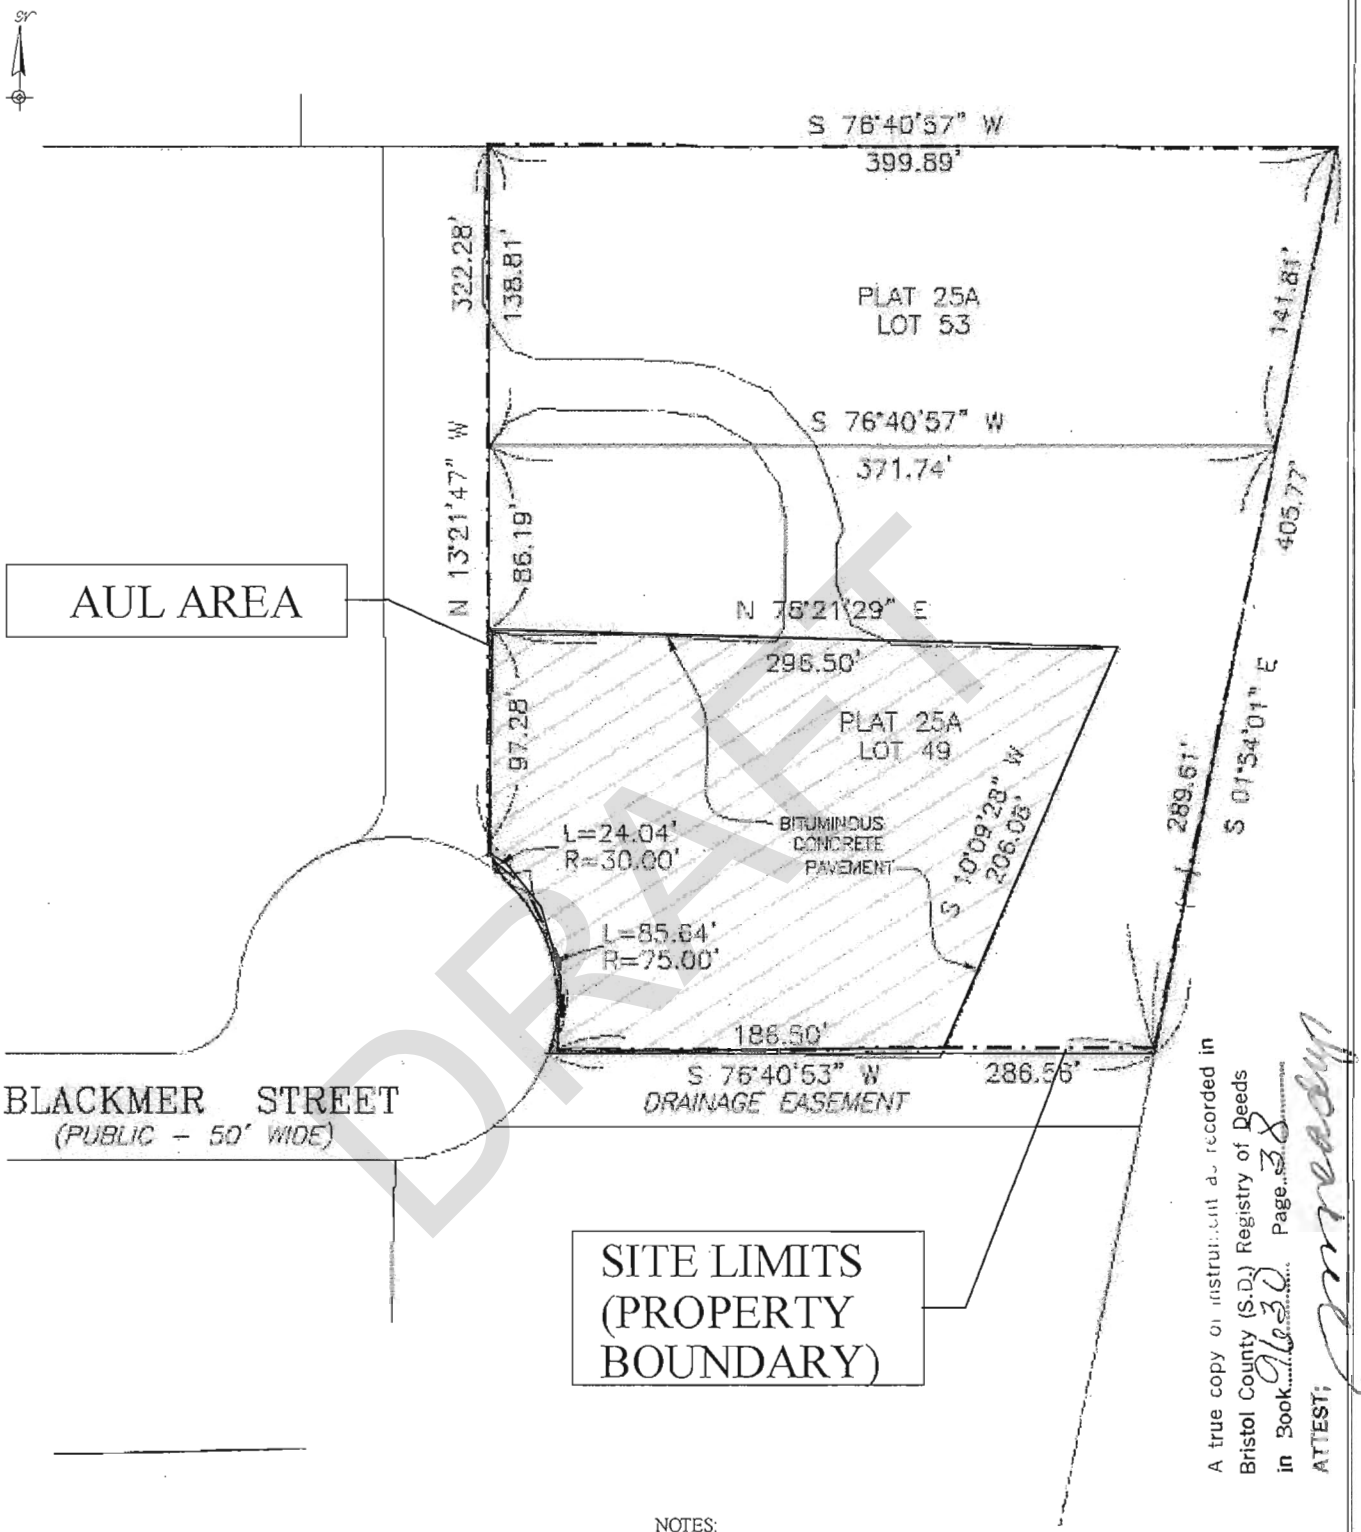
**EXHIBIT A**

(Description of Parcel of Land Containing Area Subject to AUL)

A certain parcel of land shown as Lot 3B on a Plan entitled "Approval Not Required Plan of Land located in New Bedford, MA prepared for City of New Bedford Redevelopment Authority", Scale 1"=60', dated November 21, 2001, prepared by Kenneth R. Ferreira Engineering, Inc., New Bedford, MA, recorded in the Bristol County Registry of Deeds in Plan Book 148 at Page 92, and being more particularly bounded and described as follows:

| | |
|---|---|
| BEGINNING | at a point on the easterly side of a cul-de-sac of said Blackmer Street marking the southwest corner of the parcel herein described as shown on said Plan; thence |
| Northwesterly | on a curve to the left with a radius of 75.00 feet an arc distance of 85.64 feet by said cul-de-sac of Blackmer Street to a point as shown on said Plan; thence |
| Northerly | on a curve to the right with a radius of 30.00 feet an arc distance of 24.04 feet by said cul-de-sac of Blackmer Street and by Lot 2B to a point as shown on said Plan; thence |
| N 13° 21' 47" W | one hundred eighty-three and 45/100 (183.45) feet by said Lot 2B to a point marking the northwest corner of the parcel herein described and the southwest corner of Lot 3A as shown on said Plan; thence |
| S 76° 40' 57" W | three hundred seventy-one and 74/100 (371.74) feet by said Lot 3A to a point marking the northeast corner of the parcel herein described and the southeast corner of said Lot 3A as shown on said Plan; thence |
| S 01° 54' 01" E | two hundred eighty-nine and 61/100 (289.61) feet to a point as shown on said Plan; thence |
| S 76° 40' 53" W | two hundred ninety-six and 56/100 (296.56) feet to the PLACE OF BEGINNING, containing 95,197 square feet of land, more or less, as shown on said Plan. |



DRAFT

**EXHIBIT A-1**
(Description of Area Subject to AUL)

That certain portion of a parcel of land, said parcel of land being situated in New Bedford, Bristol County, Massachusetts, and being shown as Lot 3B on the aforementioned plan recorded with said Deeds in Plan Book 148, Page 92, said portion being shown as the "Activity and Use Limitation Area" on a plan entitled, "Activity and Use Limitation Plan of Land in New Bedford, MA", dated December 2, 2008, Scale 1"=40', prepared by SITEC, Inc., Dartmouth, Massachusetts, and recorded with the Bristol County Registry of Deeds in Plan Book 163, Page 106 and being more particularly bounded and described as follows:

| | |
|---|---|
| BEGINNING | AT A POINT IN THE EASTERLY SIDELINE OF BLACKMER STREET, SAID POINT BEING THE SOUTHWEST CORNER OF THE PARCEL SHOWN AS LOT 3B ON PLAN RECORDED AT PLAN BOOK 148 PAGE 92 IN THE BRISTOL COUNTY REGISTRY OF DEEDS; THENCE |
| NORTHWESTERLY | ON A CURVE TO THE LEFT WITH A RADIUS OF 75.00 FEET AN ARC DISTANCE OF 85.64 FEET TO A POINT; THENCE |

NOTICE OF ACTIVITY AND USE LIMITATION

M.G.L. c. 21E, § 6 and 310 CMR 40.0000
Disposal Site Name: Former Dartmouth Finishing
DEP Release Tracking No.: 4-23616

This Notice of Activity and Use Limitation ("Notice") is made as of this 14th day of April, 2016, by The City of New Bedford, 133 Williams Street, New Bedford, Massachusetts, together with his/her/its/their successors and assigns (collectively "Owner").

WITNESSETH:

WHEREAS, The City of New Bedford, is the owner in fee simple of that certain parcel of vacant land located in New Bedford, Bristol County, Massachusetts, pursuant to a deed recorded with the Bristol County South Registry of Deeds in Book 8689 Page 93

WHEREAS, said parcel of land, which is more particularly bounded and described in Exhibit A, attached hereto and made a part hereof ("Property") is subject to this Notice of Activity and Use Limitation. The Property is shown on a plan recorded in the Bristol County Registry of Deeds in Plan Book 34, Plan 26;

WHEREAS, the Property comprises all of a disposal site as the result of releases of oil and/or hazardous material. Exhibit B is a sketch plan showing the relationship of the Property subject to this Notice of Activity and Use Limitation to the boundaries of said disposal site existing within the limits of the Property and to the extent such boundaries have been established. Exhibit B is attached hereto and made a part hereof; and

WHEREAS, one or more response actions have been selected for the Disposal Site in accordance with M.G.L. c. 21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 ("MCP". Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil and/or (b) the restriction of certain activities occurring in, on, through, over or under the Property. A description of the basis for such restrictions, and the oil and/or hazardous material release event(s) or site history that resulted in the contaminated media subject to the Notice of Activity and Use Limitation which is attached hereto as Exhibit C and made a part hereof;

NOW, THEREFORE, notice is hereby given that the activity and use limitations set forth in this Notice of Activity and Use Limitation are as follows:

1. Activities and Uses Consistent with Maintaining No Significant Risk Conditions. The following Activities and Uses are consistent with maintaining a Permanent Solution and a condition of No Significant Risk and, as such, may occur on the Property pursuant to 310 CMR 40.0000:

   (i) Commercial and industrial activities and uses which do not involve the disturbance of soil located greater than 3 feet below the ground surface within the AUL area, as long as the Obligations and Conditions specified herein are followed;
   (ii) Any non-residential uses of the Property, including those that are currently conducted, in which a child's presence (other than incidental) is not likely;
   (iii) Short-term (6 months or less) underground utility and/or construction activities which are likely to disturb soil, provided that such activities are conducted in accordance with the soil management provisions of the Massachusetts Contingency Plan (MCP) cited at 310 CMR 40.0030 and all applicable worker health and safety practices pursuant to 310 CMR 40.0018;
   (iv) Construction or excavation activities are allowed, except as prohibited in Paragraph 2 (ii);
   (v) Such other activities or uses which, in the Opinion of a Massachusetts Licensed Site Professional ("LSP"), shall present no greater risk of harm to human health, safety, public welfare or the environment than the activities and uses set forth in this paragraph; and
   (vi) Other activities or uses of the Property not identified in Paragraph 2 as Activities and Uses Inconsistent with the AUL.

2. Activities and Uses Inconsistent Maintaining No Significant Risk Conditions. The following Activities and Uses are inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk pursuant to 310 CMR 40.0000, and, as such, may not occur on the Property:

DRAFT

(i) Use of the Property as a residence or for growing fruits or vegetables for human consumption, as a school, daycare, nursery, recreational area (such as a park or athletic field), and/or any other use in which a child's presence (other than incidental) is likely;

(ii) Any long-term (greater than 6 months) activity at the Property that is reasonably likely to result in the excavation greater than 3 feet below grade, relocation or removal of the contaminated soil, unless such activity is first evaluated by an LSP who renders an Opinion stating that such activity is consistent with maintaining a condition of No Significant Risk and that such activity is conducted in accordance with Obligations (i) and (ii), set forth below; and

(iii) Any excavation activity which may disturb the soil located at a depth greater than 3 feet below ground surface within the AUL area, without prior development and implementation of a Soil Management Plan and a Health and Safety Plan in accordance with Obligations (i) and (ii) of this Notice.

3. Obligations and Conditions. The following obligations and/or conditions are necessary and shall be undertaken and/or maintained at the Property to maintain a Permanent Solution and a condition of No Significant Risk:

(i) Any long-term (greater than 6 months) activity at or use of the Property that is reasonably likely to result in the excavation, relocation, or removal of contaminated soil requires preparation and implementation of a Health and Safety Plan under the guidance of an LSP. At a minimum, the Health and Safety Plan must inform underground utility workers and other workers who may come into contact with soil in the AUL area of (1) the nature and hazards of the contaminants identified in the soil, (2) potential exposure routes, (3) measures to prevent exposure, (4) protective clothing requirements, and (5) any other health and safety measures appropriate for the activity or use;

(ii) Any long-term (greater than 6 months) activity at or use of the Property that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a written Soil Management Plan under the guidance of an LSP. At a minimum, the Soil Management Plan must (1) describe the soil excavation and stockpile storage methods that will be used to prevent accidental exposure to the excavated soil, including indirect exposure via surface water runoff or fugitive dust emissions, (2) contain procedures to limit access to the excavated soil and the excavation area by Property workers not covered by the Health and Safety Plan, children, Property abutters, or accidental trespassers, (3) contain procedures for characterizing, transporting and recycling/disposing excavated soil, and (4) provide for the restoration of the excavated area as soon as practicable;

(iii) Any soil removed from the Property, other than the clean backfill and overburden, must be characterized and disposed of in accordance with federal, state and local regulations, including the MCP, 310 CMR 40.0000.

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Property which may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by a Licensed Site Professional who shall render an Opinion, in accordance with 310 CMR 40.1080, as to whether the proposed changes are inconsistent with maintaining a Permanent Solution and a condition of No Significant Risk. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of a Permanent or Temporary Solution. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by a Licensed Site Professional in accordance with 310 CMR 40.1080, and without additional response actions, if necessary, to maintain a condition of No Significant Risk. If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by a Licensed Site Professional in accordance with 310 CMR 40.1080, the owner or operator of the Property subject to this Notice at the time that the activities, uses and/or exposures change, shall comply with the requirements set forth in 310 CMR 40.0020.

DRAFT

6. Incorporation into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed in accordance with 310 CMR 40.1074(5).

Owner hereby authorizes and consents to the filing and recordation and/or registration of this Notice, said Notice to become effective when executed under seal by the undersigned Licensed Site Professional, and recorded and/or registered with the appropriate Registry of Deeds and/or Land Registration Office(s). Exhibit D, attached hereto, is an Affidavit of Authority of signature for Renee Fernandes.

WITNESS the execution hereof under seal this 14th day of April, 2016.

## Metes and Bounds Description of Parcel of Land Containing Area Subject to AUL

A certain parcel of land being shown as Activities and Use Limitation (AUL) on a plan recorded herewith. More particularly described as follows:

Beginning at a point in the north line of Cove Street distant easterly therein from the east line of Harbor Street two hundred fifty-six and 47/100 (256.47) feet; thence northerly by land of Naushon Mill, Inc., a distance of eight hundred fifty-eight and 80/100 (858.80) feet to a corner; thence easterly by last named land a distance of two hundred four and 51/100 (204.51) feet to a corner; thence southeasterly by said last named land a distance of seventeen and 1/100 (17.01) feet to a point; thence southerly a distance of twenty two and 52/100 (22.52) feet to a point; thence easterly a distance of fourteen and 80/100 (14.80) feet to a point in the westerly face of an existing two-story brick building; thence southerly by line of last named building a distance of four hundred twenty-eight and 56/100 (428.56) feet to a point; thence westerly a distance of twenty-two and 14/100 (22.14) feet to a point; thence southerly a distance of three hundred fifty-six and 80/100 (356.80) feet to a point in the north line of Cove Street being easterly therein four hundred seventy-two and 67/100 (472.67) feet from the east line of Harbor Street; thence westerly in said north line of Cove Street a distance of one hundred forty-six (146) feet to a point of curvature; thence westerly in the said north line of Cove Street along the arc of a circle having a radius of 488.72 feet a distance of seventy and 20/100 (70.20) feet to the point of beginning.

# ACTIVITY AND USE LIMITATION OPINION

## 1.0 Introduction

This Licensed Site Professional (LSP) Opinion for the Notice of Activity and Use Limitation (AUL) was prepared by Michael Bingham (LSP No. 4141) on behalf of The City of New Bedford, for release conditions at the 45 Cove Street property in New Bedford, Bristol County, Massachusetts (the Property). The MassDEP has assigned Release Tracking Number (RTN) 4-23616 to this site. This LSP Opinion was prepared in accordance with 310 CMR 40.1074 and (1) explains why implementation of the AUL is appropriate to maintain a level of No Significant Risk at the Property (as defined in the AUL), (2) describes activities and uses prohibited in the area of the Property to be subject to the AUL, (3) identifies permitted activities and uses in the AUL area, and (4) identifies conditions or obligations for the AUL area in order to maintain a level of No Significant Risk.

## 2.0 Property Background

The Property consists of one vacant parcel totaling approximately 4.304 acres located at 45 Cove Street in New Bedford, Massachusetts. The Property was previously improved with a single story brick building that occupied most of the Property and was formerly occupied by Dartmouth Finishing, a fabric finishing and dyeing business, which abandoned the property in 1994. . The building demolition was completed in 2002, and except for soil stockpile and demolition debris the Property has remained vacant since. The City acquired the Property as a tax foreclosure in June 2007.

The Property was identified to be redeveloped by the nearby Marine Commerce Terminal in New Bedford (Terminal) project. The Terminal project involved the construction of a multi-purpose facility designed to support the construction, assembly and deployment of offshore wind projects, as well as handle bulk, break-bulk, container and large specialty marine cargo. The Property was selected to serve as a staging area for various cargoes associated with the Terminal operations. In 2015 the Property was graded and at least 5 feet of clean dredge material and dense graded aggregate, generated during the MCT channel dredging, was brought in to bring the final grade to street level and a fence was installed around the perimeter.

Current site features are depicted on Exhibit B to this AUL.

## 2.1 Disposal Site Description

A Notice of Noncompliance (NON) was issued by MassDEP to Dartmouth Finishing in 1994 for violations of state hazardous waste, air quality, and industrial wastewater programs. MassDEP and the EPA responded to a notification in 1997 by the New Bedford Fire Department that OHM present in corroded drums in the former Site building represented a threat of release. The MassDEP issued RTN 4-12810 for the Site on January 21, 1997. A total of 480 drums varying in size from 40 gallons to 85 gallons, one aboveground tank, four vats, and two No. 6 fuel oil underground storage tanks (USTs) were inventoried by the EPA. A removal action included pumping oil from the two USTs, removing sludge from the vats and troughs in the basement, and removing 480 drums of OHM for off-site disposal to abate the identified imminent hazard and stabilize site conditions.

An Immediate Response Action (IRA) for RTN 4-12810 was completed at the Property in 2004 and included the removal of two 10,000-gallon USTs and approximately 80 cubic yards of petroleum-impacted soil. Based on the results of the 2004 subsurface investigation and the completion of a Method 1 Risk Characterization, an Immediate Response Action Completion Statement and Class A-2 Response Action Outcome Statement were submitted in August 2004 for RTN 4-12810 by Roberts Consulting in August 2004. The contaminants of concern in the RAO and Method 3 Risk Characterization, identified below the concrete basement slab, were: arsenic, lead, and petroleum compounds. Mr. Charles Kibbee, of G & L Bedford Realty, Inc. was listed as the owner of the property.

Additional subsurface investigation was completed at the property as due diligence for a property transfer in 2012, which identified a new reportable release. The 2012 Phase II CSA investigation identified contaminant concentrations in soil and groundwater above applicable MassDEP Reportable Concentrations (RCs) at the Site. Specifically, the report identified additional contaminants of concern and areas of release in soil and groundwater beneath the concrete slab at the Site that were inconsistent with the previous RAO submittal filed for the Site with the MassDEP in 2004. In addition, the analysis of stockpiled soil staged above the slab identified contaminant concentrations greater than regulatory reportable thresholds. These soils were not previously sampled as part of the prior RAO and are located above the slab, suggesting a different exposure assumption. Also, the investigation identified concentrations of dissolved silver in groundwater above applicable reporting criteria, which was not addressed in the previous RAO findings. The detection of new contaminants of concern concentrations in soil and groundwater was reported on October 3, 2011 under a 120-day notification obligation to MassDEP which assigned RTN 4-23616 to the release.

Remedial activities completed at the Site during construction included:

- Crushing of concrete and construction debris in the stockpiled material in the former basement area;

DRAFT

BK 11656 PG 317

- Levelling of the stockpiled construction debris within the basement footprint to evenly distribute the material into an approximately one-foot thickness;
- Removal of **approximately 76 tons** of petroleum impacted material encountered during Site construction and back fill activities under Bill of Lading protocol;
- Importing approximately 40,000 cubic yards of pre-characterized and clean dredge material, consisting of glacial-fluvial sediments, to bring the grade to approximately 0ne foot below final design grade;
- The addition of a minimum of one-foot of dense graded aggregate compacted and contoured to design specifications.

### 3.0 Summary of the Risk Characterization

A Method 3 Risk Characterization was prepared in November 2015 by Apex in anticipation of site closure. The results of the risk characterization are the basis for the decision regarding the Permanent Solution with Conditions (PSC) for the release at the Site pursuant to 310 CMR 40.1000. A summary of the Risk Characterization is presented below.

The contaminants of concern and the maximum remaining concentration exceeding applicable Method 1 Risk Characterization criteria, per 310 CMR 40.0975(6) are listed below:

- Total petroleum hydrocarbons – 2,00 mg/kg;
- C11-C22 Aromatic hydrocarbons – 3,500 mg/kg;
- C9-C10 Aromatic hydrocarbons – 1,600 mg/kg;
- C9-C12 Aliphatics hydrocarbons – 1,800 mg/kg;\
- Lead – 2,900 mg/kg (no TCLP exceedance);
- Total Chromium – 300 mg/kg;
- Benzo(a)anthracene – 13 mg/kg;
- Benzo9a)pyrene – 12 mg/kg;
- Benzon(b)flouranthene – 16 mg/kg; and
- Dibenzo(a,h)anthracene 2 mg/kg.

The Property is currently a storage and staging area associated with the nearby marine terminal. Under foreseeable future conditions, receptors reasonably likely to be present on site include workers, security personnel, escorted visitors, trespassers, landscapers, utility workers, and construction workers. The Risk Characterization determined that "No Significant Risk" of harm to human health exists at the Site for each receptor type considered in the risk characterization. It also determined that "No Significant Risk" of harm to safety, public welfare and the environment exists at all portions of the Site. As a result of the risk characterization, an AUL is required to limit Residential use of the property. In addition, due to the presence of elevated concentrations of compounds of concern in soil, the AUL includes requirements for soil management if soil intrusive work is planned below the environmental cap. The disposal site includes the entire property (see Exhibit B of the AUL).

DRAFT

### 4.0 Use of the AUL to Maintain a Level of No Significant Risk

As described in the Risk Characterization, a condition of No Significant Risk to human health, safety, public welfare and the environment currently exists at the Site. However, this conclusion is based on the assumption that the Property will not be used for residential purposes or for the growing of fruits or vegetables for human consumption. This restriction is extended to limit the use of the Property as a school, daycare, nursery, recreational area (such as a park or athletic field) and/or any other use in which a child's presence is likely to be more than incidental. All other reasonably foreseeable site uses were considered. In addition, because residual contamination was documented in soil below the clean fill barrier, this AUL will also provide appropriate notice to future Site users to exercise appropriate caution when handling soil, and ensure that unnecessary exposures do not occur and that contaminated materials are handled appropriately.

### 5.0 Acceptable Activities and Uses

The AUL Opinion provides that a condition of No Significant Risk to health, safety, or public welfare exists for any foreseeable period of time (pursuant to 310 CMR 40.0000) as long as any of the following activities and uses occur on the Property:

(i) Commercial and industrial activities and uses which do not involve the disturbance of soil located greater than 3 feet below the ground surface within the AUL area, as long as the Obligations and Conditions specified herein are followed;

(ii) Any non-residential uses of the Property, including those that are currently conducted, in which a child's presence (other than incidental) is not likely;

(iii) Short-term (6 months or less) underground utility and/or construction activities which are likely to disturb soil, provided that such activities are conducted in accordance with the soil management provisions of the

BK 11656 PG 318

Massachusetts Contingency Plan (MCP) cited at 310 CMR 40.0030 and all applicable worker health and safety practices pursuant to 310 CMR 40.0018;

(iv) Construction or excavation activities are allowed, except as prohibited in Paragraph 6 (ii);

(v) Such other activities or uses which, in the Opinion of a Massachusetts Licensed Site Professional ("LSP"), shall present no greater risk of harm to human health, safety, public welfare or the environment than the activities and uses set forth in this paragraph; and

(vi) Other activities or uses of the Property not identified in Paragraph 6 as Activities and Uses Inconsistent with the AUL.

**6.0 Restricted Activities and Uses**

Activities and uses that are inconsistent with the objectives of this Notice of AUL, and that, if implemented at the Site, may result in a significant risk of harm to human health, safety, or public welfare, are as follows:

(i) Use of the Property as a residence or for growing fruits or vegetables for human consumption, as a school, daycare, nursery, recreational area (such as a park or athletic field), and/or any other use in which a child's presence (other than incidental) is likely;

(ii) Any long-term (greater than 6 months) activity at the Property that is reasonably likely to result in the excavation greater than 3 feet below grade, relocation or removal of the contaminated soil, unless such activity is first evaluated by an LSP who renders an Opinion stating that such activity is consistent with maintaining a condition of No Significant Risk and that such activity is conducted in accordance with Obligations (i) and (ii), set forth below; and

(iii) Any excavation activity which may disturb the soil located at a depth greater than 3 feet below ground surface within the AUL area, without prior development and implementation of a Soil Management Plan and a Health and Safety Plan in accordance with Obligations (i) and (ii) of this Notice.

**7.0 Obligations for the AUL Area**

If applicable, obligations and/or conditions to be undertaken and/or maintained at the Site to maintain a condition of No Significant Risk, as set forth in the AUL Opinion, shall include the following:

1. Any long-term (greater than 6 months) activity at or use of the Property that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a Health and Safety Plan under the guidance of an LSP. At a minimum, the Health and Safety Plan must inform underground utility workers and other workers who may come into contact with soil in the AUL area of (1) the nature and hazards of the contaminants identified in the soil, (2) potential exposure routes, (3) measures to prevent exposure, (4) protective clothing requirements, and (5) any other health and safety measures appropriate for the activity or use;

2. Any long-term (greater than 6 months) activity at or use of the Property that is reasonably likely to result in the excavation, relocation, or removal of the contaminated soil requires preparation and implementation of a written Soil Management Plan under the guidance of an LSP. At a minimum, the Soil Management Plan must (1) describe the soil excavation and stockpile storage methods that will be used to prevent accidental exposure to the excavated soil, including indirect exposure via surface water runoff or fugitive dust emissions, (2) contain procedures to limit access to the excavated soil and the excavation area by Property workers not covered by the Health and Safety Plan, children, Property abutters, or accidental trespassers, (3) contain procedures for characterizing, transporting and recycling/disposing excavated soil, and (4) provide for the restoration of the excavated area as soon as practicable; and

3. Any soil removed from the Property, other than the clean overburden and backfill, must be characterized and disposed of in accordance with federal, state and local regulations, including the MCP 310 CMR 40.0000.

**8.0 Summary and Conclusions**

This LSP Opinion has been prepared for implementation of a Notice of AUL for a release at the 45 Cove Street property in New Bedford, Bristol County, Massachusetts. A Method 3 Risk Characterization indicates that restrictions on activities and uses of this Property are required to maintain a condition of No Significant Risk to human health, safety or public welfare. In general, use of the Property for residential purposes, growing fruits or vegetables for human consumption, or any other use in which a child 's presence (other than incidental) is likely, are to be limited as set forth in Section 6.0. In addition, activities and uses that may result in the excavation, relocation, or removal of contaminated soil at the Property may be permitted with certain precautions.

DRAFT

EXHIBIT D

**AFFIDAVIT OF AUTHORITY**

Now comes Renee Fernandes, the Treasurer of the City of New Bedford, who upon oath hereby deposes and states:

1. The City of New Bedford, a municipal corporation existing under the laws of the Commonwealth of Massachusetts, with an address of 133 William Street, New Bedford, Bristol County, Massachusetts, is the record owner of certain real property shown as New Bedford Assessor's Map 21, Lot 45, formerly known and numbered as 45 Cove Street, New Bedford, Bristol County, Massachusetts (the "Property") pursuant to a judgment of the Land Court dated June 12, 2007 and recorded in the Bristol County (S.D.) Registry of Deeds in Book 8689, Page 93.

2. Pursuant to Section 2-102 of the Code of Ordinances of the City of New Bedford, I, as the Treasurer, am the custodian of all property acquired through the tax title process and therefore the person authorized to execute any and all documents regarding the property, including but not limited to an Activity and Use Limitation.

Signed under the pains and penalties of perjury this 11th day of April, 2016

Renee Fernandes
Treasurer, City of New Bedford

***COMMONWEALTH OF MASSACHUSETTS***

BRISTOL, ss April 11, 2016

On this 11th day of April, before me, the undersigned Notary Public, personally appeared the above-named Renee Fernandes proved to me by satisfactory evidence of identification, being (check whichever applies): ☐ driver's license or other state or federal governmental document bearing a photographic image, ☐ oath or affirmation of a credible witness known to me who knows the above signatory, or ☐ my own personal knowledge of the identity of the signatory, to be the person who signed the preceding document in my presence, and who swore or affirmed to me that the contents of the document are truthful and accurate to the best of her knowledge and belief, as the duly authorized treasurer of the City of New Bedford.

NOTICE OF ACTIVITY AND USE LIMITATION
M.G.L. c. 21E, § 6 and 310 CMR 40.0000

Disposal Site Name: CP Brodeur, Inc
DEP Release Tracking No.: 4-23643

This Notice of Activity and Use Limitation ("Notice") is made as of this 9 day of February, 2012, by CP Brodeur, Inc., a Massachusetts corporation whose address is 80 Wright Street, New Bedford, Massachusetts, together with their successors and assigns (collectively "Owner").

W I T N E S S E T H:

WHEREAS, CP Brodeur, Inc. is the owner in fee simple of that certain parcel of land located in New Bedford, Bristol County, Massachusetts with the buildings and improvements thereon pursuant to a deed recorded with the Bristol County Registry of Deeds in Book 1744 Page 996;

WHEREAS, said parcel of land, which is more particularly bounded and described in Exhibit A, attached hereto and made apart hereof ("Property") is subject to this Notice of Activity and Use Limitation. The Property is shown on a plan recorded in the Bristol County Registry of Deeds in Plan Book 99, Plan 12;

WHEREAS, a portion of the Property ("Portion of the Property") is subject to this Notice of Activity and Use Limitation. The Portion of the Property is more particularly bounded and described in Exhibit A-1, attached hereto and made a part hereof. The Portion of the Property is shown as "ACTIVITY AND USE LIMITATION AREA" on a plan recorded in the Bristol County Registry of Deeds in Plan Book 168, Plan 84.

WHEREAS, the Portion of the Property comprises all a disposal site as the result of a release of oil and/or hazardous material. Exhibit B is a sketch plan showing the relationship of the Portion of the Property subject to this Notice of Activity and Use Limitation to the boundaries of said disposal site existing within the limits of the Property and to the extent such boundaries have been established. Exhibit B is attached hereto and made a part hereof; and

WHEREAS, one or more response actions have been selected for the Disposal Site in accordance with M.G.L. c. 21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 ("MCP"). Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil and (b) the restriction of certain activities occurring in, on, through, over or under the Portion of the Property. The basis for such restrictions is set forth in an Activity and Use Limitation Opinion ("AUL Opinion"), dated January 13, 2012 (which is attached hereto as Exhibit C and made apart hereof);

DRAFT

NOW, THEREFORE, notice is hereby given that the activity and use limitations set forth in said AUL Opinion are as follows:

1. Activities and Uses Consistent with the AUL Opinion. The AUL Opinion provides that a condition of No Significant Risk to health, safety, public welfare or the environment exists for any foreseeable period of time (pursuant to 310 CMR 40.0000) so long as any of the following activities and uses occur on the Portion of the Property:

(i) Retail, commercial and/or industrial activities and uses, including but not limited to, associated pedestrian and vehicular traffic;

(ii) Excavation associated with underground utility work and/or construction work;

(iii) Activities associated with the routine maintenance of the property; including, but not limited to, mowing, landscaping, vegetation/debris removal, street sweeping, and catch basin cleaning;

(iv) Activities and uses which are not identified by this Notice as being inconsistent with maintaining a condition of No Significant Risk;

(v) Such other activities and uses which, in the Opinion of an LSP, shall present no greater risk of harm to health, safety, public welfare, or the environment than the activities and uses set forth in this paragraph; and

(vi) Such other activities and uses not identified in Paragraph 2 as being Activities and Uses Inconsistent with the AUL.

2. Activities and Uses Inconsistent with the AUL Opinion. Activities and uses which are inconsistent with the objectives of this Notice of Activity and Use Limitation, and which, if implemented at the Portion of the Property, may result in a significant risk of harm to health, safety, public welfare or the environment or in a substantial hazard, are as follows:

(i) Use of the Portion of the Property as a residence, school, playground, daycare facility or other use at which a child's regular presence is likely;

(ii) Use of the Portion of the Property for agriculture including, but not limited to, growing of homegrown produce except in raised planting beds;

(iii) Activities and/or uses that may cause physical or chemical deterioration, breakage, or structural damage to the concrete pavement on the Portion of the Property; and

(iv) Relocation of the contaminated soil from beneath the Portion of the Property unless an LSP renders an Opinion which states that such relocation is consistent with maintaining a condition of No Significant Risk.

DRAFT

3. Obligations and Conditions Set Forth in the AUL Opinion. If applicable, obligations and/or conditions to be undertaken and/or maintained at the Portion of the Property to maintain a condition of No Significant Risk as set forth in the AUL Opinion shall include the following:

(i) The concrete pavement must be maintained within the Portion of the Property to prevent exposures to the underlying contaminated soil;

(ii) A Soil Management Plan must be prepared by an LSP and implemented prior to the commencement of any activity that is likely to disturb the contaminated soil located below the concrete pavement on the Portion of the Property;

(iii) The concrete pavement within the Portion of the Property must be repaired or replaced with a comparable barrier following the completion of any activity that involves its removal and/or disturbance;

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Portion of the Property which may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by an LSP who shall render an Opinion, in accordance with 310 CMR 40.1080 *et seq.*, as to whether the proposed changes will present a significant risk of harm to health, safety, public welfare or the environment. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of a Response Action Outcome. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by an LSP in accordance with 310 CMR 40.1080 *et seq.*, and without additional response actions, if necessary, to achieve or maintain a condition of No Significant Risk or to eliminate substantial hazards.

If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by an LSP in accordance with 310 CMR 40.1080 *et seq.*, the owner or operator of the Portion of the Property subject to this Notice at the time that the activities, uses and/or exposures change, shall comply with the requirements set forth in 310 CMR 40.0020.

6. Incorporation Into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed.

Owner hereby authorizes and consents to the filing and recordation and/or registration of this Notice, said Notice to become effective when executed under seal by the undersigned LSP, and recorded and/or registered with the appropriate Registry of Deeds and/or Land Registration Office.

**EXHIBIT A**

(Description of Parcel of Land Containing Area Subject to AUL)

Beginning at a point in the southerly line of Wright Street said point being at the northwesterly corner of Parcel No. 1 Lot G of plan hereinafter described;

Thence south 12° 44' 02" east 244.41 feet;

Thence south 75° 39' 23" west 130.73 feet;

Thence north 11° 43' 32" west 148.07 feet to a point;

Thence north 11° 43' 32" west 68.66 feet to a point in the easterly line of MacArthur Drive;

Thence in an arc whose radius is 32.00 feet for a distance of 49.72 feet to a point in the southerly line of Wright Street;

Thence north 77° 17' 58" east 95.00 feet to the point of beginning, containing 31,451 square feet.

Being Lot G on plan of land entitled "The City of New Bedford, New Bedford Redevelopment Authority, Disposition Map Parcel No. 1 & 3, South Terminal Urban Renewal Project", dated September 14, 1977, Scale 1"=80', prepared by New Bedford Redevelopment Authority, New Bedford, Massachusetts and recorded with the Bristol County Registry of Deeds in Plan Book 99, Plan 12.

DRAFT

**EXHIBIT A-1**

(Description of Area Subject to AUL)

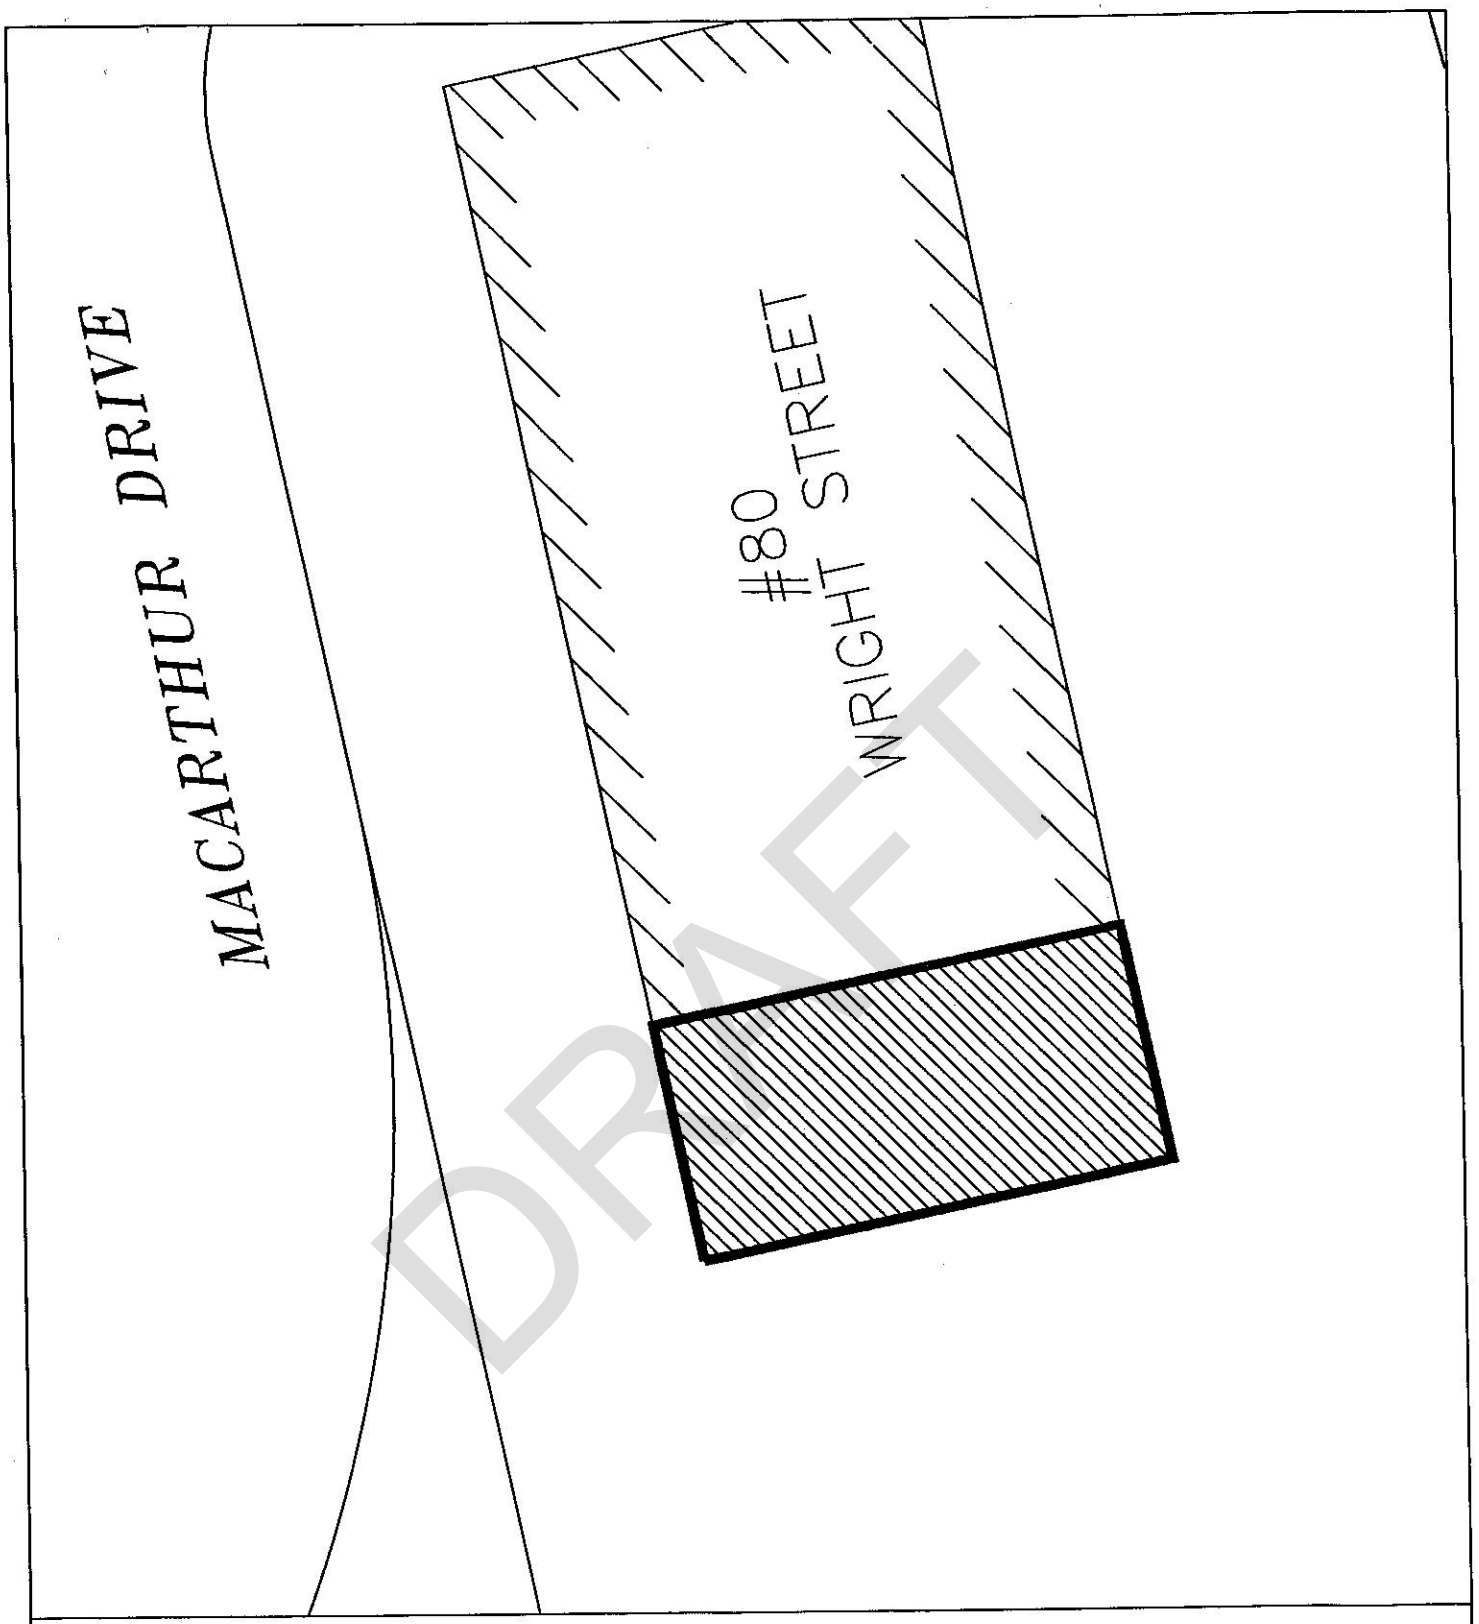
That certain portion of a parcel of land, said parcel of land being situated at 80 Wright Street in New Bedford, Bristol County, Massachusetts, and said portion being shown as "Activity and Use Limitation Area" on a plan entitled, "Plan of Activity and Use Limitation in New Bedford, MA", dated January 12, 2012, Scale 1"=20', prepared by SITEC, Inc., Dartmouth, Massachusetts, and recorded with the Bristol County Registry of Deeds in Plan Book 168, Plan 84, and said portion being more particularly bounded and described as follows:

Starting at a point on the southerly property line of the locus property, S 75° 39' 23" W, 114.23 feet distant from the southeastern-most corner of the locus lot, thence;

Perpendicular from said point on the southerly property line, 90.2 feet to the southeastern-most corner of the activity and use limitation area to be described.

Now beginning at said southeastern-most corner of the activity and use limitation area to be described, thence;

S 78° 19' 07" W, 49.93 feet, thence;



N 11° 35' 58" W, 25.02 feet, thence;

N 78° 19' 07" E 49.93 feet, thence;

S 11° 35' 58" E, 25.02 feet to the point of beginning.

Containing 1,249 square feet, more or less.

**RE: Activity and Use Limitation (AUL) Opinion**
**80 Wright Street**
**New Bedford, Massachusetts**

Dear Mrs. Pettway:

This Activity and Use Limitation (AUL) Opinion was prepared pursuant to 310 CMR 40.1074(1)(b) for a parcel of land located at 80 Wright Street, New Bedford, Bristol County, Massachusetts, and as identified as City of New Bedford Tax Assessor's Map 31, Lot 264 with the buildings and improvements thereon (the "Property").

Site History

21E investigations conducted at the Property identified elevated levels of petroleum hydrocarbons in soil and groundwater under the addition to the south of the building (the "Site"). The elevated levels of petroleum hydrocarbons are likely attributable to a leaking oil water separator located in the center of the Site. The Massachusetts Department of Environmental Protection (MassDEP) was notified of the release and a Release Abatement Measure (RAM) was completed to repair the soil water separator and stabilize the release. Site investigations were completed to define the nature and extent of the contamination and characterize the risk to human health and the environment.

DRAFT

Reason for Activity and Use Limitation

A Method 3 Risk Assessment was prepared to support the Response Action Outcome (RAO) for this Site. The Site is covered with an concrete barrier and contaminated soil is located greater than 3 feet below the ground surface eliminating routine direct contact with the sub-surface contaminated soil by full time workers, visitors, and trespassers; however, if this concrete barrier is removed this exposure pathway may become available and a level of "No Significant Risk" may not be maintained. The AUL requires the maintenance of the barrier to eliminate this exposure pathway. In addition, to inhibit increased risk of harm to human health, the AUL prohibits the use of the AUL area as a residence or other use where the routine high frequency and high intensity presence of a child is likely (i.e. daycare facility). Gardening will also be prohibited in the AUL area, which may cause a condition of "Significant Risk" if produce is grown in the contaminated soil.

Permitted Uses and Activities

(i) Retail, commercial and/or industrial activities and uses, including but not limited to, associated pedestrian and vehicular traffic;

(ii) Excavation associated with underground utility work and/or construction work;

(iii) Activities associated with the routine maintenance of the property; including, but not limited to, mowing, landscaping, vegetation/debris removal, street sweeping, and catch basin cleaning;

(iv) Activities and uses which are not identified by this Notice as being inconsistent with maintaining a condition of No Significant Risk;

(v) Such other activities and uses which, in the Opinion of an LSP, shall present no greater risk of harm to health, safety, public welfare, or the environment than the activities and uses set forth in this paragraph; and

(iv) Such other activities and uses not identified below as being Restricted Activities and Uses.

Restricted Uses and Activities

(i) Use of the Site as a residence, school, playground, daycare facility or other use at which a child's regular presence is likely;

(ii) Use of the Site for agriculture including, but not limited to, growing of homegrown produce except in raised planting beds;

DRAFT

BK 10291 PG 111

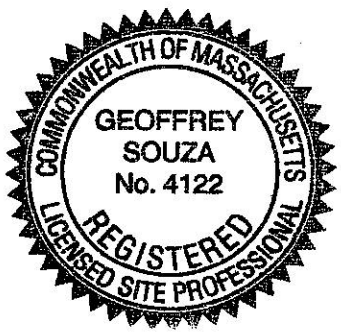
(iii) Activities and/or uses that may cause physical or chemical deterioration, breakage, or structural damage to the concrete pavement on the Site; and

(iv) Relocation of the contaminated soil from beneath the Site unless an LSP renders an Opinion which states that such relocation is consistent with maintaining a condition of No Significant Risk.

Obligations and Conditions

(i) The concrete pavement must be maintained within the Site to prevent exposures to the underlying contaminated soil;

(ii) A Soil Management Plan must be prepared by an LSP and implemented prior to the commencement of any activity that is likely to disturb the contaminated soil located below the concrete pavement on the Site;



(iii) The concrete pavement within the Site must be repaired or replaced with a comparable barrier following the completion of any activity that involves its removal and/or disturbance;

It is the opinion of SITEC Environmental, Inc. that implementation of the AUL insures that the residual contamination is unlikely to pose any significant risk to the public health or to present a condition of further environmental concern. Consequently, compliance with the requirements of the AUL also presents a regulatory closure which is unlikely to pose a future liability relative to MGL Chapter 21E and 310 CMR 40.0000 (MCP).

The AUL Opinion expressed herein has been developed based on the review of historical data, site reconnaissance, field observations and measurements, and site-specific analytical results. SITEC Environmental, Inc. makes no claims or representations (implicit or implied) as to the completeness or accuracy of information or data developed by others. Based on available information, research and site observations documented to date, the LSP Opinion forms a sound basis for effecting regulatory closure of this project via a Class A-3 RAO with an AUL, as defined.

# Rock Types

| Rock Name | Characteristics | Symbol |
|---|---|---|
| Claystone | Clay sized particles that are consolidated, lacking fissility. | |
| Coal | Black and shiny, can break into cubes or conchoidally. | |
| Conglomerate | Gravel sized grains and larger held together by finer material, called a breccia if clasts are angular. | |
| Limestone | Effervesses w/ diluted HCl, can be composed of clay up to gravel particles (fossils). | |
| Sandstone | Primarily sand sized particles modified w/ the descriptor fine, medium, or coarse. | |
| Shale | Clay sized particles, shale has fissility which is a horizontal sheet-like or laminated feature. | |
| Siltstone | Composed of silt, normally breaks as irregular chunks. | |

# Rock Quality Descriptions

## Weathering

**Completely Weathered:** All rock material is decomposed and/or disintegrated. The original rock structure may still be intact.

**Highly Weathered:** More than half of the rock material is decomposed. Fresh rock is present only as a discontinuous framework or as corestones.

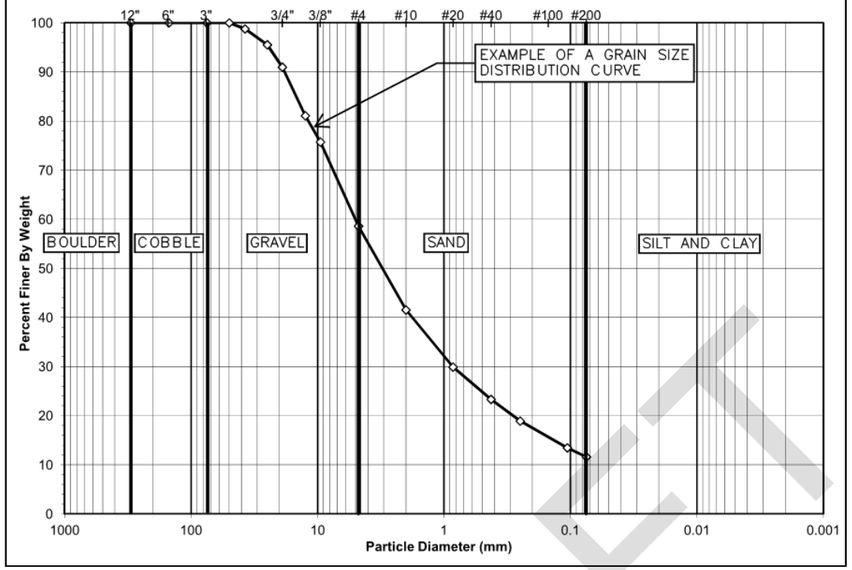
**Moderately Weathered:** Less than half of the rock material is decomposed. Fresh rock is present at a discontinuous framework or as corestones.

**Slightly Weathered:** Discoloration or staining indicates weathering of rock material on discontinuity surfaces. Rock may be discolored and softened.

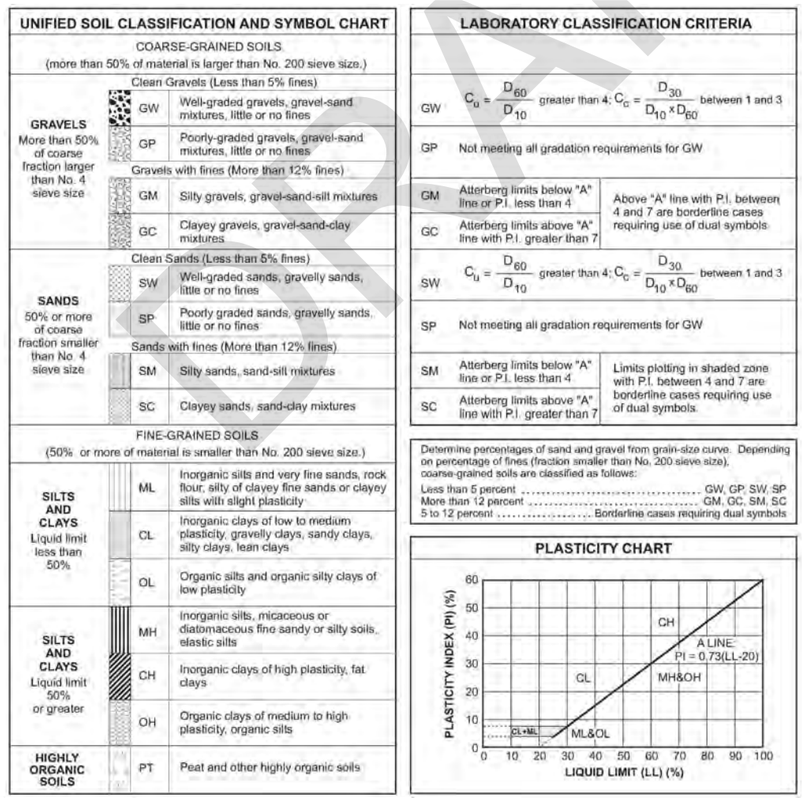
**Fresh:** No visible signs of rock material weathering.

## RQD

| Descriptor | % |
|---|---|
| Very Poor | <25 |
| Poor | 25-50 |
| Fair | 50-75 |
| Good | 75-90 |
| Excellent | >90 |



## Brokenness



| Descriptor | Fracture Spacing (in & ft) |
|---|---|
| Very Broken | <1 (<0.08) |
| Broken | 1-3 (0.08-0.25) |
| Moderately Broken | 3-6 (0.25-0.5) |
| Slightly Broken | >6 (>0.5) |

## Rock Hardness

| Descriptor | Field Criterion | Relative Unconfined Compressive Strength |
|---|---|---|
| Very Hard | Difficult to break w/ Hammer | > 30,000 psi |
| Hard | Hand-held sample breaks w/ Hammer | 8,000 to 30,000 psi |
| Medium Hard | Cannot scrape surface w/ knife | 2,000 to 8,000 psi |
| Soft | Cutting or scraping w/ knife difficult | 500 to 2,000 psi |
| Very Soft | Can be cut w/ knife | < 500 psi |

# Grain Size Distribution Curve

# Glossary

**Alluvial Soil or Alluvium:** Soil deposited by water in a river, stream, floodplain, or delta.

**Bedrock:** Materials underlying soil or other unconsolidated surficial materials in which refusal is consistently encountered on lithified, undisturbed, natural bedrock.

**Colluvial Soil or Colluvium:** Incoherent soil on or at the base of a slope deposited by gravity or slope movement.

**Fill:** Soil derived from natural soil, rock, or processed materials that was placed by artificial methods, such as construction, waste disposal, or dumping.

**Glacial Outwash:** Soil, typically sand and gravel, deposited by glacial streams or meltwater in a preexisting valley or over a plain.

**Glacial Till:** Soil deposited by and underneath a glacier, generally consisting of a heterogeneous, unstratified mixture of clay, sand, gravel, and boulders.

**N-Value:** The blow count representation of the penetration resistance of the soil determined by the Standard Penetration Test (SPT). It is the sum of the number of blows required to drive the sampler the second and third 6-inch increments (sample depth interval of 6 to 18 inches) and is recorded in blows per foot (bpf). The N-value is considered to be an indication of the relative density of coarse-grained soils (sand and gravel) or consistency of fine-grained soils (silt and clay).

**Pocket Pen (PP):** Field penetration test performed using a hand-held penetrometer that estimates unconfined compressive strength of cohesive soil in tons per square foot (tsf).

**Recovery %:** Total length of rock core or soil sample retrieved divided by the total length of the core run or sample interval, expressed as a percentage.

**Refusal:** The depth at which greater than 50 SPT hammer blows are required to drive the sampling spoon 6 inches or less.

**Residual Soil or Residuum:** Soil derived from the physical or chemical weathering of the underlying parent bedrock, generally with N-values less than 30 and 50 bpf in cohesive and cohesionless materials, respectively.

**Rock Quality Designation (RQD):** The sum of the length of intact rock core pieces longer than 4 inches (excluding mechanical breaks) divided by the total length of the core run, expressed as a percentage.

**Shelby Tube:** A 2" to 3" diameter, thin walled sampling tube that is pushed into the soil to obtain a relatively undisturbed soil sample for geotechnical laboratory tests.

**Split Spoon Sampler:** A soil sampling tube which is driven, retrieved, and split-open lengthwise for removal and visual inspection, and testing of the soil obtained.

**Standard Penetration Test (SPT) ASTM D1586 :** Field penetration test consisting of driving a 2-inch outside diameter split-spoon sampler 18 inches using a 140-pound hammer free falling a distance of 30 inches. The number of blows required to advance the spoon through successive 6-inch increments is recorded to determine the N-value.

**Weathered Rock:** Materials derived from lithified, undisturbed, natural bedrock which are able to be sampled with a split-spoon. Cohesive and cohesionless materials generally have N-values greater than 30 and 50 bpf, respectively.

# N-Value Rating

**Fine-Grained Soils (Silt and Clay)**

| Consistency | Blows/ft | PP (tsf) |
|---|---|---|
| Very Soft | 0-2 | <0.25 |
| Soft | 3-4 | 0.25-0.5 |
| Medium Stiff | 5-8 | 0.5-1 |
| Stiff | 9-15 | 1-2 |
| Very Stiff | 16-32 | 2-4 |
| Hard | >32 | >4 |

**Coarse-Grained Soils (Sand and Gravel)**

| Relative Density | Blows/ft |
|---|---|
| Very Loose | 0-4 |
| Loose | 5-10 |
| Medium Dense | 11-30 |
| Dense | 31-50 |
| Very Dense | >50 |

# Unconsolidated Material

| Term | Grain Size in mm (in) | Approximate Example Size |
|---|---|---|
| Clay and Silt | <.075 | can't see grains to barely visible |
| Fine Sand | 0.075-0.4 | table salt to sugar |
| Med. Sand | 0.4-2.0 (~<1/16) | openings in a window screen |
| Coarse Sand | 2.0-4.75 (~1/16-1/8) | sidewalk salt |
| Gravel | 4.75-75 (~1/8-3) | pea to tennis ball |
| Cobble | 75-300 (3-12) | tennis ball to basketball |
| Boulder | >300 (>12) | larger than a basketball |

**Other Features** – Used to describe other identifiable, pertinent features (e.g., angularity of coarse-grained soils, organics, construction debris, etc.)

| Term | % |
|---|---|
| Trace | < 5 |
| Few | 5-15 |
| Some | 15-45 |

**Moisture Content**

Dry: Sample is dusty or obviously dry.
Moist: Anything that does not fit the definition of dry or wet.
Wet: Sample contains free water.

**ATTACHMENT 14: SHUSTER BULKHEAD GEOTECHNICAL DATA REPORT – REVISION 1 (CIVIL & ENVIRONMENTAL CONSULTANTS, INC., APRIL 4, 2025)**

November 13, 2024
Revised April 4, 2025

Mr. Doug Ernst, P.E.
Foth Infrastructure & Environment, LLC
8191 Birchwood Court, Suite L
Johnston, IA 50131

Subject: Geotechnical Data Report – Revision 1
Proposed Shuster Bulkhead Replacement
4 Wright Street, New Bedford, Massachusetts 02740
CEC Project 332-344

Dear Mr. Ernst:

Civil & Environmental Consultants, Inc. (CEC) presents for your use our geotechnical data report for the above referenced project. This report presents a summary of the soil, bedrock, and subsurface water conditions at the site based on the data obtained from recent subsurface explorations coordinated by CEC and previous subsurface explorations performed by others. This report has been revised based on additional historical data provided to us by you.

CEC appreciates the opportunity to be of service to you on this project. Please call if you have any questions or comments.

Sincerely,

CIVIL & ENVIRONMENTAL CONSULTANTS, INC.

Antonio E. Sousa, P.E.
Project Manager

Jeffrey C. Woodcock, P.E.*
Vice President

# 1.0 INTRODUCTION

## 1.1 PURPOSE

The purpose of our services was to perform a series of subsurface explorations at the site to provide geotechnical data to Foth Infrastructure & Environment, LLC (Foth) in support of a proposed marine bulkhead and concrete platform to be designed by Foth.

## 1.2 SCOPE OF SERVICES

CEC completed the following scope of services to achieve the above-stated purpose.

(1) CEC planned and coordinated the office and field work, prepared a health and safety plan for the subsurface investigation and other field work associated with the project, and performed geotechnical research for site soils, geology, and historic conditions at the site. The subsurface explorations were coordinated between Foth and CEC.

(2) CEC located the test borings in the field utilizing a handheld Global Position System (GPS) unit. Ground surface elevations (rounded to the nearest half-foot) were obtained relative to existing site topography and their approximate locations are shown on Figure 1 of Appendix B.

(3) CEC subcontracted Geosearch Inc. (Geosearch) of Sterling, Massachusetts to drill several borings as part of three different mobilizations. The first mobilization consisted of drilling Borings CEC-1A through 3A between November 14 and 15, 2023. The second mobilization consisted of drilling Borings CEC-4A through 18A between May 20 and June 11, 2024. The third mobilization consisted of drilling Borings CEC-19A through 27A between August 26 and September 17, 2024. CEC's field representative monitored the subsurface exploration program, described the materials encountered while drilling and sampling, obtained water level readings, made modifications to the drilling program when necessary, and prepared field logs. CEC and Foth communicated daily during the subsurface explorations to modify the drilling program as needed and to discuss the

subsurface conditions prior to termination. Appendix C includes test boring logs for each test boring.

(4) CEC subcontracted Thielsch Engineering Laboratory of Cranston, Rhode Island to perform geotechnical laboratory testing on select soil and rock samples obtained during drilling operations.

(5) CEC reviewed the results of the subsurface exploration and laboratory testing and prepared this geotechnical report summarizing the data obtained in accordance with the purpose.

## 1.3 AUTHORIZATION

This geotechnical evaluation was performed, and the report was prepared in general accordance with Amendment #5 of the prime agreement between Foth and Massachusetts Clean Energy Council (MassCEC), dated August 2, 2024.

## 1.4 STANDARD OF CARE

The services performed by CEC were conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the geotechnical engineering profession practicing contemporaneously under similar conditions in the locality of the project. No warranty, express or implied, is made. Appendix A contains a document entitled "Important Information About This Geotechnical-Engineering Report." This document further explains the realities of geotechnical engineering and the limitations that exist in evaluating geotechnical issues.

## 1.5 REPORT LIMITATIONS

CEC prepared this report for the purpose of design development. Reliance on this report by any party other than Foth or its agents is expressly forbidden. CEC assumes no liability for the use of this report or information contained herein for any other purpose. Contractors should not rely on the information in this report for bid development or construction, beyond the use of the factual data presented herein.

# 2.0 DATA OBTAINED

## 2.1 BACKGROUND INFORMATION

The site is located at 4 Wright Street in New Bedford, Massachusetts (see Figure 1 in Appendix B for Locus Map). A single-story building is located at the site and currently serves as an office for the New Bedford Marine Commerce Terminal. The building is surrounded by paved parking areas. The site is located on the west bank of the Acushnet River and contains a cellular sheetpile bulkhead along the river bank with a paved surface over the bulkhead. The site is relatively flat at about El. 9 to 10 feet.

CEC understands that Foth plans to design a new marine bulkhead and concrete platform at the site. Based on a preliminary plan set provided to us by Foth titled "Shuster Bulkhead Structural Improvements", dated February 29, 2024, the existing bulkhead will be removed and existing fill from within the cellular cofferdams will be dredged. A new bulkhead is proposed approximately 55 feet west of the existing bulkhead along the Acushnet River, and the area between the existing bulkhead (to be removed) and the proposed bulkhead will consist of a concrete platform designed to support 4,100 pounds per square foot (psf) across most of the platform. The platform is also proposed to extend west of the new bulkhead and will be approximately 87 feet long by about 200 feet wide. Refer to Figure 2 in Appendix B for the approximate location of the proposed platform and bulkhead. The preliminary plan set indicates the concrete platform will be supported by 24- to 30-inch diameter pipe piles and the new bulkhead will be constructed as a king pile combination wall of sheet piles and pipe piles with a row of tieback anchors.

## 2.2 SITE SOILS AND GEOLOGY

### 2.2.1 Soils

The United States Geologic Survey (USGS) "Surficial Materials Map of the New Bedford South Quadrangle, Massachusetts (2018)" classifies the surficial soils as postglacial deposits consisting of artificial fill (i.e. earth and manmade materials that have been artificially emplaced). The United

States Department of Agriculture (USDA) web soil survey classifies the near surface soils as urban land. Urban land consists of areas previously disturbed by man-made excavation and/or fill placement, most commonly for land development.

### 2.2.2 Geology

The Bedrock Geologic Map of Massachusetts (1983) indicates bedrock in the area consists of Alaskite (gneissic granite) or biotite gneiss from the Proterozoic Era.

## 2.3 SUBSURFACE EXPLORATIONS

### 2.3.1 Recent Test Borings

CEC subcontracted Geosearch to drill three initial test boings, designated as CEC-1A trough CEC-3A, at the site between November 14th and 15th, 2023. CEC subsequently retained Geosearch to drill an additional fifteen (15) test borings at the site between May 20th and June 11th, 2024, designated as CEC-4A through CEC-18A. The final mobilization occurred from August 26th to September 17th, 2024 in which Geosearch drilled an additional nine (9) test borings, CEC-19A through CEC-27A. CEC's field representative monitored the subsurface exploration program, described the materials encountered, obtained water level readings, made modifications to the drilling program when necessary based on daily communication with Foth's design team, and prepared field logs. Appendix C includes the logs for each test boring. Soil sampling in Test Borings CEC-1A through CEC-27A totaled approximately 660 linear feet of soil drilling and approximately 313 feet of rock drilling. The test boring depths ranged from approximately 29 to 70 feet below the ground surface and terminated in either glacial till, weathered rock or bedrock. Figure 2 in Appendix B depicts the locations of the test borings, and Table 1 summarizes the information from the subsurface explorations. Appendix C includes detailed test boring logs and a summary of the definitions of standard terms and symbols used in this report and on the test boring logs.

Geosearch, Inc. advanced the test borings performed for the subsurface explorations utilizing drive and wash drilling methods and split-spoon sampling through soil in accordance with the standard penetration test (SPT) outlined in ASTM D1586. Soil sampling intervals varied during the drilling between continuous sampling to 5-foot center to center spacings for Test Borings CEC-1A through CEC-18A. No soil sampling was performed for Test Borings CEC-19A through 27A as the intent of these test borings was to obtain rock cores.

A split-spoon sampler is a 2-inch outside-diameter (OD) tube that retains a soil sample when driven into the soil. Upon retrieval, the sampler is split open for removal and identification of the retained soil sample. The SPT consists of driving a split-spoon sampler through soil using the energy of a 140-pound hammer free-falling a distance of 30 inches and recording the number of blows required to drive the split-spoon sampler through four successive 6-inch increments. The sum of the number of blows required to drive the split-spoon sampler through the second and third increments is the N-value of the soil. Soil N-values are commonly used to estimate soil density, consistency, compressibility, and shear strength. Split-spoon refusal (herein defined as when 50 or more blows of the 140-pound hammer are required to drive the split-spoon 6-inches or less) was encountered in all of the test borings where soil sampling took place except for CEC-8A and CEC-13A. CEC's project representative described the soil color, relative density (based on the SPT N-values), texture, origin, and apparent moisture content for obtained soil samples.

Rock sampling was performed with a 2-inch inside diameter, double barrel rock core drill equipped with a diamond core bit. Rock coring generally took place in 5-foot runs in test borings CEC-4A, 5A, and 9A through 27A. A maximum of 35 feet of rock was drilled (25 feet cored, see test boring log for additional info) in CEC-23A. Upon retrieval of the rock cores, each core run was placed into a rock core box for visual observation and classification. CEC's project representative documented the rock core advancement rate per foot during coring, and described the rock type and fractures, as well as the degree of weathering and hardness. CEC's project representative also documented the Rock Quality Designation (RQD) of each core run which is defined as the sum of the length of rock fragments greater than or equal to 4 inches divided by the length of the core run.

Refer to the test boring logs in Appendix C for additional information on soil and rock samples as well as Appendix D for a rock core photo log.

### 2.3.2 Previous Test Borings (Performed by Others)

Previous test borings were performed at the site by CLE Engineering in 2012 in collaboration with Geologic Earth Exploration, and by Apex Companies, LLC in collaboration with New Hampshire Boring in 2010 and 2011. Nine test borings were located within 100 feet or less of the proposed bulkhead and platform and are considered relevant to this project. The approximate location of the nine test borings (SB-1 through SB-5 from CLE Engineering and A-2010-B1, A-2011-B18, A-2011-LB-B9, and A-2011-LB-B10 from Apex) are shown in Figure 2 in Appendix B and the test boring logs are located in Appendix C. These nine borings totaled approximately 307 linear feet of soil drilled and 112 linear feet of bedrock drilled. A summary of these test borings is also included in Table 1.

## 2.4 WATER LEVEL MEASUREMENTS

CEC encountered measurable subsurface water at the completion of test drilling and soil sampling in Test Borings CEC-1A through CEC-18A; subsurface water measurements were not obtained in Test Borings CEC-19A through CEC-27A. The water levels recorded after completing soil sampling at the test boring locations ranged from approximately 4 to 8 feet bgs. CEC's field representative classified the apparent moisture contents of soil samples as ranging from dry to wet and noted that the moisture content typically increased with depth. CEC did not collect 24-hour water level measurements in the test borings because the test borings were backfilled after completing soil sampling for safety purposes. Table 1 summarizes the water level measurements recorded at the test boring and test pit locations. The water level measurements are also included in the test boring logs located in Appendix C.

## 2.5 GEOTECHNICAL LABORATORY TESTING

CEC selected soil samples obtained during the subsurface exploration for geotechnical material properties testing. Laboratory testing performed on soil samples included the following tests:

- Eight (8) Moisture content tests in accordance with ASTM D2216 "Determination of Water Content of Soil and Rock by Mass";
- Forty-three (43) Grain size analyses in accordance with ASTM D6913 "Particle-Size Distribution of Soils Using Sieve Analysis";
- Two (2) Sulfate content in accordance with EPA Method 9038 "Sulfate (Turbidimetric)";
- Two (2) Chlorides contents in accordance with EPA Method 9250 "Chloride (Colorimetric, Automated Ferricyanide AAI)";
- Two (2) pH tests in accordance with ASTM D4972 "pH of Soils";
- Two (2) Resistivity tests in accordance with EPA Method 9050A "Specific Conductance"; and
- Sixteen (16) Unconfined Compressive Strength of Rock tests in accordance with ASTM 7012, Method D "Compressive Strength and Elastic Moduli of Intact Rock Core Specimens under Varying States of Stress and Temperatures"

As part of the 2012 mobilization coordinated by CLE Engineering, twenty-four unit weight tests were performed (ASTM standard not specified). In addition, as part of the 2010-2011 mobilizations coordinated by Apex, four moisture content tests (ASTM D2216) and four unit weight tests (ASTM D7263) were performed on the test borings within the vicinity of the Shuster Bulkhead.

Table 2 summarizes the results of the laboratory testing and Appendix E includes the complete laboratory test results.

Notes:

-- Not Obtained / Not Encountered / Not Applicable

NR Not Recorded

1. Ground surface elevations are considered approximate. CEC test borings are in reference to Mean Low Water (MLW) datum and Apex test borings are in reference to Mean Low Low Water datum (MLLW), which is 0.14 ft lower than MLW.
2. Test borings CEC-19A through 27A were advanced to apparent bedrock without obtaining soil samples.
3. Top of bedrock elevation for Test Borings CEC-1A, CEC-6A and CEC-7A was based on refusal conditions encountered; no bedrock was cored.

Notes:

-- Not Obtained / Not Encountered / Not Applicable

(1) Minor Break at about 450 psi resulting in large Poisson's Ratio.

(2) Two moisture content results were obtained for this sample.

## 3.0 SUBSURFACE CONDITIONS

CEC presents the following summary of subsurface conditions based on our observations and data obtained. The subsurface materials encountered at the test boring locations included asphalt underlain by existing fill, glacial outwash, glacial till, weathered rock, and bedrock. The test borings performed by others appeared to contain similar subsurface layering to CEC's borings and are not discussed in detail the subsections below. The test borings performed at the site represent the subsurface conditions of the test locations at the time they were completed. Soil conditions encountered at other locations or times may differ.

### 3.1 ASPHALT

The existing site is primarily comprised of asphalt at the ground surface. CEC encountered asphalt pavement approximately 0.2 to 0.4 feet thick at all of the test boring locations, and pavement appeared to be placed directly on soil subgrade with no subbase drainage gravel layer.

### 3.2 EXISTING FILL CONDITIONS

Fill consists of soil, rock, or processed materials placed by human activities in order to raise a grade. The existing fill reportedly consists primarily of previously dredged marine sediment based on historical reports. CEC encountered existing fill at all test boring locations below the existing asphalt. The fill ranged in thickness from approximately 13.6 to 33.6 feet. The fill primarily consisted of poorly-graded sand with varying amounts of silt and gravel. The fill predominantly classified as SM (silty sand); SP (poorly-graded sands and gravely sands); SP-SM (poorly-graded sand with silt and gravel); and SW-SM (well-graded sand with silt and gravel) in accordance with the United Soil Classification System (USCS). One fine-grained sample of fill obtained in CEC-13A from 4 to 6 feet bgs was classified as ML (Sandy Silt). The relative density of the fill ranged from very loose to very dense, as SPT N-values in the existing fill ranged from 2 to 74 blows per foot (bpf) with an average of 19 bpf. The apparent moisture contents of the fill material ranged

from dry to moist. CEC's field representative determined apparent moisture contents based on visual observation of materials at the test boring locations at the time the test borings were drilled. Laboratory testing performed on the fill soils consisted of moisture content and grain size analysis. Moisture contents in the fill ranged from 3.5% to 17.8% and fines content in the fill ranged from 2.8% to 52%.

### 3.3 GLACIAL OUTWASH CONDITIONS

Glacial outwash consists of soil deposited by glacial streams or meltwater. CEC encountered glacial outwash soils below the fill in test borings CEC-1A, 5A, 7A, 8A, 10A to 14A, 16A and 18A and was approximately 0.5 to 9 feet thick where encountered. The glacial outwash primarily consisted of sand with varying amounts of gravel and silt. The glacial outwash samples were visually classified as SP-SM and SM in accordance with the USCS, with one sample (S-6 from 24 to 26 feet bgs in Boring CEC-10A) appeared to consist of poorly-graded gravel with silt (GP-GM). The relative density of the glacial outwash layer ranged from very loose to dense, as SPT N-values ranged from 3 to 37 bpf with an average of 16 bpf. All glacial outwash soil samples were observed below the water table.

Laboratory testing performed on the glacial outwash soils consisted of grain size analysis. The fines content in the glacial outwash ranged from 8% to 27.8%.

### 3.4 GLACIAL TILL CONDITIONS

Glacial till is defined herein as soil deposited by and underneath a glacier, generally consisting of a heterogeneous, unstratified mixture of clay, silt, sand, gravel, and boulders. CEC encountered glacial till in each boring directly beneath the fill or glacial outwash, and the glacial till was 3.7 to 20.5 feet thick. Test borings CEC-1A through CEC-3A and CEC-6A through CEC-8A terminated about 1 to 11.8 feet into the glacial till at 29.2 to 44 feet bgs. The glacial till primarily consisted of a well-sorted mix of sand, silt and gravel and were visually classified as SM, SP, SP-SM, SW-SM, ML, GM, GP, and GP-GM in accordance with the USCS. The relative density of the glacial till

ranged from loose to very dense, as SPT N-values in the glacial till layer ranged from 9 to 139 bpf with an average of 57 bpf. All glacial till soil samples were observed below the water table.

Laboratory testing performed on the glacial till soils consisted of grain size analysis. The fines content in the glacial till ranged from 7.4% to 18.2%.

## 3.5 WEATHERED ROCK CONDITIONS

Weathered rock is defined as materials derived from lithified, undisturbed, natural bedrock which are generally able to be sampled with a split-spoon. CEC encountered weathered rock at Test Borings CEC-4A, 5A and CEC-11A below glacial till at depths ranging from 40 to 54 feet bgs. The thickness of weathered rock ranged from approximately 4.1 to 10 feet. The relative density of the weathered rock was very dense, as SPT N-values ranged from 60 to 110 bpf with an average N value of 85 bpf. All weathered rock samples were observed below the water table. The one split spoon sample of weathered rock obtained generally consisted of Silty Sand with Gravel (SM). Weathered Rock was cored in Test Borings CEC-4A and 5A, but the RQD of the samples was 0 and the recovery of the samples ranged from 0 to 12%. The recovered weathered rock observed appeared to consist of highly weathered granite.

## 3.6 BEDROCK CONDITIONS

Bedrock is defined as materials underlying soil or other unconsolidated surficial materials in which refusal is consistently encountered. Bedrock was encountered in Test Borings CEC-4A, 9A, 10A, and CEC-12A through CEC-27A. The top of bedrock was encountered at about 20 to 50 feet bgs and was shallowest in the north-central area of the proposed bulkhead and platform (see Figure 3 for a Top of Bedrock Contour Map). Approximately 5 to 25 feet of bedrock was cored at the above noted test boring locations. The bedrock appeared to consist of gray to dark gray, medium to coarse grained granite or medium grained gabbro. Granite was more prevalent in the northern half of the site and gabbro was more prevalent in the southern half of the site, but intrusions of granite and gabbro were encountered across the site.

The bedrock ranged from fresh to slightly weathered. Six unconfined compressive strength tests were performed on gabbro cores, which ranged from 2,871 psi to 25,815 psi with an average compressive strength of 12,674 psi. Ten unconfined compressive strength tests were performed on granite cores, which ranged from 7,884 psi to 16,107 psi with an average compressive strength of 10,988 psi. In addition, the RQD of the gabbro cores ranged from 7% to 89% with an average of 47%, and the RQD of the granite cores ranged from 0% to 100% with an average of 54%.

## 3.7 GROUNDWATER CONDITIONS

CEC encountered groundwater at Test Borings CEC-1A to CEC-18A after completing soil sampling at depths ranging from approximately 4 to 7.5 feet bgs (El. 1.5 to 5 feet). Subsurface water conditions were not recorded in Test Borings CEC-19A through CEC-27A. Subsurface water conditions can fluctuate and vary based on precipitation, tidal influences, season, temperature, and other factors, and may vary at other times and locations across the site.

# APPENDIX A

# IMPORTANT INFORMATION ABOUT THIS GEOTECHNICAL-ENGINEERING REPORT

# Important Information about This

# Geotechnical-Engineering Report

**Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.**

**While you cannot eliminate all such risks, you can manage them. The following information is provided to help.**

**The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, clients can benefit from a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.**

## Geotechnical-Engineering Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled*. No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

## Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

## You Need to Inform Your Geotechnical Engineer about Change

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

## This Report May Not Be Reliable

*Do not rely on this report* if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be*, and, in general, *if you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying it. A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

## Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed.* The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

## This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

## This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

## Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only*. To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

## Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

## Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

## Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.*** Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

# APPENDIX C

# TEST BORING LOGS

**PERFORMED BY CIVIL & ENVIRONMENTAL CONSULTANTS (2023-2024)**

# Rock Types

| Rock Name | Characteristics | Symbol |
|---|---|---|
| Claystone | Clay sized particles that are consolidated, lacking fissility. | |
| Coal | Black and shiny, can break into cubes or conchoidally. | |
| Conglomerate | Gravel sized grains and larger held together by finer material, called a breccia if clasts are angular. | |
| Limestone | Effervesses w/ diluted HCl, can be composed of clay up to gravel particles (fossils). | |
| Sandstone | Primarily sand sized particles modified w/ the descriptor fine, medium, or coarse. | |
| Shale | Clay sized particles, shale has fissility which is a horizontal sheet-like or laminated feature. | |
| Siltstone | Composed of silt, normally breaks as irregular chunks. | |

# Rock Quality Descriptions

## Weathering

**Completely Weathered:** All rock material is decomposed and/or disintegrated. The original rock structure may still be intact.

**Highly Weathered:** More than half of the rock material is decomposed. Fresh rock is present only as a discontinuous framework or as corestones.

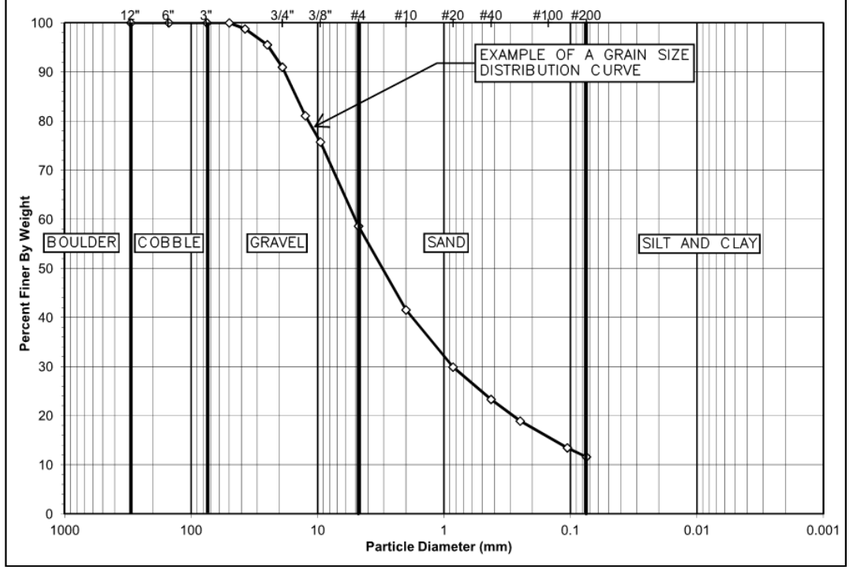
**Moderately Weathered:** Less than half of the rock material is decomposed. Fresh rock is present at a discontinuous framework or as corestones.

**Slightly Weathered:** Discoloration or staining indicates weathering of rock material on discontinuity surfaces. Rock may be discolored and softened.

**Fresh:** No visible signs of rock material weathering.

## RQD

| Descriptor | % |
|---|---|
| Very Poor | <25 |
| Poor | 25-50 |
| Fair | 50-75 |
| Good | 75-90 |
| Excellent | >90 |



## Brokenness

| Descriptor | Fracture Spacing (in & ft) |
|---|---|
| Very Broken | <1 (<0.08) |
| Broken | 1-3 (0.08-0.25) |
| Moderately Broken | 3-6 (0.25-0.5) |
| Slightly Broken | >6 (>0.5) |

## Rock Hardness

| Descriptor | Field Criterion | Relative Unconfined Compressive Strength |
|---|---|---|
| Very Hard | Difficult to break w/ Hammer | > 30,000 psi |
| Hard | Hand-held sample breaks w/ Hammer | 8,000 to 30,000 psi |
| Medium Hard | Cannot scrape surface w/ knife | 2,000 to 8,000 psi |
| Soft | Cutting or scraping w/ knife difficult | 500 to 2,000 psi |
| Very Soft | Can be cut w/ knife | < 500 psi |

# Grain Size Distribution Curve

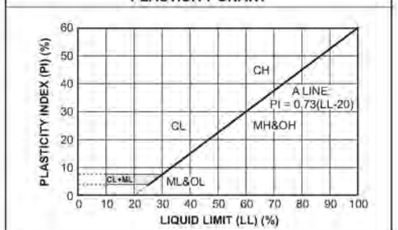
## UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS
(more than 50% of material is larger than No. 200 sieve size.)

| | | | |
|---|---|---|---|
| GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size | Clean Gravels (Less than 5% fines) | GW | Well-graded gravels, gravel-sand mixtures, little or no fines |
| | | GP | Poorly-graded gravels, gravel-sand mixtures, little or no fines |
| | Gravels with fines (More than 12% fines) | GM | Silty gravels, gravel-sand-silt mixtures |
| | | GC | Clayey gravels, gravel-sand-clay mixtures |
| SANDS 50% or more of coarse fraction smaller than No. 4 sieve size | Clean Sands (Less than 5% fines) | SW | Well-graded sands, gravelly sands, little or no fines |
| | | SP | Poorly graded sands, gravelly sands, little or no fines |
| | Sands with fines (More than 12% fines) | SM | Silty sands, sand-silt mixtures |
| | | SC | Clayey sands, sand-clay mixtures |

FINE-GRAINED SOILS
(50% or more of material is smaller than No. 200 sieve size.)

| | | | |
|---|---|---|---|
| SILTS AND CLAYS Liquid limit less than 50% | | ML | Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity |
| | | CL | Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays |
| | | OL | Organic silts and organic silty clays of low plasticity |
| SILTS AND CLAYS Liquid limit 50% or greater | | MH | Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts |
| | | CH | Inorganic clays of high plasticity, fat clays |
| | | OH | Organic clays of medium to high plasticity, organic silts |
| HIGHLY ORGANIC SOILS | | PT | Peat and other highly organic soils |



## LABORATORY CLASSIFICATION CRITERIA

| | | |
|---|---|---|
| GW | $C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3 | |
| GP | Not meeting all gradation requirements for GW | |
| GM | Atterberg limits below "A" line or P.I. less than 4 | Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols |
| GC | Atterberg limits above "A" line with P.I. greater than 7 | |
| SW | $C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3 | |
| SP | Not meeting all gradation requirements for GW | |
| SM | Atterberg limits below "A" line or P.I. less than 4 | Limits plotting in shaded zone with P.I. between 4 and 7 are borderline cases requiring use of dual symbols |
| SC | Atterberg limits above "A" line with P.I. greater than 7 | |

Determine percentages of sand and gravel from grain-size curve. Depending on percentage of fines (fraction smaller than No. 200 sieve size), coarse-grained soils are classified as follows:

| | |
|---|---|
| Less than 5 percent | GW, GP, SW, SP |
| More than 12 percent | GM, GC, SM, SC |
| 5 to 12 percent | Borderline cases requiring dual symbols |

## PLASTICITY CHART

# Glossary

**Alluvial Soil or Alluvium:** Soil deposited by water in a river, stream, floodplain, or delta.

**Bedrock:** Materials underlying soil or other unconsolidated surficial materials in which refusal is consistently encountered on lithified, undisturbed, natural bedrock.

**Colluvial Soil or Colluvium:** Incoherent soil on or at the base of a slope deposited by gravity or slope movement.

**Fill:** Soil derived from natural soil, rock, or processed materials that was placed by artificial methods, such as construction, waste disposal, or dumping.

**Glacial Outwash:** Soil, typically sand and gravel, deposited by glacial streams or meltwater in a preexisting valley or over a plain.

**Glacial Till:** Soil deposited by and underneath a glacier, generally consisting of a heterogeneous, unstratified mixture of clay, sand, gravel, and boulders.

**N-Value:** The blow count representation of the penetration resistance of the soil determined by the Standard Penetration Test (SPT). It is the sum of the number of blows required to drive the sampler the second and third 6-inch increments (sample depth interval of 6 to 18 inches) and is recorded in blows per foot (bpf). The N-value is considered to be an indication of the relative density of coarse-grained soils (sand and gravel) or consistency of fine-grained soils (silt and clay).

**Pocket Pen (PP):** Field penetration test performed using a hand-held penetrometer that estimates unconfined compressive strength of cohesive soil in tons per square foot (tsf).

**Recovery %:** Total length of rock core or soil sample retrieved divided by the total length of the core run or sample interval, expressed as a percentage.

**Refusal:** The depth at which greater than 50 SPT hammer blows are required to drive the sampling spoon 6 inches or less.

**Residual Soil or Residuum:** Soil derived from the physical or chemical weathering of the underlying parent bedrock, generally with N-values less than 30 and 50 bpf in cohesive and cohesionless materials, respectively.

**Rock Quality Designation (RQD):** The sum of the length of intact rock core pieces longer than 4 inches (excluding mechanical breaks) divided by the total length of the core run, expressed as a percentage.

**Shelby Tube:** A 2" to 3" diameter, thin walled sampling tube that is pushed into the soil to obtain a relatively undisturbed soil sample for geotechnical laboratory tests.

**Split Spoon Sampler:** A soil sampling tube which is driven, retrieved, and split-open lengthwise for removal and visual inspection, and testing of the soil obtained.

**Standard Penetration Test (SPT) ASTM D1586 :** Field penetration test consisting of driving a 2-inch outside diameter split-spoon sampler 18 inches using a 140-pound hammer free falling a distance of 30 inches. The number of blows required to advance the spoon through successive 6-inch increments is recorded to determine the N-value.

**Weathered Rock:** Materials derived from lithified, undisturbed, natural bedrock which are able to be sampled with a split-spoon. Cohesive and cohesionless materials generally have N-values greater than 30 and 50 bpf, respectively.

# N-Value Rating

### Fine-Grained Soils (Silt and Clay)

| Consistency | Blows/ft | PP (tsf) |
|---|---|---|
| Very Soft | 0-2 | <0.25 |
| Soft | 3-4 | 0.25-0.5 |
| Medium Stiff | 5-8 | 0.5-1 |
| Stiff | 9-15 | 1-2 |
| Very Stiff | 16-32 | 2-4 |
| Hard | >32 | >4 |

### Coarse-Grained Soils (Sand and Gravel)

| Relative Density | Blows/ft |
|---|---|
| Very Loose | 0-4 |
| Loose | 5-10 |
| Medium Dense | 11-30 |
| Dense | 31-50 |
| Very Dense | >50 |

# Unconsolidated Material

| Term | Grain Size in mm (in) | Approximate Example Size |
|---|---|---|
| Clay and Silt | <.075 | can't see grains to barely visible |
| Fine Sand | 0.075-0.4 | table salt to sugar |
| Med. Sand | 0.4-2.0 (~<1/16) | openings in a window screen |
| Coarse Sand | 2.0-4.75 (~1/16-1/8) | sidewalk salt |
| Gravel | 4.75-75 (~1/8-3) | pea to tennis ball |
| Cobble | 75-300 (3-12) | tennis ball to basketball |
| Boulder | >300 (>12) | larger than a basketball |

**Other Features** – Used to describe other identifiable, pertinent features (e.g., angularity of coarse-grained soils, organics, construction debris, etc.)

| Term | % |
|---|---|
| Trace | < 5 |
| Few | 5-15 |
| Some | 15-45 |

**Moisture Content**
Dry: Sample is dusty or obviously dry.
Moist: Anything that does not fit the definition of dry or wet.
Wet: Sample contains free water.

**RE: Shuster Bulkhead Improvements (332.344)**
**ESS Laboratory Work Order Number: 24F1174**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

***REVIEWED***
***By ESS Laboratory at 8:42 pm, Jul 08, 2024***

**Analytical Summary**
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

## CURRENT SW-846 METHODOLOGY VERSIONS

### Analytical Methods

1010A - Flashpoint
6010D - ICP
6020B - ICP MS
7010 - Graphite Furnace
7196A - Hexavalent Chromium
7470A - Aqueous Mercury
7471B - Solid Mercury
8011 - EDB/DBCP/TCP
8015C - GRO/DRO
8081B - Pesticides
8082A - PCB
8100M - TPH
8151A - Herbicides
8260D - VOA
8270E - SVOA
8270E SIM - SVOA Low Level
9014 - Cyanide
9038 - Sulfate
9040C - Aqueous pH
9045D - Solid pH (Corrosivity)
9050A - Specific Conductance
9056A - Anions (IC)
9060A - TOC
9095B - Paint Filter
MADEP 19-2.1 - EPH
MADEP 18-2.1 - VPH

### Prep Methods

3005A - Aqueous ICP Digestion
3020A - Aqueous Graphite Furnace / ICP MS Digestion
3050B - Solid ICP / Graphite Furnace / ICP MS Digestion
3060A - Solid Hexavalent Chromium Digestion
3510C - Separatory Funnel Extraction
3520C - Liquid / Liquid Extraction
3540C - Manual Soxhlet Extraction
3546 - Microwave Extraction
3580A - Waste Dilution
5030B - Aqueous Purge and Trap
5030C - Aqueous Purge and Trap
5035A - Solid Purge and Trap

SW846 Reactivity Methods 7.3.3.2 (Reactive Cyanide) and 7.3.4.1 (Reactive Sulfide) have been withdrawn by EPA. These methods are reported per client request and are not NELAP accredited.

## ESS Laboratory Sample and Cooler Receipt Checklist

Client: Thielsch Engineering, Inc - ESS

Shipped/Delivered Via: Client

ESS Project ID: 24F1174
Date Received: 6/28/2024
Project Due Date: 7/8/2024
Days for Project: 5 Day

1. Air bill manifest present? No
   Air No.: NA
2. Were custody seals present? No
3. Is radiation count <100 CPM? Yes
4. Is a Cooler Present? No
   Temp: 24.2 Iced with: None
5. Was COC signed and dated by client? Yes
6. Does COC match bottles? Yes
7. Is COC complete and correct? Yes
8. Were samples received intact? Yes
9. **Were labs informed about short holds & rushes?** Yes / No / NA
10. Were any analyses received outside of hold time? Yes / No

11. Any Subcontracting needed? Yes / No
    ESS Sample IDs:
    Analysis:
    TAT:
12. Were VOAs received? Yes / No
    a. Air bubbles in aqueous VOAs? Yes / No
    b. Does methanol cover soil completely? Yes / No / NA
13. Are the samples properly preserved? Yes / No
    a. If metals preserved upon receipt: Date: Time: By/Acid Lot#:
    b. If dissolved metals are requested, are they: Yes / No Field Filtered Yes / No To Be Lab Filtered
    c. Low Level VOA vials frozen: Date: Time: By:

Sample Receiving Notes:

14. Was there a need to contact Project Manager? Yes / No
    a. Was there a need to contact the client? Yes / No
    Who was contacted? Date: Time: By:

Resolution:

| Sample Number | Container ID | Proper Container | Air Bubbles Present | Sufficient Volume | Container Type | Preservative | Record pH (Cyanide and 608 Pesticides) |
|---|---|---|---|---|---|---|---|
| 1 | 567144 | Yes | N/A | Yes | Driller Jar | NP | |
| 2 | 567145 | Yes | N/A | Yes | Driller Jar | NP | |

**2nd Review**

**Were all containers scanned into storage/lab?** Initials BB Yes / No
Are barcode labels on correct containers? Yes / No / NA
Are all Flashpoint stickers attached/container ID # circled? Yes / No / NA
Are all Hex Chrome stickers attached? Yes / No / NA
Are all QC stickers attached? Yes / No / NA
Are VOA stickers attached if bubbles noted? Yes / No / NA

Notes

(1) Volume Determined By Measuring Dimensions

(2) Determined by Measuring Dimensions and Weight of Saturated Sample

(3) PLD=Point Load (diametrical), PLA= Point Load (Axial) ST= Splitting Tensile U= Unconfined Compressive Strength

(4) Taken at Peak Deviator Stress

(5) Strain at Peak Deviator Stress

(6) Represents Secant Modulus at 50% of Total Failure Stress

(7) Represents Secant Poisson's Ratio at 50% of Total Failure Stress

(8) Estimated UCS from Table 1 of ASTM D5731 for NX cores (Is x 24)

**ATTACHMENT 15: LETTER - GEOTECHNICAL ADDENDUM FOR PROPOSED SHUSTER BULKHEAD (CIVIL & ENVIRONMENTAL CONSULTANTS, INC., MAY 21, 2025)**

May 21, 2025

Mr. Douglas Ernst, P.E.
Foth Infrastructure & Environment, LLC
8191 Birchwood Court, Suite L
Johnston, IA 50131

Subject: Geotechnical Addendum – Proposed Shuster Bulkhead
4 Wright Street
New Bedford, MA 02740
CEC Project 332-344

Dear Mr. Ernst:

Civil & Environmental Consultants, Inc. (CEC) is pleased to present this geotechnical addendum to Foth Infrastructure Environment, LLC (Foth) regarding the stability of the proposed slope on the harbor side of the proposed Shuster Bulkhead at 4 Wright Street in New Bedford, MA. This Memo has been prepared per your request in an email on April 24, 2025.

## Background

CEC has been providing ongoing geotechnical support for the proposed Massachusetts Clean Energy Counsel (MassCEC) terminal expansion project. A portion of this project will include the construction of a new marine bulkhead and concrete platform in place of the existing cellular cofferdam bulkhead. CEC was selected by Foth to provide geotechnical data to support Foth's design of the new marine structures in this area, which is presented in a Data Report last revised on April 4, 2025. As part of the proposed bulkhead, the existing cellular cofferdam bulkhead will be removed and the infill material will be partially dredged. Based on Draft 30% design drawings provided to us by Foth dated October 8, 2024, the dredge line left in place will be sloped at a maximum 2.5 horizontal to 1 vertical (H:V) orientation and will be about 24 feet high. The proposed concrete platform will be above the slope and will be supported by pipe piles that extend through the slope and into the underlying bedrock. The dredge line will also contain scour protection which may consist of Fabriform concrete liner or similar. On April 24, 2025, CEC was requested by you to evaluate the stability of the final slope conditions. This addendum provides the results of the requested analysis.

## Slope Stability Analysis

CEC utilized the software program SLIDE2 by Rocscience to estimate the factor of safety (FS) of the proposed 2.5H:1V slope. SLIDE2 utilizes two-dimensional (2D) limit equilibrium slope stability techniques to determine an overall FS. The program calculates the FS based upon surface geometry, groundwater surfaces, soil unit weights, and shear strength parameters. The surface geometry for the section was determined using Drawing MR303 "Structural Section Without Ex.

Structure", as part of the above noted 30% design drawing set. The subsurface layering, soil unit weight, and shear strength parameters of the section were developed using test boring and laboratory test data from the previously provided data report. The test borings that were included in this analysis are Test Borings CEC-2A, CEC-6A, CEC-11A, and SB-3 which are generally along Subsurface Cross Section 4 in the Data Report. CEC also conservatively omitted the increased stability due to the proposed pipe piles from the stability analysis. Based on the test boring and laboratory test data, CEC developed the following strength parameters of each subsurface layer:

| SOIL DESCRIPTION | SATURATED UNIT WEIGHT (pcf) | SHEAR STRENGTH PARAMETERS | |
|---|---|---|---|
| | | c (psf) | φ' (degrees) |
| **Fabriform** | 135 | 0 | 45 |
| **Dredge Fill** | 120 | 0 | 30 |
| **Glacial Outwash** | 120 | 0 | 32 |
| **Glacial Till** | 140 | 100 | 36 |
| **Bedrock** | 170 | 400,000 | 0 |

## Conclusions

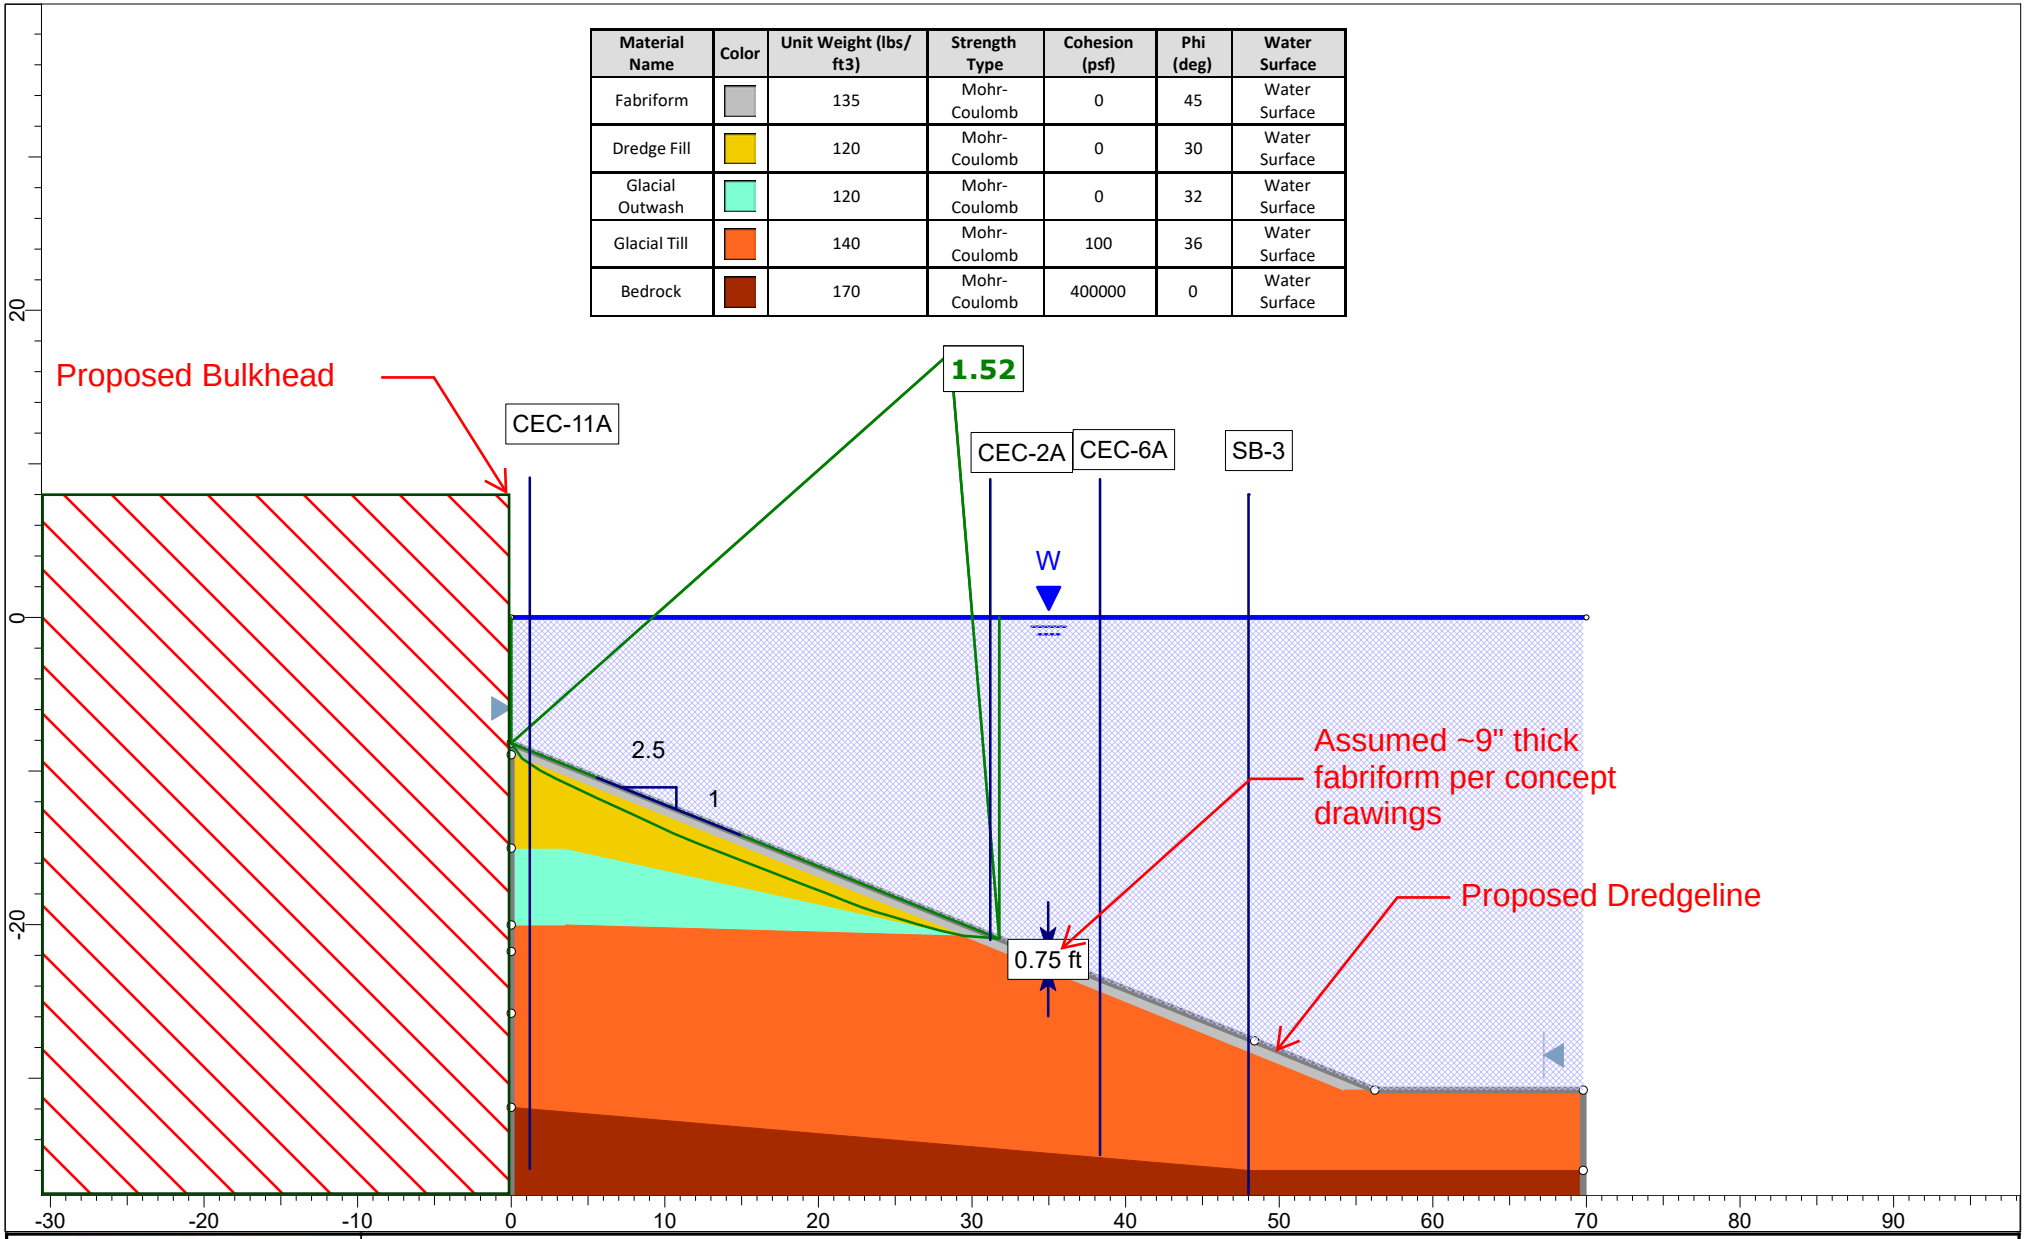
Based on the slope stability analysis output denoted as Figure 1, the FS of the proposed slope is **1.52**. This FS is greater than the industry standard for permanent slopes, which is typically 1.5. In addition, this FS is conservative due to the omission of the proposed pipe piles in our analysis, which will provide additional lateral resistance to the slope mass.

## Closing

CEC appreciates the opportunity to continue providing services to you on this project. Please call if you have any questions or comments.

Sincerely,

CIVIL & ENVIRONMENTAL CONSULTANTS, INC.



Antonio E. Sousa, P.E.
Project Manager

Jeffrey C. Woodcock
Vice President

Re: Waterfront Facilities Inspection and Assessment Report
Repair or Upgrade Design
4 Wright Street, New Bedford, MA 02740

Foth Infrastructure & Environment, LLC (Foth) is pleased to provide the attached Shuster Waterfront Facilities Inspection and Assessment (WFIA) Report for Massachusetts Clean Energy Center (MassCEC) for the Shuster facility located at 4 Wright Street, New Bedford, MA. The purpose of the Repair or Upgrade Design level inspection is to report on the existing condition of the cellular cofferdam bulkhead and upland mooring dolphin. This report provides the results of the observed conditions for recording purposes only.

At Foth, we believe in doing quality work and creating strong relationships. We look forward to the opportunity to work with you on this project. Please contact Scott Skuncik at (401) 206-2422 or Scott.Skuncik@foth.com, if you have questions or to discuss our proposal.

Sincerely,

Foth Infrastructure & Environment, LLC

# Waterfront Facilities Inspection and Assessment
# Repair or Upgrade Design
# 4 Wright Street

## Executive Summary

Foth Infrastructure & Environment, LLC (Foth), in partnership with J.F. Brennan Company (Brennan), conducted a comprehensive inspection and assessment of the waterfront structures and upland building of 4 Wright Street Facility in New Bedford, Massachusetts. This effort was performed in accordance with ASCE Manual of Practice No. 130, Second Edition, as part of a Repair or Upgrade Design-level evaluation supporting the planned redevelopment of the Facility.

The inspection focused on the existing cellular cofferdam bulkhead system and upland mooring dolphin within the facility limits. The bulkhead is partially owned and maintained by the New Bedford Port Authority (NBPA). The cofferdam system, comprising four major cells (Cells #1, 2, 3, and 4) and three minor cells (Cells #1A, 2A and 3A), forms a critical segment of the shoreline infrastructure and is scheduled for demolition and replacement with a new pile supported loading platform.

To establish a baseline condition record and support future planning, Foth performed visual topside and underwater inspections, supplemented by additional surveying. This included a bathymetric survey, sector scan imaging, and aerial drone survey.

The inspection documented observable and repeatable conditions across key structural elements. Notable findings include:

- General scour along the cofferdam cells, with bathymetric comparisons indicating up to 4 feet 2 inches of material loss in some areas.
- Undermining of the steel sheet piles at Cell #4A resulting in a sinkhole that measured up to 17 feet long by 13 feet wide.
- Localized spalling and cracking on the reinforced concrete wall and platform, particularly near mooring hardware.
- Significant surface corrosion, pitting and coating loss on the single bitt bollards and cleats within the Cellular Cofferdam Bulkhead structure.
- Signage stating “No Mooring” located behind each mooring bollard indicating restricted use or decommissioning of the mooring points.
- Limited to no defects observed on the Upland Mooring Dolphin.

Based on these observations, Foth evaluated and assessed the condition of each component. The Cellular Cofferdam Bulkhead is generally in **Poor** condition, primarily due to continued scouring and undermining along the steel sheet pile toe resulting in a large sinkhole at Cell #4A. The Upland Mooring Dolphin is generally in **Good** condition with limited to no significant defects observed.

# 1. Introduction

Foth Infrastructure & Environment, LLC (Foth) performed a comprehensive waterfront facilities inspection and assessment in accordance with ASCE Manual of Practice (MOP) No. 130, Second Edition of the Facility located at 4 Wright Street, New Bedford, MA. The Facility is currently owned by Massachusetts Clean Energy Commerce (MassCEC), however the bulkhead line and a portion of the structures are owned and maintained by the New Bedford Port Authority (NBPA).

This inspection was conducted as part of a Repair or Upgrade Design level effort per ASCE MOP 130 that is associated with the planned redevelopment of the existing bulkhead structure. The bulkhead structure is scheduled for partial demolition and replacement with a new pile-supported loading and offloading platform.

Because the existing bulkhead structure extends beyond the Shuster property limits and into adjacent parcels, a portion of the structure will remain in place to maintain shoreline continuity. To support project planning and provide a clear record of existing conditions, Foth performed a detailed inspection of the structures within the 4 Wright Street Facility limits. The inspection included documentation of observed deficiencies and structural anomalies for informational purposes and to establish a baseline condition record for both the facility owner and neighboring stakeholders.

Foth partnered with JF Brennan (Brennan) to perform the underwater inspection, including all dive operations and diver support. In addition to the above, Foth conducted a bathymetric survey and drone survey of the Facility to supplement the inspection and provide additional records of existing conditions. Brennan also performed a sector scan of the cofferdam cells for further documentation. These supplemental efforts are included as appendices to this report.

## 1.1 Purpose and Scope of Work

The purpose of this inspection and assessment is to document the existing conditions of the waterfront cellular cofferdam structures located along the 4 Wright Street Facility. These structures are planned for partial demolition and replacement with a new pile-supported loading and offloading platform. However, because the existing cofferdams extend beyond the property limits, a portion of the adjacent cofferdam system will remain in place. To ensure transparency and provide a record for both property owners, Foth performed a Repair or Upgrade Design level inspection in accordance with ASCE Manual of Practice No. 130, Second Edition.

This report specifically addresses the 4 Wright Street facility limits, which include:

- Major Cells: Cells #1, #2, and #3
- Minor Cells: Cells 1A, 2A, and 3A
- Upland Mooring Dolphin

The inspection focused on identifying and recording any visible deficiencies, structural anomalies, or deterioration within these cells. Findings are intended for informational purposes only and will serve as a baseline record for the facility owner and neighboring property stakeholders. A separate report will be prepared for the adjacent facility, which encompasses the remaining portion of the Cellular Cofferdam.

## 1.2 Description of Structures

The New Bedford Marine Commerce Terminal, located at 4 Wright Street in the southern waterfront industrial zone of New Bedford, Massachusetts, is a purpose-built heavy-lift facility supporting offshore wind and marine cargo operations. Positioned along the western bank of the New Bedford Harbor at approximately 41.624413° N, 70.915973° W, the site includes a Cellular Cofferdam bulkhead, upland laydown areas, and a single-story industrial structure.

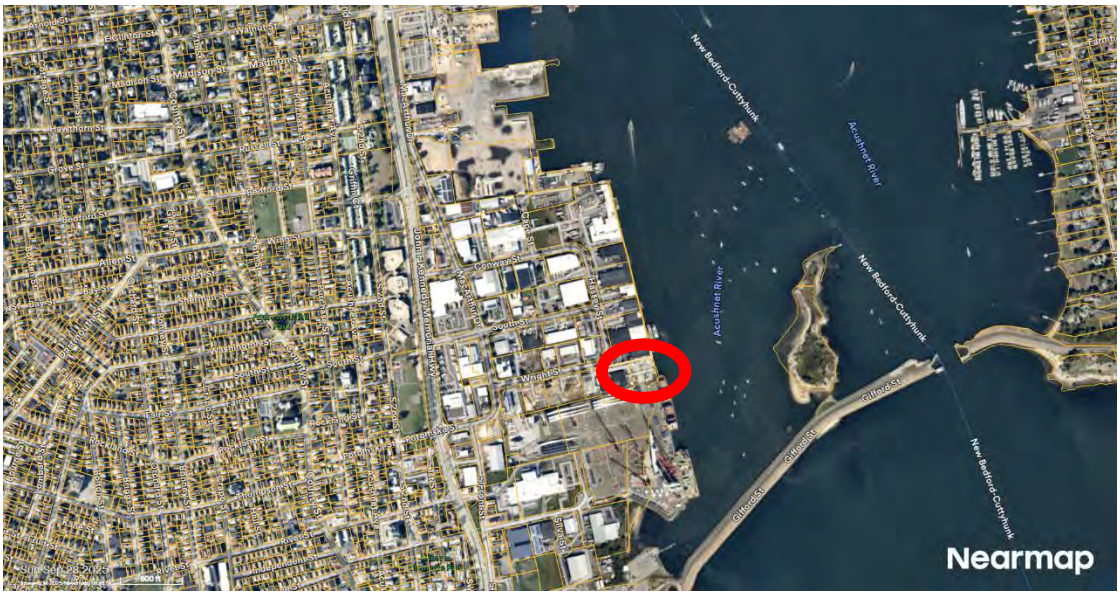

**Figure 1: Site Location Map**

### 1.2.1 Cellular Cofferdam Bulkhead

The Facility is constructed of a Cellular Cofferdam Bulkhead that consists of the following elements: steel sheet piles, reinforced concrete wall and platform, timber curb, cast steel single bitt mooring bollards, steel mooring cleats, fender system, and asphalt pavement upland surface.

There is a total of four (4) major Cells #1, 2, 3, and 4 in addition to three (3) minor Cells #1A, 2A, and 3A. Note that the Cells were labeled differently in previous inspection and repair drawings and were numbered continuously in lieu of minor Cells labeled as "A". Therefore Cell #1A would be Cell #2 and so forth.

These Cells extend approximately 195-linear feet along the existing bulkhead line. Each Cell is 54.11 feet in diameter with approximately 136 piles. The center to center of the Cells are approximately 62.92 feet. The center to center of the primary Cells to the intermediate Cells is half, 31.46 feet. The steel sheet piles are MP101, similar to PS27.5 flat sheet piles, driven to bedrock with an approximate top of sheet pile elevation of +1.5 feet Mean Lower Low Water (MLLW). Connected to the cellular cofferdam sheet piles is a set of MZ27 sheet piles that ties into the southern part of the facility. The more recently constructed South Terminal is also connected and tied into the south face of the MZ27 sheet piles. The weathered bedrock elevation varies and is estimated at approximately -32 feet MLLW.

Along the upland face of the Cells, approximately 10 feet from the interior face of the sheet piles lies a row of HP14x73 steel piles driven to bedrock. This element is fully buried. Atop of the HP, MP and MZ piles is a continuous reinforced concrete wall and platform that spans the full length of the bulkhead line. Per the original design drawings, the "L" shaped wall and platform is in total 12 feet wide by 8 feet high with gravel fill. The wall section is 2 feet wide at the top down to 3 feet wide at the bottom with various sizes of reinforcement. The platform section is 12 feet wide by 3 feet deep with various sizes of reinforcement. Reference Appendix F for additional details on the reinforced concrete wall and platform.

Along the perimeter of the reinforced concrete wall and platform is a 12-inch by 10-inch log curb. There is also a total of two (2) 35-ton single bitt cast steel bollards, and seven (7) cast steel cleats. The 35-ton bollards are 2 feet in diameter and approximately 3 feet 8.5 inches tall with four foundation bolts. The cleats are approximately 30 inches long by up to 5 inches wide with a 16.75 inch long by 6.5-inch-wide base plate anchored with two bolts.

The original design drawings indicate a timber fender system, however only a small portion of that system remains along the south face of the bulkhead. Otherwise, it has been replaced with rubber tire fenders. The rubber tires are connected to the face of the reinforced concrete wall with chains and anchors. The upland surface of the facility is constructed of asphalt pavement.

### 1.2.2 Upland Mooring Dolphin

An Upland Mooring Dolphin was installed during the South Terminal expansion and consists of 50-ton bollard supported by four (4) 9.625-inch diameter steel pipe micropiles. There are two plumb micropiles that are driven to bedrock and two battered micropiles that are driven into bedrock up to 7 feet. The bollard and micropiles are connected by a 12 feet 8 inches long by

6 feet wide up to 5 feet deep reinforced concrete cap. The concrete cap sits atop of the reinforced concrete platform associated with the Cellular Cofferdam Bulkhead.

## 1.3 Inspection and Repair History

There is a long history of inspections and repairs at this facility. Here is a timeline of the inspection and repairs:

**June 2021:** **Structural Inspection: Commercial Fishing Piers**

This report documents the inspection and assessment of marine infrastructure at municipally-owned piers in New Bedford and Fairhaven, as well as New Bedford's South Terminal. The purpose was to evaluate structural conditions in relation to projected sea level rise and flooding events.

The scope included Level 1–3 inspections of waterfront structures such as steel sheet pile bulkheads, cellular sheet pile cells, steel and timber piles, concrete piles, and timber fender systems. Underwater inspections were completed by Fathom Resources, LLC during December 2020 through February 2021, with topside inspections conducted in the same period. The report reflects observed conditions at the time of inspection and does not include repair recommendations.

More specifically Section 7. South Terminal Fish Houses was rated as Fair condition. The South Terminal bulkhead was found to have 73 through-holes in the steel sheet piling. The structure exhibited localized advanced deterioration but no immediate safety concerns. Sinkholes were observed behind the bulkhead, and areas adjacent to buildings were recommended to be investigated for potential subsurface voids that could affect structural integrity. Two specific areas required monitoring: Cell 44 (sheet separation at mudline) and Cells 5 through 7 (exposed sheet toes). Note these cells are labeled continuously and do not follow the major to minor cell labeling.

**September 2022:** **New Bedford Municipal Piers Fendering and Repairs**

The Cellular Cofferdams were repaired; specifically new rubber fenders were installed in addition to plate repairs to the steel sheet piles. The fender replacement was not performed along the Shuster Facility. See Appendix F for further information.

**January 2022:** **Shuster Bulkhead Conceptual Design**

At the request of the Massachusetts Clean Energy Center (MassCEC), Foth conducted a structural conceptual design to improve the loading capacity of the existing Shuster Bulkhead. Three design alternatives were evaluated for loading capacities of 500 psf, 2000 psf, and 4100 psf. Foth also performed a structural analysis of the existing cellular cofferdam for

a dredged elevation of -32 feet MLLW and a surcharge of 500 psf. The analysis addressed sliding, overturning, internal stability, interlock tension, and slipping between the cell and fill, using data from earlier field investigations.

The analysis concluded that the existing cofferdam could support a 500 psf surcharge with targeted rehabilitation, although the interlock safety factor at the junction piles was below the acceptable threshold and required improvement. Due to the proximity of the cofferdam's front face to the harbor line, oversheeting was deemed infeasible. Cell #4, located between the Shuster site and the adjacent property, was assumed to remain in all design scenarios.

For the higher loading scenarios of 2000 psf and 4100 psf, Foth recommended installing a combi-wall with rock anchors behind the cells, combined with a pile-supported concrete platform. This solution was determined to be the most cost-effective and constructable option to enhance the bulkhead's capacity to support increased loads.

**April 2022:** **Bollards and Cleats Evaluation**

Determined the remaining capacities of existing bollards and cleats are conservatively estimated to be within 60% to 70% of their original capacities. Therefore, the bollards have a remaining working capacity of 25 tons. It was also recommended that the existing bollards be replaced with 50-ton bollards. Additional evaluation of the concrete design, remaining capacity and quality of the concrete deck, and patching and repair of spalled and damaged concrete near the bollards were also recommended.

**September 2022:** **New Bedford Municipal Piers Fendering and Repairs**

The Cellular Cofferdams were repaired; specifically new rubber fenders were installed in addition to plate repairs to the steel sheet piles. These repairs were not performed along the Shuster Facility. See Appendix F for further information.

**December 2023:** **Shuster Sinkhole Inspection**

Foth completed an assessment of the bulkhead and determined it was in Poor condition, exhibiting significant deterioration and undermining of the steel sheet pile cells. The presence of holes and advanced corrosion indicated that the structure was nearing the end of its service life. A comparison of historical bathymetric data showed a loss of mudline elevation adjacent to the steel cells. This loss was likely caused by prop wash or subsidence, which appeared to have contributed to the formation of a sinkhole behind the bulkhead.

To mitigate further loss of fill material from within the steel cells, Foth recommended installing grout bags at the toe of the bulkhead and placing clear crushed stone within the sinkhole. These measures were intended to stabilize the area and prevent additional structural degradation.

**February 2024:** **Shuster Bulkhead Maintenance & Repairs**

Foth designed a repair package for the undermining and deterioration of the steel sheet pile cells. There were two repair area, one located between Cell#2 and #2A, and the other repair located between Cell #3 and #3A. The repairs included two types of repairs. Repair Type 1 was a steel plate formwork welded to the cells and interlocks extending to the bedrock then pumped with concrete through a pump port. Repair Type 2 included a continuous concrete bag block that was connected to the steel sheet piles with a pad eye welded to the sheet. The repairs were performed by Brennan.

**Ongoing - Routine:** **Bathymetric Surveys**

Foth has performed routine bathymetric surveys at the facility. The surveys indicate prop wash and loss of material along the toe of the Cells due to the tugboats berthing along the face of the bulkhead.

## 1.4 Methodology

The above and underwater inspection and assessment was performed in accordance with the scope of work and MOP 130, for a Repair or Upgrade Design Inspection. All commercial diving was conducted by a three-person dive team consisting of a dive supervisor, diver, and tender/backup diver in accordance with applicable Occupational Safety and Health Administration (OSHA), United States Coast Guard (USCG) regulations (29 CFR 1910 Subpart T and 46CFR197 Subpart B), and Association of Diving Contractors International (ADCI). In general, the dive inspection consisted of an in-water diver communicating to the Foth engineer who was stationed topside via two-way radio. The Foth engineer was able to view the underwater portion of the structure in real-time via closed-circuit video and direct the in-water diver during the investigations.

### 1.4.1 Levels of Inspection

According to MOP 130, there are three levels of inspection. Specifically for this routine inspection a Level I and Level II were performed. Levels of inspection are outlined below.

- Level I Effort: Includes a close visual examination above and underwater or a tactile examination using large sweeping motions of the hands where visibility is limited underwater. Although the Level I effort is often referred to as a swim by inspection, it must be detailed enough to detect obvious major damage or deterioration due to overstress or other severe deterioration. It should confirm the continuity of the full length of all members and system components and detect undermining or exposure of normally buried elements. A Level I effort may also include limited probing of the substructure and sounding of the adjacent mudline.

- Level II Effort: A detailed inspection above and underwater may require the removal of corrosion and/or marine growth from portions of the structure. Underwater marine growth removal is costly; hence, the inspection must be based on a representative sample of components. For piles, a 12-inch-high band should be cleaned at designated locations, generally near the low waterline, at the mudline, and midway between the low waterline and the mudline. On a rectangular pile, the marine growth removal should include at least three sides; on an octagonal pile, at least six sides; and on a round pile, at least three-fourths of the perimeter. On large-diameter piles, 3 ft or greater, 1 ft × 1 ft areas should be cleaned at four locations approximately equally spaced around the perimeter, at each elevation. On large solid-faced elements, such as retaining structures, 1 ft × 1 ft areas should be cleaned at these three elevations. The Level II effort should also focus on typical areas of weakness such as connections, attachment points, and welds. The Level II effort is intended to detect and identify damaged and deteriorated areas that may be hidden by surface biofouling, coating, or corrosion, or not be readily accessible for a Level I inspection effort. Marine growth removal should be governed by what is necessary to discern the condition of the underlying material. Removal of all biofouling staining is generally not required. Means and methods for the removal of biofouling growth are not typically defined in the scope of work. It may be appropriate for owners to specify particular methods on the basis of environmental and site conditions or concerns about maintaining the integrity of coating materials. Methods may include hand scrapers or mechanical systems ranging from high-pressure water blasters to barnacle busters and pressurized air bubble devices.
- Level III Effort: A detailed inspection above and underwater typically involving nondestructive or partially destructive testing conducted to detect hidden or interior damage or to evaluate material homogeneity. Typical inspection and testing techniques include the use of ultrasonic, coring, boring or resistance drilling, physical material sampling, and in situ hardness testing. Level III testing is generally limited to key structurally suspect areas or areas representative of the structure or system.

### 1.4.2 Element Level Damage Ratings

An element level damage rating was assigned to each structural element inspected during the investigation. The rating reflects the condition of the individual element only and is independent of the element's structural importance and the type of inspection being conducted. The damage rating varies per element, the general rating terms are as follows: (NI) Not Inspected, (ND) No Defects, (MN) Minor, (MD) Moderate, (MJ) Major, (SV) Severe. These ratings are based on MOP 130 element level ratings.

It is important to note that MOP 130 covers many elements, however if any specialty elements that are not outlined in MOP 130 and that fall within this inspection are up to the engineer's interpretation. The following elements were specifically referenced for this Repair or Upgrade Design Inspection based on the elements seen in the field.

- Timber Elements (MOP 130 Table 2-4 and Figure 2-2)
- Steel Elements (MOP 130 Table 2-5 and Figure 2-3)
- Reinforced Concrete Elements (MOP 130 Table 2-6 and Figure 2-4)

- Mooring System Elements (MOP 130 Tables 2-8 & 2-9 and Figures 2-6 through 2-9)
- Fender System Elements (MOP 130 Tables 2-10 through 2-13 and Figures 2-19 through 2-14)

### 1.4.3 Condition Assessment Ratings

Upon completion of the Repair or Upgrade Design Inspection and review of element level damage ratings post data processing, a condition assessment rating was assigned to the structural unit, groups of units, and overall facility. The condition assessment ratings are outlined below.

- **Good (6):** No visible or only minor damage was noted. Structural elements may show very minor deterioration, but no overstressing was observed. No repairs are required.
- **Satisfactory (5):** Limited minor to moderate defects or deterioration are observed, but no overstressing was observed. No repairs are required.
- **Fair (4):** All primary structural elements are sound, but minor to moderate defects or deterioration was observed. Localized areas of moderate to advanced deterioration may be present but do not significantly reduce the load-bearing capacity of the structure. Repairs recommended, but the priority of the recommended repairs are low.
- **Poor (3):** Advanced deterioration or overstressing was observed on the widespread portions of the structure but does not significantly reduce the load-bearing capacity of the structure. Repairs may need to be carried out with moderate urgency.
- **Serious (2):** Advanced deterioration overstressing, or breakage may have significantly affected the load- bearing capacity of primary structural components. Local failures are possible and loading restrictions may be necessary. Repairs may be carried out on a high-priority basis with urgency.
- **Critical (1):** Very advanced deterioration, overstressing or breakage has resulted in localized failure(s) of primary structure components. More widespread failures are possible or likely to occur, and load restrictions should be implemented as necessary. Repairs may need to be carried out on a very high priority basis with strong urgency.

### 1.4.4 Recommended Action Guidelines

Given this was a pre-construction and Repair or Upgrade Design Inspection for recording purposes only, recommendations were not included per ASCE MOP 130 Table 2-16, which outlines standardized action options based on observed conditions. These categories help prioritize response efforts and guide the client in planning appropriate follow-up actions:

- **Emergency Action:** Recommended when unsafe conditions are observed that pose immediate risks to life, property, or the environment. Actions may include closing access, unloading, or placing load restrictions.

- **Engineering Evaluation:** Recommended when significant damage or defects are identified that require further structural analysis to assess capacity or determine appropriate repair methods.
- **Structural Repair or Upgrade Design Inspection:** Recommended when repairs are clearly needed based on inspection findings. This may follow routine, special purpose, or post-event inspections.
- **Special Purpose Inspection:** Recommended to investigate unusual or advanced deterioration. May involve specialized testing, monitoring, or nonstandard techniques.
- **Repair Plans Development:** Recommended once sufficient field data has been collected and the structure is ready for repair design documentation.
- **No Action:** Recommended when the structure is in satisfactory condition and no further action is needed until the next scheduled inspection.

These action categories were not provided given the purpose of this inspection.

## 1.5 Methodology for Supplemental Activities

In addition to the visual and underwater inspections, several supplemental activities were performed to provide a comprehensive record of existing conditions. These activities included a bathymetric survey, sector scan imaging, and aerial drone survey. Each activity is summarized below:

### 1.5.1 Bathymetric Survey

Foth conducted a high-resolution bathymetric survey using a vessel-mounted multibeam echosounder system integrated with RTK GPS positioning and motion compensation sensors. The multibeam system provided full-bottom coverage of the nearshore area adjacent to the Shuster facility, capturing detailed depth data and bottom morphology. The survey was performed from a dedicated survey vessel equipped with a Teledyne Reson multibeam echosounder, Trimble RTK GNSS receiver for positioning, and an Applanix motion reference unit for heave, pitch, and roll corrections. Raw sonar data were processed using industry-standard hydrographic software such as Hypack and QPS Qimera to generate depth grids and contour maps referenced to Mean Lower Low Water (MLLW). The processed bathymetric data are presented in plan view and included in Appendix C.

### 1.5.2 Sector Scan Imaging

Brennan performed sector scan imaging from a dedicated survey vessel, independent of dive operations. The sector scan utilized a high-frequency scanning sonar system, such as the Kongsberg MS1000, mounted on a vessel-deployed tripod with controlled rotation to capture detailed imagery of the submerged cofferdam structures. This method produced high-resolution mosaics of the sheet pile walls, interlocks, and cell geometry, providing enhanced visualization in areas where water clarity limited diver observations. The sonar mosaics offer a baseline for future comparison and are included in Appendix D.

### 1.5.3 Aerial Drone Survey

Foth conducted an aerial drone survey to capture high-resolution imagery and video of the cofferdam structures and surrounding facility. The survey was conducted using a DJI Phantom 4 RTK drone equipped with a 20-megapixel camera and 4K video capability. RTK GNSS positioning ensured accurate georeferencing of all imagery. The drone survey provided an overhead perspective of the shoreline alignment, cofferdam geometry, and adjacent property interfaces. Imagery was processed to create orthomosaic maps and archived for record purposes. Drone survey results are included in Appendix E

# 2. Existing Conditions

The following section presents the observed existing conditions of the inspected structures. These observations are based on above- and underwater inspections conducted in accordance with the procedures outlined in ASCE MOP 130. All findings are presented factually and without interpretation or analysis. This section serves as the foundation for subsequent assessment and evaluation and includes only repeatable, observable data that would be verifiable by another qualified engineer. Documentation includes field notes, photographs, sketches, and video recordings where applicable.

The structure and sub-elements inspected include:

- Cellular Cofferdam
  - Steel Sheet Piles
  - Steel H-Piles
  - Reinforced Concrete Wall and Platform
  - Timber Curb
  - Cast Steel Single Bitt Mooring Bollards
  - Steel Mooring Cleats
  - Fender System
  - Asphalt Pavement and Backfill
- Upland Mooring Dolphin
  - Steel Pipe Micropiles
  - Reinforced Concrete Cap
  - Cast Steel Single Bitt Mooring Bollard

Each of these structures is presented in a dedicated subsection below, with observations organized by structural element and location.

## 2.1 Cellular Cofferdam Bulkhead

The following deficiencies were observed along the Cellular Cofferdam Bulkhead structure.

### 2.1.1 Steel Sheet Piles

The steel sheet piles generally exhibit typical deterioration found on steel sheet piles submerged in saltwater conditions.

Plate repair patches were observed throughout with no significant defects. All welds were intact, and signs of fill loss were not observed around the plate repairs. The toe of the sheets exhibit a layer of material with weathered stone or rock. The toe of the sheet piles is unknown unless explicitly stated. At the Cell junctions, there was a slight gap between the junction plates.

At Cell #2A, the toe of the sheet piles was exposed with undermining measuring up to 2 feet long by 14 inches high by up to 16 inches deep. The undermining was observed just beyond the previous steel plate toe repairs performed by Brennan.

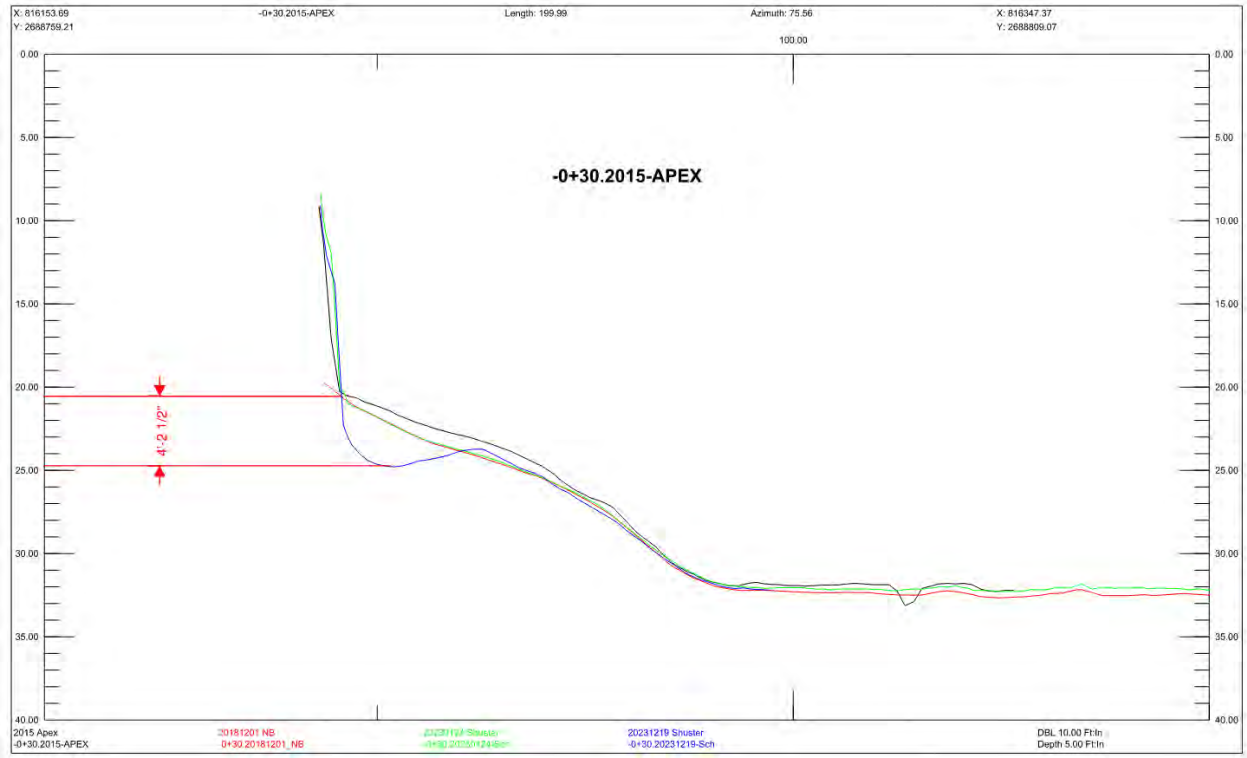

**Figure 2: 2023 Inspection Survey Comparison STA -0+30, Cell #4**

UT measurements were performed on the steel sheet piles using a Cygnus gauge. Due to equipment issues during the inspection, reliable readings could not be obtained at multiple elevations. Only one valid measurement was recorded at the mudline elevation. No readings were captured at mid-water or tidal zone levels.

**Table 1**
**UT Measurements, Cell #4**

| Location | Thickness (in.) | Recording (in.) | Section Loss (%) | Notes |
|---|---|---|---|---|
| **Cell #4, Sheet #13** | | | | |
| Tidal Zone | 0.40 | NR | N/A | Not recorded due to equipment issues. |
| Mid-Water | 0.40 | NR | N/A | Not recorded due to equipment issues. |
| Mudline | 0.40 | 0.38 | 5.0 | Taken at 31-ft below the water surface at the time of inspection. |

### 2.1.2 Steel H-Piles

The steel H-piles were fully buried and were not visible at the time of inspection.

### 2.1.3 Reinforced Concrete Wall and Platform

The reinforced concrete wall and platform exhibited general concrete weathering with localized areas of mechanical corner spalling that measured up to 12 inches long by 6 inches wide and up to 3 inches deep on the exposed faces. Hairline cracking was observed throughout. The spalls and cracks were typically seen near the cleats and fenders.

### 2.1.4 Timber Curb

The timber curb exhibits typical timber weathering with section loss up to 25 percent. No significant structural defects were observed.

### 2.1.5 Cast Steel Single Bitt Mooring Bollards

The single bitt mooring bollards exhibit typical signs of wear consistent with prolonged marine exposure. No protective coating was observed on the bollards, and scaling is present across the surface, particularly on the upper portions and around the base plate, leaving bare steel exposed. General surface corrosion is evident, with pitting throughout. The anchor bolts show signs rusting where visible. Additionally, signage located behind the bollard's states "No Docking," indicating restricted use or decommissioning of these mooring points.

### 2.1.6 Steel Mooring Cleats

The mooring cleats exhibit typical signs of wear consistent with prolonged marine exposure. No protective coating was observed on the bollards, and scaling is present across the surface, particularly on the upper portions and around the base plate, leaving bare steel exposed. General surface corrosion is evident, with pitting throughout. The anchor bolts show signs

rusting where visible. Additionally, signage located behind the bollard's states "No Docking," indicating restricted use or decommissioning of these mooring points.

### 2.1.7 Fender System

The fender system consists of multiple vertically suspended tires affixed to the bulkhead via chain assemblies. The majority of tires exhibit surface wear and abrasion consistent with routine berthing operations. Overall, the tires remain intact and in functional alignment.

A limited number of tires were observed with sagging chain connections. No visible signs of chain detachment, fracture, or loss of connection hardware were noted during the inspection.

There were no significant defects observed on the timber fendering locating along the south face of the bulkhead.

### 2.1.8 Asphalt Pavement

The asphalt pavement exhibited a pronounced surface depression, forming a sinkhole approximately 17 feet in length and 13 feet in width. The depth of the void could not be determined at the time of inspection. The affected area was cordoned off with temporary fencing. The sinkhole is in alignment with Cell #4A and corresponds with the position of previously documented undermining along the adjacent steel sheet pile wall.

Extensive surface water accumulation was observed across the upland area, encompassing the full pavement area. The pooling occurred during a heavy rainfall event and covered a substantial portion of the upland area.

## 2.2 Upland Mooring Dolphin

The following deficiencies were observed along the Upland Mooring Dolphin structure.

### 2.2.1 Steel Pipe Micropiles

The steel pipe micropiles were fully buried and were not visible at the time of inspection.

### 2.2.2 Reinforced Concrete Cap

The reinforced concrete cap exhibited no significant signs of cracking, spalling, delamination, or other surface-level deterioration. No structural defects were observed on the accessible top surface during the site visit.

### 2.2.3 Cast Steel Single Bitt Mooring Bollard

The single bitt mooring bollard exhibited no significant defects. Minor coating loss was noted along the lower portion of the bollard body. A vessel was actively moored to the bollard at the time of inspection.

# 3. Evaluation and Assessment

In accordance with the ASCE MOP 130; this section provides an engineering evaluation of the structures based on observed conditions. While the previous section documented physical deficiencies, this portion interprets those findings to assess the structural performance, functional reliability, and overall condition of each facility component.

The evaluation considers the severity, extent, and location of deterioration, as well as the potential implications for structural integrity, serviceability, and safety. This assessment forms the basis for prioritizing maintenance and repair needs and supports informed decision-making for asset management and capital planning.

## 3.1 Cellular Cofferdam

The Cellular Cofferdam is in overall **Poor** condition due to continued undermining of the sheet pile cells, which has resulted in recurring sinkholes along the upland side. Although previous repairs were made to address this undermining, the condition has continued to deteriorate, indicating that erosion and sinkhole formation will persist unless the full length of the cofferdam is repaired along the toe.

Recent bathymetric data also suggest that the ongoing propwash has caused an increase in erosion and segregation of sediment along the toe of the sheet pile cells consistent with the previous inspection.

Given that this section of the bulkhead is scheduled for demolition and replacement with a new pile-supported loading and offloading platform, the undermining and sinkhole have not been repaired. In the interim, the affected area is being monitored daily, and access has been restricted with fencing.

### 3.1.1 Steel Sheet Piles

The steel sheet piles are generally in **Poor** condition due to the observed undermining and scouring of the toes. The scour may be a result of prop wash and continuation of the scour may result in exposure of the steel sheet pile toes and potential continuation of undermining.

### 3.1.2 Steel H-Piles

A rating was not provided for the steel H-piles, given that they were fully buried and not observed during the inspection.

### 3.1.3 Reinforced Concrete Wall and Platform

The reinforced concrete wall and platform is generally in **Satisfactory** condition with minor to moderate rated cracking and mechanical spalling.

### 3.1.4 Timber Curb

The timber curb is generally in **Fair** condition due to moderate weathering of the timber with section loss up to 25 percent.

### 3.1.5 Cast Steel Single Bitt Mooring Bollards

The mooring bollards are generally in **Poor** condition due to the extensive corrosion and pitting, in addition to the signage located behind the bollard's stating "No Docking." This indicates restricted use or decommissioning of these mooring points.

### 3.1.6 Steel Mooring Cleats

The mooring cleats are generally in **Poor** condition due to the extensive corrosion and pitting, in addition to the signage located behind the bollard's stating "No Docking." This indicates restricted use or decommissioning of these mooring points.

### 3.1.7 Fender System

The rubber tire fenders are generally in **Fair** condition with moderate surface wear and sagging of chains. The timber fendering exhibited limited to no significant defects.

### 3.1.8 Asphalt Pavement

The asphalt pavement is generally in **Poor** condition due to the extensive sink hole located near Cell #4A and pooling of surface water.

## 3.2 Upland Mooring Dolphin

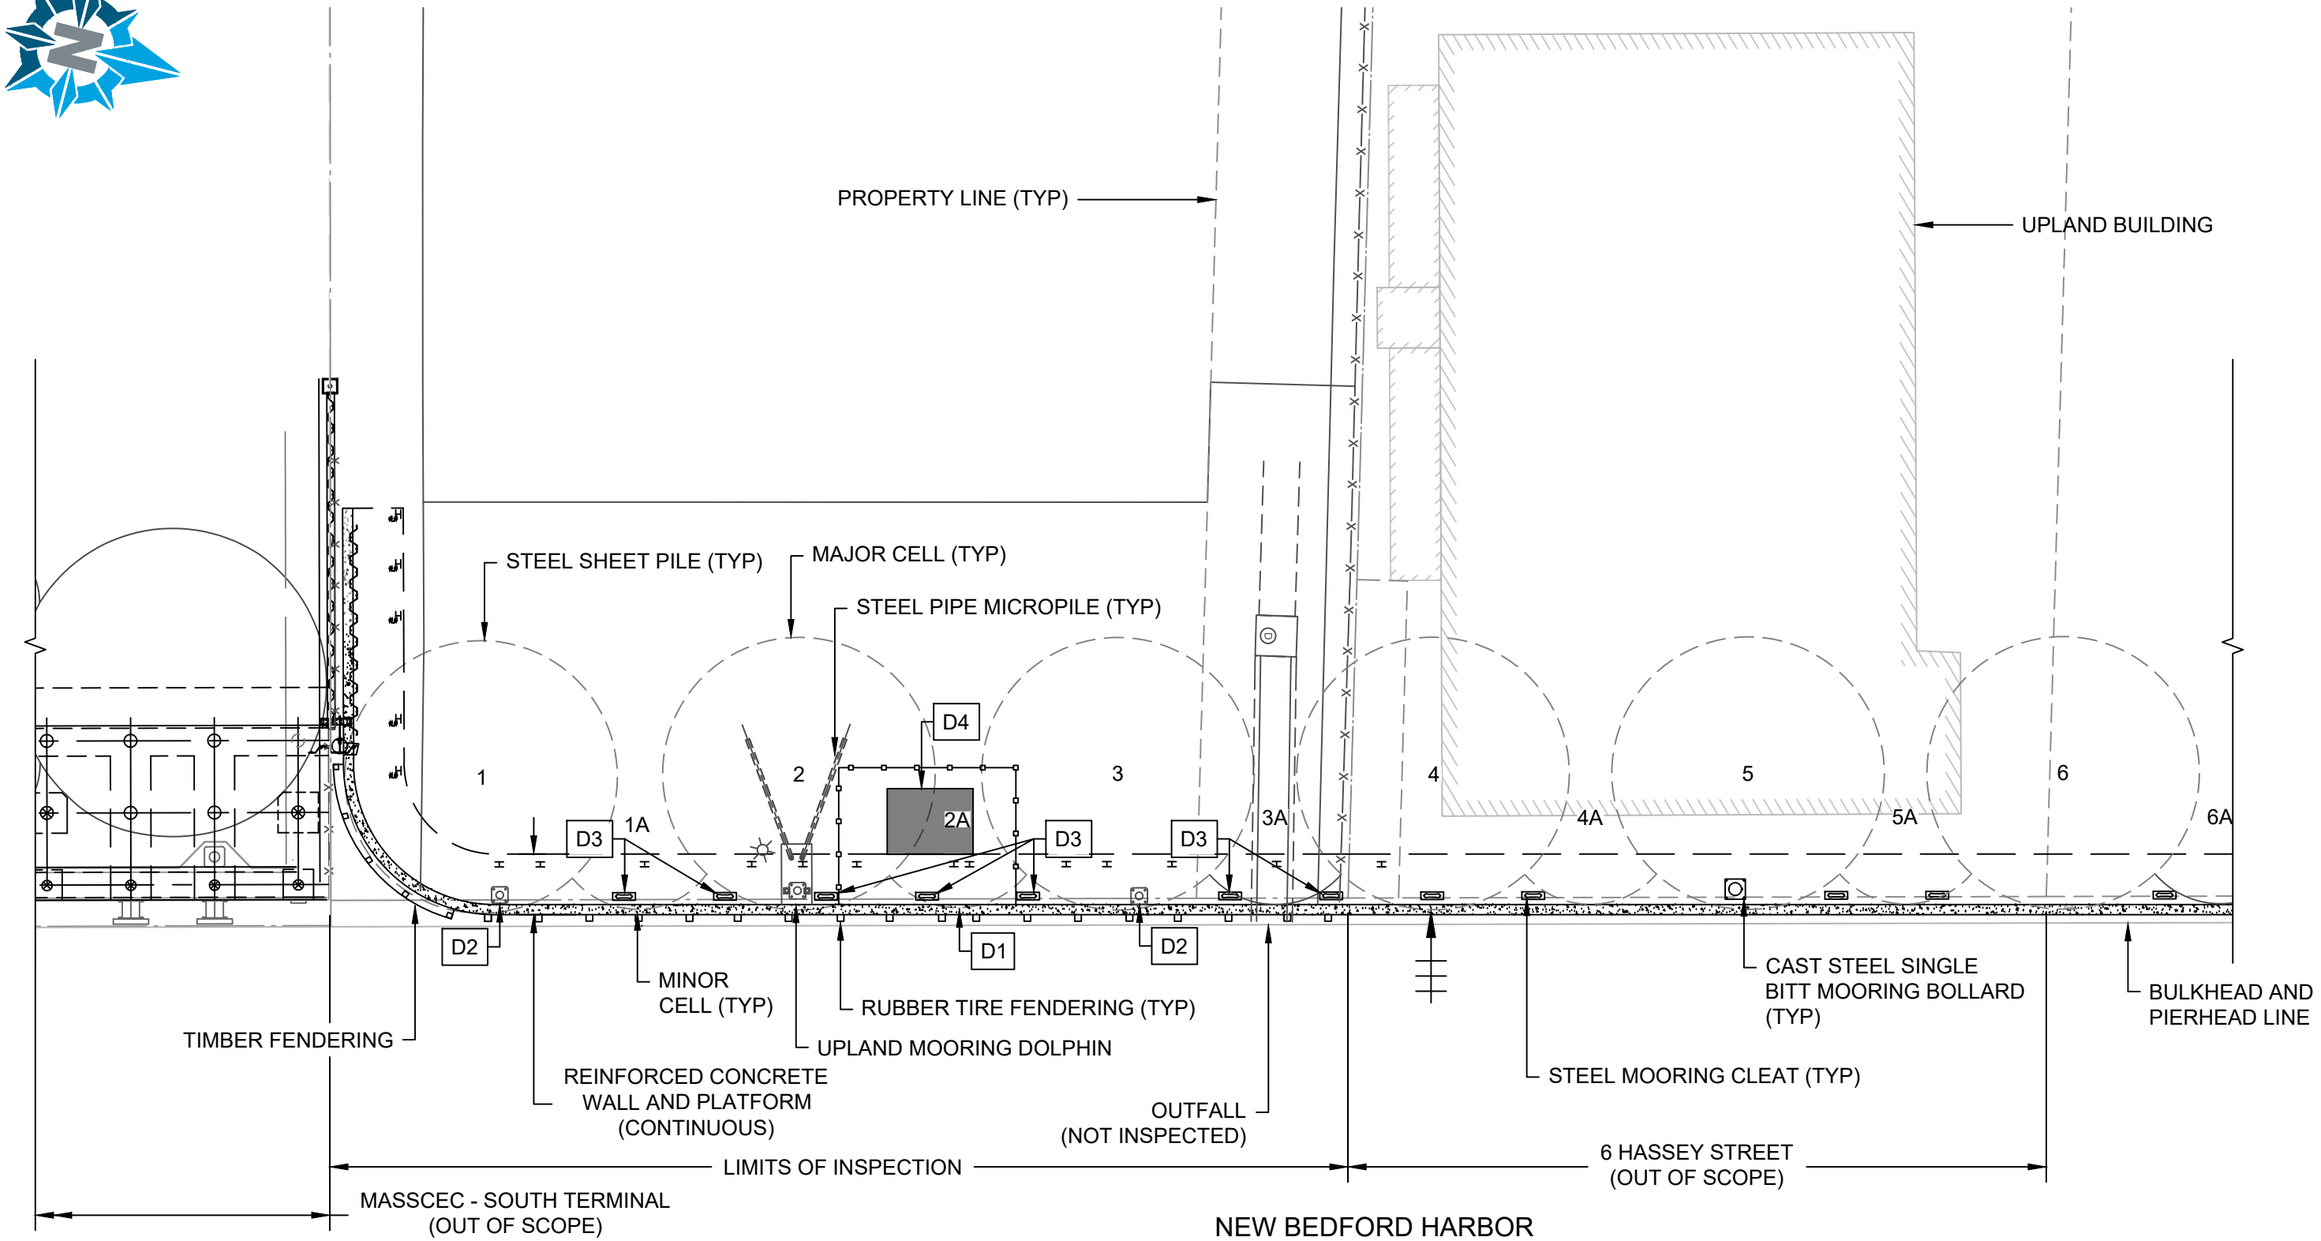
The Upland Mooring Dolphin was found to be in overall **Good** condition, with only minor coating loss on the bollard. At the time of inspection, the micropiles were buried and therefore could not be visually assessed.

This structure is scheduled for demolition, consistent with the planned removal of the adjacent cellular cofferdam.

### 3.2.1 Steel Pipe Micropiles

A rating was not provided for the steel pipe micropiles, given that they were fully buried and not observed during the inspection.

### 3.2.2 Reinforced Concrete Cap



The reinforced concrete cap is generally in **Good** condition with no significant defects observed.

### 3.2.3 Cast Steel Single Bitt Mooring Bollard

The mooring bollard is generally in **Satisfactory** condition with only minor coating loss observed along the neck of the bollard.

NOTE

This bathymetric difference plot is based on comparative analysis of hydrographic survey data collected in January 2023 and September 2025. The data sets were acquired under differing environmental and operational conditions, and may be subject to inherent variability in positioning, tide correction, and sounding density. Apparent changes in elevation may reflect actual seabed movement (e.g., scour or deposition), survey tolerances, or a combination thereof. This plot is intended for general assessment purposes only and should not be used as the sole basis for design, construction, or navigation decisions. Further site-specific investigation is recommended to confirm critical findings.

# Project Recap

| | |
|---|---|
| *Project:* | New Bedford Dock Wall underwater Dive and Sector Scan Inspection. |
| *Scope of Work:* | Brennan will provide commercial diving services to inspect approximately 340 LF of steel sheet pile cells extending to a depth of 30 FSW. The objective of this Level I inspection is to assess the overall condition of the sheet pile walls and identify any areas of deterioration, section loss, or damage requiring further attention. |
| *1. Dive Inspection Team: (09/25/2025)* | Dive Supervisor: Tony Ramella<br>Diver/Tender: Chris Drozell<br>Diver/Tender: Glenn Hutchins<br>Diver/Tender: Steve Bennett<br>Project Manager: Nathan Fontaine |
| *2. Sector Scan Inspection Team: (10/03/25)* | Sector Scan Operator: Sean McMullen<br>Boat Operator/Tender: Tony Ramella<br>Project Manager: Nathan Fontaine |
| *Foth Contacts:* | Scott Skuncik<br>Tim Magalhaes |
| *Weather:* | 9/25: Cloudy, HI 72°F Lo: 70°F, 13.05 mph S winds.<br>10/3: Sunny, Hi: 70°F Lo: 63°F, 10.56 mph SW winds. |
| *Water Visibility:* | Good, 5-feet +. |
| *Site Location:* | Marine Commerce Terminal<br>6 Hassey St.<br>New Bedford, MA 06057 |
| *Access:* | Embankment. |
| *Dive Mode:* | Surface supplied, via mobile station. All dives were conducted in accordance with Brennan's Safe Diving Practices Manual as well as all pertinent ADCI, OSHA, and USCG regulations. Additionally, all dives adhered to the dive schedules and decompression tables outlined in the U.S. Navy Dive Manual, Rev. 7. |
| *Sector Scan Type:* | Kongsberg Single Beam 1171 Sonar. The scanning sonar transmits sound waves through the water column that are then reflected to the sensor and are then processed into the images you will see in this report. The sonar waves also reflect off air bubbles and sediment in the water column which the computer cannot differentiate from the item being imaged, this may cause the image to appear cloudy. Additionally, high flows have a higher than usual amount of air bubbles and sediment in the water column which may magnify this issue. Through the operation of the system and post-processing the effects are minimized to the extent possible but may still be visible. |
| *Gage Height:* | N/A, there was no USGS River Gauge in New Bedford, MA. |
| *Discharge:* | N/A, there was no USGS River Gauge in New Bedford, MA. |
| *Condition Assessment:* | Satisfactory. |
| *Brennan Repair Rating:* | Low. |

*Summary of Findings:*

- Dive Inspection:
  - The dive inspection was performed with a Foth representative onboard the dive boat. This individual directed and took notes for the underwater inspection. All notes were retained with that individual. However, the dive videos from that inspection can be found here (please see below).
    - *To view/download the footage from the inspection, please follow the instructions below. The SharePoint site will remain active for 30 days, during this period please download the files if you want to keep them for your records. After the 30-day period, the site will be removed, and you will no longer be able to access the videos through the SharePoint link.
      - Foth, New Bedford Dock Wall (Click and follow link directly. Your email address must have been given access for you to open the folder. If you do not have access and need it, please reach out so we can get your email address added.).

- Sector Scan:
  - Please see 'Appendix A, Sector Scan 1', for an overall view of the Dock Wall.
  - Please see 'Appendix A, Sector Scan 2' for water depths throughout the New Bedford Dock Wall.
  - Please see 'Appendix B, Figures 1 – 3' for a typical view of the sheeting.
    - Moderate to heavy marine growth was observed throughout, along with minor surface rust.
  - Please see 'Appendix B, Figures 4 & 5' for a typical view of the adherent material.
    - Prop wash appears to have exposed more of the adherent material on which the Cells sheeting was driven.
  - Overall:
    - The Sector Scan inspection showed no evidence of any major holes, splits, and/or broken knuckles throughout the Cells.
      - Please consult the dive inspection report for a more in-depth inspection of the structures that made up the New Bedford Dock Wall.
    - The Sector Scan inspection showed no evidence of any major undermining or not fully driven sheets to the Cells.
      - Please consult the dive inspection report for a more in-depth inspection of the structures that made up the New Bedford Dock Wall.
  - Cell 1: See 'Appendix A, Sector Scan 3'.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, Location 1: 8.5-feet.
    - Adherent Material Height, Location 2: 7.6-feet.
  - Cell 1A: See 'Appendix A, Sector Scan 4'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, Location 1: 8.9-feet.
    - Adherent Material Height, Location 2: 7.4-feet.
  - Cell 2: See 'Appendix A, Sector Scan 5'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, in General: 3.0-feet.
  - Cell 2A: See 'Appendix A, Sector Scan 6'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, in General: 7.1-feet.
  - Cell 3: See 'Appendix A, Sector Scan 7'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, in General: 11.1-feet.
    - Adherent Material Height, Location 1: 8.2-feet tall by 7.0-feet wide.
  - Cell 3A: See 'Appendix A, Sector Scan 8'.

        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 11.8-feet.
    - Cell 4: See 'Appendix A, Sector Scan 9'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: There was not a significant amount of adherent material at this location.
    - Cell 4A: See 'Appendix A, Sector Scan 10'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 9.9-feet.
        - Adherent Material Height, Location 1: 8.7-feet tall by 9.9-feet wide.
    - Cell 5: See 'Appendix A, Sector Scan 11'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 7.4-feet.
        - Adherent Material Height, Location 1: 5.2-feet tall by 14.3-feet wide.
    - Cell 5A: See 'Appendix A, Sector Scan 12'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 6.7-feet.
    - Cell 6: See 'Appendix A, Sector Scan 13'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 4.6-feet.

*Summary of Recommendation:*

- Continue to inspect the New Bedford Dock Wall, by use of ROV and/or Sector Scan, on a regularly scheduled basis. We then recommend inspecting the Dock Wall, using a Diver, if we notice any of the following situations: new deficiencies, the growth of deterioration to previously found deficiencies, debris buildup, and/or on the regularly scheduled intervals directed by the PM's schedule.

## Brennan Condition Assessment

**Good:** No visible or only minor sporadic defects or deterioration. The “Brennan Repair Rating” is low.

**Satisfactory:** Limited minor to moderate defects or deterioration. The “Brennan Repair Rating” is low.

**Fair:** Minor to moderate defects or deterioration on widespread portions. Localized areas of moderate to advanced defects or deterioration may be present. The “Brennan Repair Rating” is low to moderate.

**Poor:** Moderate to advanced defects or deterioration on widespread portions. The “Brennan Repair Rating” is moderate.

**Serious:** Advanced defects or deterioration on widespread portions. Localized failures are possible. The “Brennan Repair Rating” is moderate to major.

**Critical:** Heavily advanced defects or deterioration have resulted in localized failure(s). More widespread failures are possible if corrective action is not taken. The “Brennan Repair Rating” is major.

## Brennan Repair Rating

Low: Repairs may have been recommended, but repair priority is low. At a minimum, we recommend continuing to monitor these defects or deteriorated areas within their upcoming routine inspections.

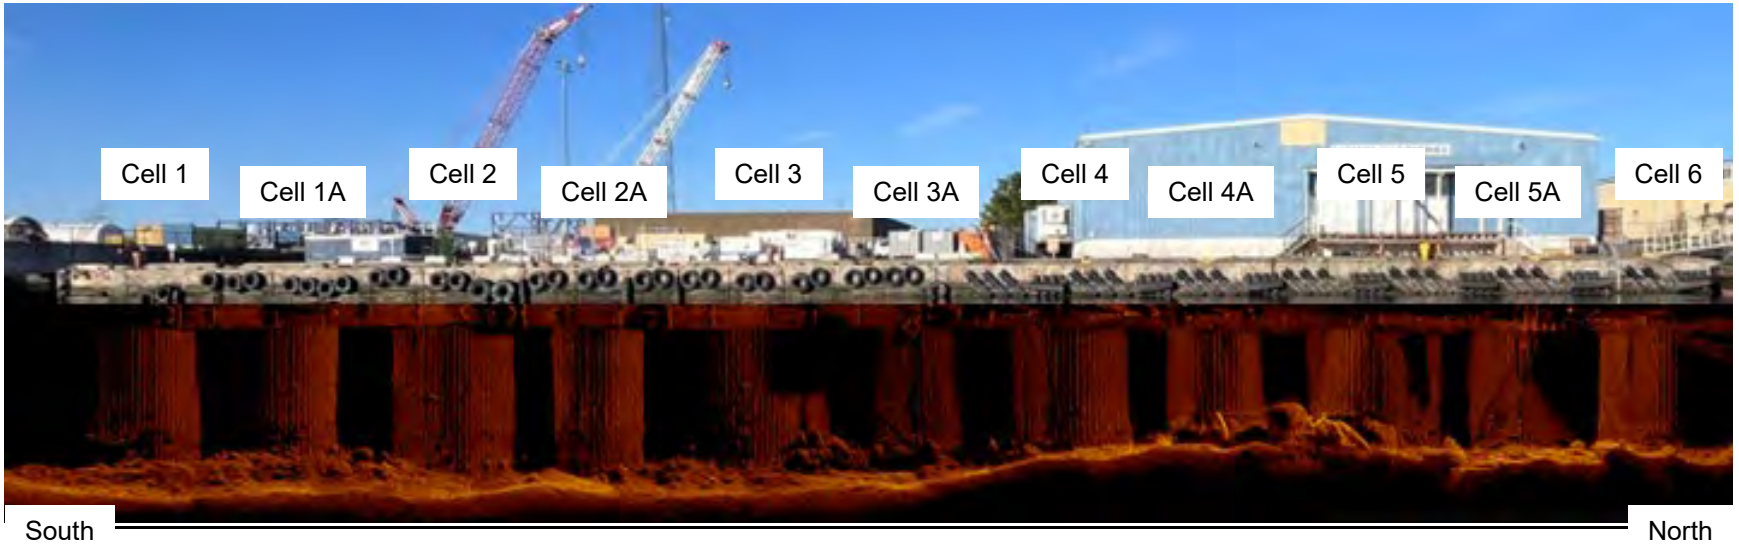
Moderate: We recommend repair talks begin and executed when possible. The observed defects or deterioration could affect the overall functionality of the structure(s).

Major: We consider the repair priority to be urgent, and repairs should be made as soon as possible.

*The Brennan Condition Assessment and Repair Ratings are considered opinions based on inspection findings of the specific inspected structure(s) and at the time of inspection. Company safety plans and/or any applicable industry regulations regarding these structure(s) should always be followed.

We appreciate the opportunity to work with Foth on this project. If you have any questions or concerns regarding the information in this report or if Brennan can be of any further assistance, please do not hesitate to reach out using the contact information below.

Respectfully submitted,



**Joe Baldoni**
Underwater Services- Underwater Inspection Program Supervisor

## GENERAL NOTES:

1. Symbols listed under "Proposed Construction" (at left) refer to work to be done by Contractor under the terms of the contract. These symbols and other specific instructions on the Drawings and in the Specifications will be used to indicate the work to be done by the Contractor.
2. Elevations are referenced to United States Coast and Geodetic Mean Sea Level (M.S.L.) datum.
   Mean high tide = 1.70'
   Spring tide = +3.0'±
   New Bedford city datum = +2.55'
3. Coordinates are referenced to Mass. Geodetic System.
4. Location of existing utilities is approximated, and is based on the best information available. Local connections are not shown. The Contractor is fully responsible for locating all utilities, whether shown on the Drawings or not, and is fully liable for any damage thereto. Additional compensation for errors and omissions in the location of utilities as shown on the Drawings will be allowed only as specified in the Specifications.
5. All elevations refer to finished pavement grade unless otherwise noted.
6. Catch Basin grate elevations are measured at center of grate and at face of curb. Elevations include 1-3/8" gutter depression. (See Catch Basin Details)
7. Curb radii are to face of curb.
8. Location of demolished buildings are not shown.
9. All proposed storm drainage pipes not labeled are 15" R.C.P.
10. All proposed sanitary sewer pipes not labeled are 8" V.C.P.
11. Modification, abandonment and/or addition to gas, electric & telephone utilities are not shown on the Drawings, but are shown on the Information Sheets only.
12. See Landscaping Detail Sheet for other landscaping work to be done by the Contractor.
13. Place 2 vitrified clay "y"s (one aimed at each side of street), with vitrified clay stoppers jointed in place, on V.C.P. sanitary sewer lines every 50' measured upgrade from the last preceeding manhole.

## DESIGN NOTES

1. General
   a. Elevations are based on mean sea level datum.
   b. Mean tide range is 3.7 feet.

2. Live Load Surcharge - 1,000 psf

3. Earthwork
   a. Unit dry weight = 106 pcf
   b. Unit moist weight = 120 pcf
   c. Unit submerged weight = 60 pcf
   d. Angle of friction, $\phi$ = 35°

4. Concrete
   a. All concrete shall have 4,000 psi ultimate.
   b. Concrete below water shall be tremie concrete.
   c. Reinforcing steel shall have a minimum yield strength of 30,000 psi and shall conform to ASTM A-615.
   d. Lap all splices 30 bar diameters.
   e. All reinforcement to have protection shown on all faces exposed to salt water action protect with 4" Concrete cover.

5. Structural Steel
   a. All material to be ASTM A36 except as noted.
   b. All hardware, anchor bolts, etc., shall be hot dipped galvanized steel.

6. Timber
   a. All timber shall be Douglas fir or Southern Yellow Pine pressure creosoted.

7. Cathodic Protection
   a. Cathodic protection shall be an impressed current system.

SCALE: 1" = 20'

## TYPICAL SECTION SHOWING LIMITS OF REMOVAL OF UNSUITABLE MATERIAL

NOT TO SCALE

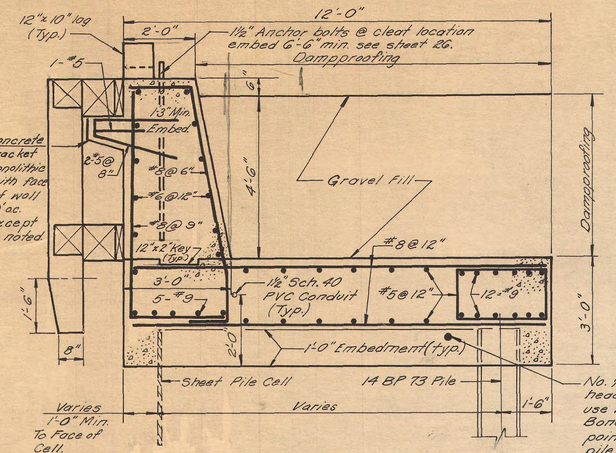
## SOUTH ELEVATION

SCALE: 1" = 10'

## TYPICAL "TEE" PILE

NOT TO SCALE

Notes:



1. Unsuitable material to be disposed of as per specifications.
2. Minimum length of dry side steel sheets in cells to be 15' in 20' draft, and 20' in 30' draft.
3. All steel sheet piling for cells and arcs to have section properties of U.S. Steel MP-101 except as otherwise noted.
4. All arc piles, and all MZ-27 sheet piles to be type-I steel sheets.
5. Gravel fill to be placed within cells and arcs insuring no segregation of particle sizes, uncontrolled dumping will not be allowed.
6. No welding of "tee" pile or fabricated connections will be permitted.
7. Protective Coating to be applied in accordance with Specifications to all type-I steel sheets.

GENERAL NOTES:

1. NOTES BELOW ARE NOT INTENDED TO REPLACE SPECIFICATIONS. SEE SPECIFICATIONS FOR REQUIREMENTS IN ADDITIONAL INFORMATION.
2. THE CONTRACTOR IS ADVISED THAT THE DRAWINGS AND SPECIFICATIONS FORM A PART OF THE CONTRACT DOCUMENTS. ALL WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE CONTRACT DOCUMENTS. THE CONTRACTOR SHALL KEEP A COPY OF THE DRAWINGS AND SPECIFICATIONS ONSITE AT ALL TIMES DURING THE PROJECT.
3. THE CONTRACTOR SHALL MAINTAIN ADEQUATE SURVEY CONTROL AT ALL TIMES TO ESTABLISH AND MAINTAIN ALL LINES AND ELEVATIONS SHOWN ON THE CONTRACT DRAWINGS.
4. THE CONTRACTOR SHALL VERIFY THE LOCATION OF ALL UNDERGROUND UTILITIES AND SUBMERGED UTILITIES WITHIN THE LIMITS OF THE WORK PRIOR TO COMMENCING ANY EXCAVATION OR GROUND PENETRATING WORK. THE CONTRACTOR SHALL NOTIFY "DIG SAFE" (1-888-344-7223) AT LEAST 3 BUSINESS DAYS PRIOR TO COMMENCEMENT OF THE EXCAVATION OR GROUND PENETRATING ACTIVITY.
5. IT IS THE CONTRACTORS RESPONSIBILITY TO PROVIDE AND MAINTAIN ENVIRONMENTAL CONTROLS AS REQUIRED BY STATE, LOCAL, AND FEDERAL REGULATION AND LAW, AS WELL AS REQUIRED WITHIN EXISTING PERMITS AND APPROVALS.
6. ALL APPLICABLE FEDERAL AND STATE REGULATION AND PERMITS SHALL BE FOLLOWED, INCLUDING BUT NOT LIMITED TO, THE CLEAN WATER ACT, THE FEDERAL DEPARTMENT OF LABOR, OCCUPATIONAL SAFETY, HEALTH ACT, 401 WATER QUALITY CERTIFICATION, CHAPTER 91 LICENSE, AND U.S. ARMY CORP OF ENGINEERS PERMIT.
7. THE CONTRACTOR IS TO VERIFY THAT THERE ARE NO EXISTING HAZARDS OR OBSTRUCTIONS IN THE SILT CURTAIN AREA SHOWN HEREON.
8. BASE PLAN COMPILED BY FOTH USING AVAILABLE MAGIS DATA AND INFORMATION PROVIDED BY USACE AND NBPA.
9. THE CONTRACTOR, PRIOR TO CONSTRUCTION AND FABRICATION OF CONSTRUCTION MATERIALS, SHALL VERIFY EXISTING CONDITIONS AND DIMENSIONS.
10. IF, DURING THE PERFORMANCE OF THE WORK, THE CONTRACTOR FINDS A CONFLICT, ERROR, OR DISCREPANCY IN THE CONTRACT DOCUMENTS, THE CONTRACTOR SHALL SO REPORT TO THE ENGINEER IN WRITING AT ONCE BEFORE PROCEEDING WITH THE WORK AFFECTED THEREBY. THE CONTRACTOR SHALL OBTAIN A WRITTEN INTERPRETATION OR CLARIFICATION FROM THE ENGINEER. WORK DONE BEFORE THE ENGINEER RENDERS HIS/HE DECISION IS AT THE CONTRACTOR'S SOLE RISK.
11. THE CONTRACTOR SHALL TAKE HIS OWN MEASUREMENTS AT THE SITE, VERIFYING THE SAME WITH THE CONTRACT DRAWINGS AND EXISTING FACILITIES, AND WILL BE HELD RESPONSIBLE FOR THE PROPER FIT AND ALIGNMENT OF COMPLETED WORK IN POSITION.
12. LENGTHS SHOWN ON THE DRAWINGS ARE CONSIDERED APPROXIMATE, AND THE ACTUAL LENGTHS MAY VARY WHEN SO ACCEPTED BY THE ENGINEER.
13. EXISTING SITE CONDITION PLAN TAKEN FROM PLAN ENTITLED "NEW BEDFORD WATERFRONT FACILITIES INSPECTIONS" BY PARE CORPORATION DATED NOVEMBER 2008.
14. PROPERTY LINES OBTAINED FROM THE MA GIS DATABASE.
15. CONTRACTOR SHALL MAINTAIN A 6-FOOT SETBACK FROM THE EXISTING BULKHEAD FOR LOAD RESTRICTION. CRANE MATTS SHALL BE UTILIZED FOR ANY CRANE OR HEAVY EQUIPMENT LOADS. A STAGING PLAN SHALL BE SUBMITTED TO THE ENGINEER FOR REVIEW PRIOR TO START OF WORK.

TOPOGRAPHIC SURVEY NOTES:

1. THE PURPOSE OF THIS PLAN IS TO SHOW A TOPOGRAPHIC SURVEY AS THE RESULT OF AN ON-THE-GROUND INSTRUMENT SURVEY WHICH OCCURRED BETWEEN 6-20-2020 TO 6-27-2020.
2. HORIZONTAL COORDINATES REFER TO MASSACHUSETTS STATE PLANE, MAINLAND ZONE, US SURVEY FEET BASED ON GPS RTK OBSERVATIONS.
3. ELEVATION REFERS TO MEAN LOW WATER MARK (MLW) VERTICAL BASED ON THE PUBLISHED BENCHMARK STATION BOLT 2008 ESTABLISHED BY U.S.A.C.E.-NAD-NE IN APRIL 2008.
4. THE ENTIRE PROJECT SITE WORK AREA IS WITHIN LAND SUBJECT TO COASTAL STORM FLOWAGE. FEMA FLOOD ZONE AE (EL 6) REFERENCED FROM MAP# 25005C0393G & 25005C0481G DATED 7/16/14.
5. WATER BOUNDARIES ARE SUBJECT TO CHANGE DUE TO NATURAL CAUSES AND THE WATER BOUNDARIES SHOWN HEREON MAY OR MAY NOT REPRESENT THE ACTUAL LOCATION OF THE LIMIT OF TITLE.
6. THE MEAN HIGH WATER ELEVATION (3.75') BASED ON VDATUM CONVERSION FROM MEAN LOWER LOW WATER TO MEAN HIGH WATER.

HYDROGRAPHIC SURVEY NOTE:

1. COORDINATES SHOWN ARE IN STATE PLANE COORDINATE SYSTEM, MASSACHUSETTS MAINLAND ZONE 2001, REFERENCED TO THE 1983 NORTH AMERICAN DATUM (NAD83), EXPRESSED IN US SURVEY FEET.
2. INFORMATION DEPICTED ON THIS PLAN REPRESENTS THE RESULTS OF SURVEYS MADE ON DATES INDICATED BELOW AND CAN ONLY BE CONSIDERED TO REPRESENT THE CONDITION AT THE TIME OF THE SURVEY AND AT SOUNDING POINTS NOTED ON THE PLAN. HYDROGRAPHIC SURVEY OF NEW BEDFORD HARBOR WAS PERFORMED BY FOTH INFRASTRUCTURE & ENVIRONMENTAL, LLC. SURVEY DATED NOVEMBER 2018.
3. ELEVATIONS & SOUNDINGS SHOWN ARE DEPTHS IN FEET BELOW MEAN LOW WATER (MLW) FOR CLARK'S POINT NOAA STATION 8447712. THE MLW ELEVATION FOR THE NEW BEDFORD HARBOR AREA IS -1.78 FEET NAVD88. SEE GRAPHIC REPRESENTATION OF DATUM SEPARATION FOR MORE INFORMATION.
4. ELEVATION REFERS TO THE PUBLISHED BENCHMARK STATION BOLT 2008 ESTABLISHED BY U.S.A.C.E.-NAD-NE IN APRIL
5. 2008. SEE SPECIFICATIONS SECTION 00800 - SUPPLEMENTAL CONDITIONS FOR BENCHMARK INFORMATION.
6. SOUNDINGS SHOWN AS NEGATIVE ARE ABOVE THE REFERENCE PLANE.
7. THE SOUNDING INFORMATION SHOWN ON THIS PLAN REPRESENTS THE AVERAGE SOUNDINGS OBTAINED FROM HYDROGRAPHIC SURVEYS. SOUNDINGS ARE GENERATED FROM A 25' X 25' AVERAGE. VALUE DATA SET.
8. THE SOUNDING INFORMATION DEPICTED ON THIS PLAN SHOULD NOT BE USED FOR THE DETERMINATION OF VOLUMES. VOLUMES ARE TO BE DETERMINED FROM A SEPARATE AVERAGE VALUE DATA SET.
9. CONTOURS SHOWN FOR NEW BEDFORD HARBOR ARE BASED ON A 3'X3' AVERAGE VALUE DATA SET. CONTOURS ARE SHOWN AT 1' INTERVALS UNLESS OTHERWISE NOTED.

UTILITY NOTES:

1. THE SUB-SURFACE UTILITY INFORMATION SHOWN HEREON IS COMPILED BASED ON FIELD SURVEY INFORMATION, RECORD INFORMATION AS SUPPLIED BY THE APPROPRIATE UTILITY COMPANIES, AND PLAN INFORMATION SUPPLIED BY THE NEW BEDFORD PORT AUTHORITY, IF ANY; THEREFORE WE CANNOT GUARANTEE THE ACCURACY OF SAID COMPILED SUB-SURFACE INFORMATION TO ANY CERTAIN DEGREE OF STATED TOLERANCE. ONLY PHYSICALLY LOCATED SUB-SURFACE UTILITY FEATURES FALL WITHIN NORMAL STANDARD OF CARE ACCURACIES.
2. THE LOCATIONS OF UNDERGROUND PIPES, CONDUITS, AND STRUCTURES HAVE BEEN DETERMINED FROM SAID INFORMATION, AND ARE APPROXIMATE ONLY. COMPILED LOCATIONS OF ANY UNDERGROUND STRUCTURES, NOT VISIBLY OBSERVED AND LOCATED, CAN VARY FROM THEIR ACTUAL LOCATIONS.
3. ADDITIONAL BURIED UTILITIES/STRUCTURES MAY BE ENCOUNTERED.
4. THE STATUS OF UTILITIES, WHETHER ACTIVE, ABANDONED, OR REMOVED, IS AN UNKNOWN CONDITION AS FAR AS OUR COMPILATION OF THIS INFORMATION.
5. IT IS INCUMBENT UPON INDIVIDUALS USING THIS INFORMATION TO UNDERSTAND THAT COMPILING UTILITY INFORMATION IS NOT EXACT, AND IS SUBJECT TO CHANGE BASED UPON VARYING PLAN INFORMATION RECEIVED AND ACTUAL LOCATIONS.
6. THE ACCURACY OF MEASURED UTILITY INVERTS AND PIPE SIZES IS SUBJECT TO FIELD CONDITIONS, THE ABILITY TO MAKE VISUAL OBSERVATIONS, DIRECT ACCESS TO THE VARIOUS ELEMENTS AND OTHER MATTERS.
7. THE PROPER UTILITY ENGINEERING/COMPANY SHOULD BE CONSULTED AND THE ACTUAL LOCATIONS OF SUBSURFACE STRUCTURES SHOULD BE VERIFIED IN THE FIELD (V.I.F.) BEFORE PLANNING FUTURE CONNECTIONS. CONTACT THE DIG SAFE CALL CENTER AT 1-888-344-7233, SEVENTY-TWO HOURS PRIOR TO EXCAVATION, BLASTING, GRADING, AND/OR PAVING.

STRUCTURAL NOTES:

1. SHOP DRAWINGS SHALL SHOW IN DETAIL ALL SIZES, SHAPES, MATERIALS, FINISHES AND METHODS OF ATTACHING MISCELLANEOUS METAL ITEMS TO ONE ANOTHER, AND WORK OF OTHER TRADES.
2. THE WORK SHALL BE PERFORMED IN A GENERAL SEQUENCE DEVELOPED BY THE CONTRACTOR AND SUBMITTED TO THE ENGINEER FOR REVIEW, IN ACCORDANCE WITH THE REQUIREMENTS OF THE CONTRACT. THE CONTRACTOR IS SOLELY RESPONSIBLE FOR THE MEANS AND METHODS OF CONSTRUCTION AND FOR THE SEQUENCES AND PROCEDURES TO BE USED.

GENERAL MATERIAL SPECIFICATIONS

STEEL:

1. STRUCTURAL STEEL SHALL COMPLY WITH THE "STEEL CONSTRUCTION MANUAL" FIFTEENTH EDITION PUBLISHED BY THE AMERICAN INSTITUTE OF STEEL CONSTRUCTION.
2. MISC STEEL OR STEEL NOT SPECIFIED TO BE GRADE 50.
3. WELDING SHALL CONFORM TO THE 'STRUCTURAL WELDING CODE - STEEL', PUBLISHED BY THE AMERICAN WELDING SOCIETY (AWS D1.1). A WELDER CERTIFIED IN ACCORDANCE WITH AWS STANDARDS SHALL PERFORM WELDING.
4. WELDING ELECTRODES SHALL BE E70XX AND COMPLY WITH AWS A5.1 AND AWS A5.5 UNLESS NOTED OTHERWISE.
5. STRUCTURAL STEEL SHAPES/PILES SHALL CONFORM TO ASTM A588, GRADE 50. STEEL PLATES SHALL CONFORM TO ASTM A588 WITH 50 KSI YIELD.
6. STEEL HARDWARE: ANCHOR AND CARRIAGE BOLTS: ASTM F 1554 GRADE 55 AND ASTM A307, HIGH STRENGTH STRUCTURAL BOLTS: ASTM F3125 GR. A325, W/ HEXAGONAL OR CARRIAGE HEADS NUTS: ASTM A563, WASHERS (EXCEPT AGAINST TIMBER): ASTM F436, WASHERS AGAINST TIMBER SHALL BE COMMON DOCK WASHERS.
7. STEEL HARDWARE ABOVE GRADE SHALL BE HOT DIPPED GALVANIZED IN ACCORDANCE WITH ASTM A153.
8. CONNECTIONS SHALL BE DESIGNED AND DETAILED BY THE STEEL FABRICATOR EXCEPT FOR THOSE SPECIFICALLY DETAILED IN THE CONTRACT DOCUMENTS.
9. PREFABRICATED PILE CAP ASSEMBLIES SHALL BE HOT DIP GALVANIZED.

STEEL PROTECTIVE COATING:

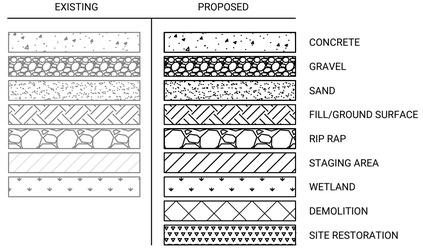
1. MATERIAL USED FOR FACTORY EPOXY COATING OF ALL SCHEDULED SURFACES SHALL BE AMERCOAT 240 OR APPROVED EQUAL ACCEPTED BY THE ENGINEER.
2. COATING SHALL BE APPLIED IN ACCORDANCE WITH THE MANUFACTURES RECOMMENDATION WITH SURFACE PREPARATION FOR IMMERSION SERVICE WITH MINIMUM GRIT BLASTING TO NEAR WHITE FINISH (SSPC-SP10 OR NACE).
3. FIELD TOUCH-UP COATING SHALL BE AMERCOAT 240 FOR AREAS ABOVE MEAN HIGH WATER AND DENSO SPLASHZONE UNDERWATER EPOXY FOR AREAS BELOW MEAN HIGH WATER, OR APPROVED EQUAL, AND SHALL BE APPLIED IN ACCORDANCE WITH THE MANUFACTURER'S REQUIREMENTS.
4. THE PROTECTIVE COATING SHALL BE INSTALLED IN STRICT ACCORDANCE WITH MANUFACTURER'S WRITTEN INSTRUCTIONS.
5. ALL IMPERFECTIONS IN THE COATING SHALL BE REMOVED OR REPAIRED AT THE CONTRACTORS EXPENSE PRIOR TO FINAL ACCEPTANCE OF THE WORK.

CONCRETE:

1. CONCRETE WORK SHALL CONFORM TO THE REQUIREMENTS OF ACI-318 "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE", AS ADOPTED BY THE AMERICAN CONCRETE INSTITUTE.
2. CONCRETE SHALL BE NORMAL WEIGHT WITH COMPRESSIVE STRENGTH OF 5000 PSI AT 28 DAYS. PORTLAND CEMENT SHALL BE TYPE II. CONCRETE SHALL CONTAIN 6% (+/- 1.5%) ENTRAINED AIR AND HAVE A MAXIMUM WATER TO CEMENT RATIO OF 0.40.
3. USE ACCELERATORS/ADMIXTURES TO IMPROVE WORKABILITY AND REDUCE WATER/CEMENT RATIO TO CONTROL SHRINKAGE. SUBMIT PROPOSED CONCRETE MIX TO THE ENGINEER FOR REVIEW. NO WATER SHALL BE ADDED TO THE MIX AT THE JOB SITE.
4. CONCRETE SHALL BE CONTROLLED CONCRETE, MIXED AND PLACED IN THE PRESENCE OF THE APPROVED TESTING AGENCY.
5. DO NOT PLACE CONCRETE UNTIL REINFORCEMENT AND EMBEDDED ITEMS HAVE BEEN APPROVED BY THE ENGINEER AND/OR THE APPROVED TESTING AGENCY (IF/WHEN DIRECTED). PROVIDE A MINIMUM OF 24 HOURS NOTIFICATION TO THE ENGINEER.
6. A MINIMUM OF 72 HOURS SHALL ELAPSE BETWEEN ADJACENT CONCRETE PLACEMENTS.

REINFORCEMENT:

1. REINFORCING STEEL SHALL CONFORM TO THE REQUIREMENTS OF ASTM A615 GRADE 60, OR 75 AS CALLED FOR.
2. DETAILING, FABRICATION, AND ERECTION OF REINFORCING STEEL SHALL BE EPOXY COATED AND CONFORM TO THE REQUIREMENTS OF ACI-318 AND ACI-315 'DETAILS AND DETAILING OF CONCRETE REINFORCEMENT'.
3. REINFORCEMENT SHALL CONFORM TO BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE (ACI 318), ACI DETAILING MANUAL (SP-66), CRSI MANUAL OF STANDARD PRACTICE (MSP), AND THE STRUCTURAL WELDING CODE-REINFORCING STEEL (AWS D1.4). ELECTRODES TO BE E-8018.
4. WELDED WIRE FABRIC SHALL CONFORM TO ASTM A185
5. PROVIDE SUPPLEMENTAL BARS AND ACCESSORIES AS REQUIRED TO HOLD REINFORCEMENT SECURELY IN POSITION.
6. MINIMUM CONCRETE PROTECTIVE COVER, UNLESS NOTED OTHERWISE, SHALL BE AS FOLLOWS:
   - 6.1. CONCRETE EXPOSED TO WEATHER 3 INCHES
   - 6.2. CONCRETE AT ADJACENT POURS 2 INCHES
   - 6.3. CONCRETE PLACED AGAINST EARTH 3 INCHES
7. ALL CONTINUOUS REINFORCEMENT SHALL BE EXTENDED AROUND CORNERS AND LAPPED AT NECESSARY SPLICES OR HOOKED AT DISCONTINUOUS ENDS. USE STANDARD HOOKS UNLESS OTHERWISE INDICATED.
8. LAPS SHALL BE CLASS B TENSION LAP SPLICES, UNLESS NOTED OTHERWISE.
9. REINFORCEMENT SHALL BE CONTINUOUS THROUGH CONSTRUCTION JOINTS. PROVIDE MECHANICAL COUPLERS WHERE REQUIRED CONTINUOUS REINFORCEMENT EXCEEDS AVAILABLE LENGTHS.



COMPOSITE FENDER SYSTEM:

1. FENDER PILES SHALL BE 13" DIAMETER PILE W/ 8x11 FG REBAR OR APPROVED EQUAL.
2. WALERS SHALL BE 12x12 TIMBER W/ 4x08 FG REBAR OR APPROVED EQUAL.
3. CHOCKS SHALL BE 8x12 TIMBER W/ 4x08 FG REBAR OR APPROVED EQUAL.
4. MATERIAL COLOR SHALL BE BLACK.
5. FENDER PILES SHALL BE DRIVEN STRAIGHT AND TRUE AT INDICATED LOCATIONS, WITH DEVIATION FROM THE LONGITUDINAL AXIS OF NOT MORE THAN 1/8 INCH PER FOOT.
6. WALERS SHALL BE CONTINUOUSLY EXTRUDED.
7. CONTRACTOR SHOULD COORDINATE WALE LENGTHS TO THE MAXIMUM EXTENT POSSIBLE IN ORDER TO MINIMIZE OVERLAP AREAS.

FIBERGLASS PILE JACKET REPAIRS:

1. FIBERGLASS PILE JACKETS SHALL BE DENSO FIBER-FORM PILE JACKETS OR APPROVED EQUAL.
2. GROUT FOR PILE JACKET REPAIRS SHALL BE DENSO SEASHIELD 550 EPOXY GROUT OR APPROVED EQUAL.
3. FIBERGLASS JACKETS AND EPOXY GROUT SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURES RECOMMENDATIONS.

HATCHING

# 7. South Terminal Fish Houses

## 7.1 Description of Site

### 7.1.1 Site Location

South Terminal is located off of Hassey Street, south of Leonard's Wharf and north of the Hurricane Barrier along the New Bedford waterfront on Buzzards Bay as shown on ***Figure 6***. The parcel is referenced by the City of New Bedford Assessor's Office as Map 31, 37-2, and 42, Lot 47 and 302. The project site is located within a Designated Port Area and Shellfish Suitability Area as regulated under the MA WPA.

Figure 6: Location of South Terminal Fish Houses

### 7.1.2 Facility Description

South Terminal is believed to have been constructed in the 1960s. It is divided into several marine industrial parcels and ship berths, and is constructed of an approximate 1,800-foot long steel cellular bulkhead with a reinforced concrete cap wall. The cellular bulkhead retains solid fill material and provides support for vessel berthing and adjacent building structures. South Terminal is constructed of twenty-six 54-foot diameter cofferdams and twenty-five 17-foot radius cofferdams that make up the total 51 steel cellular cofferdams which are built with MP-101 steel sheet piles. A bulkhead also spans the northern and southern portions of the site which connect the northern and southern most cofferdams to the landside shoreline. The northern bulkhead is constructed of approximately 100 feet of MZ-27 steel sheet piles and the southern bulkhead is constructed of approximately 85 feet of MZ-27 steel sheet piles. Supported by the cellular cofferdam cells is an L-shaped reinforced concrete cap wall that is 2-foot wide by 5-foot thick on the stem and 12-foot wide by 3-foot thick at the base. Additionally, 148 P73 H-piles were driven approximately 10-feet landward of the face of the cellular bulkhead. The cellular cofferdam cells and bulkhead are numbered, for reference, as shown on the attached plans in **Appendix A – Condition Plans**. Structures extend over the cells for the majority of the 1,800 linear feet. The first 203 feet of the bulkhead are owned and maintained by the MA Clean Energy Center (MassCEC), while the remaining ~1,597 feet are owned and maintained by the New Bedford Port Authority (NBPA). (The full extent of the bulkhead was inspected, as the bulkhead had been previously owned by NBPA in its entirety.) The fender system along South Terminal consists of a combination of large diameter tires and D-Fenders hung from the concrete deck cap. The fenders are secured by chains which are connected to eye bolts anchored to the concrete deck cap.

## 7.2 Observed Conditions - 2020

The underwater inspection of South Terminal, executed with Fathom, was performed on February 3, 4, and 5, 2021. The topside inspection was performed on January 8, 2021 by Foth. Assessment of the bituminous pavement and utilities will be stated in a later section of this report. Assessment of the adjacent buildings, loading platforms, fencing, and stairways are not included in the scope of work and therefore were not inspected. For reference, as shown on the attached plans in **Appendix E – South Terminal 2020 Condition Plan**, a baseline stationing was established along the top of the bulkhead during the inspection. Station 0+00 is located at the southern end of the project site adjacent to the Marine Commerce Terminal and extends north terminating at Station 18+15. (Stations 0+00 thru 2+60 are not the property of NBPA, but conditions have been noted since they had been previously owned by NBPA and therefore included in historic reports.) Observations were made in relation to their stationing and cofferdam cell location along the baseline as appropriate, and as noted herein and in the plans. Overall, the condition of South Terminal was found to be in *Fair* condition.

The steel sheet pile cells are of varying diameters alternating between major and minor cells and are exposed from the mud line up to the concrete cap. The flat steel sheets which comprise the cells, exhibit signs of heavy corrosion with pitting of the steel and no evidence of a passive or active cathodic protection system.

### 7.2.1 Appurtenances

Appurtenances such as the life rings were typically given a condition rating of *Minor*. Life rings were observed either bolted to the timber curb along the bulkhead or placed on the adjacent buildings at Station 2+92, Station 6+10, and Station 10+35, with no major deficiencies noted. The Life Ring at Station 14+70 was observed to be loose due to the loose and compromised timber curb, therefore was given a condition rating of *Severe*.

Similarly, the mooring cleats and mooring bollards located throughout the pier were given a condition rating ranging from *Minor* to *Severe*. Typically the mooring cleats and bollards were given condition ratings of *Minor* with typical observations consisting of coating loss, minor surface corrosion, minor wearing marks or pitting, and in-tact epoxy on hardware. (Refer to Photographs 1 through 3 of Appendix B.) Corrosion of the mooring cleats and bollards will lead to loss of section and, therefore, a reduction of strength. Mooring cleats and bollards with typical observations consisting of missing hardware epoxy, significant surface wear marks and pitting, moderate surface corrosion, delamination, scaling, and corroded hardware less than 25% loss of section were given a condition rating of *Moderate*. (Refer to Photographs 4 through 6 of Appendix B.) Several mooring cleats were observed to have corroded hardware greater than 25% loss of section and advanced corrosion and scaling with surface wear marks and pitting, resulting in a *Major* condition rating. (Refer to Photographs 7 and 8 of Appendix B.) These mooring cleats are identified as #17, #23, #27, #29, #38, and #44, as well as, mooring bollards #4, #5, and #12. Additionally, mooring bollard #13 was observed to be broken and therefore was given a condition rating of *Severe*. (Refer to Photograph 9 of Appendix B.) Refer to **Table 17** for a list of deficiencies encountered related to the mooring cleats and mooring bollards.

Additional appurtenances, such as the access ladders, are located along the bulkhead to provide access to and from the deck to the water below. The construction of the access ladders vary between timber and steel throughout the pier. The access ladders were given condition ratings of either *Minor* or *Severe*. Typical observations which attributed to these ratings were missing ladder rungs, heavily cracked/split vertical legs, damaged or broken components, impact damage, and heavy corrosion and deterioration of the hardware. Foth noted that it had appeared as though the majority of damage observed on the access ladders is likely a result of impact from vessels causing damage to the rungs and the vertical legs. The steel access ladder at Station 2+88 was given a condition rating of *Severe* and was observed to have bent/deformed vertical legs at the top of the ladder, likely from impact, as well as broken step rungs at the top of the ladder and broken connection to the reinforced concrete bulkhead cap. (Refer to Photograph 10 of Appendix B.) Timber access ladders at Station 6+65, Station 9+00, and Station 10+40

were all given condition ratings of *Severe* and were observed to have corroded connection hardware, broken step rungs, and/or broken vertical legs compromising its connection to the concrete cap. (Refer to Photographs 11 through 13 of Appendix B.) The timber access ladder at Station 4+26 was observed to have corroded connections to the reinforced concrete bulkhead cap and was given a condition rating of *Minor*. The timber access ladders at Station 7+90 and Station 12+45 had no deficiencies observed and therefore were also given condition ratings of *Minor*.

## Table 17

## South Terminal Observed Mooring Cleat and Mooring Bollard Deficiencies

| Station | Structure | Deficiency |
|---|---|---|
| **1+20 [MassCEC]** | Mooring Bollard #1 | Moderate Condition |
| **1+40 – 2+20 [MassCEC]** | Mooring Cleats #1 - #5 | Moderate Condition; Delamination and Scaling |
| **2+40 [MassCEC]** | Mooring Bollard #2 | Moderate Condition |
| **2+60 [MassCEC]** | Mooring Cleat #6 | Moderate Condition |
| **2+80** | Mooring Cleat #7 | Moderate Condition |
| **3+00** | Mooring Cleat #8 | Minor Condition |
| **3+20** | Mooring Cleat #9 | Minor Condition |

| **5+90** | Mooring Cleat #18 | Minor Condition |
| **6+10** | Mooring Bollard #5 | Major Condition |
| **6+60** | Mooring Cleat #19 | Moderate Condition |
| **6+80** | Mooring Cleat #20 | Minor Condition |
| **7+00** | Mooring Cleat #21 | Moderate Condition |
| **7+20** | Mooring Cleat #22 | Minor Condition; Missing Hardware Epoxy |
| **7+40** | Mooring Bollard #6 | Moderate Condition |
| **7+80** | Mooring Cleat #23 | Major Condition |
| **8+00** | Mooring Cleat #24 | Minor Condition |
| **8+20** | Mooring Cleat #25 | Moderate Condition |
| **8+60** | Mooring Cleat #26 | Moderate Condition |
| **8+65** | Mooring Bollard #7 | Moderate Condition |
| **8+95** | Mooring Cleat #27 | Major Condition |
| **9+30** | Mooring Bollard #8 | Moderate Condition |
| **9+55** | Mooring Cleat #28 | Minor Condition |
| **9+70** | Mooring Cleat #29 | Major Condition |
| **9+90** | Mooring Cleat #30 | Minor Condition; On Expansion Joint |
| **10+10** | Mooring Cleat #31 | Minor Condition |
| **10+35** | Mooring Cleat #32 | Minor Condition |
| **10+55** | Mooring Bollard #9 | Moderate-Major Condition |
| **10+80** | Mooring Cleat #33 | Minor Condition |
| **11+00** | Mooring Cleat #34 | Moderate Condition |

| Station | Structure | Deficiency |
|---|---|---|
| **11+40** | Mooring Cleat #35 | Moderate Condition |
| **11+60** | Mooring Cleat #36 | Minor Condition |
| **11+90** | Mooring Bollard #10 | Minor Condition |
| **12+20** | Mooring Cleat #37 | Minor Condition |
| **12+40** | Mooring Cleat #38 | Moderate-Major Condition |
| **12+80** | Mooring Cleat #39 | Moderate Condition |
| **13+00** | Mooring Cleat #40 | Minor Condition |
| **13+20** | Mooring Bollard #11 | Minor Condition |
| **13+60** | Mooring Cleat #41 | Moderate Condition |
| **13+80** | Mooring Cleat #42 | Moderate Condition |
| **14+00** | Mooring Cleat #43 | Minor Condition |
| **14+40** | Mooring Cleat #44 | Major Condition |
| **14+70** | Mooring Bollard #12 | Major Condition |
| **15+00** | Mooring Cleat #45 | Moderate Condition |
| **15+20** | Mooring Cleat #46 | Moderate Condition |
| **15+40** | Mooring Cleat #47 | Moderate Condition |
| **15+60** | Mooring Bollard #13 | Severe Condition; Broken |
| **16+00** | Mooring Cleat #48 | Minor Condition |
| **16+20** | Mooring Cleat #49 | Moderate Condition |
| **16+40** | Mooring Cleat #50 | Moderate Condition |
| **16+60** | Mooring Cleat #51 | Moderate Condition |
| **16+80** | Mooring Bollard #14 | Minor Condition |
| **17+20** | Mooring Cleat #52 | Moderate Condition |

### 7.2.2 Timber Curb

The timber curb was generally found to be in ***Fair - Poor*** condition. Condition ratings for the timber curb were given ranging from ***Minor*** to ***Severe***. (Refer to Photographs 14 through 23 of Appendix B.) Typical observations which attributed to a ***Minor*** condition rating consisted primarily of rot, fungal decay, and checking typically found given the age of the timber elements. Typical observations which attributed to the ***Moderate*** condition rating were moderate fungal decay/rotting, section loss up to 25%, checking or splitting wider than ½", and dislodged sections. Typical observations which attributed to the ***Major*** condition rating were section loss 25% to 50%, heavily corroded hardware, checking or splitting through full section, and displacement or loss of bearing connections. Typical observations which attributed to the ***Severe*** condition rating were section loss greater than 50%, loss of connection or full bearing, and partial or full breakage. In addition, there are several areas along the bulkhead were the timber curb was observed to be missing.

### 7.2.3 Rubber Fender System

The fender system primarily consists of D-Fenders and non-engineered rubber elements (tires, cylinders, etc.). Minor oxidation was observed on the hardware of the fender system. Overall, the fender system was generally given a condition rating of ***Minor-Moderate*** with gouges/wears less than 25% nominal depth, surface cracking of rubber components, and intact connections. (Refer to Photograph 24 of Appendix B.) However, several areas of the fender system along the bulkhead were given a condition rating of ***Severe***. This rating was generally given for sections where the fender system was observed to be missing, which indicates that the connections had failed. One particular section of the fender system which was missing is between Station 9+30 through 10+30 (refer to Photograph 25 Appendix B), and the other area is between Station 1+60 through Station 2+00. (Refer to Photograph 26 Appendix B.) Additionally, several D-Fenders were observed to be torn through the rubber. (Refer to Photographs 27 to 29 of Appendix B.)

### 7.2.4 Concrete Bulkhead Cap

The concrete deck was given a condition rating of *Moderate* with typical surface cracking and spalling. (Refer to Photographs 30 through 35 of Appendix B.) Vertical hairline cracks were observed along the face of the concrete deck cap, along with spalling on the topside leading edge of the concrete deck throughout the entire length of the project site. Occasionally, these areas of spalling and cracking coincided with areas where the mooring bollards or mooring cleats are located. (Refer to Photographs 33 through 35 of Appendix B.) This has a potential of compromising the structural integrity of their fasteners. Lastly, multiple areas of isolated spalling resulting in loss of section, along with exposed reinforcement were also observed during the inspection and were subsequently given a condition rating of *Severe*.

### 7.2.5 Sheet Pile Cofferdam Bulkhead

The sheet pile cellular cofferdam bulkhead at South Terminal is comprised of 51 sheet pile cells is constructed over 1,630 linear feet (the first~200 linear feet of which are not owned by NBPA) with a northern bulkhead comprised of approximately 100 feet of MZ-27 steel sheet piles and the southern bulkhead comprised of approximately 85 feet of MZ-27 steel sheet piles. The sheet pile cofferdams and bulkheads at South Terminal were given an overall condition rating of *Severe*. (Refer to Photographs 36 through 48 of Appendix B.) Typical observations which attributed to this are holes in the sheet piles, structural deformation, loss of thickness and section, and washout. During the underwater inspection, the divers encountered holes on the sheet piles at 38 out of a total of 51 cellular cofferdams. The holes range in size and diameter or length from one to two inches to greater than 30 inches and also range in location from between the tidal zone to the top of the sheets. (Refer to Photographs 36 through 41 of Appendix B.) Coincidentally, a majority of the holes observed on the cells coincided with locations of the concrete cap expansion joints. **Table 18** indicates the size and location of each hole observed during the inspection. Refer to **Table 19**for UT readings.

In addition to the observed holes, the divers also indicated a section of the sheet piles from Cell #5 through Cell #7 to be washing out from below the sheets. (Refer to Photographs 42 and 43 of Appendix B.) It appeared as though the harbor was dredged sometime after the 2016 inspection, indicated by a layer of old mudline material on the sheet piles, which has exposed the bottom of the sheets at this location. It was noted that the sheet piles appeared to have been driven to a rock layer, which may have been mistaken as refusal or bedrock during the time of installation, and therefore did not extend to the depths required. Since the previous dredge limit was higher than the current elevation and above this deficiency, it was not observed during the previous inspection in 2016. Similarly, an additional area of washout was encountered at Cell #44. The divers indicated that two of the sheet piles at this location were separated from the interlocks approximately 12 inches from the mudline where they continued to bow outward. (Refer to Photographs 44 and 45 of Appendix B.) Therefore, washout was observed at this location due to the separation of the interlocks from the adjacent sheet piles.

Lastly, during the inspection, the divers observed the sheet piles of the northern bulkhead to be in *Critical* condition. Large holes were encountered that extended through the webs of the sheet piles essentially leaving the inner and outer flanges to remain. (Refer to Photographs 46 through 48 of Appendix B.)

# Table 18

## South Terminal Cellular Cofferdam Deficiencies:

| Cell # | Sheet # | Deficiency |
|---|---|---|
| 1 [Mass CEC] | 3 | Hole 4"x6" near concrete cap |
| 2 [Mass CEC] | 25 | Hole 2"x5" at top of sheet |

## 7.3 Structural Condition Assessment

South Terminal was observed to have 73 holes through the steel bulkhead however, due to the original design these have a lesser impact to overall capacity of the system. Overall the structure is in Fair condition with localized areas of advanced deterioration but no significant reduction in capacity.

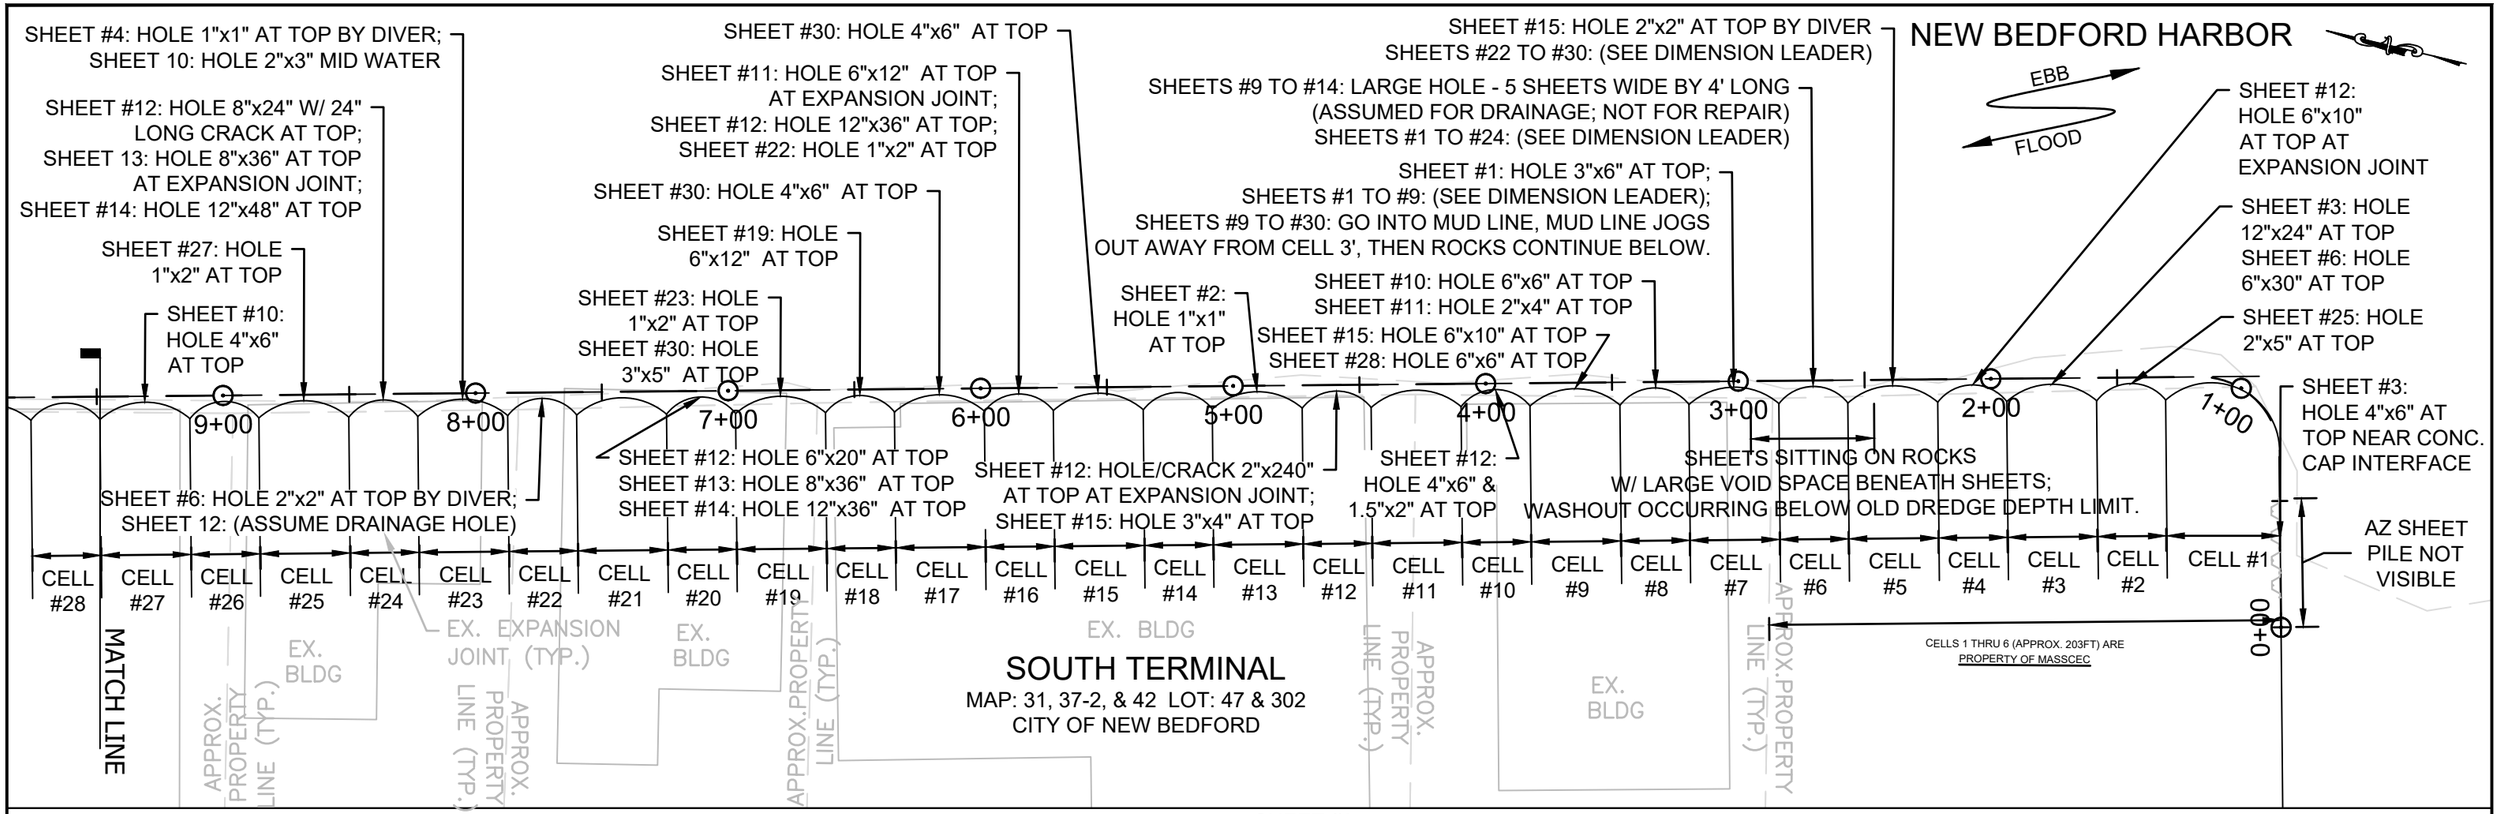
Due to the number of sinkholes observed, the interiors and areas adjacent to the buildings should be thoroughly investigated for additional sinkholes, which may compromise their structural integrity.

Two areas should be monitored periodically – Cell 44 with the separated sheets at the mudline and the exposed toes of the sheets within Cells 5 to 7.

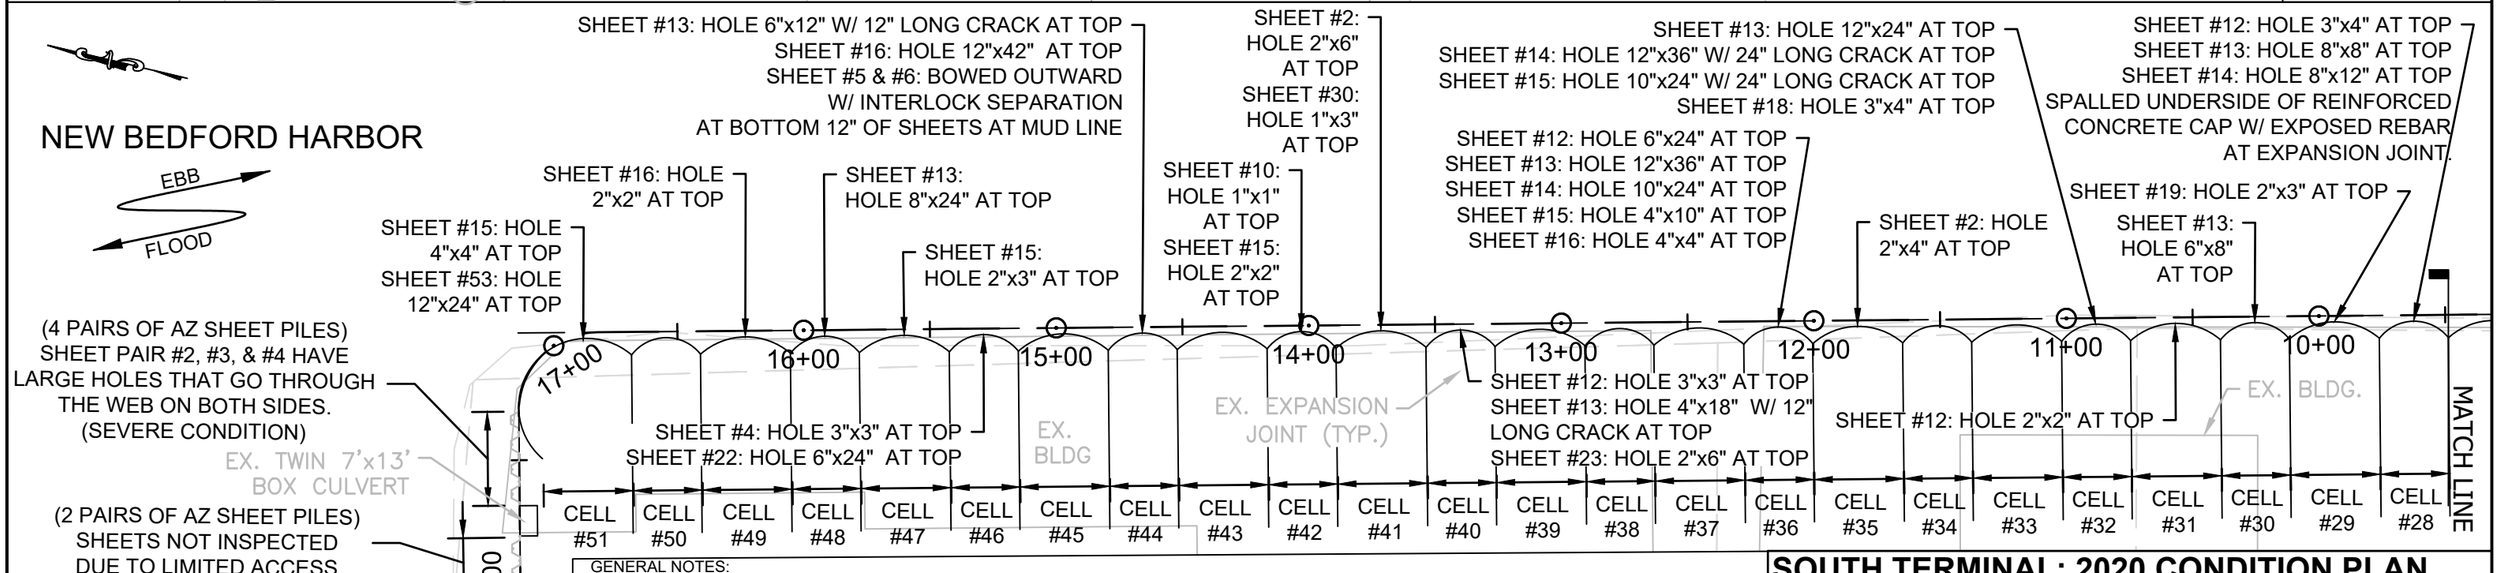
**Immediate Needs:**

No immediate needs identified, repairs can be completed within the 0-5 year timeframe.

**Short Term (0-5 years):**



Localized repair of holes in steel plating at 73 locations.



**Medium Term (5-15 years):**

Toe repairs will be required along a portion of cell 7, grout bags recommended.

**Long Term (15-50 years):**

- Plan for a full replacement of the South Terminal bulkhead within 30 years
- Requirements for replacement are dependent on the loading from the building located at the site

## Summary of Evaluation:

At the request of the Massachusetts Clean Energy Commission, On December 27, 2023, Foth Infrastructure & Environmental, LLC. (Foth) performed a routine condition assessment/inspection of the Shuster Bulkhead in order to identify the probably causation of a sinkhole which was observed along the bulkhead. The condition assessment was limited to a visual, non-destructive inspection of the Shuster steel cellular bulkhead. Foth teamed with Fathom Diving (Fathom) to perform the underwater portion of the inspection. The scope of work included a LEVEL 1 inspection of the cellular steel sheet pile bulkhead. The inspection did not include the assessment of the concrete deck/cap, fendering system, mooring components, utilities, or other cellular sheet piles beyond the Shuster property limit.

## Shuster Bulkhead Observed Conditions:

The steel cellular bulkhead is comprised of 6 steel sheet pile cells running north to south which are numbered, for reference, as shown on the attached plans in Appendix A. Structures extend over the cells for the majority of the +/- 200 linear feet.

The steel sheet pile cells are of varying diameters, alternating between major and minor cells and are exposed from the mud line to the concrete deck/cap. The flat steel sheets which comprise the cells, exhibit signs of heavy corrosion with pitting of the steel and no evidence of a passive or active cathodic protection system. In several locations, Foth observed holes in the steel sheet piles with washout of backfill material present. The holes range in diameter or length from one to two inches to greater than 24 inches *(Refer to Photographs #1 through #18 below)*. Table 1 below indicates the size and location of each hole observed during the inspection.

Table 1: Underwater Inspection Notes

| Cell # | Sheet # | Comment / Condition |
|---|---|---|
| Topside | | Sinkhole: 16'L x 13'W x 6'D; located approx. 100' north of South Terminal concrete face and 10'-4" west of Shuster bulkhead concrete face. |
| 1 | 1-5, 15-20, 25, 27, 28, 33, 34 | Grout Protrusions observed on sheet piles. |
| 1 | 5 | Plate Repair Patch +/- 6"x4" at top of sheet pile. |
| 1 | 36-43 | Stones in front of sheet piles along mud-line. |
| 1 | 38 | N/A |
| 1-2 | Junction Plate | Gap at top of junction plate sheet between sheet and concrete cap. |
| 2 | 13-14 | Stones in front of sheet piles along mud-line. |
| 2 | 19-20 | N/A |
| 2 | 22 | Plate Repair Patch +/- 8"x4" at top of sheet pile. |
| 2-3 | Junction Plate | Gap at top of junction plate sheet between sheet and concrete cap. Gap at bottom of junction plate sheet between sheet and mud-line. Junction plate does not continue below mud-line. |
| 3 | 3 | Plate Repair Patch +/- 24"x13" at top of sheet pile. |
| 3 | 5 | Plate Repair Patch +/- 30"x12" & +/- 8"x8" at top of sheet pile. |
| 3 | 10-12 | Stones & grout in front of sheet piles along mud-line. |
| 3 | 12 | N/A |
| 3 | 29-30 | Stones & grout in front of sheet piles along mud-line. |
| 3 | 31-32 | Gap between bottom of sheet pile and mud-line; Hole on sheet pile (2) sheets wide at mud-line (depth unknown due to washout material covering area); Hole on sheet pile #32 +/- 2"x2" approx. 12-inches above larger hole near mud-line. |
| 3-4 | Junction Plate | N/A |
| 4 | 4 | 5'x5' Stone w/ grout in front of sheet pile along mud-line; Hole on sheet pile +/- 10"x24" at mud-line. |
| 4 | 4-12 | Stones w/ grout in front of sheet piles along mud-line; Hole on sheet piles (8) sheets wide at mud-line (depth unknown due to washout material covering area). |
| 4 | 12 | Plate Repair Patch +/- 24"x15" at top of sheet pile. |
| 4 | 13-14 | Stones w/ grout in front of sheet piles along mud-line; Hole on sheet piles (2) sheets wide at mud-line (depth unknown due to washout material covering area). |
| 4 | 15-20 | Granite stones w/ grout in front of sheet piles along mud-line. |
| 4-5 | Junction Plate | Gap (+/- 10") at bottom of junction plate sheet between sheet and mud-line. Junction plate does not continue below mud-line. |
| 5 | 16 | Plate Repair Patch +/- 8"x8" at top of sheet pile. |
| 5 | 24-29 | Sheets sitting on rocks w/ large void space beneath sheets, height ranges from 8' to 3'; Washout occurring below old dredge depth limit. |
| 5-6 | Junction Plate | Gap at bottom of junction plate sheet between sheet and mud-line. Junction plate does not continue below mud-line. |

| | | |
|---|---|---|
| 6 | 1-6 | Granite stones w/ grout in front of sheet piles along mud-line. |
| 6 | 10-14 | Limits of existing drainage culvert. |
| 6 | 9-14 | Sheets sitting on rocks w/ large void space beneath sheets; Washout occurring below old dredge depth limit. |
| 6 | 9-10 | Approx. 12" void space between sheet piles and grout bag repair. |
| 6 | 13-14 | Approx. 8" void space between sheet piles and grout bag repair. |
| 6 | 19-20 | Approx. 6"x12" void space between sheet piles and grout bag repair. |
| 6 | 21 | Large granite stones w/ grout in front of sheet piles along mud-line, along with protruding through sheet piles. |
| 6-7 | Junction Plate | Gap at bottom of junction plate sheet between sheet and mud-line. Junction plate does not continue below mud-line. Large pile of granite stones at this junction corner. |

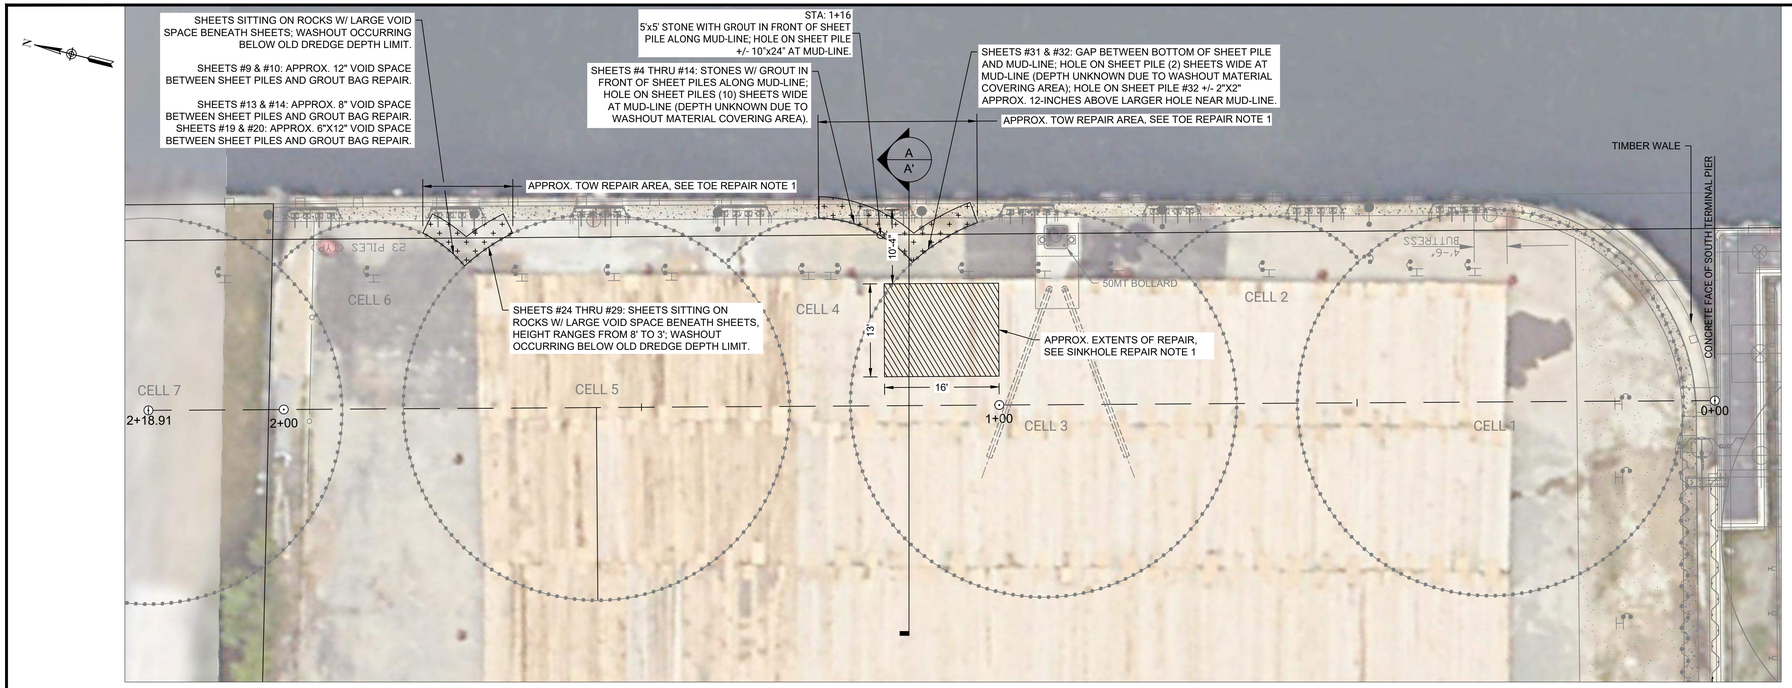
## Conclusion:

Overall the bulkhead is in Poor condition with significant deterioration as well as undermined steel cells. The presence of heavy deterioration and holes in the sheet pile cells indicate that the bulkhead is near the end of its service life. Appendix B provides a comparison of historical bathymetric data which does indicate a loss of mudline elevation immediately adjacent to the steel cells. This loss of elevation through "prop wash" or subsidence is the likely causation of the observed sinkhole.

Foth recommends that loss of fill from within the steel cells be mitigated through the use of grout bags at the toe of the bulkhead and the placement of clear crushed stone within the sinkhole.



Foth looks forward in working with the Mass CEC in resolving the issues noted in this report. Questions or concerns regarding this report or the contents contained herein should be directed to Foth Infrastructure & Environmental, LLC. at (508) 748-0937.

Sincerely,
Foth Infrastructure & Environmental, LLC.

Re: Waterfront Facilities Inspection and Assessment Report
Repair or Upgrade Design
6 Hassey Street, New Bedford, MA

Dear Mr. Griffin:

Foth Infrastructure & Environment, LLC (Foth) is pleased to provide the attached Waterfront Facilities Inspection and Assessment (WFIA) Report for Massachusetts Clean Energy Center (MassCEC) for the adjacent property located at 6 Hassey Street, New Bedford, MA. The purpose of the Repair or Upgrade Design level inspection is to report on the existing condition of the cellular cofferdam bulkhead. This report provides the results of the observed conditions for recording purposes only.

At Foth, we believe in doing quality work and creating strong relationships. We look forward to the opportunity to work with you on this project. Please contact Scott Skuncik at (401) 206-2422 or Scott.Skuncik@foth.com if you have questions or to discuss our proposal.

Sincerely,

Foth Infrastructure & Environment, LLC

## Executive Summary

Foth Infrastructure & Environment, LLC (Foth), in partnership with J.F. Brennan Company (Brennan), conducted a comprehensive inspection and assessment of the waterfront structures of 6 Hassey Street Facility in New Bedford, Massachusetts. This effort was performed in accordance with ASCE Manual of Practice No. 130, Second Edition, as part of a Repair or Upgrade Design-level evaluation supporting the planned redevelopment of the adjacent Shuster Facility.

The inspection focused on the existing cellular cofferdam bulkhead system within the facility limits. The bulkhead is partially owned and maintained by the New Bedford Port Authority (NBPA). The cofferdam system, comprising three major cells (Cells #4, 5, and 6) and two minor cells (Cells #4A and 5A), forms a critical segment of the shoreline infrastructure and is scheduled to remain in place during adjacent redevelopment to maintain shoreline continuity.

To establish a baseline condition record and support future planning, Foth performed visual topside and underwater inspections, supplemented by additional surveying. This included a bathymetric survey, sector scan imaging, and aerial drone survey. The upland building is not included in this report.

The inspection documented observable and repeatable conditions across key structural elements. Notable findings include:

- A significant defect at Cell #4A, where a 16-inch by 5-inch hole and extended cracking were observed, with a void depth exceeding 4 feet.
- General scour along the cofferdam cells, with bathymetric comparisons indicating up to 4 feet 2 inches of material loss in some areas.
- Localized spalling and cracking on the reinforced concrete wall and platform, particularly near mooring hardware.

Based on these observations, Foth evaluated and assessed the condition of each component. The Cellular Cofferdam Bulkhead is generally in **Poor** condition, primarily due to continued scouring and a severe hole in the sheet pile.

# 1. Introduction

Foth Infrastructure & Environment, LLC (Foth) performed a comprehensive waterfront facilities inspection and assessment in accordance with ASCE Manual of Practice (MOP) No. 130, Second Edition of the 6 Hassey Street Facility located in New Bedford, MA. A portion of the Facility, specifically the bulkhead structure, is owned and maintained by the New Bedford Port Authority (NBPA).

This inspection was conducted as part of a Repair or Upgrade Design level effort per ASCE MOP 130 that is associated with the planned redevelopment of the existing bulkhead structures at the abutting 4 Wright Street Facility.

Because the existing bulkhead structure extends beyond the property limits and into adjacent parcels, a portion of the structure will remain in place to maintain shoreline continuity. To support project planning and provide a clear record of existing conditions, Foth performed a detailed inspection of the structures within the Facilities' limits. The inspection included documentation of observed deficiencies and structural anomalies for informational purposes and to establish a baseline condition record for both the facility owner and neighboring stakeholders.

Foth partnered with J.F. Brennan (Brennan) to perform the underwater inspection, including all dive operations and diver support. In addition to the above, Foth conducted a bathymetric survey and drone survey of the facility to supplement the inspection and provide additional records of existing conditions. Brennan also performed a sector scan of the cofferdam cells for further documentation. These supplemental efforts are included as appendices to this report.

## 1.1 Purpose and Scope of Work

The purpose of this inspection and assessment is to document the existing conditions of the cellular cofferdam bulkhead located along the 6 Hassey Street Facility. These structures are scheduled to remain during and post the 4 Wright Street upgrades that include demolition and replacement of the Cellular Cofferdam Bulkhead with a new pile supported loading and offloading platform. To ensure transparency and provide a record for the Facilities property owners, Foth performed a Repair or Upgrade Design level inspection in accordance with ASCE MOP No. 130, Second Edition.

This report specifically addresses the 6 Hassey Street Facility limits, which include:

- Major Cells: Cells #4, #5, and #6
- Minor Cells: Cells #4A and #5A

The inspection focused on identifying and recording any visible deficiencies, structural anomalies, or deterioration within these cells. Findings are intended for informational purposes only and will serve as a baseline record for the facility owner and neighboring property stakeholders. A separate report will be prepared for the adjacent facility, which encompasses the remaining section of the Cellular Cofferdam Bulkhead.

## 1.2 Description of Structures

6 Hassey Street is an industrial waterfront property located within the New Bedford Harbor commercial fishing district, approximately one mile inside the hurricane barrier. The site consists of a 14,580-square-foot building on a 1.12-acre parcel, historically used for seafood processing and distribution. It is adjacent to other marine-related facilities and offers direct access to port infrastructure supporting New Bedford's role as the largest commercial fishing port on the East Coast.

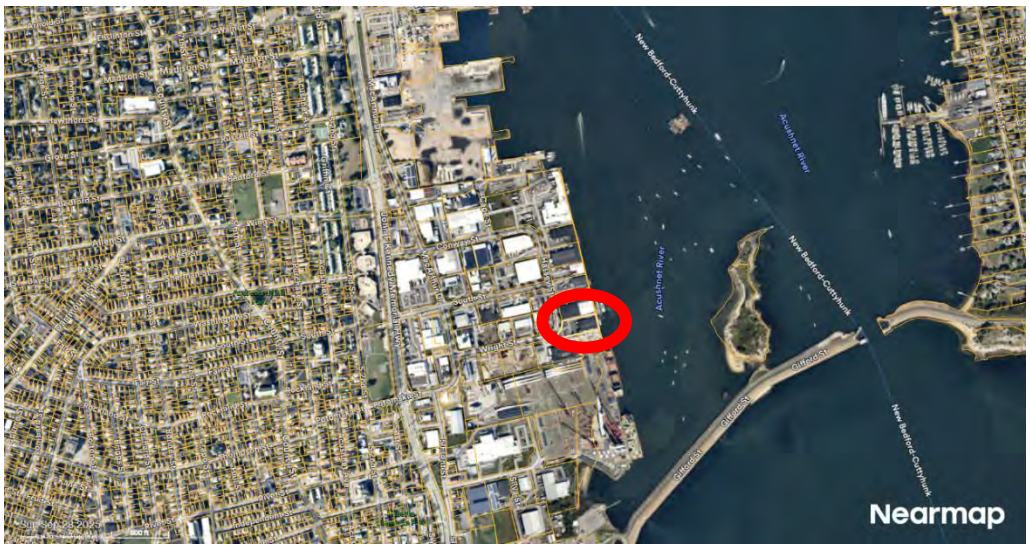

**Figure 1: Site Location Map**

### 1.2.1 Cellular Cofferdam Bulkhead

The Facility is constructed of a Cellular Cofferdam Bulkhead system that consists of the following elements: steel sheet piles, reinforced concrete wall and platform, timber curb, cast steel single bit bollards, steel mooring cleats, rubber fenders, and asphalt pavement upland surface.

There is a total of three (3) major Cells #4, #5, and #6 in addition to two (2) minor Cells #4A and #5A. Note that the Cells were labeled differently in previous inspection and repair drawings and were numbered continuously in lieu of minor Cells labeled as "A". Therefore Cell #1A would be Cell #2 and so forth. This report uses the labeling as shown on the original design drawings.

These Cells extend approximately 140-linear feet along the existing bulkhead line. Each Cell is 54.11 feet in diameter with approximately 136 piles. The center to center of the Cells are approximately 62.92 feet. The center to center of the major Cells to the minor Cells is half, 31.46 feet. The steel sheet piles are MP101, similar to PS27.5 flat sheet piles, driven to bedrock with an approximate top of sheet pile elevation of +1.5 feet Mean Lower Low Water (MLLW). The weathered bedrock elevation varies and is estimated at approximately -32 feet MLLW.

Along the upland face of the Cells, approximately 10 feet from the interior face of the sheet piles lies a row of HP14x73 steel piles driven to bedrock. This element is fully buried. Atop of the HP and MP piles is a continuous reinforced concrete wall and platform that spans the full length of the bulkhead line. Per the original design drawings, the "L" shaped Wall and Platform is in total 12 feet wide by 8 feet high with gravel fill. The wall portion is 2 feet wide at the top down to 3 feet wide at the bottom with various sizes of reinforcement. The platform section is 12 feet wide by 3 feet deep with various sizes of reinforcement. Reference Appendix F for additional details on the reinforced concrete wall and platform.

Along the perimeter of the reinforced concrete wall and platform is a 12-inch by 10-inch log curb. There is also one (1) 35-ton single bitt cast steel bollard, and four (4) cast steel cleats. The 35-ton bollard is 2 feet in diameter and approximately 3 feet 8.5 inches tall with four foundation bolts. The cleats are approximately 43 inches long by up to 4 inch wide with a 31 inch long by 9-inch-wide base plate anchored with two bolts.

The fender system was recently upgraded in 2022 to new rubber fenders. The rubber fenders are D-fenders that measure 6.5 feet long by 24 inches wide and up to 12 inches deep connected with six (6) 0.5-inch diameter bolts to the concrete wall and platform. The upland surface of the facility is constructed of asphalt pavement.

## 1.3 Inspection and Repair History

There is a long history of inspections and repairs at this facility. Here is a timeline of the inspection and repairs:

**June 2021:** **Structural Inspection: Commercial Fishing Piers**

This report documents the inspection and assessment of marine infrastructure at municipally-owned piers in New Bedford and Fairhaven, as well as New Bedford's South Terminal. The purpose was to evaluate

structural conditions in relation to projected sea level rise and flooding events.

The scope included Level 1–3 inspections of waterfront structures such as steel sheet pile bulkheads, cellular sheet pile cells, steel and timber piles, concrete piles, and timber fender systems. Underwater inspections were completed by Fathom Resources, LLC during December 2020 through February 2021, with topside inspections conducted in the same period. The report reflects observed conditions at the time of inspection and does not include repair recommendations.

More specifically Section 7. South Terminal Fish Houses was rated as Fair condition. The South Terminal bulkhead was found to have 73 through-holes in the steel sheet piling. The structure exhibited localized advanced deterioration but no immediate safety concerns. Sinkholes were observed behind the bulkhead, and areas adjacent to buildings were recommended to be investigated for potential subsurface voids that could affect structural integrity. Two specific areas required monitoring: Cell 44 (sheet separation at mudline) and Cells 5 through 7 (exposed sheet toes). Note these cells are labeled continuously and do not follow the major to minor cell labeling.

**September 2022:** **New Bedford Municipal Piers Fendering and Repairs**

The Cellular Cofferdams were repaired; specifically new rubber fenders were installed in addition to plate repairs to the steel sheet piles. See Appendix F for further information.

**Ongoing - Routine:** **Bathymetric Surveys**

Foth has performed routine bathymetric surveys at the facility. The surveys indicate prop wash and loss of material along the toe of the Cells due to the tugboats berthing along the face of the bulkhead.

## 1.4 Methodology

The above and underwater inspection and assessment was performed in accordance with the scope of work and MOP 130, for a Repair or Upgrade Design Inspection. All commercial diving was conducted by a three-person dive team consisting of a dive supervisor, diver, and tender/backup diver in accordance with applicable Occupational Safety and Health Administration (OSHA), United States Coast Guard (USCG) regulations (29 CFR 1910 Subpart T and 46CFR197 Subpart B), and Association of Diving Contractors International (ADCI). In general, the dive inspection consisted of an in-water diver communicating to the Foth Engineer who was stationed topside via two-way radio. The Foth Engineer was able to view the underwater portion of the structure in real-time via closed-circuit video and direct the in-water diver during the investigations.

### 1.4.1 Levels of Inspection

According to MOP 130, there are three levels of inspection. Specifically for this routine inspection, Level I and Level II inspections were performed. Levels of inspection are outlined below.

- Level I Effort: Includes a close visual examination above and underwater or a tactile examination using large sweeping motions of the hands where visibility is limited underwater. Although the Level I effort is often referred to as a swim by inspection, it must be detailed enough to detect obvious major damage or deterioration due to overstress or other severe deterioration. It should confirm the continuity of the full length of all members and system components and detect undermining or exposure of normally buried elements. A Level I effort may also include limited probing of the substructure and sounding of the adjacent mudline.

- Level II Effort: A detailed inspection above and underwater may require the removal of corrosion and/or marine growth from portions of the structure. Underwater marine growth removal is costly; hence, the inspection must be based on a representative sample of components. For piles, a 12-inch-high band should be cleaned at designated locations, generally near the low waterline, at the mudline, and midway between the low waterline and the mudline. On a rectangular pile, the marine growth removal should include at least three sides; on an octagonal pile, at least six sides; and on a round pile, at least three-fourths of the perimeter. On large-diameter piles, 3 feet or greater, 1 feet × 1 feet areas should be cleaned at four locations approximately equally spaced around the perimeter, at each elevation. On large solid-faced elements, such as retaining structures, 1 feet × 1 feet areas should be cleaned at these three elevations. The Level II effort should also focus on typical areas of weakness such as connections, attachment points, and welds. The Level II effort is intended to detect and identify damaged and deteriorated areas that may be hidden by surface biofouling, coating, or corrosion, or not be readily accessible for a Level I inspection effort. Marine growth removal should be governed by what is necessary to discern the condition of the underlying material. Removal of all biofouling staining is generally not required. Means and methods for the removal of biofouling growth are not typically defined in the scope of work. It may be appropriate for owners to specify particular methods on the basis of environmental and site conditions or concerns about maintaining the integrity of coating materials. Methods may include hand scrapers or mechanical systems ranging from high-pressure water blasters to barnacle busters and pressurized air bubble devices.

- Level III Effort: A detailed inspection above and underwater typically involving nondestructive or partially destructive testing conducted to detect hidden or interior damage or to evaluate material homogeneity. Typical inspection and testing techniques include the use of ultrasonic, coring, boring or resistance drilling, physical material sampling, and in situ hardness testing. Level III testing is generally limited to key structurally suspect areas or areas representative of the structure or system.

### 1.4.2 Element Level Damage Ratings

An element level damage rating was assigned to each structural element inspected during the investigation. The rating reflects the condition of the individual element only and is independent

of the element's structural importance and the type of inspection being conducted. The damage rating varies per element, the general rating terms are as follows: (NI) Not Inspected, (ND) No Defects, (MN) Minor, (MD) Moderate, (MJ) Major, (SV) Severe. These ratings are based on MOP 130 element level ratings.

It is important to note that MOP 130 covers many elements, however if any specialty elements that are not outlined in MOP 130 and that fall within this inspection are up to the Engineer's interpretation. The following elements were specifically referenced for this Repair or Upgrade Design Inspection based on the elements seen in the field.

- Timber Elements (MOP 130 Table 2-4 and Figure 2-2)
- Steel Elements (MOP 130 Table 2-5 and Figure 2-3)
- Reinforced Concrete Elements (MOP 130 Table 2-6 and Figure 2-4)
- Mooring System Elements (MOP 130 Tables 2-8 & 2-9 and Figures 2-6 through 2-9)
- Fender System Elements (MOP 130 Tables 2-10 through 2-13 and Figures 2-19 through 2-14)

### 1.4.3 Condition Assessment Ratings

Upon completion of the Repair or Upgrade Design Inspection and review of element level damage ratings post data processing, a condition assessment rating was assigned to the structural unit, groups of units, and overall facility. The condition assessment ratings are outlined below.

- **Good (6):** No visible or only minor damage was noted. Structural elements may show very minor deterioration, but no overstressing was observed. No repairs are required.
- **Satisfactory (5):** Limited minor to moderate defects or deterioration are observed, but no overstressing was observed. No repairs are required.
- **Fair (4):** All primary structural elements are sound, but minor to moderate defects or deterioration was observed. Localized areas of moderate to advanced deterioration may be present but do not significantly reduce the load-bearing capacity of the structure. Repairs recommended, but the priority of the recommended repairs are low.
- **Poor (3):** Advanced deterioration or overstressing was observed on the widespread portions of the structure but does not significantly reduce the load-bearing capacity of the structure. Repairs may need to be carried out with moderate urgency.
- **Serious (2):** Advanced deterioration overstressing, or breakage may have significantly affected the load- bearing capacity of primary structural components. Local failures are possible and loading restrictions may be necessary. Repairs may be carried out on a high-priority basis with urgency.
- **Critical (1):** Very advanced deterioration, overstressing or breakage has resulted in localized failure(s) of primary structure components. More widespread failures are

possible or likely to occur, and load restrictions should be implemented as necessary. Repairs may need to be carried out on a very high priority basis with strong urgency.

### 1.4.4 Recommended Action Guidelines

Given this was a pre-construction and Repair or Upgrade Design Inspection for recording purposes only, recommendations were not included per ASCE MOP 130 Table 2-16, which outlines standardized action options based on observed conditions. These categories help prioritize response efforts and guide the client in planning appropriate follow-up actions:

- **Emergency Action:** Recommended when unsafe conditions are observed that pose immediate risks to life, property, or the environment. Actions may include closing access, unloading, or placing load restrictions.
- **Engineering Evaluation:** Recommended when significant damage or defects are identified that require further structural analysis to assess capacity or determine appropriate repair methods.
- **Structural Repair or Upgrade Design Inspection:** Recommended when repairs are clearly needed based on inspection findings. This may follow routine, special purpose, or post-event inspections.
- **Special Purpose Inspection:** Recommended to investigate unusual or advanced deterioration. May involve specialized testing, monitoring, or nonstandard techniques.
- **Repair Plans Development:** Recommended once sufficient field data has been collected, and the structure is ready for repair design documentation.
- **No Action:** Recommended when the structure is in satisfactory condition and no further action is needed until the next scheduled inspection.

These action categories were not provided given the purpose of this inspection.

## 1.5 Methodology for Supplemental Activities

In addition to the visual and underwater inspections, several supplemental activities were performed to provide a comprehensive record of existing conditions. These activities included a bathymetric survey, sector scan imaging, and aerial drone survey. Each activity is summarized below.

### 1.5.1 Bathymetric Survey

Foth conducted a high-resolution bathymetric survey in accordance with the U.S. Army Corps of Engineers (USACE) Engineer Manual EM 1110-2-1003: Hydrographic Surveying. The survey utilized a vessel-mounted multibeam echosounder system integrated with RTK GPS positioning and motion compensation sensors to ensure compliance with USACE standards for horizontal and vertical accuracy, data density, and bottom coverage.

The survey was performed from a dedicated hydrographic vessel equipped with a Teledyne Reson multibeam echosounder, a Trimble RTK GNSS receiver for precise geospatial positioning, and an Applanix motion reference unit to correct for heave, pitch, and roll. Raw sonar data were

processed using industry-standard hydrographic software (Hypack) to generate georeferenced outputs. Quality control procedures followed USACE guidelines for data validation and error correction. The final processed bathymetric data is presented in Appendix C.

### 1.5.2 Sector Scan Imaging

Brennan performed sector scan imaging from a dedicated survey vessel, independent of dive operations. The sector scan utilized a high-frequency scanning sonar system, such as the Kongsberg MS1000, mounted on a vessel-deployed tripod with controlled rotation to capture detailed imagery of the submerged cofferdam structures. This method produced high-resolution mosaics of the sheet pile walls, interlocks, and cell geometry, providing enhanced visualization in areas where water clarity limited diver observations. The sonar mosaics offer a baseline for future comparison and are included in Appendix D.

### 1.5.3 Aerial Drone Survey

Foth conducted an aerial drone survey in accordance with the ASPRS Positional Accuracy Standards for Digital Geospatial Data, Edition 2, Version 2 (2024), including the UAS Mapping Addendum. The survey was performed using a Skydio X2 drone equipped with RTK GNSS positioning to ensure accurate georeferencing of all imagery and compliance with ASPRS standards for horizontal accuracy and checkpoint validation.

The drone captured high-resolution imagery and video of the facility structures, providing an overhead perspective for inspection and documentation. Imagery was processed to generate a 3D iTwin Capture Model, with positional accuracy verified against ground control points in accordance with ASPRS checkpoint requirements. The processed imagery and model are archived for record purposes, and results are included in Appendix E.

# 2. Existing Conditions

The following section presents the observed existing conditions of the inspected structures. These observations are based on above- and underwater inspections conducted in accordance with the procedures outlined in ASCE MOP 130. All findings are presented factually and without interpretation or analysis. This section serves as the foundation for subsequent assessment and evaluation and includes only repeatable, observable data that would be verifiable by another qualified engineer. Documentation includes field notes, photographs, sketches, and video recordings where applicable.

The structure and sub-elements inspected include:

- Cellular Cofferdam Bulkhead
  - Steel Sheet Piles
  - Steel H-Piles
  - Reinforced Concrete Wall and Platform
  - Timber Curb
  - Steel Single Bitt Cast Steel Mooring Bollards
  - Steel Mooring Cleats
  - Rubber Fenders
  - Asphalt Pavement and Backfill

Each of these structures is presented in a dedicated subsection below, with observations organized by structural element and location.

## 2.1 Cellular Cofferdam Bulkhead

The following deficiencies were observed along the Cellular Cofferdam Bulkhead structure.

### 2.1.1 Steel Sheet Piles

The steel sheet piles generally exhibit typical deterioration found on steel sheet piles submerged in saltwater conditions.

Plate repair patches were observed throughout with no significant defects. All welds were intact, and signs of fill loss were not observed around the plate repairs. The toe of the sheets exhibits a layer of material with weathered stone or rock. The toe of the sheet piles is unknown unless explicitly stated. At the Cell junctions, there was a slight gap between the junction plates.

At Cell #4A, the sheet pile exhibits a hole with a crack that measures 16 inches long by up to 5 inches wide. The crack extends an additional 5 feet from the bottom of the sheet pile hole. The void behind the hole is greater than 4 feet deep.

Scouring was observed throughout the dive inspection and is representative of the bathymetric survey comparison plan from the 2023 versus 2025 survey data. The survey data shows more than 1 feet of scour along the cells. Additionally, the 2023 inspection survey data indicated up to 4 feet 2 inches of scour along STA -0+30.

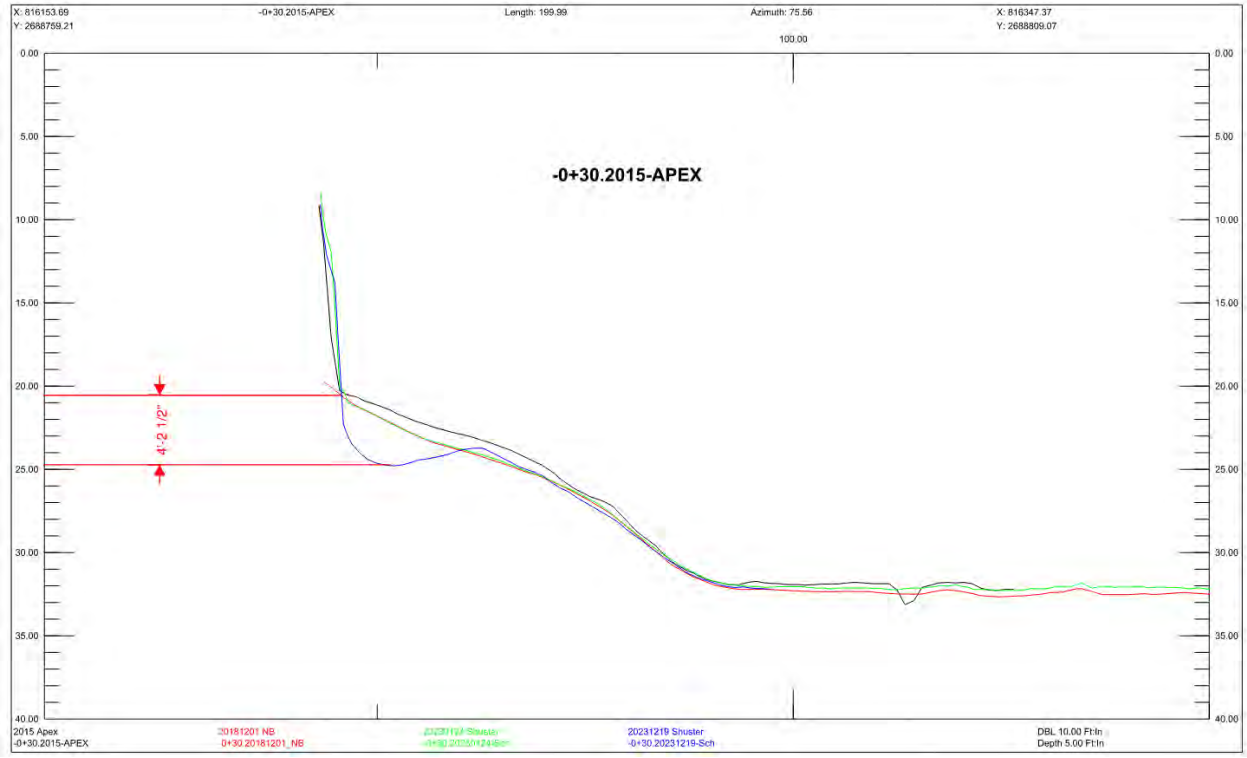

**Figure 2: 2023 Inspection Survey Comparison STA -0+30, Cell #4**

UT measurements were performed on the steel sheet piles using a Cygnus gauge. Due to equipment issues during the inspection, reliable readings could not be obtained at multiple elevations. Only one valid measurement was recorded at the mudline elevation. No readings were captured at mid-water or tidal zone levels.

**Table 1**

**UT Measurements, Cell #4**

| Location | Thickness (in.) | Recording (in.) | Section Loss (%) | Notes |
|---|---|---|---|---|
| **Cell #4, Sheet #13** | | | | |
| Tidal Zone | 0.40 | NR | N/A | Not recorded due to equipment issues. |
| Mid-Water | 0.40 | NR | N/A | Not recorded due to equipment issues. |
| Mudline | 0.40 | 0.38 | 5.0 | Taken at 31 feet below the water surface at the time of inspection. |

### 2.1.2 Steel H-Piles

The steel H-piles were fully buried and were not visible at the time of inspection.

### 2.1.3 Reinforced Concrete Wall and Platform

The reinforced concrete wall and platform exhibited general concrete weathering with localized areas of mechanical corner spalling that measured up to 12 inches long by 6 inches wide and up to 3 inches deep along the exposed face. Hairline cracking was observed throughout. The spalls and cracks were typically seen near the existing cleats and fenders.

### 2.1.4 Timber Curb

The timber curb exhibits typical timber weathering with section loss of up to 25 percent. No significant defects were observed.

### 2.1.5 Cast Steel Single Bitt Mooring Bollard

The single bitt mooring bollard exhibits typical signs of wear consistent with marine exposure. The protective coating is largely worn away, particularly on the upper surfaces and around the base plate, leaving bare steel exposed. General surface corrosion is present across the bollard body, with minor pitting observed near the anchor bolt heads and washers. The anchor bolts themselves show light to moderate rusting, though no deformation or looseness was noted during inspection.

### 2.1.6 Steel Mooring Cleats

The mooring cleats were observed to be fully intact with no visible deformation or damage. The protective coating was present and continuous across all exposed surfaces, providing full coverage. There were no signs of corrosion on the cleat body, base plate, or associated hardware. All anchor bolts and washers were present, secure, and showed no evidence of loosening or material loss. No cracks, spalls, or other deficiencies were noted in the surrounding deck area adjacent to the cleats.

### 2.1.7 Rubber Fenders

The rubber fenders were observed to be fully installed along the bulkhead with no visible displacement or detachment. The fender bodies exhibited uniform alignment and were securely fastened to the supporting hardware. No tears, cracks, or significant surface abrasions were noted on the rubber elements. All associated mounting hardware, including bolts and brackets, were present and appeared properly seated. No missing components or signs of excessive wear were observed at the time of inspection.

### 2.1.8 Asphalt Pavement

The asphalt surface and adjacent fill areas were observed to have cracking throughout, primarily consisting of minor transverse cracks. Very minor depressions and slight heaving were noted in isolated locations, but no significant deviations or large surface failures were present. The cracking and minor surface irregularities appear consistent with typical wear and tear for asphalt pavement exposed to heavy use and environmental conditions. No areas of exposed subgrade or severe raveling were observed at the time of inspection.

# 3. Evaluation and Assessment

In accordance with the ASCE MOP 130; this section provides an engineering evaluation of the structures based on observed conditions. While the previous section documented physical deficiencies, this portion interprets those findings to assess the structural performance, functional reliability, and overall condition of each facility component.

The evaluation considers the severity, extent, and location of deterioration, as well as the potential implications for structural integrity, serviceability, and safety. This assessment forms the basis for prioritizing maintenance and repair needs and supports informed decision-making for asset management and capital planning.

## 3.1 Cellular Cofferdam Bulkhead

The Cellular Cofferdam Bulkhead is in overall **Poor** condition due to continued scouring and section loss of the sheet pile cells. Although previous plate repairs were conducted in 2022 to the sheet piles holes, one large hole was observed along Cell #4A.

### 3.1.1 Steel Sheet Piles

The steel sheet piles are generally in **Poor** condition due to scouring throughout the sheets in addition to 100 percent section loss resulting in a full penetration hole in the sheet pile. The scour may be a result of prop wash and continuation of the scour may result in exposure of the steel sheet pile toes and potential undermining. Additionally, the hole in the sheet pile may result in increased fill loss and potential settlement of the Upland Building or sinkholes.

### 3.1.2 Steel H-Piles

A rating was not provided for the steel H-piles, given that they were fully buried and not observed during the inspection.

### 3.1.3 Reinforced Concrete Wall and Platform

The reinforced concrete wall and platform is generally in **Satisfactory** condition with minor to moderate rated cracking and mechanical spalling.

### 3.1.4 Timber Curb

The timber curb is generally in **Fair** condition due to moderate weathering of the timber with section loss up to 25 percent.

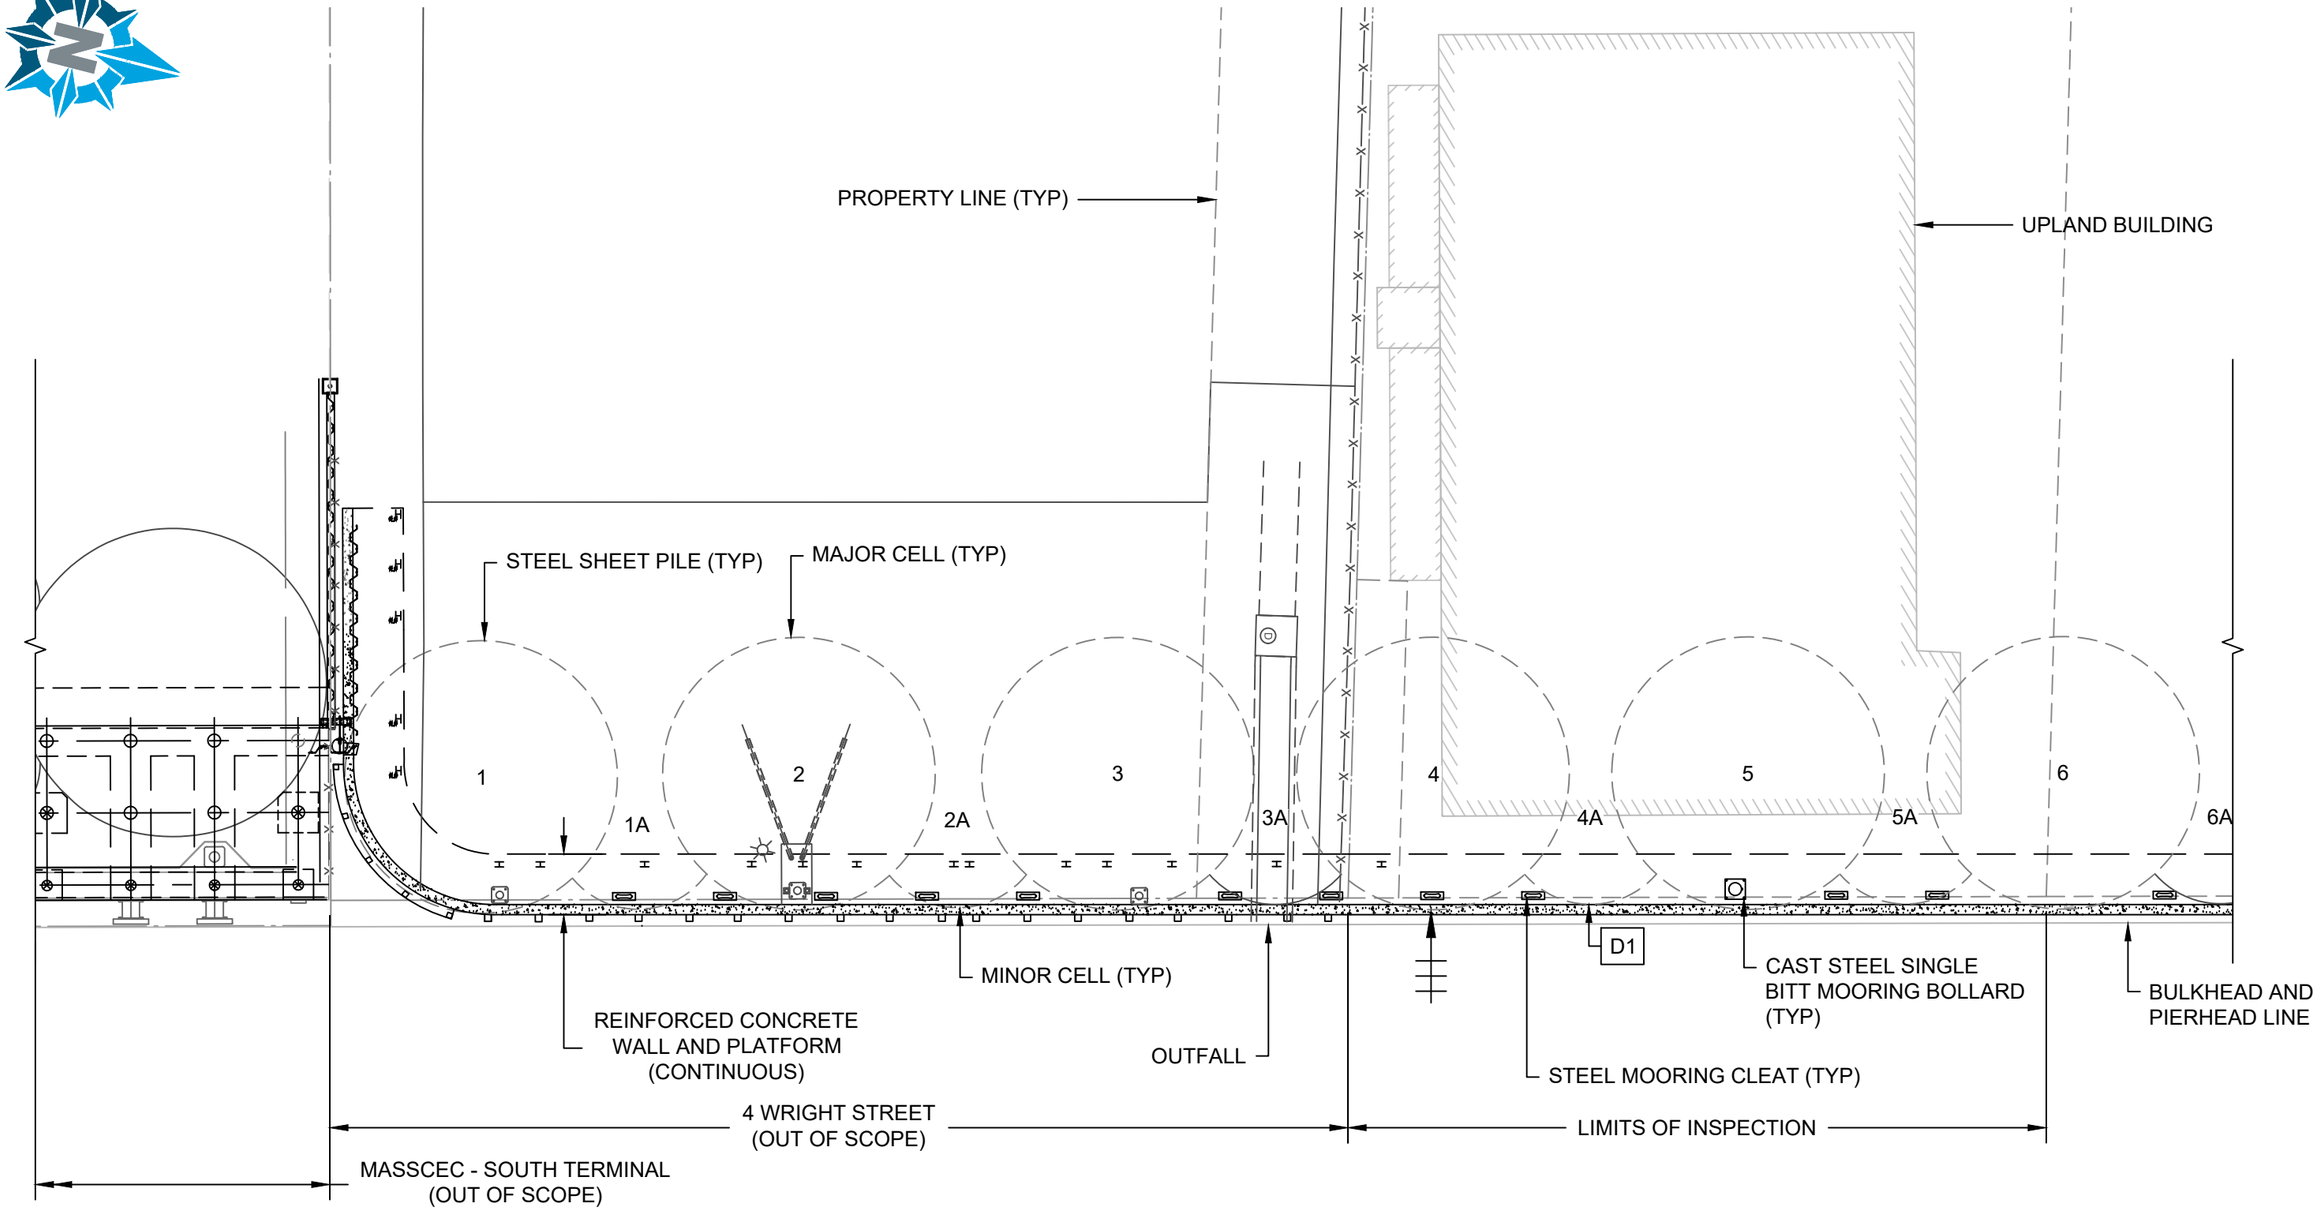
### 3.1.5 Cast Steel Single Bitt Mooring Bollard

The cast steel single bitt mooring bollard is generally in **Fair** condition with minor to moderate rated deterioration, typical to mooring bollards exposed to continued use.

### 3.1.6 Steel Mooring Cleats

The steel mooring cleats are generally in **Satisfactory** condition with limited to no significant defects observed.

### 3.1.7 Rubber Fenders



The rubber fenders are generally in **Good** condition with limited to no significant defects observed. The fenders were recently replaced in 2022.

### 3.1.8 Asphalt Pavement

The asphalt pavement is generally in **Poor** condition due to loss of fill behind the sheet pile hole in addition to moderate settlement cracking and heaving along the backside of the cells.

NOTE

This bathymetric difference plot is based on comparative analysis of hydrographic survey data collected in January 2023 and September 2025. The data sets were acquired under differing environmental and operational conditions, and may be subject to inherent variability in positioning, tide correction, and sounding density. Apparent changes in elevation may reflect actual seabed movement (e.g., scour or deposition), survey tolerances, or a combination thereof. This plot is intended for general assessment purposes only and should not be used as the sole basis for design, construction, or navigation decisions. Further site-specific investigation is recommended to confirm critical findings.

# Project Recap

| | |
|---|---|
| *Project:* | New Bedford Dock Wall underwater Dive and Sector Scan Inspection. |
| *Scope of Work:* | Brennan will provide commercial diving services to inspect approximately 340 LF of steel sheet pile cells extending to a depth of 30 FSW. The objective of this Level I inspection is to assess the overall condition of the sheet pile walls and identify any areas of deterioration, section loss, or damage requiring further attention. |
| *1. Dive Inspection Team: (09/25/2025)* | Dive Supervisor: Tony Ramella<br>Diver/Tender: Chris Drozell<br>Diver/Tender: Glenn Hutchins<br>Diver/Tender: Steve Bennett<br>Project Manager: Nathan Fontaine |
| *2. Sector Scan Inspection Team: (10/03/25)* | Sector Scan Operator: Sean McMullen<br>Boat Operator/Tender: Tony Ramella<br>Project Manager: Nathan Fontaine |
| *Foth Contacts:* | Scott Skuncik<br>Tim Magalhaes |
| *Weather:* | 9/25: Cloudy, HI 72°F Lo: 70°F, 13.05 mph S winds.<br>10/3: Sunny, Hi: 70°F Lo: 63°F, 10.56 mph SW winds. |
| *Water Visibility:* | Good, 5-feet +. |
| *Site Location:* | Marine Commerce Terminal<br>6 Hassey St.<br>New Bedford, MA 06057 |
| *Access:* | Embankment. |
| *Dive Mode:* | Surface supplied, via mobile station. All dives were conducted in accordance with Brennan's Safe Diving Practices Manual as well as all pertinent ADCI, OSHA, and USCG regulations. Additionally, all dives adhered to the dive schedules and decompression tables outlined in the U.S. Navy Dive Manual, Rev. 7. |
| *Sector Scan Type:* | Kongsberg Single Beam 1171 Sonar. The scanning sonar transmits sound waves through the water column that are then reflected to the sensor and are then processed into the images you will see in this report. The sonar waves also reflect off air bubbles and sediment in the water column which the computer cannot differentiate from the item being imaged, this may cause the image to appear cloudy. Additionally, high flows have a higher than usual amount of air bubbles and sediment in the water column which may magnify this issue. Through the operation of the system and post-processing the effects are minimized to the extent possible but may still be visible. |
| *Gage Height:* | N/A, there was no USGS River Gauge in New Bedford, MA. |
| *Discharge:* | N/A, there was no USGS River Gauge in New Bedford, MA. |
| *Condition Assessment:* | Satisfactory. |
| *Brennan Repair Rating:* | Low. |

*Summary of Findings:*

- Dive Inspection:
  - The dive inspection was performed with a Foth representative onboard the dive boat. This individual directed and took notes for the underwater inspection. All notes were retained with that individual. However, the dive videos from that inspection can be found here (please see below).
    - *To view/download the footage from the inspection, please follow the instructions below. The SharePoint site will remain active for 30 days, during this period please download the files if you want to keep them for your records. After the 30-day period, the site will be removed, and you will no longer be able to access the videos through the SharePoint link.
      - Foth, New Bedford Dock Wall (Click and follow link directly. Your email address must have been given access for you to open the folder. If you do not have access and need it, please reach out so we can get your email address added.).

- Sector Scan:
  - Please see 'Appendix A, Sector Scan 1', for an overall view of the Dock Wall.
  - Please see 'Appendix A, Sector Scan 2' for water depths throughout the New Bedford Dock Wall.
  - Please see 'Appendix B, Figures 1 – 3' for a typical view of the sheeting.
    - Moderate to heavy marine growth was observed throughout, along with minor surface rust.
  - Please see 'Appendix B, Figures 4 & 5' for a typical view of the adherent material.
    - Prop wash appears to have exposed more of the adherent material on which the Cells sheeting was driven.
  - Overall:
    - The Sector Scan inspection showed no evidence of any major holes, splits, and/or broken knuckles throughout the Cells.
      - Please consult the dive inspection report for a more in-depth inspection of the structures that made up the New Bedford Dock Wall.
    - The Sector Scan inspection showed no evidence of any major undermining or not fully driven sheets to the Cells.
      - Please consult the dive inspection report for a more in-depth inspection of the structures that made up the New Bedford Dock Wall.
  - Cell 1: See 'Appendix A, Sector Scan 3'.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, Location 1: 8.5-feet.
    - Adherent Material Height, Location 2: 7.6-feet.
  - Cell 1A: See 'Appendix A, Sector Scan 4'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, Location 1: 8.9-feet.
    - Adherent Material Height, Location 2: 7.4-feet.
  - Cell 2: See 'Appendix A, Sector Scan 5'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, in General: 3.0-feet.
  - Cell 2A: See 'Appendix A, Sector Scan 6'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, in General: 7.1-feet.
  - Cell 3: See 'Appendix A, Sector Scan 7'.
    - There were no signs of any split and/or broken knuckles.
    - There were no signs of undermining to the sheets.
    - Adherent Material Height, in General: 11.1-feet.
    - Adherent Material Height, Location 1: 8.2-feet tall by 7.0-feet wide.
  - Cell 3A: See 'Appendix A, Sector Scan 8'.

        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 11.8-feet.
    - Cell 4: See 'Appendix A, Sector Scan 9'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: There was not a significant amount of adherent material at this location.
    - Cell 4A: See 'Appendix A, Sector Scan 10'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 9.9-feet.
        - Adherent Material Height, Location 1: 8.7-feet tall by 9.9-feet wide.
    - Cell 5: See 'Appendix A, Sector Scan 11'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 7.4-feet.
        - Adherent Material Height, Location 1: 5.2-feet tall by 14.3-feet wide.
    - Cell 5A: See 'Appendix A, Sector Scan 12'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 6.7-feet.
    - Cell 6: See 'Appendix A, Sector Scan 13'.
        - There were no signs of any split and/or broken knuckles.
        - There were no signs of undermining to the sheets.
        - Adherent Material Height, in General: 4.6-feet.

*Summary of Recommendation:*

- Continue to inspect the New Bedford Dock Wall, by use of ROV and/or Sector Scan, on a regularly scheduled basis. We then recommend inspecting the Dock Wall, using a Diver, if we notice any of the following situations: new deficiencies, the growth of deterioration to previously found deficiencies, debris buildup, and/or on the regularly scheduled intervals directed by the PM's schedule.

## Brennan Condition Assessment

**Good:** No visible or only minor sporadic defects or deterioration. The “Brennan Repair Rating” is low.

**Satisfactory:** Limited minor to moderate defects or deterioration. The “Brennan Repair Rating” is low.

**Fair:** Minor to moderate defects or deterioration on widespread portions. Localized areas of moderate to advanced defects or deterioration may be present. The “Brennan Repair Rating” is low to moderate.

**Poor:** Moderate to advanced defects or deterioration on widespread portions. The “Brennan Repair Rating” is moderate.

**Serious:** Advanced defects or deterioration on widespread portions. Localized failures are possible. The “Brennan Repair Rating” is moderate to major.

**Critical:** Heavily advanced defects or deterioration have resulted in localized failure(s). More widespread failures are possible if corrective action is not taken. The “Brennan Repair Rating” is major.

## Brennan Repair Rating

Low: Repairs may have been recommended, but repair priority is low. At a minimum, we recommend continuing to monitor these defects or deteriorated areas within their upcoming routine inspections.

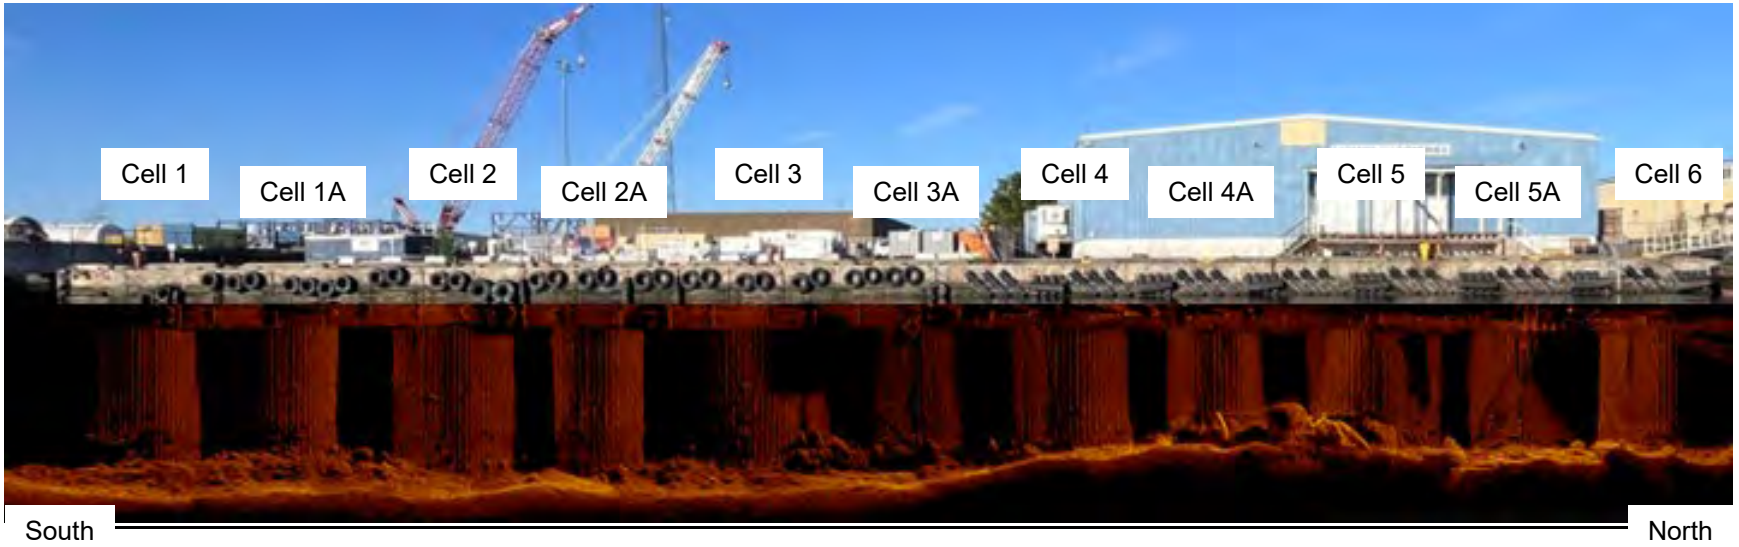
Moderate: We recommend repair talks begin and executed when possible. The observed defects or deterioration could affect the overall functionality of the structure(s).

Major: We consider the repair priority to be urgent, and repairs should be made as soon as possible.

*The Brennan Condition Assessment and Repair Ratings are considered opinions based on inspection findings of the specific inspected structure(s) and at the time of inspection. Company safety plans and/or any applicable industry regulations regarding these structure(s) should always be followed.

We appreciate the opportunity to work with Foth on this project. If you have any questions or concerns regarding the information in this report or if Brennan can be of any further assistance, please do not hesitate to reach out using the contact information below.

Respectfully submitted,



**Joe Baldoni**
Underwater Services- Underwater Inspection Program Supervisor

(2) = SHEET NUMBER

## GENERAL NOTES:

1. Symbols listed under "Proposed Construction" (at left) refer to work to be done by Contractor under the terms of the contract. These symbols and other specific instructions on the Drawings and in the Specifications will be used to indicate the work to be done by the Contractor.
2. Elevations are referenced to United States Coast and Geodetic Mean Sea Level (M.S.L.) datum.
   Mean high tide = 1.70'
   Spring tide = +3.0'±
   New Bedford city datum = +2.55'
3. Coordinates are referenced to Mass. Geodetic System.
4. Location of existing utilities is approximated, and is based on the best information available. Local connections are not shown. The Contractor is fully responsible for locating all utilities, whether shown on the Drawings or not, and is fully liable for any damage thereto. Additional compensation for errors and omissions in the location of utilities as shown on the Drawings will be allowed only as specified in the Specifications.
5. All elevations refer to finished pavement grade unless otherwise noted.
6. Catch Basin grate elevations are measured at center of grate and at face of curb. Elevations include 1-3/8" gutter depression. (See Catch Basin Details)
7. Curb radii are to face of curb.
8. Location of demolished buildings are not shown.
9. All proposed storm drainage pipes not labeled are 15" R.C.P.
10. All proposed sanitary sewer pipes not labeled are 8" V.C.P.
11. Modification, abandonment and/or addition to gas, electric & telephone utilities are not shown on the Drawings, but are shown on the Information Sheets only.
12. See Landscaping Detail Sheet for other landscaping work to be done by the Contractor.
13. Place 2 vitrified clay "y"s (one aimed at each side of street), with vitrified clay stoppers jointed in place, on V.C.P. sanitary sewer lines every 50' measured upgrade from the last preceeding manhole.

## DESIGN NOTES

1. General
   a. Elevations are based on mean sea level datum.
   b. Mean tide range is 3.7 feet.

2. Live Load Surcharge - 1,000 psf

3. Earthwork
   a. Unit dry weight = 106 pcf
   b. Unit moist weight = 120 pcf
   c. Unit submerged weight = 60 pcf
   d. Angle of friction, $\phi$ = 35°

4. Concrete
   a. All concrete shall have 4,000 psi ultimate.
   b. Concrete below water shall be tremie concrete.
   c. Reinforcing steel shall have a minimum yield strength of 30,000 psi and shall conform to ASTM A-615.
   d. Lap all splices 30 bar diameters.
   e. All reinforcement to have protection shown on all faces exposed to salt water action protect with 4" Concrete cover.

5. Structural Steel
   a. All material to be ASTM A36 except as noted.
   b. All hardware, anchor bolts, etc., shall be hot dipped galvanized steel.

6. Timber
   a. All timber shall be Douglas fir or Southern Yellow Pine pressure creosoted.

7. Cathodic Protection
   a. Cathodic protection shall be an impressed current system.

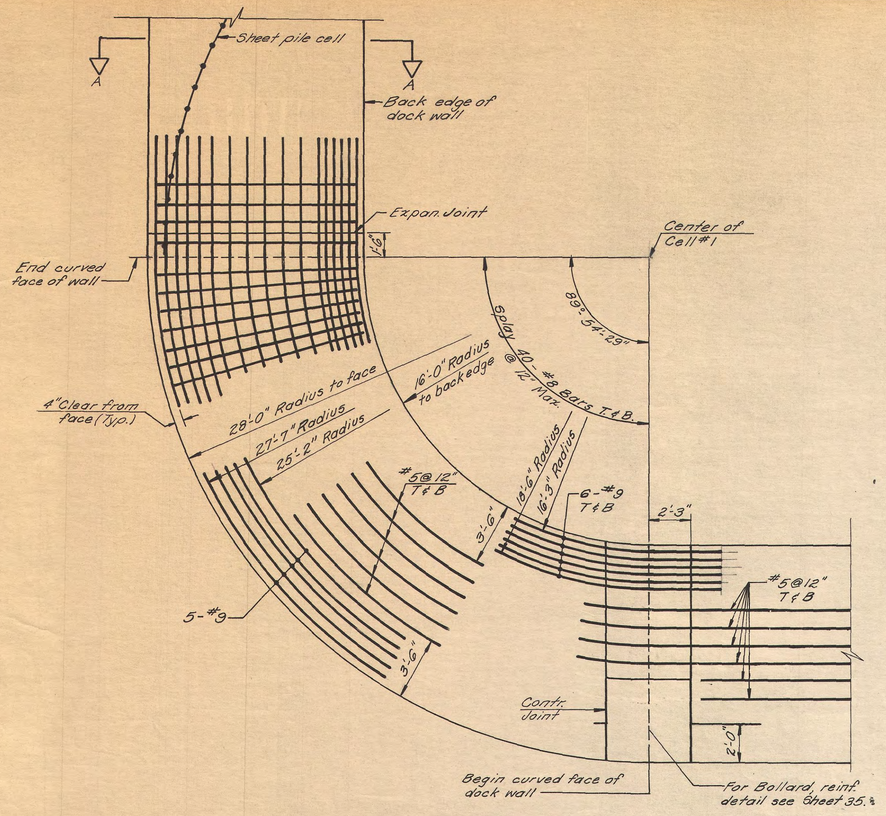
### Notes:



1. All exposed edges of Concrete Dock Wall to have 1"x1" chamfer.
2. Fender System to be pressure creosoted Douglas Fir conforming to details shown. The Contractor is to submit Shop Drawings of Fender System for approval of Engineer prior to fabrication.
3. Upper and lower wale splices to be staggered 10'-0" c.c. minimum.
4. All piles are to be driven prior to placing Dock Wall.
5. Cap log to be discontinued at Bollard and cleat locations to allow for tie-up lines.

GENERAL NOTES:

1. NOTES BELOW ARE NOT INTENDED TO REPLACE SPECIFICATIONS. SEE SPECIFICATIONS FOR REQUIREMENTS IN ADDITIONAL INFORMATION.
2. THE CONTRACTOR IS ADVISED THAT THE DRAWINGS AND SPECIFICATIONS FORM A PART OF THE CONTRACT DOCUMENTS. ALL WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE CONTRACT DOCUMENTS. THE CONTRACTOR SHALL KEEP A COPY OF THE DRAWINGS AND SPECIFICATIONS ONSITE AT ALL TIMES DURING THE PROJECT.
3. THE CONTRACTOR SHALL MAINTAIN ADEQUATE SURVEY CONTROL AT ALL TIMES TO ESTABLISH AND MAINTAIN ALL LINES AND ELEVATIONS SHOWN ON THE CONTRACT DRAWINGS.
4. THE CONTRACTOR SHALL VERIFY THE LOCATION OF ALL UNDERGROUND UTILITIES AND SUBMERGED UTILITIES WITHIN THE LIMITS OF THE WORK PRIOR TO COMMENCING ANY EXCAVATION OR GROUND PENETRATING WORK. THE CONTRACTOR SHALL NOTIFY "DIG SAFE" (1-888-344-7223) AT LEAST 3 BUSINESS DAYS PRIOR TO COMMENCEMENT OF THE EXCAVATION OR GROUND PENETRATING ACTIVITY.
5. IT IS THE CONTRACTORS RESPONSIBILITY TO PROVIDE AND MAINTAIN ENVIRONMENTAL CONTROLS AS REQUIRED BY STATE, LOCAL, AND FEDERAL REGULATION AND LAW, AS WELL AS REQUIRED WITHIN EXISTING PERMITS AND APPROVALS.
6. ALL APPLICABLE FEDERAL AND STATE REGULATION AND PERMITS SHALL BE FOLLOWED, INCLUDING BUT NOT LIMITED TO, THE CLEAN WATER ACT, THE FEDERAL DEPARTMENT OF LABOR, OCCUPATIONAL SAFETY, HEALTH ACT, 401 WATER QUALITY CERTIFICATION, CHAPTER 91 LICENSE, AND U.S. ARMY CORP OF ENGINEERS PERMIT.
7. THE CONTRACTOR IS TO VERIFY THAT THERE ARE NO EXISTING HAZARDS OR OBSTRUCTIONS IN THE SILT CURTAIN AREA SHOWN HEREON.
8. BASE PLAN COMPILED BY FOTH USING AVAILABLE MAGIS DATA AND INFORMATION PROVIDED BY USACE AND NBPA.
9. THE CONTRACTOR, PRIOR TO CONSTRUCTION AND FABRICATION OF CONSTRUCTION MATERIALS, SHALL VERIFY EXISTING CONDITIONS AND DIMENSIONS.
10. IF, DURING THE PERFORMANCE OF THE WORK, THE CONTRACTOR FINDS A CONFLICT, ERROR, OR DISCREPANCY IN THE CONTRACT DOCUMENTS, THE CONTRACTOR SHALL SO REPORT TO THE ENGINEER IN WRITING AT ONCE BEFORE PROCEEDING WITH THE WORK AFFECTED THEREBY. THE CONTRACTOR SHALL OBTAIN A WRITTEN INTERPRETATION OR CLARIFICATION FROM THE ENGINEER. WORK DONE BEFORE THE ENGINEER RENDERS HIS/HE DECISION IS AT THE CONTRACTOR'S SOLE RISK.
11. THE CONTRACTOR SHALL TAKE HIS OWN MEASUREMENTS AT THE SITE, VERIFYING THE SAME WITH THE CONTRACT DRAWINGS AND EXISTING FACILITIES, AND WILL BE HELD RESPONSIBLE FOR THE PROPER FIT AND ALIGNMENT OF COMPLETED WORK IN POSITION.
12. LENGTHS SHOWN ON THE DRAWINGS ARE CONSIDERED APPROXIMATE, AND THE ACTUAL LENGTHS MAY VARY WHEN SO ACCEPTED BY THE ENGINEER.
13. EXISTING SITE CONDITION PLAN TAKEN FROM PLAN ENTITLED "NEW BEDFORD WATERFRONT FACILITIES INSPECTIONS" BY PARE CORPORATION DATED NOVEMBER 2008.
14. PROPERTY LINES OBTAINED FROM THE MA GIS DATABASE.
15. CONTRACTOR SHALL MAINTAIN A 6-FOOT SETBACK FROM THE EXISTING BULKHEAD FOR LOAD RESTRICTION. CRANE MATTS SHALL BE UTILIZED FOR ANY CRANE OR HEAVY EQUIPMENT LOADS. A STAGING PLAN SHALL BE SUBMITTED TO THE ENGINEER FOR REVIEW PRIOR TO START OF WORK.

TOPOGRAPHIC SURVEY NOTES:

1. THE PURPOSE OF THIS PLAN IS TO SHOW A TOPOGRAPHIC SURVEY AS THE RESULT OF AN ON-THE-GROUND INSTRUMENT SURVEY WHICH OCCURRED BETWEEN 6-20-2020 TO 6-27-2020.
2. HORIZONTAL COORDINATES REFER TO MASSACHUSETTS STATE PLANE, MAINLAND ZONE, US SURVEY FEET BASED ON GPS RTK OBSERVATIONS.
3. ELEVATION REFERS TO MEAN LOW WATER MARK (MLW) VERTICAL BASED ON THE PUBLISHED BENCHMARK STATION BOLT 2008 ESTABLISHED BY U.S.A.C.E.-NAD-NE IN APRIL 2008.
4. THE ENTIRE PROJECT SITE WORK AREA IS WITHIN LAND SUBJECT TO COASTAL STORM FLOWAGE. FEMA FLOOD ZONE AE (EL 6) REFERENCED FROM MAP# 25005C0393G & 25005C0481G DATED 7/16/14.
5. WATER BOUNDARIES ARE SUBJECT TO CHANGE DUE TO NATURAL CAUSES AND THE WATER BOUNDARIES SHOWN HEREON MAY OR MAY NOT REPRESENT THE ACTUAL LOCATION OF THE LIMIT OF TITLE.
6. THE MEAN HIGH WATER ELEVATION (3.75') BASED ON VDATUM CONVERSION FROM MEAN LOWER LOW WATER TO MEAN HIGH WATER.

HYDROGRAPHIC SURVEY NOTE:

1. COORDINATES SHOWN ARE IN STATE PLANE COORDINATE SYSTEM, MASSACHUSETTS MAINLAND ZONE 2001, REFERENCED TO THE 1983 NORTH AMERICAN DATUM (NAD83), EXPRESSED IN US SURVEY FEET.
2. INFORMATION DEPICTED ON THIS PLAN REPRESENTS THE RESULTS OF SURVEYS MADE ON DATES INDICATED BELOW AND CAN ONLY BE CONSIDERED TO REPRESENT THE CONDITION AT THE TIME OF THE SURVEY AND AT SOUNDING POINTS NOTED ON THE PLAN. HYDROGRAPHIC SURVEY OF NEW BEDFORD HARBOR WAS PERFORMED BY FOTH INFRASTRUCTURE & ENVIRONMENTAL, LLC. SURVEY DATED NOVEMBER 2018.
3. ELEVATIONS & SOUNDINGS SHOWN ARE DEPTHS IN FEET BELOW MEAN LOW WATER (MLW) FOR CLARK'S POINT NOAA STATION 8447712. THE MLW ELEVATION FOR THE NEW BEDFORD HARBOR AREA IS -1.78 FEET NAVD88. SEE GRAPHIC REPRESENTATION OF DATUM SEPARATION FOR MORE INFORMATION.
4. ELEVATION REFERS TO THE PUBLISHED BENCHMARK STATION BOLT 2008 ESTABLISHED BY U.S.A.C.E.-NAD-NE IN APRIL
5. 2008. SEE SPECIFICATIONS SECTION 00800 - SUPPLEMENTAL CONDITIONS FOR BENCHMARK INFORMATION.
6. SOUNDINGS SHOWN AS NEGATIVE ARE ABOVE THE REFERENCE PLANE.
7. THE SOUNDING INFORMATION SHOWN ON THIS PLAN REPRESENTS THE AVERAGE SOUNDINGS OBTAINED FROM HYDROGRAPHIC SURVEYS. SOUNDINGS ARE GENERATED FROM A 25' X 25' AVERAGE. VALUE DATA SET.
8. THE SOUNDING INFORMATION DEPICTED ON THIS PLAN SHOULD NOT BE USED FOR THE DETERMINATION OF VOLUMES. VOLUMES ARE TO BE DETERMINED FROM A SEPARATE AVERAGE VALUE DATA SET.
9. CONTOURS SHOWN FOR NEW BEDFORD HARBOR ARE BASED ON A 3'X3' AVERAGE VALUE DATA SET. CONTOURS ARE SHOWN AT 1' INTERVALS UNLESS OTHERWISE NOTED.

UTILITY NOTES:

1. THE SUB-SURFACE UTILITY INFORMATION SHOWN HEREON IS COMPILED BASED ON FIELD SURVEY INFORMATION, RECORD INFORMATION AS SUPPLIED BY THE APPROPRIATE UTILITY COMPANIES, AND PLAN INFORMATION SUPPLIED BY THE NEW BEDFORD PORT AUTHORITY, IF ANY; THEREFORE WE CANNOT GUARANTEE THE ACCURACY OF SAID COMPILED SUB-SURFACE INFORMATION TO ANY CERTAIN DEGREE OF STATED TOLERANCE. ONLY PHYSICALLY LOCATED SUB-SURFACE UTILITY FEATURES FALL WITHIN NORMAL STANDARD OF CARE ACCURACIES.
2. THE LOCATIONS OF UNDERGROUND PIPES, CONDUITS, AND STRUCTURES HAVE BEEN DETERMINED FROM SAID INFORMATION, AND ARE APPROXIMATE ONLY. COMPILED LOCATIONS OF ANY UNDERGROUND STRUCTURES, NOT VISIBLY OBSERVED AND LOCATED, CAN VARY FROM THEIR ACTUAL LOCATIONS.
3. ADDITIONAL BURIED UTILITIES/STRUCTURES MAY BE ENCOUNTERED.
4. THE STATUS OF UTILITIES, WHETHER ACTIVE, ABANDONED, OR REMOVED, IS AN UNKNOWN CONDITION AS FAR AS OUR COMPILATION OF THIS INFORMATION.
5. IT IS INCUMBENT UPON INDIVIDUALS USING THIS INFORMATION TO UNDERSTAND THAT COMPILING UTILITY INFORMATION IS NOT EXACT, AND IS SUBJECT TO CHANGE BASED UPON VARYING PLAN INFORMATION RECEIVED AND ACTUAL LOCATIONS.
6. THE ACCURACY OF MEASURED UTILITY INVERTS AND PIPE SIZES IS SUBJECT TO FIELD CONDITIONS, THE ABILITY TO MAKE VISUAL OBSERVATIONS, DIRECT ACCESS TO THE VARIOUS ELEMENTS AND OTHER MATTERS.
7. THE PROPER UTILITY ENGINEERING/COMPANY SHOULD BE CONSULTED AND THE ACTUAL LOCATIONS OF SUBSURFACE STRUCTURES SHOULD BE VERIFIED IN THE FIELD (V.I.F.) BEFORE PLANNING FUTURE CONNECTIONS. CONTACT THE DIG SAFE CALL CENTER AT 1-888-344-7233, SEVENTY-TWO HOURS PRIOR TO EXCAVATION, BLASTING, GRADING, AND/OR PAVING.

STRUCTURAL NOTES:

1. SHOP DRAWINGS SHALL SHOW IN DETAIL ALL SIZES, SHAPES, MATERIALS, FINISHES AND METHODS OF ATTACHING MISCELLANEOUS METAL ITEMS TO ONE ANOTHER, AND WORK OF OTHER TRADES.
2. THE WORK SHALL BE PERFORMED IN A GENERAL SEQUENCE DEVELOPED BY THE CONTRACTOR AND SUBMITTED TO THE ENGINEER FOR REVIEW, IN ACCORDANCE WITH THE REQUIREMENTS OF THE CONTRACT. THE CONTRACTOR IS SOLELY RESPONSIBLE FOR THE MEANS AND METHODS OF CONSTRUCTION AND FOR THE SEQUENCES AND PROCEDURES TO BE USED.

GENERAL MATERIAL SPECIFICATIONS

STEEL:

1. STRUCTURAL STEEL SHALL COMPLY WITH THE "STEEL CONSTRUCTION MANUAL" FIFTEENTH EDITION PUBLISHED BY THE AMERICAN INSTITUTE OF STEEL CONSTRUCTION.
2. MISC STEEL OR STEEL NOT SPECIFIED TO BE GRADE 50.
3. WELDING SHALL CONFORM TO THE 'STRUCTURAL WELDING CODE - STEEL', PUBLISHED BY THE AMERICAN WELDING SOCIETY (AWS D1.1). A WELDER CERTIFIED IN ACCORDANCE WITH AWS STANDARDS SHALL PERFORM WELDING.
4. WELDING ELECTRODES SHALL BE E70XX AND COMPLY WITH AWS A5.1 AND AWS A5.5 UNLESS NOTED OTHERWISE.
5. STRUCTURAL STEEL SHAPES/PILES SHALL CONFORM TO ASTM A588, GRADE 50. STEEL PLATES SHALL CONFORM TO ASTM A588 WITH 50 KSI YIELD.
6. STEEL HARDWARE: ANCHOR AND CARRIAGE BOLTS: ASTM F 1554 GRADE 55 AND ASTM A307, HIGH STRENGTH STRUCTURAL BOLTS: ASTM F3125 GR. A325, W/ HEXAGONAL OR CARRIAGE HEADS NUTS: ASTM A563, WASHERS (EXCEPT AGAINST TIMBER): ASTM F436, WASHERS AGAINST TIMBER SHALL BE COMMON DOCK WASHERS.
7. STEEL HARDWARE ABOVE GRADE SHALL BE HOT DIPPED GALVANIZED IN ACCORDANCE WITH ASTM A153.
8. CONNECTIONS SHALL BE DESIGNED AND DETAILED BY THE STEEL FABRICATOR EXCEPT FOR THOSE SPECIFICALLY DETAILED IN THE CONTRACT DOCUMENTS.
9. PREFABRICATED PILE CAP ASSEMBLIES SHALL BE HOT DIP GALVANIZED.

STEEL PROTECTIVE COATING:

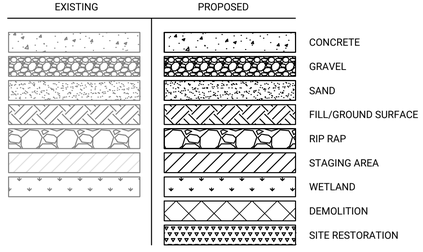
1. MATERIAL USED FOR FACTORY EPOXY COATING OF ALL SCHEDULED SURFACES SHALL BE AMERCOAT 240 OR APPROVED EQUAL ACCEPTED BY THE ENGINEER.
2. COATING SHALL BE APPLIED IN ACCORDANCE WITH THE MANUFACTURES RECOMMENDATION WITH SURFACE PREPARATION FOR IMMERSION SERVICE WITH MINIMUM GRIT BLASTING TO NEAR WHITE FINISH (SSPC-SP10 OR NACE).
3. FIELD TOUCH-UP COATING SHALL BE AMERCOAT 240 FOR AREAS ABOVE MEAN HIGH WATER AND DENSO SPLASHZONE UNDERWATER EPOXY FOR AREAS BELOW MEAN HIGH WATER, OR APPROVED EQUAL, AND SHALL BE APPLIED IN ACCORDANCE WITH THE MANUFACTURER'S REQUIREMENTS.
4. THE PROTECTIVE COATING SHALL BE INSTALLED IN STRICT ACCORDANCE WITH MANUFACTURER'S WRITTEN INSTRUCTIONS.
5. ALL IMPERFECTIONS IN THE COATING SHALL BE REMOVED OR REPAIRED AT THE CONTRACTORS EXPENSE PRIOR TO FINAL ACCEPTANCE OF THE WORK.

CONCRETE:

1. CONCRETE WORK SHALL CONFORM TO THE REQUIREMENTS OF ACI-318 "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE", AS ADOPTED BY THE AMERICAN CONCRETE INSTITUTE.
2. CONCRETE SHALL BE NORMAL WEIGHT WITH COMPRESSIVE STRENGTH OF 5000 PSI AT 28 DAYS. PORTLAND CEMENT SHALL BE TYPE II. CONCRETE SHALL CONTAIN 6% (+/- 1.5%) ENTRAINED AIR AND HAVE A MAXIMUM WATER TO CEMENT RATIO OF 0.40.
3. USE ACCELERATORS/ADMIXTURES TO IMPROVE WORKABILITY AND REDUCE WATER/CEMENT RATIO TO CONTROL SHRINKAGE. SUBMIT PROPOSED CONCRETE MIX TO THE ENGINEER FOR REVIEW. NO WATER SHALL BE ADDED TO THE MIX AT THE JOB SITE.
4. CONCRETE SHALL BE CONTROLLED CONCRETE, MIXED AND PLACED IN THE PRESENCE OF THE APPROVED TESTING AGENCY.
5. DO NOT PLACE CONCRETE UNTIL REINFORCEMENT AND EMBEDDED ITEMS HAVE BEEN APPROVED BY THE ENGINEER AND/OR THE APPROVED TESTING AGENCY (IF/WHEN DIRECTED). PROVIDE A MINIMUM OF 24 HOURS NOTIFICATION TO THE ENGINEER.
6. A MINIMUM OF 72 HOURS SHALL ELAPSE BETWEEN ADJACENT CONCRETE PLACEMENTS.

REINFORCEMENT:

1. REINFORCING STEEL SHALL CONFORM TO THE REQUIREMENTS OF ASTM A615 GRADE 60, OR 75 AS CALLED FOR.
2. DETAILING, FABRICATION, AND ERECTION OF REINFORCING STEEL SHALL BE EPOXY COATED AND CONFORM TO THE REQUIREMENTS OF ACI-318 AND ACI-315 'DETAILS AND DETAILING OF CONCRETE REINFORCEMENT'.
3. REINFORCEMENT SHALL CONFORM TO BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE (ACI 318), ACI DETAILING MANUAL (SP-66), CRSI MANUAL OF STANDARD PRACTICE (MSP), AND THE STRUCTURAL WELDING CODE-REINFORCING STEEL (AWS D1.4). ELECTRODES TO BE E-8018.
4. WELDED WIRE FABRIC SHALL CONFORM TO ASTM A185
5. PROVIDE SUPPLEMENTAL BARS AND ACCESSORIES AS REQUIRED TO HOLD REINFORCEMENT SECURELY IN POSITION.
6. MINIMUM CONCRETE PROTECTIVE COVER, UNLESS NOTED OTHERWISE, SHALL BE AS FOLLOWS:
   - 6.1. CONCRETE EXPOSED TO WEATHER 3 INCHES
   - 6.2. CONCRETE AT ADJACENT POURS 2 INCHES
   - 6.3. CONCRETE PLACED AGAINST EARTH 3 INCHES
7. ALL CONTINUOUS REINFORCEMENT SHALL BE EXTENDED AROUND CORNERS AND LAPPED AT NECESSARY SPLICES OR HOOKED AT DISCONTINUOUS ENDS. USE STANDARD HOOKS UNLESS OTHERWISE INDICATED.
8. LAPS SHALL BE CLASS B TENSION LAP SPLICES, UNLESS NOTED OTHERWISE.
9. REINFORCEMENT SHALL BE CONTINUOUS THROUGH CONSTRUCTION JOINTS. PROVIDE MECHANICAL COUPLERS WHERE REQUIRED CONTINUOUS REINFORCEMENT EXCEEDS AVAILABLE LENGTHS.



COMPOSITE FENDER SYSTEM:

1. FENDER PILES SHALL BE 13" DIAMETER PILE W/ 8x11 FG REBAR OR APPROVED EQUAL.
2. WALERS SHALL BE 12x12 TIMBER W/ 4x08 FG REBAR OR APPROVED EQUAL.
3. CHOCKS SHALL BE 8x12 TIMBER W/ 4x08 FG REBAR OR APPROVED EQUAL.
4. MATERIAL COLOR SHALL BE BLACK.
5. FENDER PILES SHALL BE DRIVEN STRAIGHT AND TRUE AT INDICATED LOCATIONS, WITH DEVIATION FROM THE LONGITUDINAL AXIS OF NOT MORE THAN 1/8 INCH PER FOOT.
6. WALERS SHALL BE CONTINUOUSLY EXTRUDED.
7. CONTRACTOR SHOULD COORDINATE WALE LENGTHS TO THE MAXIMUM EXTENT POSSIBLE IN ORDER TO MINIMIZE OVERLAP AREAS.

FIBERGLASS PILE JACKET REPAIRS:

1. FIBERGLASS PILE JACKETS SHALL BE DENSO FIBER-FORM PILE JACKETS OR APPROVED EQUAL.
2. GROUT FOR PILE JACKET REPAIRS SHALL BE DENSO SEASHIELD 550 EPOXY GROUT OR APPROVED EQUAL.
3. FIBERGLASS JACKETS AND EPOXY GROUT SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURES RECOMMENDATIONS.

# 7. South Terminal Fish Houses

## 7.1 Description of Site

### 7.1.1 Site Location

South Terminal is located off of Hassey Street, south of Leonard's Wharf and north of the Hurricane Barrier along the New Bedford waterfront on Buzzards Bay as shown on ***Figure 6***. The parcel is referenced by the City of New Bedford Assessor's Office as Map 31, 37-2, and 42, Lot 47 and 302. The project site is located within a Designated Port Area and Shellfish Suitability Area as regulated under the MA WPA.

Figure 6: Location of South Terminal Fish Houses

### 7.1.2 Facility Description

South Terminal is believed to have been constructed in the 1960s. It is divided into several marine industrial parcels and ship berths, and is constructed of an approximate 1,800-foot long steel cellular bulkhead with a reinforced concrete cap wall. The cellular bulkhead retains solid fill material and provides support for vessel berthing and adjacent building structures. South Terminal is constructed of twenty-six 54-foot diameter cofferdams and twenty-five 17-foot radius cofferdams that make up the total 51 steel cellular cofferdams which are built with MP-101 steel sheet piles. A bulkhead also spans the northern and southern portions of the site which connect the northern and southern most cofferdams to the landside shoreline. The northern bulkhead is constructed of approximately 100 feet of MZ-27 steel sheet piles and the southern bulkhead is constructed of approximately 85 feet of MZ-27 steel sheet piles. Supported by the cellular cofferdam cells is an L-shaped reinforced concrete cap wall that is 2-foot wide by 5-foot thick on the stem and 12-foot wide by 3-foot thick at the base. Additionally, 148 P73 H-piles were driven approximately 10-feet landward of the face of the cellular bulkhead. The cellular cofferdam cells and bulkhead are numbered, for reference, as shown on the attached plans in **Appendix A – Condition Plans**. Structures extend over the cells for the majority of the 1,800 linear feet. The first 203 feet of the bulkhead are owned and maintained by the MA Clean Energy Center (MassCEC), while the remaining ~1,597 feet are owned and maintained by the New Bedford Port Authority (NBPA). (The full extent of the bulkhead was inspected, as the bulkhead had been previously owned by NBPA in its entirety.) The fender system along South Terminal consists of a combination of large diameter tires and D-Fenders hung from the concrete deck cap. The fenders are secured by chains which are connected to eye bolts anchored to the concrete deck cap.

## 7.2 Observed Conditions - 2020

The underwater inspection of South Terminal, executed with Fathom, was performed on February 3, 4, and 5, 2021. The topside inspection was performed on January 8, 2021 by Foth. Assessment of the bituminous pavement and utilities will be stated in a later section of this report. Assessment of the adjacent buildings, loading platforms, fencing, and stairways are not included in the scope of work and therefore were not inspected. For reference, as shown on the attached plans in **Appendix E – South Terminal 2020 Condition Plan**, a baseline stationing was established along the top of the bulkhead during the inspection. Station 0+00 is located at the southern end of the project site adjacent to the Marine Commerce Terminal and extends north terminating at Station 18+15. (Stations 0+00 thru 2+60 are not the property of NBPA, but conditions have been noted since they had been previously owned by NBPA and therefore included in historic reports.) Observations were made in relation to their stationing and cofferdam cell location along the baseline as appropriate, and as noted herein and in the plans. Overall, the condition of South Terminal was found to be in *Fair* condition.

The steel sheet pile cells are of varying diameters alternating between major and minor cells and are exposed from the mud line up to the concrete cap. The flat steel sheets which comprise the cells, exhibit signs of heavy corrosion with pitting of the steel and no evidence of a passive or active cathodic protection system.

### 7.2.1 Appurtenances

Appurtenances such as the life rings were typically given a condition rating of *Minor*. Life rings were observed either bolted to the timber curb along the bulkhead or placed on the adjacent buildings at Station 2+92, Station 6+10, and Station 10+35, with no major deficiencies noted. The Life Ring at Station 14+70 was observed to be loose due to the loose and compromised timber curb, therefore was given a condition rating of *Severe*.

Similarly, the mooring cleats and mooring bollards located throughout the pier were given a condition rating ranging from *Minor* to *Severe*. Typically the mooring cleats and bollards were given condition ratings of *Minor* with typical observations consisting of coating loss, minor surface corrosion, minor wearing marks or pitting, and in-tact epoxy on hardware. (Refer to Photographs 1 through 3 of Appendix B.) Corrosion of the mooring cleats and bollards will lead to loss of section and, therefore, a reduction of strength. Mooring cleats and bollards with typical observations consisting of missing hardware epoxy, significant surface wear marks and pitting, moderate surface corrosion, delamination, scaling, and corroded hardware less than 25% loss of section were given a condition rating of *Moderate*. (Refer to Photographs 4 through 6 of Appendix B.) Several mooring cleats were observed to have corroded hardware greater than 25% loss of section and advanced corrosion and scaling with surface wear marks and pitting, resulting in a *Major* condition rating. (Refer to Photographs 7 and 8 of Appendix B.) These mooring cleats are identified as #17, #23, #27, #29, #38, and #44, as well as, mooring bollards #4, #5, and #12. Additionally, mooring bollard #13 was observed to be broken and therefore was given a condition rating of *Severe*. (Refer to Photograph 9 of Appendix B.) Refer to **Table 17** for a list of deficiencies encountered related to the mooring cleats and mooring bollards.

Additional appurtenances, such as the access ladders, are located along the bulkhead to provide access to and from the deck to the water below. The construction of the access ladders vary between timber and steel throughout the pier. The access ladders were given condition ratings of either *Minor* or *Severe*. Typical observations which attributed to these ratings were missing ladder rungs, heavily cracked/split vertical legs, damaged or broken components, impact damage, and heavy corrosion and deterioration of the hardware. Foth noted that it had appeared as though the majority of damage observed on the access ladders is likely a result of impact from vessels causing damage to the rungs and the vertical legs. The steel access ladder at Station 2+88 was given a condition rating of *Severe* and was observed to have bent/deformed vertical legs at the top of the ladder, likely from impact, as well as broken step rungs at the top of the ladder and broken connection to the reinforced concrete bulkhead cap. (Refer to Photograph 10 of Appendix B.) Timber access ladders at Station 6+65, Station 9+00, and Station 10+40

were all given condition ratings of *Severe* and were observed to have corroded connection hardware, broken step rungs, and/or broken vertical legs compromising its connection to the concrete cap. (Refer to Photographs 11 through 13 of Appendix B.) The timber access ladder at Station 4+26 was observed to have corroded connections to the reinforced concrete bulkhead cap and was given a condition rating of *Minor*. The timber access ladders at Station 7+90 and Station 12+45 had no deficiencies observed and therefore were also given condition ratings of *Minor*.

## Table 17

## South Terminal Observed Mooring Cleat and Mooring Bollard Deficiencies

| Station | Structure | Deficiency |
|---|---|---|
| **1+20 [MassCEC]** | Mooring Bollard #1 | Moderate Condition |

### 7.2.2 Timber Curb

The timber curb was generally found to be in ***Fair - Poor*** condition. Condition ratings for the timber curb were given ranging from ***Minor*** to ***Severe***. (Refer to Photographs 14 through 23 of Appendix B.) Typical observations which attributed to a ***Minor*** condition rating consisted primarily of rot, fungal decay, and checking typically found given the age of the timber elements. Typical observations which attributed to the ***Moderate*** condition rating were moderate fungal decay/rotting, section loss up to 25%, checking or splitting wider than ½", and dislodged sections. Typical observations which attributed to the ***Major*** condition rating were section loss 25% to 50%, heavily corroded hardware, checking or splitting through full section, and displacement or loss of bearing connections. Typical observations which attributed to the ***Severe*** condition rating were section loss greater than 50%, loss of connection or full bearing, and partial or full breakage. In addition, there are several areas along the bulkhead were the timber curb was observed to be missing.

### 7.2.3 Rubber Fender System

The fender system primarily consists of D-Fenders and non-engineered rubber elements (tires, cylinders, etc.). Minor oxidation was observed on the hardware of the fender system. Overall, the fender system was generally given a condition rating of ***Minor-Moderate*** with gouges/wears less than 25% nominal depth, surface cracking of rubber components, and intact connections. (Refer to Photograph 24 of Appendix B.) However, several areas of the fender system along the bulkhead were given a condition rating of ***Severe***. This rating was generally given for sections where the fender system was observed to be missing, which indicates that the connections had failed. One particular section of the fender system which was missing is between Station 9+30 through 10+30 (refer to Photograph 25 Appendix B), and the other area is between Station 1+60 through Station 2+00. (Refer to Photograph 26 Appendix B.) Additionally, several D-Fenders were observed to be torn through the rubber. (Refer to Photographs 27 to 29 of Appendix B.)

### 7.2.4 Concrete Bulkhead Cap

The concrete deck was given a condition rating of *Moderate* with typical surface cracking and spalling. (Refer to Photographs 30 through 35 of Appendix B.) Vertical hairline cracks were observed along the face of the concrete deck cap, along with spalling on the topside leading edge of the concrete deck throughout the entire length of the project site. Occasionally, these areas of spalling and cracking coincided with areas where the mooring bollards or mooring cleats are located. (Refer to Photographs 33 through 35 of Appendix B.) This has a potential of compromising the structural integrity of their fasteners. Lastly, multiple areas of isolated spalling resulting in loss of section, along with exposed reinforcement were also observed during the inspection and were subsequently given a condition rating of *Severe*.

### 7.2.5 Sheet Pile Cofferdam Bulkhead

The sheet pile cellular cofferdam bulkhead at South Terminal is comprised of 51 sheet pile cells is constructed over 1,630 linear feet (the first~200 linear feet of which are not owned by NBPA) with a northern bulkhead comprised of approximately 100 feet of MZ-27 steel sheet piles and the southern bulkhead comprised of approximately 85 feet of MZ-27 steel sheet piles. The sheet pile cofferdams and bulkheads at South Terminal were given an overall condition rating of *Severe*. (Refer to Photographs 36 through 48 of Appendix B.) Typical observations which attributed to this are holes in the sheet piles, structural deformation, loss of thickness and section, and washout. During the underwater inspection, the divers encountered holes on the sheet piles at 38 out of a total of 51 cellular cofferdams. The holes range in size and diameter or length from one to two inches to greater than 30 inches and also range in location from between the tidal zone to the top of the sheets. (Refer to Photographs 36 through 41 of Appendix B.) Coincidentally, a majority of the holes observed on the cells coincided with locations of the concrete cap expansion joints. **Table 18** indicates the size and location of each hole observed during the inspection. Refer to **Table 19**for UT readings.

In addition to the observed holes, the divers also indicated a section of the sheet piles from Cell #5 through Cell #7 to be washing out from below the sheets. (Refer to Photographs 42 and 43 of Appendix B.) It appeared as though the harbor was dredged sometime after the 2016 inspection, indicated by a layer of old mudline material on the sheet piles, which has exposed the bottom of the sheets at this location. It was noted that the sheet piles appeared to have been driven to a rock layer, which may have been mistaken as refusal or bedrock during the time of installation, and therefore did not extend to the depths required. Since the previous dredge limit was higher than the current elevation and above this deficiency, it was not observed during the previous inspection in 2016. Similarly, an additional area of washout was encountered at Cell #44. The divers indicated that two of the sheet piles at this location were separated from the interlocks approximately 12 inches from the mudline where they continued to bow outward. (Refer to Photographs 44 and 45 of Appendix B.) Therefore, washout was observed at this location due to the separation of the interlocks from the adjacent sheet piles.

Lastly, during the inspection, the divers observed the sheet piles of the northern bulkhead to be in *Critical* condition. Large holes were encountered that extended through the webs of the sheet piles essentially leaving the inner and outer flanges to remain. (Refer to Photographs 46 through 48 of Appendix B.)

# Table 18

## South Terminal Cellular Cofferdam Deficiencies:

| Cell # | Sheet # | Deficiency |
|---|---|---|
| 1 [Mass CEC] | 3 | Hole 4"x6" near concrete cap |
| 2 [Mass CEC] | 25 | Hole 2"x5" at top of sheet |
| 3 [Mass CEC] | 3 | Hole 12"x24" at top of sheet |
| 3 [Mass CEC] | 6 | Hole 6"x30" at top of sheet |
| 4 [Mass CEC] | 12 | Hole 6"x10" at top of sheet near expansion joint |
| 5 [Mass CEC] | 15 | Hole 2"x2" at top of sheet by diver |
| 5 [Mass CEC] | 22-30 | Sheets sitting on rocks w/ large void space beneath sheets; Washout occurring below |
| 6 [Mass CEC] | 1-24 | Sheets sitting on rocks w/ large void space beneath sheets; Washout occurring below |
| 6 [Mass CEC] | 9-14 | Large Hole - 5 sheets wide by 48" long (assumed for drainage; not for repair) |
| 7 [Mass CEC] | 1 | Hole 3"x6" at top of sheet |
| 7 [Mass CEC/ NBPA] | 1-9 | Sheets sitting on rocks w/ large void space beneath sheets; Washout occurring below |
| 7 | 9-30 | Go into mud line, mud line jogs out away from cell 3', then rocks continue below |
| 8 | 10 | Hole 6"x6" at top of sheet |

## 7.3 Structural Condition Assessment

South Terminal was observed to have 73 holes through the steel bulkhead however, due to the original design these have a lesser impact to overall capacity of the system. Overall the structure is in Fair condition with localized areas of advanced deterioration but no significant reduction in capacity.

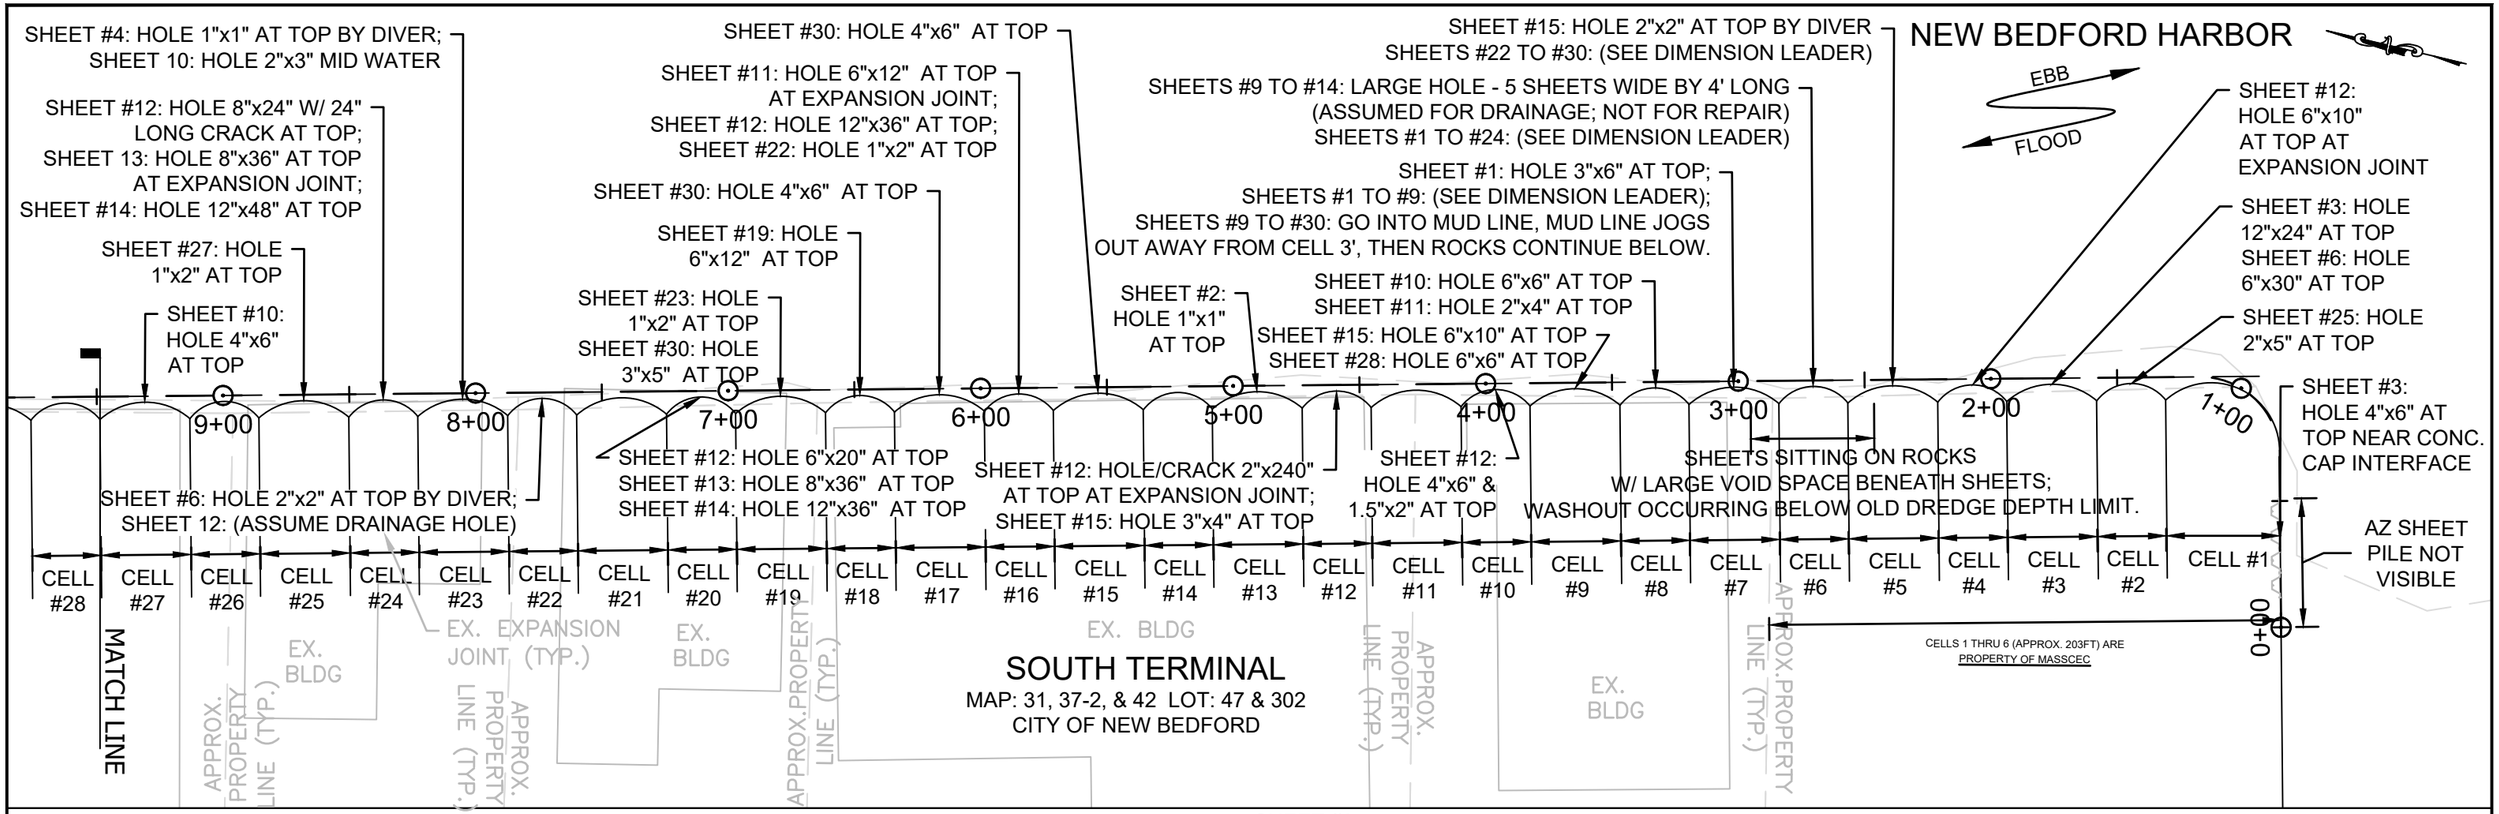
Due to the number of sinkholes observed, the interiors and areas adjacent to the buildings should be thoroughly investigated for additional sinkholes, which may compromise their structural integrity.

Two areas should be monitored periodically – Cell 44 with the separated sheets at the mudline and the exposed toes of the sheets within Cells 5 to 7.

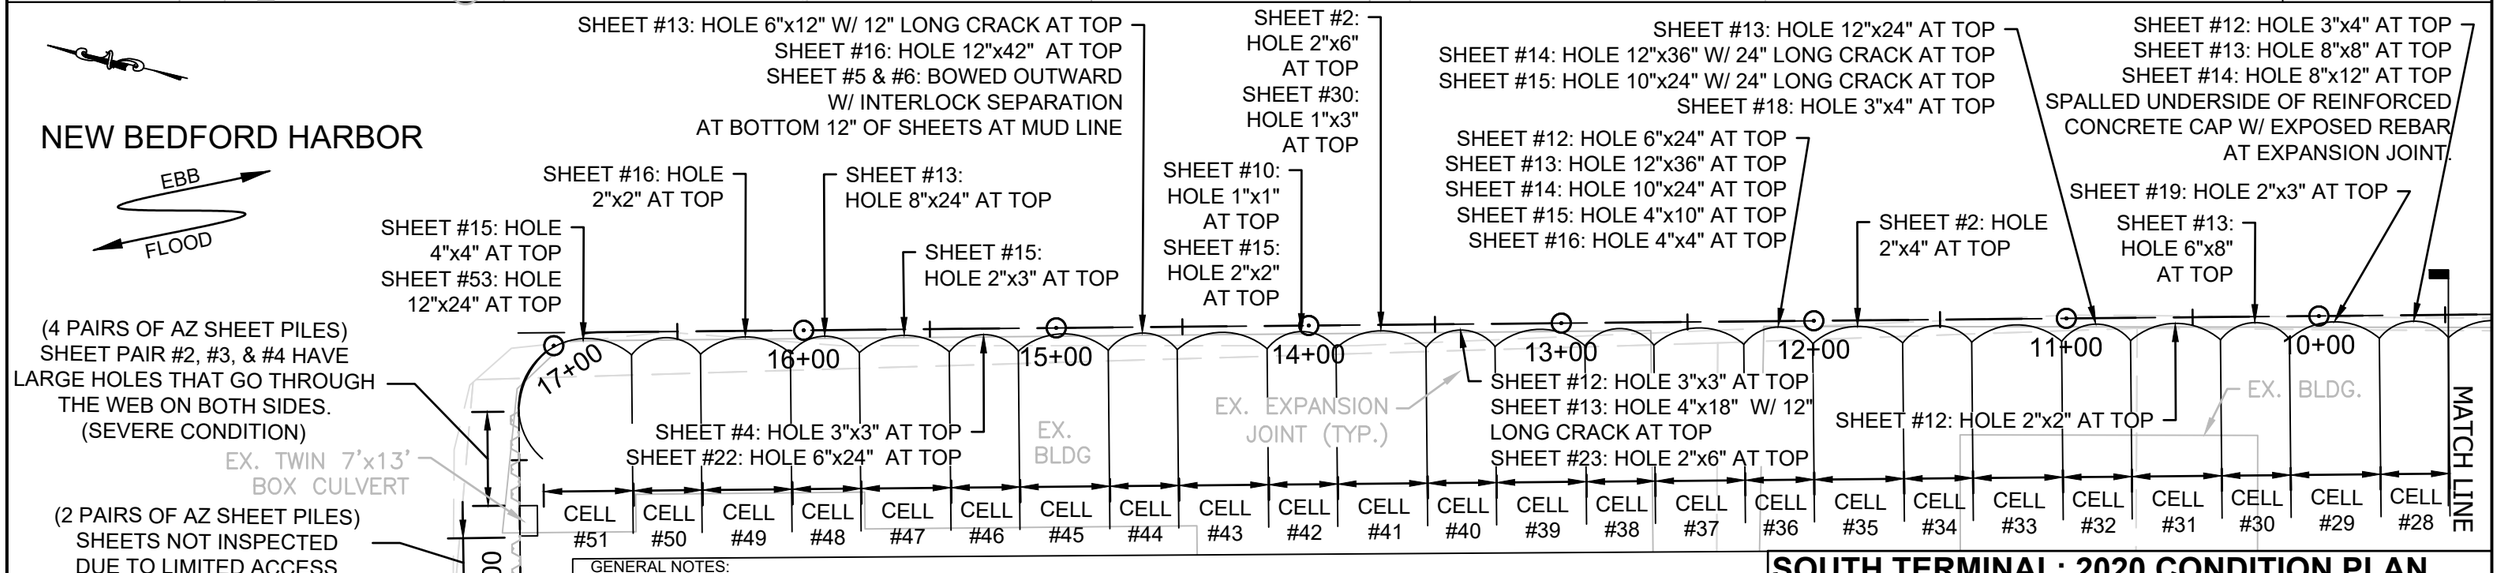
**Immediate Needs:**

No immediate needs identified, repairs can be completed within the 0-5 year timeframe.

**Short Term (0-5 years):**



Localized repair of holes in steel plating at 73 locations.



**Medium Term (5-15 years):**

Toe repairs will be required along a portion of cell 7, grout bags recommended.

**Long Term (15-50 years):**

- Plan for a full replacement of the South Terminal bulkhead within 30 years
- Requirements for replacement are dependent on the loading from the building located at the site
