Hydraulic analysis confirms that scour countermeasures are required around the bridge to prevent erosion. Under proposed conditions, the scour analysis predicts contraction scour of approximately 2.6' to 2.7' and worst local abutment scour of approximately 13' during the 25-year and 50-year storm events. Total predicted scour exceeds 5'. These scour depths indicate that the existing bridge is vulnerable to scour without protection. Accordingly, riprap countermeasures are required to protect the substructure and reduce erosion risk during flood events. Dredging is only proposed to install scour countermeasures. An alternative to installing scour protection would be to replace the substructure and embed it to a depth below the level where scour would occur. However, this alternative would still result in significant impacts to LUW and Bank associated with water controls and pier removal/installation and would be cost-prohibitive to the City of Taunton based on current funding. Installation of scour protection is significantly less costly than substructure replacement and the proposed 2' of native streambed material proposed over the scour protection will provide appropriate restoration in the final condition.

Alternative #1 was selected because the installation of riprap countermeasures is necessary to protect the area around the bridge from scour and results in less disturbance than Alternative #4. The proposed riprap countermeasures are consistent with the MassDOT Bridge Manual - Hundredth Anniversary Edition.

6.0 Regulatory Compliance

The Project is proposed under the provisions specified under Town of Raynham Wetlands Protection Bylaw (the Bylaw), which builds upon the provisions of the Massachusetts Wetlands Protection Act pursuant to "Home Rule". The Project was designed to meet the Performance Standards of the Act, and where more stringent, the Bylaw.

The Project will result in the following impacts:

- 66 linear feet (lf) of temporary and 51 lf of permanent impact to Bank;
- 2,304 square feet (sf) of temporary and 4,399 sf of permanent impact to LUW associated with a dredge volume of 1,052 cubic yards (cy);
- 1,121 sf of permanent impact to BLSF;
- 1,867 sf of temporary impact and 4,477 sf permanent impact to Riverfront Area; and
- 315 sf of temporary impact and 645 sf of permanent impact to the Bylaw 25' No-Activity Buffer Zone.

The Project is located entirely within the Bylaw 100' Buffer Zone to BLSF and therefore will result in 5,518 sf of temporary impact and 5,616 sf of permanent impact to the Bylaw 100' Buffer Zone to BLSF. The

Project will also result in 1,309 sf of temporary impact and 3,253 sf of permanent impact to 100' Buffer Zone to Bank and 3,479 sf of temporary impact and 3,895 sf of permanent impact to 100' Buffer Zone to BVW.

6.1 MASSACHUSETTS STREAM CROSSING STANDARDS

The Project only proposes the replacement of the superstructure and will make no changes to the existing bridge substructure. While the existing conditions do not fully meet all Massachusetts Stream Crossing Standards, the proposed Project conditions meet the Standards to the maximum extent practicable. The compliance of the existing bridge with the Standards will not change given the nature of the work being applicable only to the superstructure. Proposing improvements to the bridge to meet the Standards would require a full bridge substructure replacement which is outside the scope of the Project.

The existing structure is an approximately 90' two-span bridge with equal spans of approximately 45'. The hydraulic opening of the existing bridge is 79' with a sharp nose pier that varies in width from 3' to 2.75'. The bankfull width of the Taunton River is estimated to be approximately 99.5'. Bankfull width was calculated in AutoCAD by measuring the width between flags of the B1/B2 Series, taking the average of three (3) bankfull widths upstream of the bridge and three (3) bankfull widths downstream of the bridge. Table 12: Stream Crossing Standards Compliance demonstrates the Project's ability to comply with the Massachusetts Stream Crossing Standards as follows:

Table 12: Stream Crossing Standards Compliance

Stream Information and Standards	Existing/Proposed Project
Standard 1 **Crossing Type**	Bridge – **Met** (**Optimal Standard Met)**
Standard 2 **Embedment > 2 feet**	Crossing type is a bridge. **Not Applicable**
Standard 3 **Crossing Span >1.2*BFW**	BFW = 99.5' 1.2*99.5' = 119.4' Span = 79.0' 79.0' < 119.4' **Not Met**
Standard 4 **Substrate Type**	Simulated natural substrate will be used to restore streambed (LUW) **Met**
Standard 5 **Water Depth and Velocity**	The Project will result in water depths and velocities equivalent to existing conditions during 25/50/100-year storm events at the location of the Bridge. **Met – proposed water depths and velocity are comparable to existing conditions upstream and downstream of the bridge. See Appendix D– Hydraulic Analysis and Scour Report.**
Standard 6 **Openness Ratio > 0.82**	$\frac{15.6' \; x \; 79.0'}{37.7'}$ = 32.69 Openness Ratio: 32.69 > 1.64 (Optimal) > 0.82

	Height: 15.6’ > 6’ (Optimal) **Met (Optimal Standard Met)**

6.2 TOWN OF RAYNHAM WETLANDS PROTECTION BYLAW (THE BYLAW)

The Town of Raynham has individual wetland protection regulations, which outline the specific wetland protections applied within its municipal boundaries. While some of these regulations are unique to the Bylaw, it relies on the Act for the majority of the wetland protection regulations. Therefore, references to the Act Performance Standards per 310 CMR 10.00 are included below as appropriate. The Project will fully adhere to Performance Standards for Bank, LUW, and BLSF.

6.2.1 INLAND BANK – GENERAL PERFORMANCE STANDARDS – 310 CMR 10.54(4)

Work impacting Inland Bank will fully meet the Performance Standards at 310 CMR 10.54(4). Permanent impacts to Bank result from scour protection that will not impair the capacity of the Bank to provide wildlife habitat, water carrying capacity, or physical stability of the Bank. Once scour protection is placed, a typical modified rockfill detail will be used (i.e., voids will be filled with loam/compost, seeded with a native seed mix, and covered with erosion control matting if necessary). Final grades will match existing conditions and there will be no change to the geometry of the River. Temporarily impacted banks will be restored to existing grade and stabilized with a native seed mix.

6.2.2 LUW – GENERAL PERFORMANCE STANDARDS – 310 CMR 10.56(4)

The Project will involve the loss of less than 5,000 sf of LUW (4,171 sf) that shall be mitigated in accordance with the Performance Standards listed at 310 CMR 10.56(4)(a)1. through 5. There will be no loss in capacity of LUW to support the interests of the Bylaw.

Dredging will remove 1,052 cy that will be restored in-place through the placement of streambed material over the proposed scour protection, which will protect ground and surface water quality following Project completion. Temporary impacts to LUW will be restored in-place following construction activities through then restoring with native streambed material over the proposed scour protection to reestablish existing wildlife habitat functions. All temporary LUW impacts will be restored upon completion of the Project. Therefore, work impacting LUW will meet the Performance Standards at 310 CMR 10.56(4) because impacted areas will be restored in-place and stream crossing conditions will not change from existing conditions. While areas with proposed scour protection are quantified as permanent impacts, conditions at the surface of the streambed will match existing conditions.

6.2.3 BORDERING LAND SUBJECT TO FLOODING – 310 CMR 10.57(4)

Work impacting BLSF will meet the Performance Standards at 310 CMR 10.57(4) fully, as the proposed permanent impacts will not impair the capacity of the BLSF to provide wildlife habitat or flood storage. No fill is proposed within BLSF, and all disturbed areas will be restored and/or stabilized.

6.2.4 RIVERFRONT AREA – 310 CMR 10.58(4)

The Project proposes temporary and permanent impacts to the RA to the Taunton River; however, the Performance Standards will be met fully. There are no practicable or substantially equivalent alternatives that would result in less adverse effects on the interest of the Act as discussed in the Alternatives Analysis provided in Section 5. All alternatives for the Project result in the same impacts to RA with the exception of the No Build Alternative, which was not selected due to it being inconsistent with the Project purpose.

The bridge carrying Old Colony Avenue over the Taunton River was constructed in 1946. Proposed impacts total less than 5,000 sf, are primarily temporary, and are proposed within an area of maintained roadway. Due to the bridge's proximity to the roadway, a 100'-wide vegetated area does not exist between the structure and the roadway. RA in the vicinity of the Project primarily consists of maintained road, road shoulder, and vegetated areas. Roadway resurfacing was not considered in impact calculations or the assessment of Performance Standards compliance, as this activity will only occur within an existing altered footprint and will not result in new encroachment into RA. Cleared areas of vegetation will be restored following completion of the work to replace any lost wildlife habitat. There are no vernal pools in the vicinity of the Project. Temporarily cleared vegetation adjacent to the roadway will be restored using native seed mix.

The Project qualifies as a Redevelopment Project under the Massachusetts Stormwater Management Standards and will meet Standards 1 and 7 through 10 fully. Erosion and sedimentation controls will be maintained throughout the Project, and work within the Taunton River will be conducted in the dry to prevent migration of sediment into the waterway. Erosion controls will only be removed once full stabilization of the Site is achieved. Therefore, work within Riverfront Area fully complies with the Performance Standards at 310 CMR 10.58(4).

6.2.5 25' No-Activity Buffer Zone

The Bylaw provides a 25' No-Activity Buffer Zone around BVWs for all construction activities. This No-Activity Buffer Zone extends 25' upgradient of the delineated boundaries of the *WF1* and *WF2* Series BVWs. Given that the Project consists of bridge work in proximity to BVWs, work within the 25' No-Activity Buffer Zone is required to complete the Project.

A total of 631 sf of temporary impacts and 329 sf of permanent impacts to the 25' No-Activity Buffer Zone is proposed with the Project. These impacts result from the activities described in Section 3.1. Wildlife habitat function is not anticipated to be impacted by the Project.

7.0 Summary

The proposed Project is anticipated to provide a critical bridge replacement to support motorist, cyclist, and pedestrian safety along Old Colony Avenue and South Street East. Construction of the Project will result in permanent and temporary impacts to jurisdictional Resource Areas which have been minimized to the maximum extent possible and will be mitigated through in-kind restoration. The Project has been designed to meet all local, state, and federal standards and comply with the regulations set forth in the Bylaw as described herein.

The City of Taunton respectfully requests that the Raynham Conservation Commission find these measures adequately protective of the interests of the Bylaw, the Order of Conditions approving the work as described in the Notice of Intent and accompanying plans.

APPENDIX A – Resource Area Boundary Delineation Report

IMPROVING COMMUNITIES TOGETHER

Resource Area Boundary Delineation
Old Colony Avenue Bridge
Taunton and Raynham, Massachusetts

July 01, 2024

On March 31, 2023, BETA Group, Inc. (BETA) Wetland Scientists performed Wetland Resource Area delineations near the bridge over the Taunton River along Old Colony Avenue in Taunton and South Street East in Raynham, Massachusetts (the Site). This report describes Wetland Resource Areas Subject to Protection under the Massachusetts Wetlands Protection Act (M.G.L. Chapter 131 Section 40 - the Act), the City of Taunton Wetlands Protection Ordinance (City of Taunton Code (2010) §§ 16-30 to 16-38 – the Ordinance), the Raynham Wetland Protection Bylaw (the Bylaw), the federal Clean Water Act (33 U.S.C. §1251 et seq (1972)), and the Massachusetts Clean Waters Act (MGL Chapter 21 Section 26-53) that exist on or within 100 feet of the Site as well as the methodologies used to delineate their boundaries.

Site Description

The Site consists of a two-lane bituminous concrete roadway and underlying bridge that spans the Taunton River at the municipal boundary between the City of Taunton and the Town of Raynham (Figure 1 – Site Locus). The bridge is a two-span reinforced concrete deck supported on reinforced concrete abutments and timber piles. The Site is bounded by undeveloped forest and residential housing to the north, multi-family residential and industrial properties to the south, and the Taunton River to the east and west (Figure 2 – Environmental Resources).

According to the USDA Natural Resources Conservation Service – Soil Survey, mapped soils on and within proximity to the Site are generally classified as Urban Land, Birdsall silt loam and Udorthents, smoothed. Field observations generally confirmed the soil types at the Site. The *Custom Soil Resource Report for Bristol County, Massachusetts, Northern Part* is attached.

State jurisdictional Resource Areas identified within 100 feet of the Site include Inland Bank (to perennial and intermittent streams), Bordering Vegetated Wetlands (BVW), Land Under Water (LUW), Bordering Land Subject to Flooding (BLSF), and Riverfront Area (RA). The MassGIS database was used as the initial step in identifying critical areas on or within proximity to the Site. The table below describes selected environmentally critical categories as determined through MassGIS.

Jurisdictional Wetland Resource Areas – Massachusetts Wetlands Protection Act

A Site visit was conducted by BETA Wetland Scientists on March 31, 2023 to identify and delineate the boundaries of Wetland Resource Areas at and in the immediate vicinity to the Site. Resource Area boundaries were identified and delineated in accordance with methods developed by the Massachusetts Department of Environmental Protection's *Delineating Bordering Vegetated Wetlands Under the Massachusetts Wetlands Protection Act: Second Edition*, dated September 2022, as well as definitions set forth in the Wetland Regulations, 310 CMR 10.00. Several areas subject to Protection under the Act exist along the Site and are described below.

Inland Bank (to perennial and intermittent streams) – 310 CMR 10.54

According to 310 CMR 10.54(2), the definition of a Bank is the portion of the land surface which normally abuts and confines a water body, occurring between a water body and a vegetated bordering wetland and adjacent floodplain, or, in the absence of these, it occurs between a water body and an upland. The upper boundary of a Bank is the first observable break in the slope or the mean annual flood level, whichever is lower.

BETA identified the resource Bank to one (1) perennial stream (the Taunton River) and one (1) unnamed intermittent stream within and near the Site. Banks were delineated in the field with blue flagging as described in Table 2.

Table 2: Bank Boundary Description

Flag Series	Location	Description / Notes
B1 Series *Flags* *B1-99 to 95, and B1-100 to 106* *B2 Series* *Flags* *B2-91 to 99, and 100 to 105*	Taunton River, located east, under and west of the Old Colony Ave Bridge	The northern (*B1 Series*) and southern (*B2 Series*) Banks associated with the Taunton River, a perennial stream, that generally flows west were delineated in two (2) segments along the first observable break in slope consistent with the mean annual flood level. The Bank north of the Taunton River was delineated west (*B1-99 to B1-95*) and east (*B1-100 to B1-106*) of the Old Colony Avenue Bridge in Raynham. Banks west of the bridge were generally well defined and consisted of eroded soils. Banks east of the bridge were observed to be undercut and also consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including bush honeysuckle (*Diervilla lonicera*), silky dogwood (*Cornus amomum*) and Norway maple (*Acer platanoides*). Populations of poison ivy (*Toxicodendron radicans*) were also observed. The Bank south of the Taunton River was delineated west (*B2-91 to 99*) and east (*B2-100 to 105*) of the Old Colony Avenue Bridge in Taunton. Banks west of the bridge were generally poorly defined and consisted of rocks and stones of various sizes. Banks east of the bridge were generally well defined and generally consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including slippery elm (*Ulmus rubra*),

Flag Series	Location	Description / Notes
		Norway maple, and silky dogwood. Populations of poison ivy were also observed. The channel width downstream of the Old Colony Avenue bridge is between 95 to 110 feet wide with a mucky, gravel substrate. The channel width upstream is 90 to 100 feet wide with a mixed cobble, gravel, and mucky substrate. Water depths within the Taunton River could not be determined in the field. The Taunton River is mapped as perennial on USGS topographic maps; therefore, it meets the definition of a perennial stream (River) per 310 CMR 10.58(2).
B3/B4 Series *Flags* *B3-96 to 107 and B4-96 to 107*	Northwest of Old Colony Avenue Bridge at 0 South East Street	The interior (*B4 Series*) and exterior (*B3 Series*) Banks associated with a shallow, braided intermittent stream west of South Street East were delineated along the first observable break in slope (consistent with the mean annual flood level). The *B3/B4 Series* stream flows west out of a drainage outfall associated with the closed drainage system under South Street East in Raynham, where flow becomes braided prior to reaching a confluence west of the Site. The *B3/ B4 Series* Banks were primarily vegetated with silky dogwood. The channel is approximately 3 to 5 feet wide and 2 to 6 inches deep with a substrate of sand and muck. This stream is not depicted on current USGS topographic maps or on the StreamStats program; therefore, it is presumed to be intermittent.

Bordering Vegetated Wetlands – 310 CMR 10.55

According to 310 CMR 10.55(2), the definition of BVW are freshwater wetlands which border on creeks, Rivers, streams, ponds and lakes and are areas where the soils are saturated and/or inundated such that they support a predominance of wetland indicator plants. The boundary of BVW is the line within which 50% or more of the vegetation community consists of wetland indicator plants and saturated or inundated conditions exist.

BETA identified two (2) areas of BVW within and adjacent to the Site. US Army Corps of Engineers' *Vegetated Wetland Boundary Delineation Field Data Sheets* documenting BETA's observed evidence of hydrology, soils, and hydrophytic vegetation at specific data plots are attached.

Table 3: BVW Boundary Description

Flag Series	Location	Description / Notes
WF1 Series *Flags* *WF1-108 to 111*	Northwest of Old Colony Avenue Bridge at 0 South East Street	The *WF1 Series* BVW is a scrub shrub wetland bordering on the *B3/B4 Series* intermittent stream. The attached U.S. Army Corps of Engineers Field Data Sheets describe evidence of hydrophytic vegetation, hydric soils, and indicators of hydrology at a specific data plot.

Flag Series	Location	Description / Notes
WF2 Series *Flags* *WF2-100 to 102*	Along the northern Bank of the Taunton River	The *WF2 Series* BVW is a scrub shrub wetland located along the northern bank of the Taunton River, west of the *B1 Series* Bank. Dominant hydrophytic vegetation observed within the area includes silky dogwood. Evidence of hydrology observed in the field includes sediment deposition and stressed vegetation (buttressed roots), and hydric soils indicators including sandy soils with prominent redox concentrations. A formal data plot was not performed at this location.

Land Under Water – 310 CMR 10.56

According to 310 CMR 10.56(2), the definition of LUW is the land beneath any creek, river, stream, pond or lake and may be composed of organic muck or peat, fine sediments, rocks or bedrock. LUW exists between the Bank boundaries below the mean annual low water levels of the streams delineated at the Site (Table 2). The boundary of LUW is the mean annual low water level. This boundary was not delineated in the field.

Bordering Land Subject to Flooding – 310 CMR 10.57

According to the Federal Emergency Management Agency (FEMA) FIRM Number 25005C0169G, dated July 16, 2015, a Zone AE Flood Hazard associated with the Taunton River exists at the Site with Base Flood Elevations (BFE) ranging from 14.4 feet (NAVD88) downstream of the bridge and 14.8 feet (NAVD88) upstream of the bridge. The Site is also located within the Regulatory Floodway of the Taunton River. Any work performed within BLSF (i.e. areas with a 0.1% yearly chance of flooding) is Subject to Jurisdiction under the Act.

Riverfront Area – 310 CMR 10.58

According to 310 CMR 10.58(2), RA is defined as the area of land between a river's MAHW line and a parallel line measured 200' away horizontally. A River is any natural flowing body of water that empties to any ocean, lake, pond, or other River flowing throughout the year and is shown as perennial on the current United States Geological Survey or more recent map provided by the Department, or has a watershed size of at least 0.50 square miles and a predicted flow rate greater than or equal to 0.01 cubic feet per second at the 99% flow duration using the USGS Stream Stats Method.

As noted in Table 2 above, the B1/B2 Series stream qualifies as a perennial stream (River) and is therefore afforded a 200-foot RA. The RA at the Site would be measured 200 feet horizontally from the MAHW flags. Descriptions of the MAHW boundaries associated with the Taunton River are provided below in Table 4.

Table 4: MAHW Boundary Description

Flag Series	Waterbody	Description / Notes
B1 Series *Flags* *B1-99 to 95, and B1-100 to 106* *B2 Series* *Flags* *B2-91 to 99, and 100 to 105*	Taunton River	The northern (*B1 Series*) Banks were delineated at the mean annual flood level (coincident with the mean annual high-water mark – MAHW) approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation and scour. The southern (*B2 Series*) Banks were delineated approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation, scour and the presence of debris.

Jurisdictional Wetland Resource Areas – City of Taunton

The City of Taunton protects resource areas under the City of Taunton Wetlands Protection Ordinance and Conservation Ordinance Regulations. In some instances, these regulations provide additional jurisdiction and protection beyond what is set forth in the Wetlands Regulations at 310 CMR 10.00.

Freshwater Wetland

The Ordinance and Regulations defines a freshwater wetland per the definition presented in the Act, or if it meets two of three total criteria including vegetation within the community consisting of at least 50% wetland plant species, hydric soils are present, or hydrology or field indicators of hydrology are present. BVWs delineated at the Site (Table 3) meet the Ordinance definition of a freshwater wetland.

Vernal Pool

The Ordinance and Regulations consider vernal pools to be *"any confined basin depression that has been certified as such by the Natural Heritage and Endangered Species Program or has been demonstrated by credible proof to contain obligate vernal pool breeding species".* A potential vernal pool (PVP) is mapped interior to the *WF1 Series* BVW approximately 350 feet from the Site; however, it has not been certified, nor was the area reviewed for the presence of vernal pool breeding species.

Wetland Protection Zone (WPZ)

The WPZ as defined in the Ordinance and Regulations is *"an area of no less than 25 feet and no more than 100 feet from the border of BVWs, vernal pools, lakes, ponds and ILSFs larger than a quarter acre-foot in size".* The WPZ is measured from the boundary of Bank and BVW at the Site and allows for limitations and prohibitions on activities that may negatively impact a Resource Area.

Wildlife Corridors

The Ordinance defines Wildlife Corridors as: "*contiguous areas of land within a Wetlands Protection Zone, which provide feeding areas, breeding areas, and normal home range movement for wildlife. An area will be deemed a wildlife corridor upon presentation of credible evidence of the corridors and wildlife value. Wildlife corridors may be both narrow and vulnerable. Wildlife corridors can also contain core vegetative life, which make them sensitive and important for plant diversity*." A narrow strip of contiguous area is located along the southern (B2 Series) Bank to the Taunton River, located within the City of Taunton. This area is primarily developed however it supports vegetation that may provide habitat for wildlife therefore this area may be considered a Wildlife Corridor under the Ordinance.

Jurisdictional Wetland Resource Areas – Town of Raynham

The Town of Raynham protects resource areas under the Town of Raynham Conservation Bylaw. In some instances, these regulations provide additional jurisdiction and protection beyond what is set forth in the Wetlands Regulations at 310 CMR 10.00.

Land Subject to Flooding

The Town of Raynham provides a 100 foot buffer zone to any land subject to flooding or inundation by groundwater or surface water, where a buffer zone to these resource areas is not present under the Act. The area of BLSF associated with the Taunton River has a 100-foot buffer zone under the Bylaw.

25-foot No Activity Buffer

The Bylaw provides a 25-foot "No Activity Buffer" around bordering vegetated wetlands for all construction activities. This No Activity Buffer extends 25-feet upgradient of the delineated boundaries of the WF1 and WF2 Series BVW's.

Jurisdictional Wetland Resource Areas – Federal Clean Water Act (Section 404)

The wetlands and waterways located at the Site are "Waters of the United States," and are therefore subject to the federal Clean Water Act, 33 U.S.C. §1251 et seq (1972). The boundary to "Waters of the United States" is the vegetated wetlands boundary, or, in the absence of vegetated wetlands, is the Ordinary High Water Mark (OHWM) for non-tidal rivers and streams, as specified at 33 CFR §328.4.

According to 33 CFR §328.3(c)(4), vegetated wetlands are defined as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." The wetland boundary previously described in this report was delineated in accordance with this definition. US Army Corps vegetated wetland boundary delineation field data sheets are attached documenting BETA's observations of evidence of hydrology, soils, and hydrophytic vegetation at specific data plots.

Work conducted below the boundary of Vegetated Wetlands or the OHWM is Subject to Jurisdiction under Section 404 of the Clean Water Act. Where present, Vegetated Wetland boundaries (Table 3) are the extent of federal Jurisdiction. Where streams are present and upgradient Vegetated Wetlands are absent, the OHWM coincides with the delineated boundaries of the B1/B2 Series Banks. The OHWM for the unnamed intermittent stream coincides with the delineated boundaries of the B3/B4 Series Banks.

Jurisdictional Wetland Resource Areas – Massachusetts Clean Waters Act (Section 401)

The limit of jurisdiction under the Massachusetts Clean Waters Act (Section 401), as specified in 314 CMR 9.00, is the limit of Section 404 jurisdiction under the federal Clean Water Act. Exceedances of the jurisdictional threshold under 314 CMR 9.00 require filing for a Water Quality Certification under Section 401.

Findings and Recommendations

BETA has identified areas Subject to Protection and/or Jurisdiction under the Massachusetts Wetlands Protection Act, the Taunton Conservation Ordinance, the Town of Raynham Wetland Protection Bylaw, the federal Clean Water Act, and the Massachusetts Clean Waters Act located on or within 100 feet of the Site, and has delineated the boundaries of Bank, BVW, and MAHW that exist along the Site. In order to definitively determine the extent of Conservation Commission jurisdiction, Army Corps jurisdiction, and

MassDEP jurisdiction, the boundary flags would need to be located and depicted on a to-scale plan of the Site.

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/28/2023 at 3:27 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

WETLAND DETERMINATION DATA FORM – Northcentral and Northeast Region

Project/Site: Old Colony Avenue Bridge City/County: Taunton and Raynham Sampling Date: 3/31/23

Applicant/Owner: MassDOT State: MA Sampling Point: WF1-109 UP

Investigator(s): Tyler Drew, Jonathan Niro Section, Township, Range: Bristol County

Landform (hillside, terrace, etc.): Hillside Local relief (concave, convex, none): Convex Slope %: 10

Subregion (LRR or MLRA): LRR R, MLRA 144A Lat: 41.88676 Long: -71.03012 Datum: WGS84

Soil Map Unit Name: Udorthents, smoothed NWI classification: N/A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No ____ (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____	No X	**Is the Sampled Area**
Hydric Soil Present?	Yes ____	No X	**within a Wetland?** **Yes** ____ **No** X
Wetland Hydrology Present?	Yes ____	No X	If yes, optional Wetland Site ID: ____

Remarks: (Explain alternative procedures here or in a separate report.)

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1)
- ___ Sediment Deposits (B2)
- ___ Drift Deposits (B3)
- ___ Algal Mat or Crust (B4)
- ___ Iron Deposits (B5)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Sparsely Vegetated Concave Surface (B8)
- ___ Water-Stained Leaves (B9)
- ___ Aquatic Fauna (B13)
- ___ Marl Deposits (B15)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres on Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ___ Surface Soil Cracks (B6)
- ___ Drainage Patterns (B10)
- ___ Moss Trim Lines (B16)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Stunted or Stressed Plants (D1)
- ___ Geomorphic Position (D2)
- ___ Shallow Aquitard (D3)
- ___ Microtopographic Relief (D4)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present?	Yes ____	No X	Depth (inches): ____
Water Table Present?	Yes ____	No X	Depth (inches): ____
Saturation Present? (includes capillary fringe)	Yes ____	No X	Depth (inches): ____

Wetland Hydrology Present? **Yes** ____ **No** X

United States Department of Agriculture

NRCS

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Bristol County, Massachusetts, Northern Part

January 10, 2024

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 16, Sep 10, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 14, 2022—Jul 1, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

602	Urban land	2.3	41.8%
651	Udorthents, smoothed	1.9	35.0%
Totals for Area of Interest		**5.5**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The

delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Bristol County, Massachusetts, Northern Part

1—Water

Map Unit Setting

National map unit symbol: 997q
Frost-free period: 120 to 200 days
Farmland classification: Not prime farmland

Map Unit Composition

Water: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

9A—Birdsall silt loam, 0 to 3 percent slopes

Map Unit Setting

National map unit symbol: 997p
Elevation: 0 to 150 feet
Mean annual precipitation: 45 to 54 inches
Mean annual air temperature: 43 to 54 degrees F
Frost-free period: 145 to 240 days
Farmland classification: Not prime farmland

Map Unit Composition

Birdsall and similar soils: 80 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Birdsall

Setting

Landform: Depressions
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Concave
Across-slope shape: Concave
Parent material: Soft coarse-silty lacustrine deposits over hard coarse-silty lacustrine deposits

Typical profile

H1 - 0 to 7 inches: silt loam
H2 - 7 to 21 inches: silt loam
H3 - 21 to 60 inches: very fine sandy loam

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Very poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: About 0 inches
Frequency of flooding: None

Frequency of ponding: Frequent
Available water supply, 0 to 60 inches: Very high (about 12.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 5w
Hydrologic Soil Group: C/D
Ecological site: F144AY031MA - Very Wet Outwash
Hydric soil rating: Yes

Minor Components

Raynham

Percent of map unit: 10 percent
Landform: Depressions
Hydric soil rating: Yes

Swansea

Percent of map unit: 10 percent
Landform: Bogs
Hydric soil rating: Yes

602—Urban land

Map Unit Setting

National map unit symbol: 9999
Frost-free period: 120 to 200 days
Farmland classification: Not prime farmland

Map Unit Composition

Urban land: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

651—Udorthents, smoothed

Map Unit Setting

National map unit symbol: v4w7
Elevation: 0 to 3,000 feet
Mean annual precipitation: 45 to 54 inches
Mean annual air temperature: 43 to 54 degrees F
Frost-free period: 145 to 240 days
Farmland classification: Not prime farmland

Map Unit Composition

Udorthents and similar soils: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Udorthents

Setting

Landform position (two-dimensional): Summit
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Excavated and filled land over loose sandy and gravelly glaciofluvial deposits and/or firm loamy basal till

Typical profile

H1 - 0 to 6 inches: variable
H2 - 6 to 60 inches: variable

Properties and qualities

Slope: 0 to 15 percent
Depth to restrictive feature: More than 80 inches
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to very high (0.06 to 20.00 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6s
Hydrologic Soil Group: A
Hydric soil rating: Unranked

Introduction

This Stormwater Management Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards (the Standards) in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00). Appendix A includes a completed Massachusetts Department of Environmental Protection (MassDEP) Checklist for Stormwater Report, stamped by a Massachusetts registered professional engineer.

The Project follows the guidance presented in the MassDOT Stormwater Design Guide (SDG), and stormwater management systems are designed in accordance with the Standards.

2

Project Summary

The Applicant, the City of Taunton, is proposing Project 613642 for the replacement of the Old Colony Avenue Bridge (Bridge #R-02-00=T-01-004) over the Taunton River, including work along adjacent roadways (the Project) located in Raynham, MA and Taunton, MA.

As proposed, the Project generally consists of bridge replacement, roadway paving, and new sidewalk, as more fully described in Section 4. The purpose of this project is to replace a structurally deficient bridge as well as improving safety for vehicles, cyclists, and pedestrians.

The project area is an approximately 0.14-mile-long section of a roadway which is identified as Old Colony Ave within the City of Taunton and South Street East within the Town of Raynham. Old Colony Ave crosses over the Taunton River and the work includes temporary and permanent work within the river's footprint. The project also includes portions of Sandy Hill Road, an intersecting side street, and the Riverbend Condominiums driveway.

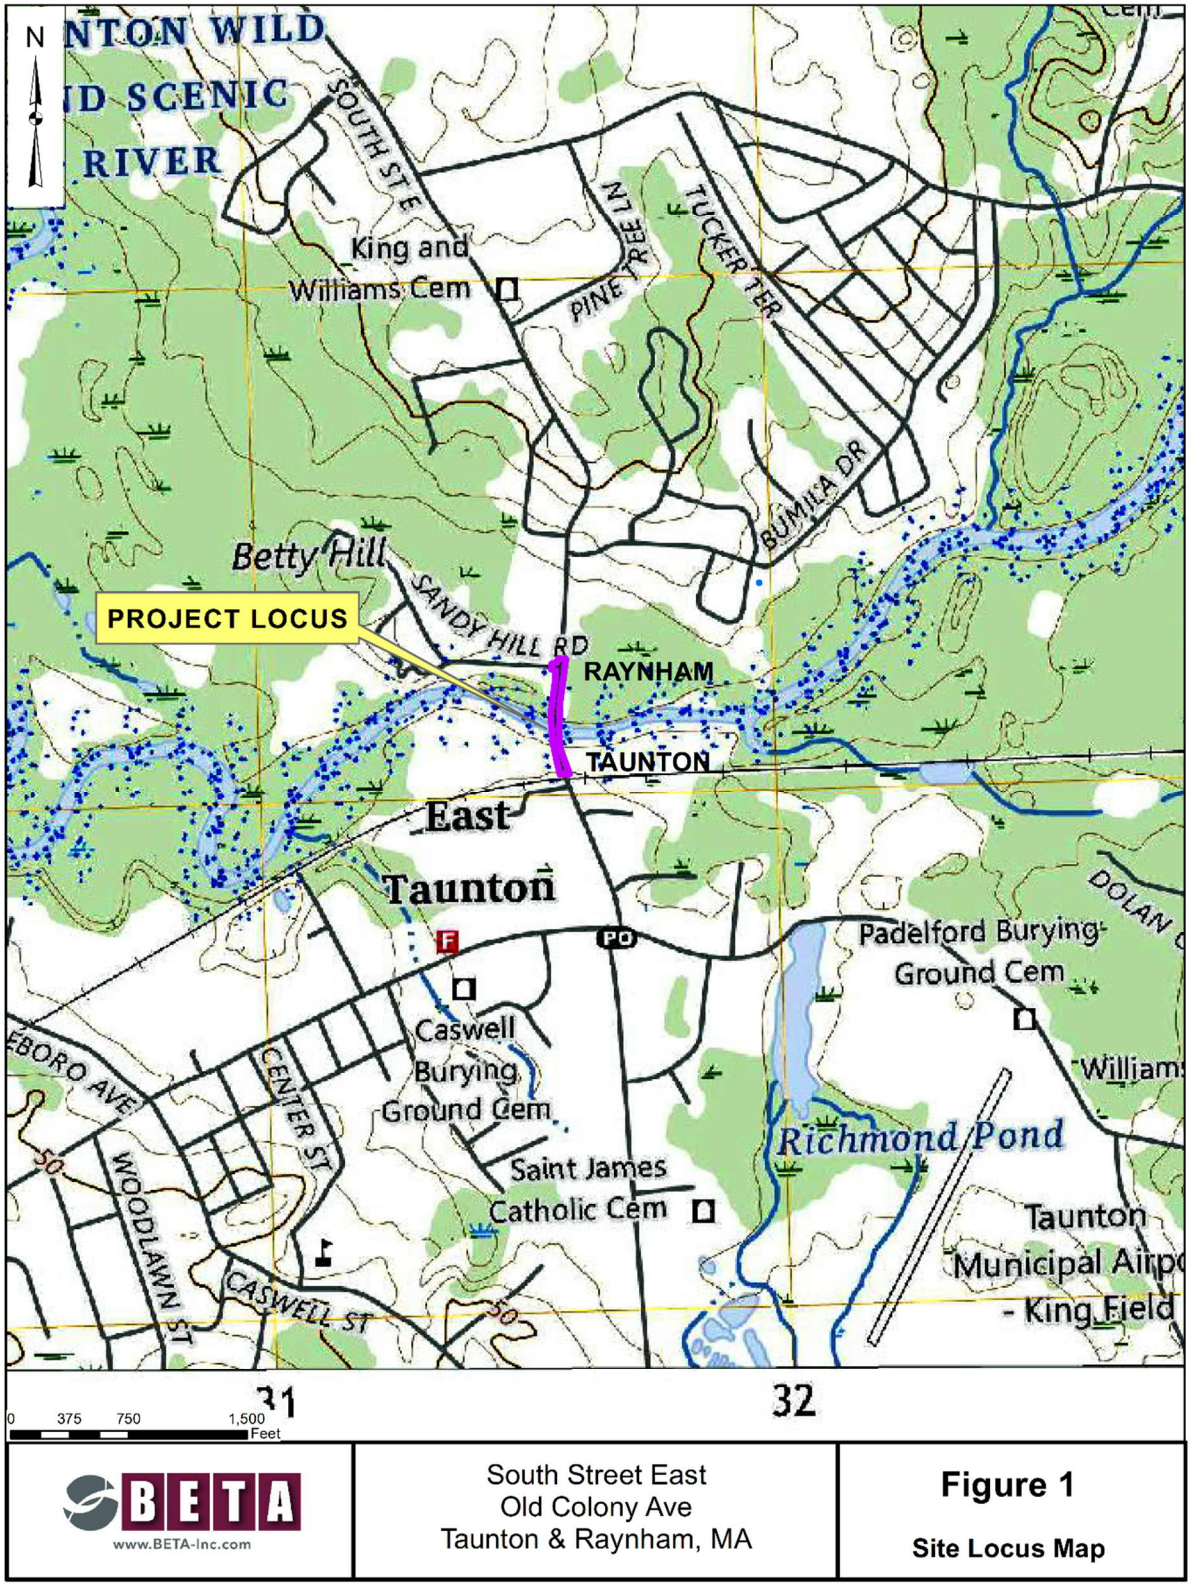
Land use on surrounding lots includes the River Bend Condominiums, several commercial properties, a pump station, a single family residence, and woodlands.

Wetland resource areas are located in proximity to the project area, notably including the Taunton River. Refer to Notice of Intent narrative for a summary of project compliance. The project is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) and the project is not located within or near to a Zone II or Interim Wellhead Protection Area, any other critical areas, or a NHESP-mapped habitat.

This stormwater analysis has been prepared to support a bridge replacement and roadway reconstruction project and associated stormwater management measures, as more fully described in Section 3.0. A total disturbance of approximately 1.05± Acres is anticipated as a result of the proposed work.

See Figure 1 for the Project Locus Map.

Figure 1 Locus Figure



3

Existing Conditions

The project includes Old Colony Ave / South Street East, a two-lane, two-way Urban Collector roadway. A bridge carries Old Colony Avenue over the Taunton River. Within the project area, the width of the roadway generally varies from 27 to 35 feet, with one lane in each direction. A short sidewalk segment is provided on the north side of the road near Riverbend Condominiums and along the south side of the bridge. Otherwise, the roadway is bordered by grass or driveways. Granite curb is provided along the north side of the roadway and along the bridge; otherwise, no edge treatment is provided.

The project corridor generally consists of an impervious roadway and pervious grass/woodland side areas or impervious driveways. Topography is generally directed away from the roadway and towards the Taunton River, and the roadway is crowned throughout the entire project limits.

Resource Areas of Interest

Wetland resource areas are located (within or in proximity to) the project area. Refer to Notice of Intent narrative for a thorough description of these areas and a summary of project compliance. Notably, the project crosses over the Taunton River, which flows east to west. A stream is located in the northwestern portion of the project.

The project is located In the IWP Priority #2: Taunton Watershed. Waterbodies located immediately downgradient of the Site include the Taunton River, a Category 5 water, which is impaired for Dissolved Oxygen, Enterococcus, and E. Coli. The Taunton River eventually discharges to Mt. Hope Bay. Refer to Section 5 for discussion of impairments and TMDLs.

Existing Stormwater Characteristics

Topography in areas adjacent to the roadway is generally directed away from the roadway. Existing closed drainage systems are present along the roadway which convey stormwater runoff to two outfalls, one of which discharges to the Taunton River and one of which discharges to a stream. As no formal edge treatment is provided on the southern side of South Street East, stormwater runoff from this portion of the Site can flow overland into an area of woodlands.

Refer to the watershed plans in Appendix F for detailed delineation of pre-development flow patterns and watershed boundaries. Refer to Appendix D for hydrologic calculations relating to existing conditions.

Table 1 presents the existing drainage areas and their characteristics. See Figure 2 for existing drainages areas and existing SCMs by design point.

Table 1 Existing Drainage Areas

Drainage Area	Design Point	Area (acres)	Curve Number
Ex-1E	DP-1L	0.576	82
Ex-2E	DP-2L	0.395	81
Ex-3E	DP-3L	0.400	74

Key features in and around the project area include the Taunton River and associated riverfront area, a stream, and vegetated wetlands, as shown on Figure 2.

The Project is partially located within the 100-year floodplain as shown on FEMA map panel 25005C0169G eff. 7/16/2015. A FEMA flood map is included in Appendix B. 100-year flood areas included a Zone AE Floodway coincident with the Taunton River (Elev. 15 ft.) and a Zone AE (Elev. 15 ft.). Refer to the Notice of Intent for an evaluation of impact to flood zones.

Review of the NRCS Soil Survey map of the project area identified three major soil groups. South Street East is mapped as Unit 651: Udorthents with Hydrologic Soil Group Rating (HSGR) A and Unit 9A: Birdsall silt loam with HSGR C/D. Old Colony Ave is mapped as 602: Urban Land with no assigned HSGR. Additionally, the footprint of the Taunton River is mapped as Unit 1: Water with no assigned HSGR. NRCS soils information is shown on the plans in Appendix F and included in Appendix B.

4

Proposed Conditions

Scope of Work

The scope of work generally consists of bridge replacement, full depth pavement construction in the vicinity of the bridge, pavement milling and overlay to the north and south of the bridge, modifications to roadway geometry (less than a single lane), construction of a sidewalk, new granite curbing, striping of two travel lanes and a bike lane, new ADA compliant ramps, replacement of guardrail, modifications to water, sewer, gas, electric, and drainage utilities, and restoration of disturbed areas.

Table 2 provides a breakdown of the impervious area for the Project.

Table 2 Impervious Area

Condition	Impervious Area (sq. ft)
Existing	31210
Proposed	31991
Net	781

Proposed Stormwater Management

Stormwater Management will be accomplished through modifications to the existing closed drainage systems. Existing inlets will be replaced, where necessary, with deep-sump catch basins, and additional deep-sump catch basins will be installed to provide more effective stormwater collection and treatment. New curbing is proposed to better direct stormwater runoff to catch basins. The majority of existing trunklines will be retained. The project will retain existing drainage grading patterns to the maximum extent practicable.

The project will retain the existing outfall from the closed drainage system within the Town of Raynham. The project will replace the existing outfall associated with the closed drainage system within the Town of Taunton. The new outfall will be increased in size from 12” to 18” and the existing headwall will be rebuilt at the same location.

The project proposes new stormwater control measures (SCM) including a new infiltration trench. This new practice is proposed within the Town of Raynham near the northeastern limit of work. Stormwater runoff will be directed to this SCM through a new deep sump catch basin which will overflow into the existing closed drainage system.

Additionally, country drainage/pavement disconnection will be implemented for several portions of South Street East by excluding curbing to allow treatment in the grass/woodland area adjacent to the roadway. Of this, approximately 100 ft. of South Street East, on the eastern side of the roadway, drains to an area that meets the definition of qualifying pervious area and is comprised of 1,500 ± sq. ft. of impervious area.

Table 3 presents the proposed drainage areas and their characteristics under proposed conditions. Refer to Appendix F for proposed drainage patterns and drainage area delineations by design point.

Table 3 Proposed Drainage Areas

Drainage Area	Design Point	Area (acres)	Curve Numbers
Pr-10P	DP-1L	0.598	83
Pr-20P/21P	DP-2L	0.410	83
Pr-30P	DP-3L	0.363	71

Project Constraints

The project is constrained by the presence of the Taunton River, presence of wetland resource areas, presence of private commercial and residential features within the Town of Taunton, and conflicts with existing utilities which restrict the opportunity to install substantial Stormwater Control Measures (SCMs). The project is also constrained by minimum required setbacks outlined in the MassDOT Stormwater Design Guide, namely the 10 foot setback to property lines, the 50 foot setback to surface waters, and the 50 foot setback to any slope greater than 15% for infiltration basins. The project area was evaluated for potential locations of SCMs and is summarized on the SCM Analysis Plan located in Appendix G. Despite constraints, the proposed stormwater management systems will provide an improvement to the existing conditions by installing deep sump catch basins and a new infiltration trench. Note the project is considered a redevelopment, as discussed in Section 7.0.

Table 4 lists the proposed SCMs and provides a description of each.

Table 4 Proposed SCMs

SCM	Description
Infiltration Trench	One infiltration trench consisting of a perforated pipe surrounded by crushed stone, located from STA 6+00 RT to STA 6+45 RT. A deep-sump catch basin is provided at STA 5+96 for pretreatment and conveyance to the infiltration trench as well to convey overflow.

LID measures incorporated at the project include the preservation of existing vegetation and maintaining pre-development drainage patterns. The use of country drainage/pavement disconnection is proposed for stormwater runoff from portions of the roadway by directing portions of South Street East to areas of pervious grass/woodlands. The reduction of impervious cover was considered; however, the introduction of new impervious area is required to replace the bridge and extend sidewalks to areas where none currently exist.

5

Impaired Waters and TMDLs

As described under the previous sections, the Project will discharge to the Taunton River, which is impaired based on the MassDEP Year 2023 Integrated List of Waters, also known as the 303(d) list.

Table 5 lists the receiving water bodies that are impaired and if the water body has a TMDL.

Table 5 Impaired Waters and TMDL Information

Water Body	303(d) Category	303(d) Impairments	TMDL	TMDL Pollutant	TMDL Report Name
Taunton River (MA62-01)	5 – Waters Requiring a TMDL	Dissolved Oxygen, Enterococcus, E. Coli	Yes	Pathogens (Fecal coliform, E. Coli, Enterococcus)	Final Pathogen TMDL for the Taunton River Watershed

Note that this segment of the Taunton River is not included in the TMDL. However, the downstream portions of the river are.

As stated in the Final Pathogen TMDL for the Taunton River Watershed, leading sources of bacterial surface water pollution include failing septic systems, combined sewer overflows (CSOs), sanitary sewer overflows (SSOs), sewer pipes connecting to storm drains, certain recreational activities, wildlife, and direct overland stormwater runoff.

The project includes relocation of a portion of the existing sanitary sewer force main. This work will not include any sanitary sewer discharges to the Taunton River. Any sanitary sewer pipes connecting to the storm drain will be eliminated, if identified. See Illicit Discharge Compliance Statement under Standard 10 in Section 6 below. All stormwater runoff discharged from the Site will receive additional treatment via deep sump catch basins, the new infiltration trench, or through country drainage. As a transportation facility, pathogen loads from the roadway surfaces are anticipated to be minimal.

The proposed infiltration trench has been selected for their capability to treat phosphorus, nitrogen, and total suspended solids. A load reduction of 0.03 lb/yr of phosphorus, 0.21 lb/yr of nitrogen, and 29 lb/yr of total suspended solids is anticipated for this SCM, as calculated based on EPA Water Quality Curves in the MassDOT Water Quality Date Form.

See Standard 4 in Section 6 below for more water quality calculations and discussion.

6

Stormwater Management Standards

As demonstrated below, the proposed Project complies with the MassDEP Stormwater Management Standards (the Standards).

The Project is classified as a limited, redevelopment under the first definition “Maintenance and improvement of existing roadways, including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving.” Work related to the maintenance, repair, and improvement of the bridge is considered a Limited Project.

Standard 1: No New Untreated Discharges

No new stormwater conveyances may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

The Project has been designed to comply with Standard 1. The project proposes to replace the existing outfall from the City of Taunton closed drainage system. This work will include replacing the existing 12” MTL and 12” CMP outfalls with a new 18” DI outfall at the same location, replacing the existing headwall, and providing stone for pipe ends as stabilization to prevent erosion to the Taunton River. The project proposes to retain the existing outfall from the Town of Raynham closed drainage system.

Appendix C provides supporting calculations for the outlet protection design.

Stormwater runoff will be treated by deep sump catch basins, the infiltration trench, or country drainage before discharging off-site.

See Standard 4 for the water quality treatment provided by the Project.

Standard 2: Peak Rate Attenuation

Stormwater management systems shall be designed so that post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for discharges to land subject to coastal storm flowage as defined in 310 CMR 10.04.

The Project has been designed to comply with Standard 2 only to the maximum extent practicable as the project is a limited, redevelopment project. This project reduces post-development peak runoff rates to below pre-development peak runoff rates for DP-2 and DP-3, as well as on a site-wide basis, during the 1-year, 2-year, 10-year, and 100-year 24-hour

design storm events based on NOAA Atlas 14 precipitation data. Minor increases in peak runoff rates are anticipated for DP-1.

Table 6 Rainfall Depths (in)

Design Storm Event	Rainfall Depth (in)
2-year	3.42
10-year	5.08
100-year	7.71

Table 7 provides a summary of peak rates for each design point under existing and proposed conditions. Appendix D provides computations and supporting information regarding the hydrologic modeling.

Table 7 Peak Discharge Rates (cfs)

Design Point	Existing			Proposed		
	2-year	10-year	100-year	2-year	10-year	100-year
DP 1	1.14	2.08	3.61	1.23	2.22	3.81
DP 2	0.74	1.39	2.44	0.67	1.28	2.20
DP 3	0.52	1.11	2.14	0.39	0.90	1.81
Total	2.40	4.58	8.19	2.29	4.41	7.82

The project is unable to fully meet this standard due to constraints at the project site as described previously. This project includes a net increase of 781± sq. ft. of impervious surface, which will result in minor increases to the volume and rate of stormwater runoff from the project area. This increase in impervious area is necessary to provide sidewalks where none currently exist. Despite project constraints and an increase in peak flow rates, the proposed deep-sump catch basins and infiltration trench will improve existing conditions throughout the project corridor. Refer to HydroCAD calculations provided in Appendix D for additional information.

Standard 3: Recharge

Loss of annual recharge to groundwater shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The project has been designed to meet this standard on a project-wide basis. The project has significant right-of-way constraints as described previously, which restrict opportunities for recharge on the southern portions of the Site. Despite constraints, the proposed infiltration trench has been designed to provide the sitewide required recharge volume for new and a portion of the existing impervious area.

Table 8 provides the required recharge volume for the Project, and Table 9 provides the recharge volumes proposed for each design point.

Table 8 Required Recharge Volume for Project

	HSG A	HSG B	HSG C	HSG D	Total
Existing Impervious (sq. ft.)	26829		1964	2417	31210
Proposed Impervious (sq. ft.)	27280		2213	2498	31991
Net Impervious Area (sq. ft.)	451		249	81	781
Target depth, F (in)	0.6	0.35	0.25	0.1	-
Required Recharge Volume, ReV (cf)	22.55		5.19	0.68	28.41

Table 9 Provided Recharge Volumes at Each Design Point

	HSG A	HSG B	HSG C	HSG D	Total
DP-1					
Net Impervious Area (sf)	461		5	705	9844
Required Recharge Volume, ReV (cf)	23.05		0.10	5.88	29.03
Provided Recharge Volume (cf)	0		0		0.00
DP-2					
Net Impervious Area (sf)	1583		0	-195	1388
Required Recharge Volume, ReV (cf)	79.15		0.00	-1.63	77.53
Provided Recharge Volume (cf)	81.42		0		81.42
DP-3					
Net Impervious Area (sf)	-1593		244	-429	-1778
Required Recharge Volume, ReV (cf)	-79.65		5.08	-3.58	-78.14
Provided Recharge Volume (cf)	0.00		0		0.00

The infiltration SCM has been designed to drain completely within 72 hours.

Appendix B provides soil evaluation information (including the geotechnical report if applicable), and Appendix C provides computations, drawdown calculations, and supporting information regarding recharge.

Standard 4: Water Quality Treatment

Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This Standard is met when:

- Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained.
- Structural stormwater best management practices are sized to capture the required water quality volume determined in accordance with the Massachusetts Stormwater Handbook.

› Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.

The Project has been designed to comply with Standard 4 on a project wide basis. Proposed drainage system improvements, including the installation of deep sump catch basins and an infiltration trench will provide treatment of stormwater runoff that does not currently exist and will improve existing conditions. The proposed project will provide an average TSS removal rate of 20% for 31,991± sq. ft. of impervious surfaces.

Note that the project is located in an area with a rapid infiltration rate (>2.4 in/hr) and the required water quality volume has been calculated based on the 1.0-inch water quality depth.

Table 10 shows the WQV to be treated for both new and existing impervious area within each drainage area, organized by design point.

Table 10 WQV at Each Design Point

Design Point	WQV for New IA (cf)	WQV for Existing IA (cf)	Total WQV (cf)
DP-1			
10P	97.58	722.75	820.33
Total	97.58	722.75	820.33
DP-2			
20P	44.75	1028.50	1073.25
21P	70.92	0.00	70.92
Total	115.67	1028.50	1144.17
DP-3			
30P	-148.17	849.58	701.42
Total	-148.17	849.58	701.42
Project Total	65.08	2600.83	2665.92

Table 11 shows the WQV provided by the SCMs at each design point.

Table 11 WQV Provided by the SCMs at Each Design Point

Design Point	Pretreatment (y/n)	WQV Provided (cf)	Meets Total WQV	Meets Required WQV for New IA
DP-1		0	No	No
DP-2			No	Yes
Linear Infiltration Practice	Y	81.42		
Total	Y	81.42		
DP-3		0	No	No
Project Total			No	Yes

As previously noted, the project is a limited, redevelopment project; therefore, the project is required to meet this standard only to the maximum extent practicable. Opportunities to install treatment and recharge SCMs are limited due to the constraints described previously. Despite project constraints, the proposed deep sump catch basins will improve existing

conditions throughout the project corridor and groundwater recharge will be provided via the new infiltration trench. Refer to Appendix C for calculations relating to TSS Removal. Refer to Illicit Discharge Compliance Statement under Standard 10.

Appendix E includes the Long Term Pollution Prevention Plan for this project.

Standard 5: Land Uses with Higher Potential Pollutant Loads

For Land Uses with Higher Potential Pollutant Loads (LUHPPLs), source control and pollution prevention shall be implemented in accordance with the Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If through source control and/or pollution prevention all LHPPLs cannot be completely protected from exposure to rain, snow, snow melt, and stormwater runoff, the proponent shall use the specific structural stormwater BMPs determined by the Department to be suitable for such uses as provided in the Massachusetts Stormwater Handbook. Stormwater discharges from LUHPPLs shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26-53 and the regulations promulgated thereunder at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.

Standard 5 does not apply to the Project. There are no Land Uses with Higher Potential Pollutant Loads within the project area.

Standard 6: Critical Areas

Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of the specific source control and pollution prevention measures and the specific structural stormwater best management practices determined by the Department to be suitable for managing discharges to such areas as provided in the Massachusetts Stormwater Handbook. A discharge is near a critical area if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters and Special Resource Waters shall be removed and set back from the receiving water or wetland and receive the highest and best practical method of treatment. A “stormwater discharge” as defined in 314 CMR 3.04(2)(a)1 or (b), to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00. Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of a public water supply.

Standard 6 does not apply to the Project. There are no Critical Areas near the project area.

Standard 7: Redevelopment

A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

The Project is a limited, redevelopment project under the first definition: “Maintenance and improvement of existing roadways, including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving.” Proposed deep sump catch basins and infiltration trench will provide treatment to the maximum extent practicable and represent an improvement to the existing conditions. Standards 1, 8, 9, and 10 are met, Standards 3 and 4 are met on a project wide basis, and Standard 2 is met to the maximum extent practicable. Standards 5 and 6 are not applicable to this project.

Standard 8: Erosion and Sediment Control

A plan to control construction related impacts, including erosion, sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan) shall be developed and implemented.

The implementation of erosion and sediment (E&S) controls during construction is considered a standard practice for all projects. E&S controls will be installed before any land disturbance begins for the Project and will remain in place for the duration of the Project. The E&S controls for the Project are shown on the project plans and include perimeter sediment control barrier, inlet protection, tree protection, temporary cofferdam for water control, and dewatering.

The Project disturbs one or more acres of land; therefore, the project contractor will request coverage under the NPDES Construction General Permit (CGP) and develop a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP follows the requirements of this standard and complies with the NPDES CGP.

Standard 9: Operation and Maintenance Plan

A long-term operation and maintenance plan shall be developed and implemented to ensure that stormwater management systems function as designed.

The roadway and bridge included in this project are located in both the City of Taunton and the Toad of Raynham. Ownership is divided between the Town of Taunton and the Town of Raynham. The activities included in the O&M Plan will be implemented by the municipality. Appendix E includes the O&M Plan for this project.

Standard 10: Prohibition of Illicit Discharges

All illicit discharges to the stormwater management system are prohibited.

Illicit Discharge Statement

The project’s stormwater management system, as shown on the plans submitted with this report, have been designed in full compliance with Standard 10. The project area does not have any known illicit connections. Any illicit connections to the stormwater management system found in the project limit of work during construction will be removed and/or resolved through the City of Taunton’s or Town of Raynham’s Illicit Discharge Detention and Elimination (IDDE) Programs. The Long-Term Pollution Prevention Plan, provided in Appendix E, includes measures to prevent illicit discharges.

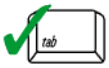
Appendix A: MassDEP Checklist for Stormwater Report

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

- ☐ New development
- ☒ Redevelopment
- ☐ Mix of New Development and Redevelopment

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- ☐ No disturbance to any Wetland Resource Areas
- ☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- ☐ Reduced Impervious Area (Redevelopment Only)
- ☒ Minimizing disturbance to existing trees and shrubs
- ☐ LID Site Design Credit Requested:
  - ☐ Credit 1
  - ☐ Credit 2
  - ☐ Credit 3
- ☒ Use of “country drainage” versus curb and gutter conveyance and pipe
- ☐ Bioretention Cells (includes Rain Gardens)
- ☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- ☐ Treebox Filter
- ☐ Water Quality Swale
- ☐ Grass Channel
- ☐ Green Roof
- ☐ Other (describe): _____

Standard 1: No New Untreated Discharges

- ☒ No new untreated discharges
- ☒ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- ☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☐ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☐ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☒ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☒ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☒ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☒ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☐ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☒ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☒ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☒ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☐ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☒ Name of the stormwater management system owners;
- ☒ Party responsible for operation and maintenance;
- ☒ Schedule for implementation of routine and non-routine maintenance tasks;
- ☒ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☒ Description and delineation of public safety features;
- ☒ Estimated operation and maintenance budget; and
- ☒ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☒ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 17, Aug 27, 2024

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 14, 2022—Jul 1, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
1	Water		0.7	9.0%
9A	Birdsall silt loam, 0 to 3 percent slopes	C/D	0.9	11.6%
256A	Deerfield loamy fine sand, 0 to 3 percent slopes	A	0.1	1.4%
602	Urban land		3.3	42.2%
651	Udorthents, smoothed	A	2.8	35.8%
Totals for Area of Interest			**7.9**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/26/2025 at 11:50 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

60-day	13.0 (11.4-14.8)	14.1 (12.3-16.0)	15.8 (13.8-18.0)	17.2 (14.9-19.6)	19.2 (16.0-22.2)	20.7 (16.9-24.3)	22.2 (17.4-26.3)	23.4 (17.9-28.7)	24.8 (18.2-31.1)	25.6 (18.4-32.6)

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Appendix E: O&M Plan and LTPPP

1

Stormwater Management System Operation and Maintenance (O&M) Plan

This Stormwater Management System Operation and Maintenance (O&M) Plan describes the approach for inspection and maintenance of drainage infrastructure and structural stormwater control measures (SCMs) to minimize contaminant loading for South Street East / Old Colony Ave in the Town of Raynham and City of Taunton, MA. In general, inspection and maintenance activities will be conducted consistent with the National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer System (MS4).

This document has been prepared per the requirements of Massachusetts Department of Environmental Protection (MassDEP) Regulations 310 CMR 10.05 (6)(k)(9) and satisfies the requirements of Massachusetts Stormwater Standard 9.

1.1 Responsible Party

The Town of Raynham and City of Taunton will be responsible for the operation and maintenance of all stormwater management systems under their respective ownership within the project limits. Questions or concerns regarding activities associated with this O&M Plan should be addressed to the Raynham Highway Department located at 1555 King Phillip Street, Raynham, MA 02767, phone (508) 824-2718 and/or the Taunton Public Works Department located at 90 Ingell Street, Taunton, MA 02780, phone (508) 821-1431.

It shall be the responsibility of the Owner to provide a revised plan to the Conservation Commission indicating any change of ownership or responsible party. The responsible party shall also be responsible for financing maintenance and emergency repairs at the Site.

Project information is summarized in the following table:

Project Name:	South Street East / Old Colony Avenue
Project Type:	Transportation
Address:	Old Colony Ave, Taunton, MA, from approximately 75 feet north of Battle Row to the Taunton/Raynham Town Line South Street East , Raynham, MA, from the Taunton/Raynham Town Line to the north side of Sandy Hill Road.
SWMS Owner (Taunton):	Taunton Department of Public Works 90 Ingell Street, Taunton, MA
SWMS Owner (Raynham):	Raynham Highway Department 1555 King Phillip Street, Raynham, MA 02767
Responsible Party (Taunton):	Taunton Department of Public Works 90 Ingell Street, Taunton, MA
Responsible Party (Raynham):	Raynham Highway Department 1555 King Phillip Street, Raynham, MA 02767
Contact (Taunton):	Fred Cornaglia, Commissioner of Public Works (508) 821-1431
Contact (Raynham):	Norman Sturtevent, Superintendent (508) 824-2718

1.2 Inspection and Maintenance Measures and Record-Keeping

See Appendix F of the Stormwater Management Report for the proposed stormwater system within the project limits. The stormwater management system covered by this O&M Plan consists of the following measures:

- Deep Sump Catch Basins
- Infiltration Trench

The Town of Raynham and City of Taunton shall use a performance-based inspection and maintenance program for SCMs and catch basins. For SCMs, the overall approach is to inspect SCMs, and based on the results of the inspections, perform maintenance to preserve functionality. For catch basins, the overall approach is to perform maintenance at an interval that maintains the functionality of the catch basin (e.g., sump is less than 50% full of sediment). Catch basin inspections, including documentation of sediment accumulation, and maintenance will generally occur simultaneously.

The following table summarizes inspection requirements for each asset type.

Inspection Form	Applicable Stormwater Assets	Inspection Requirements
Inlets	› Catch basins	› Sediment accumulation › Trash/Debris accumulation › Signs of contamination › Frame and grate condition › Overall structure condition
SCMs	› Infiltration SCMs › Other SCMs	› SCM accessibility › Presence of standing water › Level of erosion › Sediment accumulation › Trash/Debris accumulation › Vegetation condition › Overall SCM condition
Storm Discharge Points	› Outlets to SCMs	› Presence of flow › Signs of contaminated flow › Sediment accumulation › Level of erosion › Pipe condition › Scour protection condition › Overall structure condition

Inspection and maintenance records can be made available by contacting the Town of Raynham Highway Department or the City of Taunton Department of Public Works. Representatives of each Town's Conservation Commission, MassDEP, and US EPA may obtain access to these records, upon request.

Maintenance actions will not occur at any set frequency, but rather will be based on condition and impact to functionality. Maintenance to be performed on the stormwater system includes:

Stormwater Feature	Potential Maintenance Actions	
Surface SCMs	• Remove and properly dispose of accumulated material (e.g., sediment, trash, leaf litter, debris) • Mow vegetated areas and remove and dispose of grass clippings • Regrade areas that show signs of unwanted ponding and channelization • Stabilize or reconstruct eroded areas and reseed • Replace stones/soil and/or replant vegetation	• Remove woody growth • Treat invasive plants • Address issues of standing water • Drain and reconstruct SCM • If rehabilitation is not possible, then retrofit to be a wet SCM while considering safety implications
Underground SCMs	• Remove and properly dispose of trash, sediment, debris, and root intrusions • Clean out sumps at an interval to maintain functionality (less than 50% full of sediment) • Jet and repair pipes	• Rehabilitate filtering and infiltration materials (e.g., geotextile fabric, crushed stone) • Stabilize and replace deteriorated structures • Perform evaluations (e.g., test pits) to evaluate subsurface conditions
Inlets and Outlets to SCMs	• Clear inlet and remove and properly dispose of sediment, trash, leaf litter, debris, and vegetation • Regrade areas that show signs of ponding and channelization • Repair or replace structural components • Repair damaged or eroded areas	• Provide or rehabilitate erosion control at the outlet • Regrade and replace the channel materials • Remove woody growth • Stabilize or reconstruct eroded areas • Treat invasive plants.

Based on the results of the inspection, repairs will be made in accordance with Town/City standard practices. Maintenance will be prioritized given the urgency of the required maintenance and availability of staff, contracts, etc. Maintenance may require contracting if existing maintenance personel are unavailable to perform the work. More intensive remedial activities may require permitting and/or an engineering solution.

Inspection, maintenance, and record keeping on will be performed in conjunction with the Town of Raynham / Taunton MS4 compliance requirements.

1.3 Erosion and Sediment Control Measures during Maintenance Activities

For maintenance activities that could result in discharges of sediments or other contaminants into wetlands, waterways, or other resource areas regulated under 310 CMR 10.00, the responsible maintenance personnel will employ measures to prevent migration of these sediments/contaminants. Such temporary measures may include, but are not necessarily limited to, the use of siltation barriers, catch basin silt sacks/filter bags, pipe plugs, cofferdams deployed within the stormwater structure, turbidity curtains, or other practices designed to prevent such discharges.

Where maintenance occurs in areas that are confined, with no risk of discharge to adjacent water bodies, no special measures may be needed. Examples include, but are not limited to: (1) cleaning of a forebay under dry conditions when the work can be completed and exposed surfaces stabilized prior to placing it back into service; and (2) catch basin cleaning where the activity is limited to removing material from a sump below the elevation of the outlet pipe.

1.4 O&M Budget

The Town of Raynham and City of Taunton perform maintenance for stormwater management systems as part of their routine operation and maintenance budget for roadways and bridges.

2

Long-Term Pollution Prevention Plan

This Long-Term Pollution Prevention Plan (LTPPP) describes the approach for pollution prevention and related maintenance activities for South Street East / Old Colony Ave in the Town of Raynham and City of Taunton, MA. In general, long-term pollution prevention and related maintenance activities will be conducted consistent with:

- The National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer System (MS4),
- Measures outlined in the Town of Raynham's and City of Taunton's Stormwater Management Plans (SWMP).

This LTPPP satisfies the requirements related to pollution prevention under Massachusetts Stormwater Standards 4, 5, 6, and 10.

2.1 Practices for Long-Term Pollution Prevention

For the facilities covered, long-term pollution prevention includes the following measures.

2.1.1 Litter Pick-up

The municipalities will conduct litter pick-up from the stormwater management facilities in conjunction with routine road maintenance activities.

2.1.2 Material Storage and Handling

The following storage and handling practices shall be implemented at the Site:

- Avoid stockpiling of soil or materials within 100 feet of wetland resources and wellhead protection areas. If necessary, provide sufficient erosion controls to prevent migration of sediments.
- All materials shall be stored or disposed in accordance with all local, state, and federal regulations.
- All sand piles shall be contained and stabilized to prevent the discharge of sand to wetlands or water bodies and, where feasible, covered.
- Minimize hazardous materials stored on site. All materials stored on site shall be stored in original containers and sealed.
- All solid waste, if encountered, shall be handled and disposed of in accordance with all local, state, and federal regulations.
- No snow shall be stored within waterbodies, resource areas, wellhead protection areas, or associated buffer zones.

2.1.3 Inspection and Maintenance of Stormwater Assets

The municipalities will conduct inspection and maintenance of drainage infrastructure and the stormwater control measures (SCMs) in accordance with the O&M Plan, as described in Section 1.

2.1.4 Maintenance of Landscaped Areas

Routine mowing will be conducted according to standard Town practices. SCM basin bottoms and embankments designed to impound water should be mowed as required to prevent establishment of woody vegetation.

2.1.5 Snow and Ice Management

Snow and Ice Management will be conducted consistent with Town/City Snow and Ice Policy and Procedures.

2.1.6 Street Sweeping

Operations on Town-owned roadways with be conducted in accordance with Town Standard Operating Procedures.

2.1.7 Prohibition of Illicit Discharges

The MassDEP Stormwater Management Standard 10 prohibits illicit discharges to the stormwater management system. Illicit discharges are discharges that do not consist entirely of stormwater, except for certain specified non-stormwater discharges.

In accordance with the existing MS4 permit, examples of discharges from the following sources are not considered illicit discharges:

- Firefighting activities*
- Foundation drains
- Water line flushing
- Footing drains
- Landscape irrigation
- Individual residential car washing
- Uncontaminated groundwater
- Rising groundwater
- Diverted stream flows
- Flows from riparian habitats/wetlands
- Potable water sources
- Dechlorinated swimming pool water
- Street wash waters
- Wash water from residential buildings (no detergents)
- Condensation from air conditioning units
- Run-on from private driveways caused by precipitation
- Lawn watering
- Water from crawl space pumps

*Water from firefighting activities is allowed and need only be addressed where they are identified as significant sources of pollutants to waters of the United States.

Based on plan review and existing survey, there are no known or proposed illicit connections associated with the project. Should an interconnection to the stormwater management system be identified, the Town/City will determine if the connections are authorized. For unauthorized

connections, the Town/City will investigate the connections and if they are determined to be illicit, the connections will be managed through Town's/City's Illicit Discharge Detection and Elimination (IDDE) program.

2.1.8 Spill Prevention and Response

The following spill prevention and response measures shall be implemented at the Site:

- Refuel construction equipment off-site.
- Any spills of hazardous materials shall be reported, contained, and removed in accordance with local, State, and Federal regulations.
- Review on-site equipment and activities to ensure no illicit discharges are created.

3

Construction Period Pollution Prevention and Erosion and Sediment Control Plan

3.1.1 Introduction

The project is anticipated to disturb greater than one acre; therefore, filing a Notice of Intent with EPA and developing of a Stormwater Pollution Prevention Plan (SWPPP) is required. The SWPPP will be provided as part of the construction documents and will be submitted to the Town of Raynham and the City of Taunton Conservation Commission prior to commencement of construction. The following plan provides general guidance for the prevention of pollution and erosion and sedimentation during construction.

Potential Erosion and Sedimentation

Portions of the project involve soil disturbance in areas upgradient of stormwater collection systems and wetland resources. Site preparation, scheduling, and construction practices need to be carefully planned to prevent construction debris and erosion caused by stormwater runoff over exposed soils from causing degradation of downstream wetland resources. Although it is not always possible to avoid impacts from storm events, the following guidelines shall be followed:

- Minimize land disturbance area and soil exposure to stormwater and wind erosion.
- Minimize time that area is disturbed.
- Avoid routing stormwater runoff or dewatering flows through disturbed areas.
- Inspect and maintain erosion controls until all soils are stabilized.
- Maintain good housekeeping practices.
- Stabilize disturbed soils as soon as possible to limit exposure.

Erosion and Sedimentation Plan

This Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan has been prepared in accordance with the Department of Environmental Protection's Massachusetts Erosion and Sedimentation Guidelines for Urban and Suburban Areas.

Extent of Disturbance

The total area of disturbance is approximately 1.05± acres. The project has been designed to minimize disturbance to existing woodlands and the majority of proposed work is within an existing roadway and its associated right-of-way. The existing Site will be impacted by tree clearing/trimming, grading, roadway widening, sidewalk and shared use path construction, utility installation, and other associated activities. Off-site areas are not proposed to be

directly altered but may be impacted by erosion and sedimentation if the controls described in this plan are not followed. No off-site land disturbance is proposed.

Refer to construction drawings for locations of all proposed erosion and sedimentation controls and the proposed area of disturbance.

Pre-Construction and Site Preparation

- Install all erosion control barrier in accordance with the construction documents prior to commencing any land disturbance activity.
- Inspect and maintain erosion controls until all soils are stabilized.
- Monitor weather reports daily and stabilize/prepare site if storm event in excess of the 2-year storm is expected.
- Maintain an inspection logbook on-site at all times. The specific location of the logbook shall be conveyed to the Town.

3.1.2 Planned Erosion and Sedimentation Control Practices

Catch Basin Inlet Protection

Inlet protection is proposed at all existing and proposed drain inlets within the project area. Inlet protection shall also be provided at off-site drain inlets located immediately downgradient of the area of disturbance, pending coordination with the Town and/or abutting property owners.

The purpose of inlet protection is to intercept and capture sediment that would otherwise enter the drainage system. Inlet protection shall consist of manufactured polyproplylene fabric consistent with the construction details.

Inspection and maintenance shall consist of checking for sediment accumulation and removing sediment when the protection device is at least one-half full.

Sediment Control Barrier

Sediment control barrier is proposed along the downgradient limit of work, as depicted on the construction plans. Additional erosion control barrier may be required at other locations as needed.

The purpose of erosion control barrier is to intercept and capture sediment that would otherwise migrate off-site. Erosion control barrier shall consist of compost filter tubes, straw wattles, and silt fence.

Inspection and maintenance:

- Check for sedimentation accumulation and removing sediments when they reach excessive volumes (approximately 1/3 the height of the barrier).
- Remove sediments when runoff ponds for 24 or more hours to prevent potential mosquito breeding habitat. Restake/replace controls as necessary to maintain their effectiveness.

Control of Water

Control of water is proposed along the Taunton River upstream and downstream of the proposed bridge rehabilitation.

The purpose of control of water is redirect flows around the work area to prevent sedimentation transport downstream. The means and methods of the controls shall be the responsibility of contractor and will be based on their construction operations and the conditions at the site. Methods are anticipated to include temporary cofferdams and dewatering.

Inspection and maintenance, as applicable:

- Check for sediment accumulation, plant growth, or debris behind the control.
- Check for stability at anchoring points and identify any breaks in the control.
- Identify any areas where turbid water is passing through the control.
- Repair as necessary to maintain effectiveness.

Tree Protection

Tree protection is proposed at existing trees to remain near to the area of disturbance, as noted on the construction plans.

The purpose of tree protection is to minimize risk of damage to trees designated to remain. Tree protection shall consist of armoring, pruning, and/or fencing consistent with the construction details.

Temporary Seeding

Temporary seeding is proposed for disturbed areas which have remained exposed for more than 14 days.

The purpose of temporary seeding is to provide vegetative stabilization of loose soil to mitigate risk of erosion.

Inspection and maintenance:

- Confirm that vegetation has been established
- Provide additional seeding as needed

3.1.3 Additional Control Measures

Good Housekeeping

- Minimize hazardous materials stored on site. All materials stored on site shall be stored in original containers and sealed.
- Refuel construction equipment off-site.
- Any spills of hazardous materials shall be reported, contained, and removed in accordance with local, State, and Federal regulations.

Material Stockpiling

All construction materials shall be stored in designated stockpile areas. Stockpiles shall be surrounded with silt fence, straw wattles, and/or compost filter tubes to mitigate erosion potential. All waste materials shall be removed from the Site or placed in approved receptacles at the conclusion of each workday. Disposal of waste materials shall be in accordance with relevant local, state, and federal regulations.

Protection of Infiltration Areas

To protect the infiltrative capacity of proposed infiltration areas, SCMs shall be excavated as late as practicable in the construction sequence.

Potential Construction Site Pollutants

Pollutant-Generating Activity	Pollutants or Pollutant Constituents	Location on Site
Equipment Re-fueling	Diesel Fuel, Gasoline	Laydown Area
Leaking or Broken Hydraulic Lines	Hydraulic Oil	Building Work Areas and Laydown Area
Minor Equipment Maintenance	Diesel Fuel, Gasoline, Hydraulic Oil, Motor Oil, Anti-Freeze	Laydown Area
Applying Fertilizer	Nitrogen, Phosphorous	Newly Seeded Areas
Portable Sanitary Toilets	Bacteria, Parasites and Viruses	Laydown Area
Vehicle Accident	Diesel Fuel, Gasoline	Entire Site
Trash Containers/Dumpsters	Paper, Plastic, and Food Waste	Laydown Area

Refer to Long-Term Pollution Prevention Plan, included as Section 2, for measures to be implemented to minimize pollutant discharges.

APPENDIX E – Emergency Certification Request

IMPROVING COMMUNITIES TOGETHER

July 31, 2025

City of Taunton
Taunton Conservation Commission
141 Oak Street
Taunton, MA 02780

Attn: Steven Turner, Chair

Re: Request for Emergency Certification for South St E / Taunton River Bridge Closure and Repairs
Raynham: South St E / Taunton River
Bridge No: R-02-003 = T-01-004
BIN No: 3M4
Structure No: R02003-3M4-MUN-NBI

Dear Mr. Steven Turner:

This letter serves to notify the Taunton Conservation Commission of proposed emergency repairs to the Old Colony Avenue Bridge (identified as South Street in Raynham) necessitated by unsafe structural conditions that pose immediate risk to public safety and access.

The Massachusetts Department of Transportation (MassDOT) – Highway Division has undertaken the inventory, inspection, and rating of locally owned bridges to assist the City of Taunton in complying with State and Federal Legislation. In accordance with the provisions of **M.G.L.C. 85, sub-section 35**, the MassDOT – Highway Division determined the maximum load which the subject bridge may safely carry. The structure was recently rated and it is recommended that the bridge be closed to vehicular traffic due to the poor condition of the ends of beams 1, 2, 5, and 7 at the South Abutment, and beam 2 at the North Abutment.

Pursuant to **310 CMR 10.06(1) and (2)** of the Massachusetts Wetlands Protection Act, this work qualifies as an emergency exempt from prior permitting requirements for the protection of the safety of the citizens of the Commonwealth. The poor condition of the bridge requires prompt action to prevent collapse, injury, and loss of access.

Proposed emergency work includes:

- Concrete repairs along beams 1, 2, 5, and 7 at the South Abutment;
- Concrete repairs along beam 2 at the North Abutment; and
- Temporary scaffolding / staging that will be partially located within Land Under Water (LUW) but will not require permanent alterations.

Work on the bridge will need to be performed in and around the Taunton River, within NFHL 100 Year Flood Zone AE (i.e., Bordering Land Subject to Flooding), and within the 100-foot Buffer Zone to two (2) Bordering Vegetated Wetlands. All reasonable measures will be taken to minimize impacts to resource areas. Emergency repair work shall not exceed thirty (30) days. Only work necessary to abate the emergency will be performed on the subject bridge. Following the completion of emergency repairs, documentation will be submitted as required, and coordination with the Commission will continue to ensure full compliance.

BRIDGE CLOSURE

Raynham: SOUTH ST E / TAUNTON RIVER
Bridge No: R-02-003 = T-01-004
BIN No: 3M4
Structure No: R02003-3M4-MUN-NBI

Dear Select Board:

The Massachusetts Department of Transportation (MassDOT) - Highway Division has undertaken the inventory, inspection, and rating of locally owned bridges to assist the cities and towns in complying with State and Federal Legislation. In accordance with the provisions of **M.G.L.C 85, sub-section 35**, the MassDOT - Highway Division has determined the maximum load which the subject bridge may safely carry.

The above structure was recently rated, and it is recommended that the bridge be **CLOSED** to vehicular traffic.

The reason for this recommendation is due to the poor condition of the ends of beams 1, 2, 5 and 7 at the South Abutment, and beam 2 at the North Abutment.

Your immediate action is requested. Please coordinate with the District Bridge Engineer, Shane Sousa, at (781)853-7065 on your action taken so the Bridge Inspection Unit can document the closure.

A copy of the Rating Report regarding this recommendation is on file at our District office. Mary-Joe Perry, the District Highway Director, will be pleased to review the report with you and advise you of any programs available regarding this bridge.

Thank you for your cooperation.

Sincerely,

Alexander K. Bardow, P.E.
State Bridge Engineer

1.0 EXISTING CONDITIONS

1.1 STUDY AREA

The project is located at the bridge carrying South Street East / Old Colony Ave over the Taunton River in Raynham Taunton. The project limits are from the intersection with Sandy Hill Road approximately 380 feet north of the bridge to the railroad grade crossing approximately 200 feet south of the bridge.

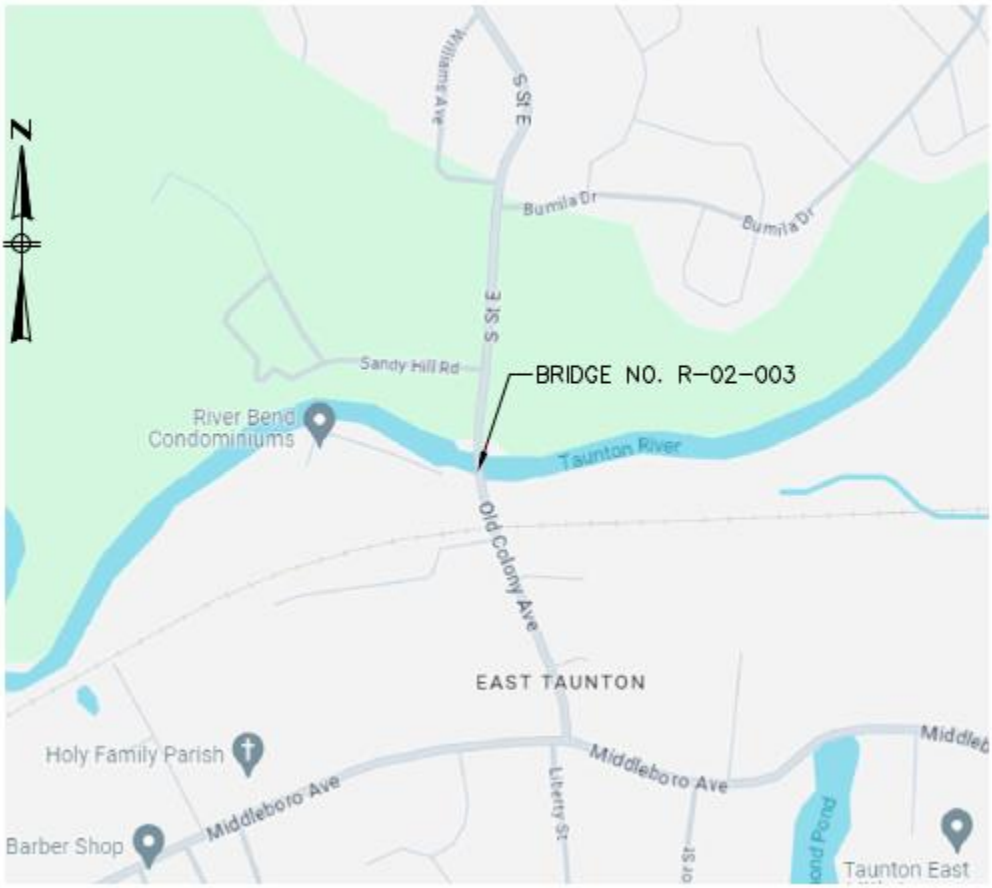

Figure 1 Location Map

1.2 BRIDGE

The existing structure is an approximately 89'-6" two span bridge with equal spans of approximately 44'-9", constructed in 1945. The structure consists of eight (8) 27 WF steel beams spaced at 4'-6 ½" on center supporting a 7" concrete deck and 2-1/4" of bituminous paving. The bridge is supported by unreinforced concrete gravity abutments and wingwalls and a reinforced concrete pier. The south abutment is founded on spread footings and the north abutment and pier are founded on timber piles. The bridge is 35'-0" wide, which includes a 26'-0" roadway, a 2'-6" safety walk and 5'-0" sidewalk with metal railing. The bridge has a skew angle of 23.6° and was designed for H20 loading.

1.3 ROADWAY

Old Colony Ave is a 0.3-mile-long (0.5 km) road in Taunton, Massachusetts, that runs north-south adjacent to the Taunton River. The roadway is under the jurisdiction of the City of Taunton. Old Colony Ave is classified as an Urban Collector.

Old Colony Ave within the study area consists of approximately (2) 13.5-foot-wide travel lanes with no shoulders on the approach to the bridge and over the bridge (2) 11.5-foot-wide travel lanes with 1 to 2-ft shoulders. Directional flow along the roadway is separated by a double yellow line and there are no bicycle accommodations within the project area. The legal speed regulation along the roadway in the study area is 30 miles per hour (mph).

South Street East is a 1.5-mile-long (2.4 km) road in Raynham, Massachusetts, that runs north-south adjacent to the Taunton River. The roadway is under the jurisdiction of the Town of Raynham. South Street East is classified as an Urban Collector.

South Street East within the study area consists of approximately (2) 11- to 11.5-foot-wide travel lanes with 1.5- to 2-ft shoulders. Guardrail exists on the southbound side of the roadway leading up to the bridge. Directional flow along the roadway is separated by a double yellow line and there are no bicycle accommodations within the project area. The legal speed regulation along the roadway in the study area is 30 miles per hour (mph).

1.4 SAFETY ANALYSIS

Crash data for the major intersections included within the detour limits was obtained for the five most recent years available, January 2019 through December 2023, from the MassDOT IMPACT Crash Portal. Refer to Section 3.0 of this report for further discussion of the four intersections used for the detour.

A review of the MassDOT crash data revealed that there were 49 crashes that occurred at the intersection of New State Hwy (Route 44) and Orchard St, 33 crashes at the intersection of New State Hwy (Route 44) and Church St, 31 crashes at the intersection of Middleboro Ave and Old Colony Ave/Liberty St and 6 crashes at the intersection of Middleboro Ave and Precinct St/South Precinct St. No fatalities were reported within the analysis limits. Most crashes within the intersections (95 out of 119) were either angle crashes or rear-end crashes. Furthermore, most crashes within the study area occurred during clear/dry weather. **Table 1** provides a summary of the roadway crash history.

Table 1: Roadway Crash Summary

	ROADWAY	New State Hwy (Route 44)@ Orchard St	New State Hwy (Route 44)@ Church St	Middleboro Ave @ Old Colony Ave/Liberty St	Middleboro Ave @ Precinct St/South Precinct St	TOTAL
Number of Crashes	Total	49	33	31	6	119
	Average Per Year	*9.8*	*6.6*	*6.2*	*1.2*	*23.8*
Severity	Fatal Injury	0	0	0	0	0

2.0 ENVIRONMENTAL

2.1 ENVIRONMENTAL PERMITTING ASSESSMENT

The following Table is a list of applicable permits and reviews for the Project:

Table 2 Regulatory Permits and Reviews

Permit or Review	Yes	No	Notes:
Bridge Exempt	✓		The Project is considered "bridge exempt" and therefore does not require permitting under the Massachusetts Wetlands Protection Act, the Massachusetts Public Waterfront Act, or the Massachusetts Environmental Policy Act.
Wetlands Protection Act (WPA)		✓	
Chapter 91		✓	
Environmental Justice Community		✓	None mapped within 1 mile of the Site.
Massachusetts Environmental Policy Act (MEPA)		✓	

National Environmental Policy Act (NEPA)	✓		Categorical Exclusion (CE) required.
Section 401 Water Quality Certification (WQC)		✓	Should any wetland or waterway impacts be necessary based on Project scope revisions, a 401 WQC will be required if the "bridge exemption" is claimed for Massachusetts Wetlands Protection Act permitting. Otherwise, the Order of Conditions would serve as the 401 WQC.
Section 404 Army Corps General Permit		✓	
U.S. Coast Guard Bridge Permit		✓	
Coastal Zone Management (CZM) Federal Consistency Review		✓	
Essential Fish Habitat		✓	
Section 7 Endangered Species Act	✓		Consultation required.
Natural Heritage and Endangered Species Program (NHESP) Estimated or Priority Habitat		✓	
Section 106	✓		Project Notification Form required.
Adjacent Parkland or Wildlife Refuges for Section 4(f)	✓		Land to the north of the site is publicly owned and may be considered subject to Section 4(f); however, it does not appear to be protected open space based on cursory online research.
Wild and Scenic River	✓		Coordination with the National Parks Service will be required during design.
Adjacent Section 6(f) Properties		✓	
Article 97		✓	
Other		✓	

The differences in proposed work under the Alternatives presented in this report are related to striping and lane width; under either Alternative, the bridge superstructure will be replaced. Therefore, it is not anticipated that the selection of an Alternative will result in changes to the permitting requirements for the Project. The Project will not result in direct Resource Area impacts (e.g., fill and/or alteration). As summarized in Table 1 above, the following environmental permits/reviews are anticipated to be required under either Alternative:

Categorical Exclusion (MassDOT / FHWA)

The Project will be funded by a federal Community Project Funding Grant routed through the Federal Highway Administration (FHWA); therefore, documentation of compliance with the National Environmental Policy Act (NEPA) will be required. It is anticipated that the Project will require the

submission of a Categorical Exclusion (CE) pursuant to the FHWA's list of CE-eligible activities and that no Environmental Assessment or Environmental Impact Study will be required.

Section 7 – Endangered Species Act (USFWS)

As part of Project's environmental review process, coordination with the U.S. Fish and Wildlife Service (USFWS) under Section 7 of the federal Endangered Species Act will be undertaken. At a minimum, it is anticipated that the Project will require securing a "Not Likely to Adversely Affect" determination due to the Project Area being within the range of the Northern long-eared bat (*Myotis septentrionalis*), the Plymouth redbelly turtle (*Pseudemys rubriventris bangsi*), and the Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*).

Project Notification Form (State Historic Preservation Officer / Bureau of Underwater Archaeological Resources / Relevant Tribes)

Due to the use of federal funding, the Project will require the submission of a Project Notification Form (PNF) to the State Historic Preservation Officer (SHPO), Bureau of Underwater Archaeological Resources (BUAR), and all relevant Tribes to demonstrate compliance with Section 106 of the National Historic Preservation Act.

The Project will be constructed within/adjacent to the Old Colony Iron Works – Nemasket Mill Complex National Register Historic District (TAU.AA). Based on mapping reviewed via the Massachusetts Cultural Resources Information System (MACRIS), only roadway approach work within Taunton will be located within this Historic District. Both MACRIS mapping and the Massachusetts Historical Commission Inventory Form do not indicate that the bridge itself is a historic or cultural resource. Nearby historic and cultural resources associated with this Historic District include TAU.630 and TAU.628.

2.2 HAZMAT

The selection of a specific alternative will not affect the hazardous materials due diligence required for the Project.

2.2.1 HISTORIC AND CURRENT LAND USE

Historic and current land uses near the Project Area consist of residential and industrial properties to the south (within Taunton) and undeveloped woodlands and residential properties to the north (within Raynham).

2.2.2 ADJACENT RELEASE SITES AND CONTAMINATION SOURCES

According to the Massachusetts Underground Storage Tank (UST) Facility Search there is one (1) UST facilities within 0.25-miles of the Project Corridor, the Amaros Market Inc. (Facility ID #3854) located at 508 Middleboro Ave in Taunton.

According to MassDEP's Searchable Sites Database, the following releases have been reported within the vicinity of the Project Area:

RTN 4-0000160 – 103 Old Colony Avenue, Taunton

In July of 1992, a Phase I Environmental Site Assessment (ESA) was completed at the former Bacon Felt Facility located at 103 Old Colony Avenue in Taunton due to soil and groundwater contamination associated with a former leaching tank. Contaminants noted in the Phase 1 ESA included elevated levels of toluene and Volatile Organic Compounds (VOCs). Due to the limited vertical and horizontal spread of the contaminants per monitoring well data and surface water sampling, the property was assigned a Tier II classification.

Given the scope of the Project, there is currently no anticipated excavation of soils; therefore, management of contaminated media is unlikely.

2.2.3 Known or suspected Contamination Sites

A search for known oil and hazardous material releases in proximity of Project limits was conducted using online resources as noted above. No superfund sites are present within the Project Area.

2.2.4 Active Use Limitations (AUL)

There are no AUL Deed Restrictions within or adjacent to the Project limits that may be impacted by construction.

2.2.5 Excavation Work

The Project does not propose excavation into soils; only full-depth pavement construction will be conducted.

2.2.6 Excess Soil Generation

The Project does not propose activity that will generate excess soil.

2.2.7 Rail trail Projects

The Project is not a rail trail project.

2.2.8 Dewatering Contaminated groundwater

The Project does not propose any dewatering of polluted groundwater.

2.2.9 Hazardous Building Materials

Due to the age of the bridge, there is the potential for asbestos within concrete, joint caulking materials, gunite patches on the concrete, or the asphalt road surface. There is also potential for the presence of Polychlorinated biphenyls (PCBs) in paint and/or joint caulking materials. Lead paint may also be present on bridge surfaces.

3.0 Temporary Traffic Management

3.1 Detour Route

The construction staging alternative under consideration for the bridge and roadway construction involves a full bridge closure with traffic detours. Based on traffic counts conducted in May of 2024, the Old Colony Ave Bridge experiences a heavy vehicle percentage of approximately 0.8% in the northbound direction and 0.7% in the southbound direction.

The proposed detour would be via New State Highway (US Route 44), Church Street/Precinct Street and Middleboro Ave. Vehicles typically utilizing the Pleasant Street Bridge northbound approach would follow the detour route on Middleboro Ave and turn left onto Precinct Street, continue onto Church Street and turn left onto New State Highway. Vehicles destined in the southbound direction over the bridge would use the same route in the opposite direction. The two intersections on Middleboro Ave are stop controlled. The two study intersections on New State Highway (US Route 44) are signalized.

3.2 OPERATIONS ANALYSIS

Traffic Operations Analysis

Capacity analyses were conducted to assess the quality of traffic flow at four study intersections. This analysis was performed for existing Year 2024 volume conditions and Year 2024 detour volume conditions during the weekday AM and PM peak hours.

Capacity analysis was performed using Trafficware's Synchro software package (Version 12.0). The Synchro software analysis utilizes methodologies contained in the *Highway Capacity Manual, 7th Edition (HCM7)* published by the Transportation Research Board.

Six levels of service (LOS), "A"-"F", have been established with "A" representing very good operation and "F" representing very poor operation. For signalized and unsignalized intersections, level of service is defined in terms of total delay and is computed for individual intersection turning movements. Delay is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The relationship between LOS and delay for signalized intersections are summarized in Error! Reference source not found.**3**. The relationship between LOS and delay for unsignalized intersections are summarized in Error! Reference source not found.4. In addition to delay and level of service, the analysis examined the volume to capacity ratio (v/c) and 95th percentile queues for each lane group. Capacity analysis worksheets are provided in **Appendix C.**

Table 3: Signalized Intersection Level of Service Criteria

LOS	**Signalized Intersection Criteria Average Total Delay** (Seconds per Vehicle)	**General Description**
A	< 10.0	Free Flow
B	10.1 to 20.0	Stable flow (slight delays)
C	20.1 to 35.0	Stable flow (acceptable delays)
D	35.1 to 55.0	Approaching unstable flow (tolerable delay)
E	55.1 to 80.0	Unstable flow (intolerable delay)
F	> 80.0	Forced flow (jammed)

Table 4: Unsignalized Intersection Level of Service Criteria

LOS	Unsignalized Intersection Criteria Average Total Delay (Seconds per Vehicle)	General Description
A	< 10.0	Free Flow
B	10.1 to 15.0	Stable flow (slight delays)
C	15.1 to 25.0	Stable flow (acceptable delays)
D	25.1 to 35.0	Approaching unstable flow (tolerable delay)
E	35.1 to 50.0	Unstable flow (intolerable delay)
F	> 50.0	Forced flow (jammed)

Traffic Capacity Analysis Results

Intersection capacity and Level of Service (LOS) analysis was conducted for the Existing and Detour conditions for the AM and PM weekday commuting peak hours. Summaries of this analysis are provided in **Tables 5 and 6**.

a. Delay measured in seconds per vehicle
b. v/c represents Volume to Capacity Ratio
c. 95th Percentile Queue measured in vehicles

Route 44 at Orchard Street

At the Route 44 signalized intersection with Orchard Street, the traffic operations with the proposed detour in place is projected to operate at a slightly improved level of service over existing conditions for the overall intersection. A few of the individual lane movements are projected to experience a slight increase in delay, but all will operate at LOS E or better.

Route 44 at Church Street

At the Route 44 signalized intersection with Church Street, the traffic operations with the proposed detour in place is projected to operate at a worse level of service over existing conditions for the overall intersection due to the additional traffic volume that will need to be processed by the traffic signal. The overall intersection and the EB, WB, and NB approaches are projected to operate at LOS F, have a volume to capacity ratio over 1.0 and have longer queues when compared with existing conditions. A potential mitigation measure is for a traffic control officer to be present to monitor peak time periods. An additional mitigation strategy is to adjust the traffic signal timing while the detour is in place.

Middleboro Ave at Old Colony Ave/Liberty Street

At the Middleboro Ave unsignalized intersection with Old Colony Ave/Liberty Street, the traffic operations with the proposed detour in place is projected to operate at significantly improved level of service over existing conditions for the overall intersection due to the full closure of the Old Colony Ave bridge over the Taunton River just north of this intersection. A few of the individual lane movements are projected to experience a slight increase in delay, but all will operate at LOS C or better.

Middleboro Ave at Precinct Street/S Precinct Street

At the Middleboro Ave unsignalized intersection with Precinct Street/ S Precinct Street, the traffic operations with the proposed detour in place is projected to operate at a worse level of service over existing conditions due to the additional traffic volume that will need to be processed through the intersection. The NB and SB stop-controlled approaches are projected to operate at LOS F, have a volume to capacity ratio well over 1.0 and have longer queues when compared with existing conditions. A potential mitigation measure is for a traffic control officer be present during peak time periods to mitigate the anticipated side street delay.

4.0 Utilities

Underground utilities within the project area include water, sewer, and gas. Gas and sewer are carried on the bridge superstructure and will be relocated from the east sidewalk to the west sidewalk so that service can be maintained during construction. An additional utility bay will be added to the bridge for a future water main.

Overhead utility poles will be permanently relocated from the west side of the roadway to the east side for bridge construction and for sidewalk clearance within project limits.

5.0 Right of Way

The existing Right of Way is municipal owned and varies in width starting from approximately 38’ at the beginning of the project and widening to up to 58’ over the bridge on the Taunton Side. On the Raynham side the Right of Way also varies in width. The Right of Way goes from 73’ by the sewer pump station. to 45’ wide by Sandy Hill Street.

Both alternatives presented below will have the same Right of Way impacts. A permanent easement will be required for proposed pedestrian curb ramp at #96 Old Colony Avenue. Permanent utility easements will be required for overhead wires that are being relocated from the west to the east side of the roadway. Temporary easements will be required for slope work, driveway work, sediment control barriers, and construction access.

6.0 Alternatives

6.1 General

There are two alternatives under consideration. Both alternatives were chosen based on the constraint that the existing bridge substructure be retained and only the superstructure be replaced. This restricts the cross-section of the roadway to approximately 26 ft curb to curb with a 6 ft sidewalk on one side of

the roadway. Both alternatives are proposing relocating the sidewalk from the east side to the west side of the roadway so that the sidewalk connects to the existing sidewalk at the condominium on the south side of the bridge. The sidewalk will be extended to Sandy Hill Street in Raynham.

The difference in the two alternatives are the lane and shoulder widths. Alternative 1 offers a narrower lane width with larger shoulder on the bridge curb side. Alternative 2 offers a more typical lane width with narrow shoulders on both sides of the roadway. Both alternatives will require design justifications for pedestrian and bicycle accommodation.

6.2 ALTERNATIVE 1

Alternative 1 features a cross-section with two 10-foot-wide travel lanes in each direction, accompanied by one 2-foot-wide shoulder on the sidewalk side and one 4-foot-wide shoulder on the safety curb side. Sidewalk is proposed on the west side of the roadway. The sidewalk is 6 feet wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5 feet wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative 1 will require a design justification for pedestrian accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, a 4-foot shoulder was provided on the east side, which is the minimum width for bicycle accomodation. A 2-foot shoulder was provided on the west side against the sidewalk for drainage, errant vehicles, and encroachment and off-tracking of wide vehicles. Sharrows can be added in the northbound lane.

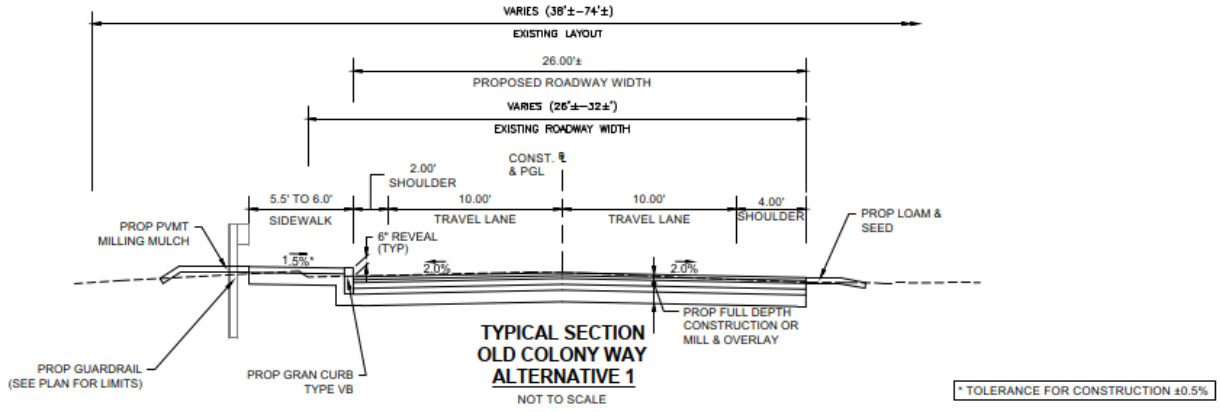

Figure 2 Typical Section Alternative 1

6.3 ALTERNATIVE 2

Alternative 2 features a cross-section with two 11-foot-wide travel lanes in each direction, accompanied by two 2-foot-wide shoulders. Vertical granite curbing lines both sides of the roadway. Sidewalk proposed on the west side of the roadway. The sidewalk is 6 feet wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5 feet wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative 2 will require a design justification for pedestrian

accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, 2- foot shoulders were provided on both sides of the roadway. Sharrows can be added to both travel lanes.

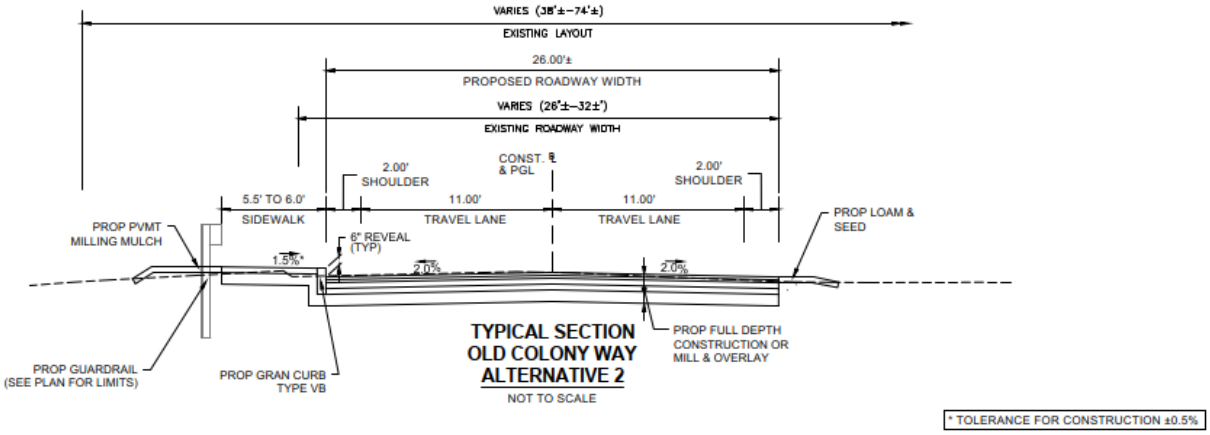

Figure 3 Typical Section Alternative 2

7.0 Opinion of Cost

The cost in both alternatives is the same because the cross-sectional width of the roadway, bridge, sidewalk and project limits are not different. The total estimated construction cost is $6,510,000.

8.0 Conclusion

Both alternatives require design justification for pedestrian and bicycle accommodation. Both have the same cost and impacts to utilities and properties. The only difference between the two are lane and shoulder configuration. Alternative 1 allows for bicycle accommodation southbound with a 4’ shoulder, while still maintaining the minimum lane width for a collector of 10-foot. Old Colony Avenue and South Street East is a bus route on the Greater Attleboro Taunton Regional Transit Authority. Bus lanes are permitted on 10’ travel lanes. The narrower 10’ roadway will help reduce speeds. Alternative 2 is like existing conditions where the lane widths are close to 11-feet and the shoulders are close 2-feet. Sharrows can be added to both lanes to signify that vehicles will be sharing the roadway with bicyclists.

Project code: 2026-0024808
Project Name: 613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER

Subject: Not Likely to Adversely Affect Concurrence verification letter for the '613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER' project under the December 13, 2024, FHWA, FRA, FTA Programmatic Biological Opinion for Transportation Projects within the Range of the Indiana Bat, Northern Long-eared Bat, and Tricolored Bat.

To whom it may concern:

This letter records the determination of effects to federally listed (or proposed) bat species anticipated to result from the 613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER (the Project). This determination is based upon information you entered into the assisted determination key (Dkey) associated with the above referenced Programmatic Biological Opinion/Conference Opinion (PBO/PCO) in the U.S. Fish and Wildlife Service's (Service) Information for Planning and Consultation (IPaC) system on the date listed above to verify that the Project may rely on the concurrence provided in the PBO/PCO to satisfy requirements under section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (16 USC 1536), as amended.

Ensuring Accurate Determinations When Using IPaC:

The Service developed the IPaC system and this Dkey in accordance with the ESA and based on the PBO/PCO. All information submitted by the project proponent into IPaC must accurately represent the full scope and details of the Project.

Failure to accurately represent or implement the Project as detailed in the Dkey invalidates this letter. Answers to certain questions in the Dkey commit the project proponent to implementation of conservation measures that must be followed for the ESA determinations to remain valid. Carefully review this letter, your ESA requirements are <u>NOT</u> yet complete.

Determinations:

Based on the information you provided (Project Description shown below), you have determined that the Project is within the scope and adheres to the criteria of the PBO/PCO, including the adoption of applicable avoidance and minimization measures. Based on your IPaC submission and the PBO/PCO, the Project is consistent with the following effect determinations:

Species	Listing Status	Determination
Northern Long-eared Bat (*Myotis septentrionalis*)	Endangered	NLAA
Tricolored Bat (*Perimyotis subflavus*)	Proposed Endangered	NLAA

The tricolored bat is proposed for listing as endangered under the ESA, but not yet listed. For actions that may affect a proposed species, agencies cannot consult, but they can confer under the authority of section 7(a)(4) of the ESA. Such conferences can follow the procedures for a consultation and be adopted as such if the proposed species is listed. Should the tricolored bat be listed, agencies must review projects that are not yet complete, or projects with ongoing effects within the tricolored bat range that previously received a no effect or not likely to adversely affect (NLAA) determination from the key to confirm that the determination is still accurate.

The Service has 14 calendar days to notify the lead Federal action agency or designated non-federal representative if we determine that the Project does not meet the criteria for a NLAA determination under the PBO/PCO. **If the Service does <u>not</u> notify the lead Federal action agency or designated non-federal representative within that timeframe, you may proceed with the Project under the terms of the NLAA concurrence provided in the PBO/PCO**. This verification period allows Service Field Offices to apply local knowledge to implementation of the PBO, as we may identify a small subset of actions having impacts that were unanticipated. In such instances, Service Field Offices may request additional information that is necessary to verify inclusion of the proposed action under the PBO/PCO.

If the Project is modified, or new information reveals that it may affect the Indiana bat, northern long-eared bat, or tricolored bat in a manner or to an extent not considered in the PBO/PCO, further review to conclude the requirements of ESA section 7(a)(2) may be required.

For Proposed Actions that include bridge/culvert or structure removal, replacement, and/or maintenance activities:

If your initial bridge, culvert, or structure assessment failed to detect Indiana bat, northern long-eared bat, or tricolored bat use or occupancy, yet bats are later detected prior to, or during construction, promptly notify the local Service Field Office within 2 working days of the discovery. In addition, please document whether incidental take occurred, and if so, the type (i.e. kill or harm) and amount (i.e. number of individuals) and submit documentation to the local Service Field Office within 5 working days from the completion of the bridge, culvert, or structure construction (use Appendix E - Post Assessment Discovery of Bats at Bridge/Culvert or Structure Form in the User's Guide). In these instances, potential incidental take of Indiana bats, northern long-eared bats, or tricolored bats may be exempted provided that the take is reported to

the Service. In these instances, potential incidental take of Indiana bats, northern long-eared bats, or tricolored bats may be exempted provided that the take is reported to the Service.

If the Project may affect any other federally listed or proposed species and/or designated critical habitat, additional consultation between the lead Federal action agency and this Service Field Office is required for those species/designated critical habitat. If the Project has the potential to take bald or golden eagles, additional coordination with the Service under the Bald and Golden Eagle Protection Act may also be required. In either of these circumstances, please advise the lead Federal action agency to contact this Service Field Office

The following species may occur in your project area and **are not** covered by this determination:

- Monarch Butterfly *Danaus plexippus* Proposed Threatened
- Plymouth Redbelly Turtle = Plymouth Redbelly Cooter *Pseudemys rubriventris bangsi* Endangered

PROJECT DESCRIPTION

The following project name and description was collected in IPaC as part of the endangered species review process.

NAME

613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER

DESCRIPTION

RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003=T-01-004 (3M4), SOUTH STREET EAST OVER THE TAUNTON RIVER

The proposed project consists of replacing the bridge deck, increasing safety, and improving operations of the roadway. The proposed design relocates the existing bridge sidewalk from the east to the west side of the bridge to connect to an existing sidewalk on the southwest approach. A 5-foot shoulder for a bike lane in the northbound direction improves safety by providing dedicated space for cyclists, separating them from vehicular traffic. This separation reduces the risk of conflicts between cyclists and vehicles.

Monarch Butterfly: Proposed Threatened Species only. The project action will not jeopardize the continued existence of the proposed species.

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@41.88630155,-71.03005054127355,14z

DETERMINATION KEY RESULT

Based on your answers provided, this project(s) may affect, but is not likely to adversely affect the Indiana bat, northern long-eared bat or tricolored bat, therefore, consultation with the U.S. Fish and Wildlife Service pursuant to Section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended 16 U.S.C. 1531 et seq.) is required. However, also based on your answers provided, this project may rely on the concurrence provided in the Programmatic Biological Opinion/Conference Opinion for Transportation Projects in the Range of the Indiana bat, northern long-eared bat, and tricolored bat, dated December 13, 2024.

QUALIFICATION INTERVIEW

1. Which Federal Agency is the lead federal agency the action?

   A) Federal Highway Administration (FHWA)

2. Does the Action Area intersect the species list area of the Northern long-eared bat?

   Automatically answered
   Yes

3. Does the Action Area intersect the species list area of the tricolored Bat (TCB)?

   Automatically answered
   Yes

4. [Semantic] Is any portion of the action area within a 0.5 mile radius of an entrance/opening to any known NLEB or TCB hibernacula?

   Note: The map queried for this question contains proprietary information and cannot be displayed. If you need additional information, please contact the Field Office listed in the letterhead of this letter.

   Automatically answered
   No

5. Does your project's activities include raising the road profile above the tree canopy in documented habitat for the Indiana bat, NLEB, or TCB?

   Note: For the definition of documented habitat, refer to Appendix A: https://www.fws.gov/media/users-guide-range-wide-programmatic-consultation-indiana-bat-and-northern-long-eared-bat

   No

6. Is your project located within a karst area?

   No

7. Will the project include bridge, culvert, or structure removal, replacement, and/or alteration activities?

   Note: For definitions of bridge, culvert, and structure, refer to Appendix A: https://www.fws.gov/media/users-guide-range-wide-programmatic-consultation-indiana-bat-and-northern-long-eared-bat.

   Yes

8. Do your project's activities involve tree removal/trimming, temporary lighting, new/ additional permanent lighting, ground disturbance, percussives that involves noise/ vibration above existing background levels, vibrations, or slash pile burning?

   Yes

9. Is there suitable summer habitat for the Indiana bat, NLEB, or TCB within the project action area?

   Note: See the Service's summer survey guidance for current definitions of suitable habitat [https://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html].

   Yes

10. Have P/A surveys for the Indiana bat, NLEB, or TCB been conducted within the suitable summer habitat located within your project action area? This refers to mist-netting or acoustic surveys, not bridge assessments.

    Note: See the Service's survey guidance https://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html

    Yes

    SUBMITTED DOCUMENTS

    - *Raynham_613642_memo_20251027.pdf https://ipac.ecosphere.fws.gov/project/A3767GZ2FBHULEJFUCBVE3PERE/projectDocuments/173932326*

11. Did the P/A surveys detect Indiana bats, NLEBs, or TCBs?

    Note: If Indiana bats, NLEBs, or TCBs are detected, the action area is considered **documented habitat.**

    No

12. Did the local Service Field Office verify that this P/A survey can be used to determine Indiana bat, NLEB, and TCB are **not likely to be present** within the suitable summer habitat located within your project area?

    Yes

13. Will the project include **bridge** removal, replacement, and/or alteration activities?

    Yes

14. Has a Bridge Bat Assessment been conducted **within the last 24 months** to determine if the bridge is being used by the Indiana bat, NLEB, or TCB? If yes, upload assessment.

    Note: Refer to the Service's current survey guidance for acceptable assessment practices and validity timeframe of bridge/culvert and structure bat assessments: https://www.fws.gov/library/collections/range-wide-indiana-bat-and-northern-long-eared-bat-survey-guidelines.

    Yes

    SUBMITTED DOCUMENTS

    - *Raynham_613642_memo_20251027.pdf https://ipac.ecosphere.fws.gov/project/A3767GZ2FBHULEJFUCBVE3PERE/projectDocuments/173932326*

15. Please select one of the following results of the Bridge Bat Assessment:

    c) *Indicates the* ***absence*** *of Indiana bats, NLEBs, or TCBs roosting in/under the bridge (no bats, guano, etc.)?*

16. Does the project include **culvert** removal, replacement, and/or alteration activities?

    No

17. Does the project include **structure** removal, replacement, and/or alteration activities?

    No

18. Does the Action Area intersect the species list area of the tricolored Bat (TCB)?

    Automatically answered
    Yes

19. Does the Action Area intersect the species list area of the northern long-eared bat (NLEB)?

    Automatically answered
    Yes

PROJECT QUESTIONNAIRE

1. Have you made a No Effect determinations for all other species included on the FWS IPaC generated species list?

   Yes

2. Have you made a May Affect determination for any other species on the FWS IPaC generated list?

   No

3. Please enter the date of the bridge assessment.

   6/2/2025

AVOIDANCE AND MINIMIZATION MEASURES (AMMS)

This determination key result includes the commitment to implement the following Avoidance and Minimization Measures (AMMs):

GAMM1

Ensure all operators, employees, and contractors working in areas of Indiana bat, NLEB, or TCB suitable habitat are aware of all Transportation Agency environmental commitments, including all applicable AMMs.

DETERMINATION KEY DESCRIPTION: FHWA, FRA, FTA PROGRAMMATIC CONSULTATION FOR TRANSPORTATION PROJECTS AFFECTING IBAT, NLEB, OR TCB

This key was last updated in IPaC on September 11, 2025. Keys are subject to periodic revision.

This decision key is intended for projects/activities funded or authorized by the Federal Highway Administration (FHWA), Federal Railroad Administration (FRA), and/or Federal Transit Administration (FTA), which may require consultation with the U.S. Fish and Wildlife Service (Service) under Section 7 of the Endangered Species Act (ESA) and may affect the federally listed endangered Indiana bat (*Myotis sodalis*), northern long-eared bat (*Myotis septentrionalis*), and/or federally proposed endangered tricolored bat (*Perimyotis subflavus*).

This decision key should only be used to verify project applicability with the Service's Programmatic Biological Opinion/Conference Opinion for Transportation Projects in the Range of the Indiana bat, northern long-eared bat, and tricolored bat, dated December 13, 2024. The programmatic consultation limited transportation activities that may affect the covered bat species and addresses situations that are both likely and not likely to adversely affect the covered bat species. This decision key will assist in identifying the effect of a specific project/activity and the applicability of the programmatic consultation. The programmatic consultation is not intended to cover all types of transportation actions. Activities outside the scope of the programmatic consultation, or that may affect ESA-listed species other than the Indiana bat, northern long-eared bat, or tricolored bat, or their designated critical habitat, may require additional ESA Section 7 consultation.

IPAC USER CONTACT INFORMATION

Appendix A. Verification Form (updated January 2025)

Federal Highway Administration (FHWA) or the applicable state Department of Transportation (DOT) shall submit a signed version of this completed form, together with any project plans, maps, supporting analyses, etc., to NOAA's National Marine Fisheries Service (NMFS), Greater Atlantic Regional Fisheries Office, Protected Resources Division (GARFO PRD) at nmfs.gar.esa.section7@noaa.gov with "FHWA GARFO NLAA Program: [Project Title or Number]" in the subject line. **Note:** project design contractors and/or consultants may assist in preparing the form, but only FHWA/DOT staff shall sign off on it on the final page.

Project Activity Type (check all that apply to the entire action):

- [x] 1. Bridge repair, demolition, or replacement project
- [ ] 2. Culvert repair or replacement project
- [ ] 3. Dock, pier, or waterway access project (includes construction, demolition, and repairs)
- [ ] 4. Slope stabilization project

Transportation Project Information

Name of Project:	613642 RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003=T-01-004		
Reinitiation (Yes/No):	No		
State DOT/Program:	MassDOT		
DOT ID Code:	613642		
Contact Person:	Dave Paulson		
Phone:	+ 1 857 262 3378	Email:	david.j.paulson@dot.state.ma.
Project Latitude (e.g., 42.625884):		41.886006	
Project Longitude (e.g., -70.646114):		-71.030015	
Maximum Water Depth (m)		2.3	
Anticipated Project Start Date:	Decemeber 2026	Anticipated Project End Date:	October 2028
City/Town:	Taunton/ Raynham MA	Water body:	Taunton River
Project/Action Description and Purpose:	The Massachusetts Department of Transportation (MassDOT – Highway Division) Is proposing a reconstruction of the Old Colony Avenue Bridge over the Taunton River. The overall project limits extend 250' north of the intersection of Old Colony Avenue and Battle Row in Taunton, MA; along the Old Colony Avenue Bridge; and 370' to the intersection of South Street East and Sandy Hill Road, in Raynham, MA . The total length of the Project is approximately 790' along Old Colony Avenue and South Street East. The Project will consist of several activities including: Bridge deck replacement; Full depth pavement construction in the vicinity of the bridge; Pavement milling and overlay to the north and south of the bridge; Modifications to roadway geometry; Construction of a new sidewalk; New granite curbing; Striping of two travel lanes and a bike lane; Installation of Americans With Disabilities Act (ADA)-Compliant Ramps; Replacement of Guardrails; Paving of an existing town-owned gravel area associated with the pump station; Modifications to water, sewer, gas, electric and drainage utilities; Installation of a sediment forebay and leaching basins; Placement of riprap scour protection within the Taunton River; and Tree clearing and trimming. The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). The project will result in temporary and permanent impacts to federally jurisdictional Waters of the U.S. including the land below Ordinary High Water (Streambank and Streambed) associated with the Taunton River. The Project will result in a total of 13,270		

ESA-listed species and/or critical habitats in the action area (Check all that apply)

☑	Atlantic sturgeon (all DPSs)	☐	Kemp's ridley sea turtle
☐	Atlantic sturgeon critical habitat Indicate which DPS (GOM, NYB, Chesapeake Bay DPSs): Select DPS	☐	Loggerhead sea turtle (Northwest Atlantic DPS)
☐	Shortnose sturgeon	☐	Leatherback sea turtle
☐	Atlantic salmon (GOM DPS)	☐	North Atlantic right whale
☐	Atlantic salmon critical habitat (GOM DPS)	☐	North Atlantic right whale critical habitat
☐	Green sea turtle (North Atlantic DPS)	☐	Fin whale

* Please consult GARFO PRD's ESA Section 7 Mapper for ESA-listed species and critical habitat information for your action area at: https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-species-critical-habitat-information-maps-greater.

The following stressors are applicable to the action:

- ☐ Underwater Noise
- ■ Impingement/Entrainment and Entanglement
- ■ Water Quality/Turbidity
- ■ Habitat Alteration
- ☐ Vessel Traffic

Impacts Table

Habitat Alteration		
	Permanent (acres)	Temporary (acres)
Sand (saline)		
Silt/Mud/Clay (saline)		
Hard bottom (saline)		
Submerged Aquatic Vegetation (SAV) (saline)		
Sand (freshwater)		
Silt/Mud/Clay (freshwater)	0.19	0.10
Hard bottom (freshwater)		
Submerged Aquatic Vegetation (SAV) (freshwater)		
Total amount of habitat alteration	0.19	0.10

In-water Construction Impacts	
	Amount in meters
Width of water body in action area (m)	27.0
Stressor category that extends furthest distance into water body (e.g.; underwater noise, turbidity plume)	Turbidity
Maximum extent of stressor into the water body (m)	92.0

Project Design Criteria (PDC) Checklist
FHWA/DOT shall incorporate all general PDCs and all applicable PDCs in the appropriate stressor categories. For any PDCs that are not incorporated, additional justification is required for a project to be eligible for the NLAA Program. FHWA/DOT shall check the corresponding box for each PDC that is, or will be, incorporated into the project or indicate if not applicable.

GENERAL PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	1.	Ensure all operators, employees, and contractors are aware of all FHWA environmental commitments, including these PDC, when working in areas where ESA-listed species may be present or in critical habitat.
☑		2.	No portion of the proposed action will individually or cumulatively have an adverse effect on ESA-listed species or critical habitat.
☐	☑	3.	No portion of the proposed action that may affect the GOM DPS of Atlantic salmon will occur in the tidally influenced portion of rivers/streams where their presence is possible from April 10 through November 7. The range of the GOM DPS only occurs in Maine. **Note**: If the project will occur within the geographic range of the GOM DPS Atlantic salmon but their presence is not expected following the best available commercial scientific data, the work window does not need to be applied. Please attach best available information (i.e. local fisheries biologist correspondence).
☐	☑	4.	No portion of the proposed action that may affect shortnose or Atlantic sturgeon will occur in areas identified as spawning grounds as follows: i. Gulf of Maine: Apr 1-Aug 31 ii. Southern New England/New York Bight: Mar 15-Aug 31 iii. Chesapeake Bay: Mar 15-Jul 1 and Sep 15-Nov 1 **Note**: If river specific information exists that provides better or more refined time of year information, those dates may be substituted with NMFS approval.
☐	☑	5.	No portion of the proposed action that may affect shortnose or Atlantic sturgeon will occur in areas identified as overwintering grounds where dense aggregations are known to occur as follows: i. Gulf of Maine: Oct 15-Apr 30 ii. Southern New England/New York Bight: Nov 1-Mar 15 iii. Chesapeake Bay: Nov 1-Mar 15 **Note**: If river specific information exists that provides better or more refined time of year information, those dates may be substituted with NMFS approval.
☐	☑	6.	Within designated critical habitat for Atlantic sturgeon, no work will affect hard bottom substrate (e.g., rock, cobble, gravel, limestone, boulder, etc.) in low salinity waters (i.e., 0.0-0.5 parts per thousand) (PBF 1).
☑		7.	Work will result in no or only temporary/short-term changes in water temperature, water flow, salinity, or dissolved oxygen levels.

Yes	N/A	PDC #	PDC Description
☑		8.	If ESA-listed species are (a) likely to pass through the action area at the time of year when project activities occur; and/or (b) the project will create an obstruction to passage when in-water work is completed, then a zone of passage (~50% of water body) with appropriate habitat for ESA-listed species (e.g., depth, water velocity, etc.) must be maintained (i.e., physical or biological stressors such as turbidity and sound pressure must not create barrier to passage).
☑		9.	The project will not adversely impact any submerged aquatic vegetation (SAV) or oyster reefs.
☑		10.	No blasting or use of explosives will occur.
☑		11.	No in-water work on large dams or tide gates (small dam and tide gate repairs may be permitted with prior review and approval from NMFS).

UNDERWATER NOISE PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	12.	If pile driving is occurring during a time of year when ESA-listed species may be present, and the anticipated noise is above the behavioral noise threshold, a "soft start" is required to allow animals an opportunity to leave the project vicinity before sound pressure levels increase. *In addition to using a soft start at the beginning of the work day for pile driving, one must also be used at any time following cessation of pile driving for a period of 30 minutes or longer.* <u>For impact pile driving</u>: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving. <u>For vibratory pile installation</u>: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.

Yes	N/A	PDC #	PDC Description
☐	☑	13.	All underwater noise is below the injury thresholds of ESA-listed species in the action area. Attach your calculations to this verification form supporting this.
☐	☑	14.	Any new pile-supported structure must involve the installation of no more than 50 piles (below MHW).

Information for Pile Driving:
If your project includes **pile driving of any kind**, please attach your calculation to this verification form to verify that it fits within the scope of the behavioral/injury threshold analysis for ESA-listed species in the action area. The NMFS Office of Protected Resources Acoustic Calculator is available as one source, should you not have other information:
https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-effects-analysis-acoustics-greater-atlantic-region

Pile material (e.g., steel pipe, concrete)	Pile diameter/ width (in)	Number of piles	Installation method (e.g., impact hammer, vibratory start and then impact hammer to depth, drilling)

IMPINGEMENT/ENTRAINMENT AND ENTANGLEMENT PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	15.	If excavating or dredging, only mechanical buckets, hydraulic cutterheads, or low volume hopper dredges (e.g., CURRITUCK, ≤300 cubic yard maximum bin capacity) may be used. **Note**: We consider excavating a smaller scale form of mechanical dredging.
☑	☐	16.	No new excavation or dredging in Atlantic sturgeon or salmon critical habitat (excavation in a prior construction footprint or maintenance dredging is permitted, but still must meet all other PDCs). New excavation or dredging outside Atlantic sturgeon or salmon critical habitat is limited to one-time events (e.g., burying a cable or utility line) and minor (≤2 acres) expansions of areas already subject to prior excavation or maintenance dredging. Locating a replacement bridge within 250 feet (centerline to centerline) of an existing bridge and excavation of sediment around bridge piers are considered work in a previous construction footprint. **Note**: We consider excavating a smaller scale form of mechanical dredging.

Yes	N/A	PDC #	PDC Description
☑	☐	17.	Temporary intakes related to construction are prohibited in sturgeon and salmon spawning, rearing, or overwintering habitat during the time of year windows identified in General PDCs 3-5. If utilized outside those areas and times of year and in an area with anticipated sturgeon and salmon presence, temporary intakes must be equipped with 2-millimeter wedge wire mesh screening and must not have greater than 0.5 feet per second intake velocities, to prevent impingement or entrainment of juvenile and early life stages of these species.
☑	☐	18.	Work behind cofferdams, turbidity curtains, or other instruments that prevent access of animals to the project area is required when ESA-listed species are likely to be present (if presence is limited to rare, transient individuals, access control measures are not necessary). Once constructed, work inside a cofferdam at any time of year may be permitted with NMFS approval, provided the cofferdam is installed/removed outside the time-restricted period.
☑	☐	19.	No new permanent surface water withdrawal, water intakes, or water diversions.
☑	☐	20.	Turbidity control measures, including cofferdams, must be designed to not entangle or entrap ESA-listed species.
☐	☑	21.	Any in-water lines, ropes, or chains must be made of materials and installed in a manner to minimize or avoid the risk of entanglement by using thick, heavy, and taut lines that do not loop or entangle. Lines can be enclosed in a rigid sleeve.

WATER QUALITY/TURBIDITY PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	22.	In-water offshore disposal may only occur at designated disposal sites that have already been the subject of ESA section 7 consultation with NMFS and where a valid consultation is in place.
☐	☑	23.	Any temporary discharges must meet state water quality standards (e.g., no discharges of substances in concentrations that may cause acute or chronic adverse reactions, as defined by EPA water quality standards criteria).
☑	☐	24.	Only repair, upgrades, relocations, and improvements of existing discharge pipes or replacement in-kind are allowed; no new construction of untreated discharges.
☑	☐	25.	Work behind cofferdams, turbidity curtains, or other instruments to control turbidity is required when operationally feasible and ESA-listed species are likely to be present (if presence is limited to rare, transient individuals, turbidity control methods are not necessary).

HABITAT ALTERATION PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	26.	Minimize all new waterward encroachment and permanent fill.
☐	☑	27.	In Atlantic salmon critical habitat, stream simulation design with a minimum span of 1.2 bankfull width will be used in areas with minimal tidal influence. In tidal areas, a design that allows for unimpeded flow will be used (no delay in water entering or exiting the area upstream of the crossing).
☐	☑	28.	In Atlantic salmon critical habitat, no culvert end extensions, invert line culvert rehabilitation, or slipline culvert rehabilitation may occur.

VESSEL TRAFFIC PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	29.	Maintain project (i.e., construction) vessels operating within the action area to speed limits below 10 knots and dredge vessels to speeds of 4 knots maximum, while dredging.
☐	☑	30.	Maintain a 1,500-foot buffer between project (i.e., construction) vessels and ESA-listed whales and a 300-foot buffer between project vessels and sea turtles. This also applies to dredge vessels.
☐	☑	31.	The number of project (construction) vessels must be limited to the greatest extent possible, as appropriate to size and scale of project.
☐	☑	32.	The project must not result in the permanent net increase of commercial vessels.

Justification for NLAA Determination if not Incorporating All PDC
If the project is not in compliance with all of the general and stressor-based PDCs, but you can provide justification and/or special conditions to demonstrate why the project still meets the NLAA determination and is consistent with the aggregate effects considered in the programmatic consultation, you may still certify your project through the NLAA program using this verification form. Please identify which PDCs your project does not meet (e.g., PDC 9, PDC 15, PDC 22, etc.) and provide your rationale and justification for why the project is still eligible for the verification form. Project modifications must not result in different effects not already considered.

To demonstrate that the project is still NLAA, you must explain why the effects on ESA-listed species or critical habitat are **insignificant** (i.e., too small to be meaningfully measured or detected) or **discountable** (i.e., extremely unlikely to occur). **Please use this language in your justification.**

PDC#	Justification

FHWA/DOT Verification of Determination (To be filled out by FHWA/DOT staff only)
By submitting this Verification Form, FHWA, or the state DOT as FHWA's designated non-federal representative, indicates that they determined that the proposed activity described above is not likely to adversely affect (NLAA) ESA-listed species or designated critical habitat under NMFS jurisdiction in accordance with the Program, and all effects (direct, indirect, interrelated, and interdependent) are either insignificant (so small they cannot meaningfully be measured, detected, or evaluated) or discountable (extremely unlikely to occur).

☑	In accordance with the FHWA GARFO NLAA Program, we have determined that the action complies with all applicable PDCs and is not likely to adversely affect listed species.
☐	In accordance with the FHWA GARFO NLAA Program, we have determined that the action is not likely to adversely affect listed species per the justifications and/or special conditions provided above.

FHWA/DOT Signature:	Date:
	01/09/2026

By providing your determination and signature, you are certifying that to the best of your knowledge the information provided in this form is accurate and based upon the best available scientific information. This form must be filled out and signed by FHWA or state DOT staff, as an officially designated non-federal representative.

GARFO PRD Concurrence (To be filled out by GARFO PRD)
After receiving the Verification Form, GARFO PRD will contact FHWA/DOT with any concerns and indicate whether GARFO PRD concurs with FHWA/DOT's determination.

☑	In accordance with the FHWA GARFO NLAA Program, GARFO PRD concurs with FHWA/DOT's determination that the action complies with all applicable PDCs and is not likely to adversely affect listed species or critical habitat.
☐	In accordance with the FHWA GARFO NLAA Program, GARFO PRD concurs with FHWA/DOT's determination that the action is not likely to adversely affect listed species or critical habitat per the justifications and/or special conditions provided above.
☐	GARFO PRD does not concur with FHWA/DOT's determination that the action complies with the applicable PDCs (with or without justifications), and recommends an individual Section 7 consultation to be completed independent from the FHWA GARFO NLAA Program.

GARFO PRD Signature:	Date:
	01/12/2026

Appendix B. Verification Form

This form demonstrates compliance with the FHWA/NMFS GARFO EFH Programmatic Consultation dated 1/16/24. The applicable state Department of Transportation (state DOT) will complete this form and enter the project details into the ESA/EFH webtool (https://www.environment.fhwa.dot.gov/esawebtool/) to apply the programmatic consultation to a transportation project. FHWA will receive and review the completed forms before a final NEPA decision as part of the overall environmental review process. FHWA with the assistance of VOLPE will compile the information provided by all covered state DOTs on the completed Verification Forms and ESA/EFH webtool for the purposes of tracking and annual monitoring. FHWA/state DOT must include the completed Verification Form as part of a permit application with any other federal agency, such as U.S. Army Corps of Engineers or U.S. Coast Guard, to confirm that EFH consultation is complete.

Projects that are unable to meet the mandatory conservation recommendations in **bold** the state DOT will work with their FHWA Division Office to complete individual EFH consultation with NMFS.

Project Activity Type

1. ☒ Bridge repair, demolition, and replacement
2. ☐ Culvert repair and replacement
3. ☐ Docks, piers, and waterway access projects
4. ☐ Slope stabilization

Transportation Project Information

Project Name:	RAYNHAM- TAUNTON- BI	Project Number:	613642
Project Sponsor:	MassDOT	Contact Person:	Dave Paulson
Email:	david.j.paulson@dot.state.	Phone:	+ 1 857 262 3378
Latitude (e.g., 42.625884):		41.886005903543975	
Longitude (e.g., -70.646114):		71.0300152141668	
City/Town, State:	Taunton/ Raynham MA	Waterway:	Taunton River
Project Description and Purpose:	The Massachusetts Department of Transportation (MassDOT – Highway Division) Is proposing a reconstruction of the Old Colony Avenue Bridge over the Taunton River. The overall project limits extend 250' north of the intersection of Old Colony Avenue and Battle Row in Taunton, MA; along the Old Colony Avenue Bridge; and 370' to the intersection of South Street East and Sandy Hill Road in Raynham MA. The total length of the Project		
Anticipated Project Start Date:	Dec 2026	Anticipated Project End Date:	October 2028
Total area of impact to EFH (in acres): Include locus map with area of impact.		0.29	
Area of impacts to sensitive habitats (in square feet):		No impacts to submerged aquatic vegetation (SAV) or oyster reefs allowed.	
Natural rocky habitat (e.g., bedrock, boulders, cobble, and/or gravel):		0	
Salt marsh:		0	
Areas containing shellfish (excluding oyster reefs):		0	
Intertidal mudflats:		0	
Area of impact to diadromous fish habitat:		0.29	

Potential Stressors Caused by the Activity (Check all that apply based on activity type)

☐ Underwater Noise
☒ Impingement/Entrainment and Entanglement
☒ Water Quality/Turbidity
☒ Habitat Alteration
☐ Vessel Traffic

EFH Conservation Recommendation Checklist

FHWA/state DOT will indicate how the project addresses each of the programmatic EFH conservation recommendations, by selecting the appropriate check box and providing a brief explanation where necessary. **Bolded CRs are required.** If the project is not in compliance with any additional programmatic EFH conservation recommendation and FHWA/state DOT has still determined that the effects of a project on EFH are not substantial and the project is otherwise consistent with the FHWA programmatic EFH consultation, provide justification below under the conservation recommendations that are not included.

Underwater Noise

☒ Check here if the EFH conservation recommendations in this section are not applicable because the project will not create underwater noise as a stressor. Proceed to the next stressor.

1. Use a vibratory hammer to the maximum extent practicable.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans
☐ Included in description, other terms and conditions

2. For impact driving, an initial set of three strikes would be made by the hammer at 40 percent energy, followed by a 1-minute wait period, then two subsequent 3-strike sets at 40 percent energy, with 1-minute waiting periods, before initiating continuous impact driving. In addition to a soft start at the beginning of the day for impact pile driving, a soft start must also be used at any time following cessation of impact pile driving for a period of thirty minutes or longer and if any increase in pile installation or removal intensity is required. Build up power slowly from a low energy start-up over a 20-minute period to warn fish to leave the vicinity. This buildup shall occur in uniform stages to provide a constant increase in output. This should be done in accordance with the methods outlined in the NMFS GARFO/FHWA Best Management Practices (BMP) Manual.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

3. Avoid the use of hollow steel pipe piles when possible.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

4. Do not undertake noise-generating work in diadromous streams within the spring diadromous fish TOY restriction listed in Appendix C unless it is isolated behind sealed, dewatered cofferdams, to avoid impeding fish migration.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and condition

Impingement/Entrainment and Entanglement

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not lead to impingement/entrainment and entanglement as a stressor. Proceed to the next stressor.

5. **Turbidity control measures must be properly installed, secured and regularly monitored to ensure aquatic species are not entangled or trapped in the project area.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

6. **No new permanent surface water withdrawal, water intakes, or water diversions. (Permanent surface water intakes do not include dry hydrants.)**

☐ Not met: Project requires individual consultation with NMFS

☒ Met
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

7. Install and operate temporary intakes related to construction in accordance with the NMFS GARFO/FHWA Best Management Practices (BMP) Manual and equip intakes with mesh size screening and approach velocity appropriate for the species and life stage anticipated to be present during construction. Temporary pumping/intakes related to construction water handling will be based on the resource present and be in accordance with state fisheries consultation (with documentation provided) where such consultation is available. In addition,
   a) Per the NMFS Anadromous Salmonid Passage Facility Design manual, screen openings must not exceed 3/32 inch and screen approach velocity must be less than 0.25 feet per second (ft. /sec) in waters supporting anadromous salmonids.
   b) The use of 2 millimeter (mm) wedge wire screens must be used with a maximum intake velocity of 0.5 feet per second (ft. /sec).
   c) In Virginia, a 1 mm wedge wire screen with a maximum intake velocity of 0.25 ft. /sec) is required.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

Water Quality/Turbidity

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not negatively affect water quality or create turbidity. Proceed to the next stressor.

8. **Install soil erosion, sediment, and turbidity controls and maintain them in effective operating condition during construction. Remove controls upon completion of work, after all exposed soil and other fills, as well as any work waterward of ordinary high water or the high tide line, are permanently stabilized.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☒ Shown on project plans
- ☒ Included in description, other terms and conditions

9. **Prevent construction debris and sediment from entering aquatic areas and remove all construction debris and excess/deteriorated materials and dispose of in an appropriate upland area.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

10. **Dredged and/or excavated materials, including any fine-grained materials removed from inside culverts, shall either be moved to an upland location and stabilized to prevent reentry into the waterway or disposed of at a previously approved disposal site.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

11. **Completely remove and do not reuse existing creosote piles that are affected by project activities and do not install new creosote piles. Piles that break or cannot be removed due to site conditions must be cut off at the mudline.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

12. **Ensure that raw concrete does not contact the water; wet pours of concrete must be confined within sealed forms until the concrete is set or pre-cast members installed. Ensure grout bags are watertight.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

13. Install and remove any in-water soil erosion, sediment, and turbidity controls outside of the TOY restrictions listed in Appendix C.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

14. Conduct in-water work that produces turbidity or sedimentation in diadromous streams or EFH outside of the TOY restriction(s) in Appendix C.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

15. Do not use any creosote, coal tar epoxy, or other hydrocarbon-based coatings on any in-water structures or overwater structures. Dispose of any demolished structures treated with creosote, coal tar epoxy, or other hydrocarbon-based coatings in an approved upland disposal site.

☒ Not met:
- ☒ Not applicable, provide reasoning:

Project does not propose any hydrocarbon-based coatings

- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

16. In NJ only, in areas mapped as shellfish beds pursuant to N.J.A.C 7:7-9.2
    - All structures should be constructed with alternative materials, such as plastic, natural cedar or other untreated wood, or pressure-treated wood, coated offsite with an impact resistant, biologically inert substance to minimize leachate into shellfish areas.

- Coat any chemically or pressure treated piles (CCA, ACQ, etc.) with an impact-resistant, biologically inert substance. Coating should be applied during the manufacturing process, not post-manufacturing by a third party or contractor.

☒ Not met:

☒ Not applicable, provide reasoning:

Project action area is not in New Jersey

Habitat Alteration

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not cause habitat alteration. Proceed to the next stressor.

17. **Remove temporary and/or obsolete structures and fills in their entirety. Use geotextile barriers prior to placement of temporary fill material to ensure complete removal.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

18. **Return areas impacted by temporary activities, fills, or structures to pre-construction or better condition, including elevations and substrate, and replant with native species.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

19. **Temporary monitoring devices, if used in-water as part of an activity, shall be removed and the substrate restored to pre-construction elevations no later than 24 months from initial installation, or upon completion of data acquisition.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

20. **Pipelines and cables that cross a waterway must not rest on the substrate. They may be**

attached to an overwater structure or be buried to allow an area to return to preexisting conditions.

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

21. **Any fill, including planting media and placement of any seed shellfish, spatted-shell, or cultch must be free of all non-native or invasive species and/or contaminants. An invasive species control plan must be part of the project if the transportation agency cannot guarantee this.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

22. **Prevent dislodging of coir logs, mats, or native oyster shell.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

23. **Lowermost section of floating docks and vessels must be ≥18 inches above the substrate at all times.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

24. **Avoid propeller scour and grounding of all project vessels and floating docks.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

25. Provide compensatory mitigation for all permanent impacts to aquatic habitats and for temporary impacts in place over 12 months to address the temporal loss of aquatic habitat functions. This could include a contribution to an existing in-lieu fee program. Because compensatory mitigation is intended to offset adverse effects of an action, it

cannot be viewed separately from an action causing the effect.

When impacts are unavoidable:

a) Conduct a pre-biological survey to map the coverage of the sensitive habitats;
b) Develop a compensatory mitigation plan for biological resource losses, including success criteria, monitoring and adaptive management plans, and long-term maintenance plan. Use the 2008 Final Rule, Compensatory Mitigation for Losses of Aquatic Resources under Clean Water Act Section 404 (33 CFR Parts 325 and 332, 40 CFR Part 230) and NOAA's Mitigation Policy as guides for the development of the compensatory mitigation plan.
c) Undertake compensatory mitigation prior to or concurrent with any impacts to sensitive habitat.

☒ Not met:

◉ Not applicable, provide reasoning:

The project does not propose any loss of aquatic resources

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans
☐ Included in description, other terms and conditions

26. Prior to construction, identify and mark in the field any SAV and wetlands at the project site. An SAV survey is required for activities adjacent to mapped or known SAV if a survey has not been conducted in the previous three years.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans
☒ Included in description, other terms and conditions

27. Locate temporary structures, anchors, spud barges, and construction, access, and dewatering activities outside of special aquatic sites.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

28. All in-water work, including dredging or discharge of fill material will be undertaken at, or approximating, low tide and using low ground pressure equipment to prevent compaction. Low ground pressure is defined as < 3 psi. Where construction requires heavy equipment operation in or across wetlands or mudflats, the equipment shall be placed on construction timber mats that are adequate to support the equipment; be operated on dry or frozen wetlands such that shear pressure does not cause subsidence of the wetlands immediately beneath equipment and upheaval of adjacent wetlands. Construction mats must not be dragged into position.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

29. Remove temporary and/or obsolete structures and fills in their entirety, unless the structure or fill is to be left in place in order to comply with conditions imposed by other state or federal permits. Obsolete structures do not include any structures that are repurposed or preserved to prevent habitat degradation (e.g., abutments or sheet piling that remain in place for habitat or scour protection).

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans

30. If rock relocation is necessary, move them to an area of equivalent depth and substrate.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

31. The height of docks and piers must be at least four feet above salt marsh substrate and must be greater than or equal to the width of the deck to minimize shading impacts. The height must be measured from the marsh substrate to the bottom of the longitudinal support beam.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

32. The lowermost part of floating docks must be greater than or equal to 18 inches above the substrate at all times to avoid grounding and propeller scour and to provide adequate circulation and flushing.

☒ Not met:

☒ Not applicable, provide reasoning:

Floating docks not proposed

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

33. Habitat restoration or mitigation projects must not result in a permanent conversion or loss of sensitive habitats such as SAV, natural rocky habitats, areas containing shellfish, mudflats, and riffle and pool complexes.

☒ Not met:

☒ Not applicable, provide reasoning:

No SAS in action area

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

34. Grain size of any sediment used as part of habitat restoration must be the same size or larger than the native material at the site. Material must be free from toxic chemicals (in excess of ERM values in NOAA SQuiRT tables), asphalt, and other trash or anthropogenic debris.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

35. The following buffers apply between the following habitats and the top of slope of the area to be dredged/excavated.:

a) In New England, setbacks of 100 ft. from tidal SAV or 25 ft. from natural rocky habitats, Special Aquatic Sites (wetlands, mudflats, riffle/pool complexes) and areas containing shellfish.
b) In NY, NJ, DE and PA, dredging shall not occur within 25 ft. from the edge of vegetated wetlands.
c) In NY and NJ, dredging shall not occur within 500 ft. of SAV in sediments greater than or equal to 90% sand and 250 ft. of SAV if sediments are less than 90% sand during the growing season (April 15-October 15) to minimize impacts to SAV due to turbidity.
d) In Virginia and Maryland, dredging shall not occur in areas within the distance from wetlands equal to four times the depth of the dredging.
e) In Maryland, dredging shall not occur within 500 yds. of a natural oyster beds between December 16 to March 14 and June 1 to September 30.

☐ Not met:
☐ Not applicable, provide reasoning:

☒ Included in description, other terms and conditions

Fish Passage/Migration Habitat

37. Design replacement crossings to provide anadromous and resident fish and aquatic organism passage to the maximum extent possible. Use the Federal Interagency Nature-like Fishway Passage Design Guidelines for Atlantic Coast Diadromous Fishes and Culvert Design For Aquatic Organism Passage FHWA-HIF-11-008) for design guidance. In addition, structures must:
    - provide sufficient water depth and maintain suitable water velocities during migration periods; and
    - maintain or replicate natural stream channel and flow conditions.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☒ Shown on project plans
☒ Included in description, other terms and conditions

38. Replaced or upgraded crossings must be a similar or improved structure type and must be designed to provide diadromous and resident fish organism passage by providing sufficient water depth, maintaining suitable water velocities during migration periods, and maintaining or replicating natural stream channel and flow conditions. Upgraded crossings must be designed in accordance with the order of preference set out in NMFS' Anadromous Salmonid Passage Facility Design, unless such design is otherwise approved by the State Fisheries Agency.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
☒ Shown on project plans
☒ Included in description, other terms and conditions

39. For activities that require soil erosion, sediment, and turbidity controls, prevent impeding the run by incorporating the following:
    a) in non-tidal streams containing diadromous fish
        i. the activities must not encroach >25% of the stream width measured from ordinary high water during the anadromous TOY restriction unless such encroachment is otherwise approved by State Fisheries; and
        ii. In waterways supporting diadromous fish, the activities must maintain safe, timely, and effective downstream fish passage throughout the project.
    b) in tidal waters:
        i. The activities must not encroach >50% of a tidal stream's width as measured from mean high water unless such encroachment is otherwise approved by the State Fisheries Agency.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans
☒ Included in description, other terms and conditions

40. Incorporate climate change and sea level rise projections into the project design as appropriate to address changing hydrologic conditions (increased precipitation and stream flow, altered tidal regimes, etc.). Guidance can be found in NOAA Fisheries' national Procedure for Addressing Climate Change in NMFS Essential Fish Habitat Consultations and GARFO's Guidance for Integrating Climate Change Information in Greater Atlantic Region Habitat Conservation Division Consultation Processes, including the recommendation to use relevant local or regional climate prediction models where available as well as emission and climate projection scenarios on a global scale from the Intergovernmental Panel on Climate Change (IPCC). The use of a "high" (e.g., RCP/SSP8.5) and an "intermediate" (e.g., RCP/SSP 4.5 or RCP 6.0) scenario (IPCC 2021) is suggested. For SLR projections, at a minimum the 1.0 m mean global scenario is recommended with the relevant downscaled projections for the closest tide gauge location identified in Sweet et al. (2022).

☒ Not met:
☒ Not applicable, provide reasoning:

Climate change analysis was not done due to the project keeping existing abutments.

☐ Project is unable to accommodate, provide justification:

☐ Met:
☐ Shown on project plans
☐ Included in description, other terms and conditions

Vessel Interactions

☒ Check here if the EFH conservation recommendations in this section are not applicable because the project will not use vessels.

41. Project vessels shall be operated in adequate water depths in the action area to avoid propeller scour and grounding at all tides. Shallow draft vessels will be used in shallow areas to maximize the navigational clearance between the vessel and the bottom substrate. Spuds may be used to elevate the vessel.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

42. Project vessels shall not be moored in or use spuds in SAV or be located in such a way that the vessel could shade SAV.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

43. Vessels transit through SAV shall be done at high tide.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

Activities that Require Individual Consultation

1. Any work (including anchoring) that results in temporary or permanent impacts to:
    a) Existing or historically mapped submerged aquatic vegetation (SAV) beds or areas within 100 feet of existing or historically mapped SAV beds unless otherwise confirmed to be absent by survey.
    b) ≥ 1,000 SF of tidal SAS (except tidal SAV, see 1 above), natural rocky habitats, or freshwater SAV.
2. Stream channelization.
3. Any temporary structures, construction access, and dewatering activities proposed to be in place for ≥ two years
4. Slip-lining or invert lining existing culverts in tidal waters or non-tidal waters that support diadromous fishes. Resources to assist in the identification of these waters can be found in Appendix H and from State fishery agencies.
5. Structures (docks, piers, walkways) or temporary structures: Less than 1:1 height/width ratio or wider than 4 ft. over salt marsh waterward of MHW. The height should be measured from the substrate to the bottom of the longitudinal support beam lowermost portion of the deck structure.
6. Construction of new or expansion of existing boating facilities. For the purposes of this programmatic EFH consultation, a boating facility is boat docking or mooring space for more than two non-commercial vessels.
7. Excavation for the purpose of establishing new or improved navigation channels (e.g. dredging), exceeding the thresholds listed under number 1 above.
8. Any nearshore disposal or beach nourishment activities.
9. New fill or stabilization structures placed below mean low water in excess of 200 linear feet (lf).
10. Replacement of:
    a) slope stabilization structures > 200 lf. *and* waterward of the existing toe, or
    b) vertical structures > 18 inches waterward of the existing face *and* > 200 lf.
11. in layer deposition as a part of wetland restoration.
12. Placement of any seed shellfish, spatted-shell, or cultch in the following sensitive habitats: fish and wildlife sanctuaries and refuges, mudflats, SAV beds, riffle/pool complexes, natural rocky habitats, intertidal areas, and areas containing shellfish.
13. In-water utility lines ≥100 linear feet (LF) installed by trench excavation; or where installed by jet-plow, fluidization or other direct burial methods:
    a) installed in mud, clay, or silt substrates; or
    b) ≥200 LF when installed in sandy substrates (e.g. >/= 90% coarse grained sand habitats (Wentworth <35 ASTM No. US Standard)). Direct burial methods do not include jacking or directional drilling/boring.
14. Airgun seismic activities.
15. Any new permanent surface water withdrawal, water intakes, or water diversions.
16. All work to tide gates without a USACE-approved operation and maintenance plan or alterations to tide gates that will affect the hydraulic regime. This does not include work on tide gates (e.g., duckbills, flap gates, etc.) that solely convey stormwater and/or NPDES-permitted discharges. See The Effects of Tide Gates on New England Wetlands and Other Tidal Resources. Greater Atlantic Region Policy Series [23-01] for additional information on tide gates and associated BMPs.
17. In-water blasting that affects EFH or diadromous species habitat, or out-of-water blasting with the discharge of blasted material in water.

18. Construction of new bridges or culverts, where no crossing existed previously.
19. Any new or replacement causeways (raised roadways across waters or wetlands). Temporary causeways do not require project specific consultation (i.e., they are covered under the programmatic consultation), provided they do not exceed the above listed threshold or include other excluded activities.
20. Dam and flood control or levee repairs that will alter water levels or flood elevations during the diadromous time of year (TOY) restriction provided in App C.
21. Living shoreline >500 linear feet in length located below OHW or the HTL and/or includes beach nourishment/ land reclamation activities.
22. Living shorelines with structure and/or fill area that extends into the waterbody more than 30 FT from the MLW line, including sand fills, sills, breakwaters, or reefs, or any living shoreline that proposes to impact SAV.
23. Excavated materials, stored, deposited, and retained anywhere but an upland area that prevents sediments from reentering aquatic habitats, except as authorized/required by the terms of a USACE or USCG approval.

DOT Determination of Effects to Essential Fish Habitat and Signature
After reviewing the programmatic EFH conservation recommendations in Section 6.0 and Appendix B, state DOT will select the appropriate determination:

☒ The activity is in compliance with all programmatic EFH conservation recommendations in the FHWA programmatic EFH consultation and adverse effects to EFH will not be substantial.

☐ The activity is not in compliance with all of the programmatic EFH conservation recommendations in the FHWA programmatic EFH consultation and individual consultation with NMFS is needed.

Use the electronic fillable fields to include the name and signature of the state DOT preparing this Verification Form, along with the date.

State DOT Name Massachusetts Department of Transportation

Signature David Paulson

Digitally signed by David Paulson
Date: 2025.12.19 10:03:33 -05'00'

Date 12/19/2025

By providing your determination and signature, you are certifying that to the best of your knowledge the information provided in this form is accurate and based upon the best available scientific information. This form must be filled out and signed state DOT staff, as an officially designated non-federal representative. Email this Verification Form to your FHWA Division Office.

FHWA Review
After receiving the Verification Form, the FHWA Division Office will contact the state DOT with any concerns. FHWA will review this form before a final NEPA decision. FHWA will email the signed form back to the state DOT for record keeping.

☐ FHWA concurs with state DOT's determination that the proposed project is consistent with the programmatic EFH consultation (without the need for justification).

☒ FHWA concurs with state DOT's determination that the proposed project is consistent with the programmatic EFH consultation, with justification described above.

☐ FHWA does not concur with state DOT's determination that the project is consistent with the programmatic EFH consultation. FHWA/state DOT must conduct additional coordination with GARFO HCD and a separate individual EFH consultation may be required.

Re: Notice of Intent – Old Colony Avenue Bridge Replacement
Old Colony Avenue, Taunton, MA

Dear Mr. Turner and Commissioners:

On behalf of the City of Taunton, BETA Group, Inc. (BETA) is submitting this Notice of Intent (NOI) for the proposed Bridge Reconstruction of bridge R-02-003=T-01-004 (the Project) at Old Colony Avenue over the Taunton River in Taunton and Raynham, Massachusetts (the Site). The Project is being filed under the MassDOT bridge exemption as specified in the 2014 Transportation Bond Bill. The bridge replacement design is substantially the functional equivalent of and in similar alignment to, the existing bridge. Therefore, the Project is not subject to the Massachusetts Wetlands Protection Act (M.G.L. ch.131, s.40 – the Act) and this NOI is being filed under the Taunton Wetlands Protection Ordinance (Chapter 432 – the Ordinance) only.

The Project is necessary to improve safety and transportation infrastructure in Taunton and Raynham along the Taunton River. The existing bridge was constructed in 1945, and following a recent rating it was recommended the bridge be closed to vehicular traffic due to poor conditions along the bridge abutments. The Project will require demolition of the existing bridge superstructure, construction of the new bridge deck and associated structural appurtenances; installation of scour protection within the Taunton River; full depth pavement reconstruction; and grading. The Project proposes to retain the existing bridge substructure while replacing the superstructure with a deck that is one foot wider to allow for the addition of a bicycle lane. Ancillary Project facets including guardrails and a relocated sidewalk have also been incorporated into the design, and the Project will also address the addition of scour protection within the river during construction.

Portions of the Project are considered a limited project because they involve the maintenance and improvement of an existing public roadway limited to widening less than a single lane, adding shoulders, and improving the drainage system per 310 CMR 10.53(3)(f), and involve the repair and improvement of a bridge per 310 CMR 10.53(3)(i).

The Project will consist of the following:

- Bridge deck replacement;
- Installation of scour protection within the Taunton River;
- Full depth pavement construction in the vicinity of the bridge;
- Pavement milling and overlay to the north and south of the bridge;
- Modifications to roadway geometry;
- Construction of a new sidewalk;
- Installation of new granite curbing;
- Striping of two travel lanes and a bike lane;

BETA GROUP, INC.
89 Shrewsbury Street, Suite 300, Worcester, MA 01604
P: 508.756.1600 | W: www.BETA-Inc.com

- Installation of Americans With Disabilities Act (ADA)-Compliant curb ramps;
- Replacement of guardrails;
- Modifications to water, sewer, gas, electric and drainage utilities; and
- Tree clearing and trimming.

The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). Accordingly, the Project will meet the Massachusetts Stream Crossing Standards to the maximum extent practicable because the existing conditions do not meet the Standards, and compliance of the existing bridge with the Standards will not change given the nature of work. Work associated with the Project will result in temporary and permanent impacts to Areas Subject to Protection under the Ordinance including Bank, Land Under Water (LUW), Bordering Land Subject to Flooding (BLSF), Wildlife Corridor, Wetland Protection Zone, and Riverfront Area (RA) associated with the Taunton River. The Project will result in a total of 12,776 square feet (sf) and 119 linear feet (lf) of impacts to Resource Areas with the City of Taunton, further broken down as follows:

- 98 linear feet (lf) of temporary and 21 lf of permanent impact to Bank;
- 2,395 square feet (sf) of temporary and 4,171 sf of permanent impact to LUW associated with a dredge volume of 1,003 cubic yards (cy);
- 1,039 sf of permanent impact to BLSF;
- 1,246 sf of permanent impact to Riverfront Area;
- 1,242 sf of permanent impact to Wildlife Corridor; and
- 1,273 sf of permanent and 705 sf of temporary impact to the Wetland Protection Zone.

As a municipal project, this filing is not subject to the fee requirements of the Ordinance. Abutters to the Project have been notified in accordance with Local requirements.

We trust that the following application provides adequate information to facilitate the issuance of an Order of Conditions approving the Project as presented. Should you have any additional questions, please do not hesitate to contact us.

Very truly yours,
BETA Group, Inc.

Taunton
City/Town

A. General Information (continued)

6. General Project Description:

The purpose of the Project is to replace the existing superstructure that makes up bridge No. R-02-003=T-01-004 over the Taunton River to address deteriorating conditions, install scour protection and to improve pedestrian and bicycle accommodations.

7a. Project Type Checklist: (Limited Project Types see Section A. 7b.)

1. ☐ Single Family Home
2. ☐ Residential Subdivision
3. ☐ Commercial/Industrial
4. ☐ Dock/Pier
5. ☐ Utilities
6. ☐ Coastal engineering Structure
7. ☐ Agriculture (e.g., cranberries, forestry)
8. ☒ Transportation
9. ☐ Other

7b. Is any portion of the proposed activity eligible to be treated as a limited project (including Ecological Restoration Limited Project) subject to 310 CMR 10.24 (coastal) or 310 CMR 10.53 (inland)?

1. ☒ Yes ☐ No

If yes, describe which limited project applies to this project. (See 310 CMR 10.24 and 10.53 for a complete list and description of limited project types)

Inland limited project per 310 CMR 10.53(3)(f) and (i)
2. Limited Project Type

If the proposed activity is eligible to be treated as an Ecological Restoration Limited Project (310 CMR10.24(8), 310 CMR 10.53(4)), complete and attach Appendix A: Ecological Restoration Limited Project Checklist and Signed Certification.

8. Property recorded at the Registry of Deeds for:

N/A - Roadway ROW
a. County

b. Certificate # (if registered land)

c. Book

d. Page Number

B. Buffer Zone & Resource Area Impacts (temporary & permanent)

1. ☐ Buffer Zone Only – Check if the project is located only in the Buffer Zone of a Bordering Vegetated Wetland, Inland Bank, or Coastal Resource Area.
2. ☒ Inland Resource Areas (see 310 CMR 10.54-10.58; if not applicable, go to Section B.3, Coastal Resource Areas).

Check all that apply below. Attach narrative and any supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

For all projects affecting other Resource Areas, please attach a narrative explaining how the resource area was delineated.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☒ Bank	21 PERM, 98 TEMP (1. linear feet)	98 REST (2. linear feet)
b. ☐ Bordering Vegetated Wetland	(1. square feet)	(2. square feet)
c. ☒ Land Under Waterbodies and Waterways	4,171 PERM, 2,395 TEMP (1. square feet); 1,003 (3. cubic yards dredged)	6,567 REST (2. square feet)

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
d. ☒ Bordering Land Subject to Flooding	1,039 PERM, 0 SF TEMP (1. square feet); (3. cubic feet of flood storage lost)	(2. square feet); (4. cubic feet replaced)
e. ☐ Isolated Land Subject to Flooding	(1. square feet); (2. cubic feet of flood storage lost)	(3. cubic feet replaced)
f. ☒ Riverfront Area	Taunton River (1. Name of Waterway (if available) - **specify coastal or inland**)	

2. Width of Riverfront Area (check one):

☐ 25 ft. - Designated Densely Developed Areas only

☐ 100 ft. - New agricultural projects only

☒ 200 ft. - All other projects

3. Total area of Riverfront Area on the site of the proposed project: 33,200 square feet

4. Proposed alteration of the Riverfront Area:

a. total square feet	b. square feet within 100 ft.	c. square feet between 100 ft. and 200 ft.
1,246	1,246	0

5. Has an alternatives analysis been done and is it attached to this NOI? ☒ Yes ☐ No

6. Was the lot where the activity is proposed created prior to August 1, 1996? ☐ Yes ☒ No

3. ☐ Coastal Resource Areas: (See 310 CMR 10.25-10.35)

Note: for coastal riverfront areas, please complete **Section B.2.f**. above.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

Check all that apply below. Attach narrative and supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

Online Users: Include your document transaction number (provided on your receipt page) with all supplementary information you submit to the Department.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☐ Designated Port Areas	Indicate size under Land Under the Ocean, below	
b. ☐ Land Under the Ocean	1. square feet 2. cubic yards dredged	
c. ☐ Barrier Beach	Indicate size under Coastal Beaches and/or Coastal Dunes below	
d. ☐ Coastal Beaches	1. square feet	2. cubic yards beach nourishment
e. ☐ Coastal Dunes	1. square feet	2. cubic yards dune nourishment

	Size of Proposed Alteration	Proposed Replacement (if any)
f. ☐ Coastal Banks	1. linear feet	
g. ☐ Rocky Intertidal Shores	1. square feet	
h. ☐ Salt Marshes	1. square feet	2. sq ft restoration, rehab., creation
i. ☐ Land Under Salt Ponds	1. square feet 2. cubic yards dredged	
j. ☐ Land Containing Shellfish	1. square feet	
k. ☐ Fish Runs	Indicate size under Coastal Banks, inland Bank, Land Under the Ocean, and/or inland Land Under Waterbodies and Waterways, above 1. cubic yards dredged	
l. ☐ Land Subject to Coastal Storm Flowage	1. square feet	

4. ☐ Restoration/Enhancement

If the project is for the purpose of restoring or enhancing a wetland resource area in addition to the square footage that has been entered in Section B.2.b or B.3.h above, please enter the additional amount here.

a. square feet of BVW

b. square feet of Salt Marsh

5. ☐ Project Involves Stream Crossings

a. number of new stream crossings

b. number of replacement stream crossings

C. Other Applicable Standards and Requirements

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section C and complete Appendix A: Ecological Restoration Limited Project Checklists – Required Actions (310 CMR 10.11).

Streamlined Massachusetts Endangered Species Act/Wetlands Protection Act Review

1. Is any portion of the proposed project located in **Estimated Habitat of Rare Wildlife** as indicated on the most recent Estimated Habitat Map of State-Listed Rare Wetland Wildlife published by the Natural Heritage and Endangered Species Program (NHESP)? To view habitat maps, see the *Massachusetts Natural Heritage Atlas* or go to http://maps.massgis.state.ma.us/PRI_EST_HAB/viewer.htm.

a. ☐ Yes ☒ No

If yes, include proof of mailing or hand delivery of NOI to:

Natural Heritage and Endangered Species Program
Division of Fisheries and Wildlife
1 Rabbit Hill Road
Westborough, MA 01581

2023
b. Date of map

If *yes*, the project is also subject to Massachusetts Endangered Species Act (MESA) review (321 CMR 10.18). To qualify for a streamlined, 30-day, MESA/Wetlands Protection Act review, please complete Section C.1.c, and include requested materials with this Notice of Intent (NOI); *OR* complete Section C.2.f, if applicable. *If MESA supplemental information is not included with the NOI, by completing Section 1 of this form, the NHESP will require a separate MESA filing which may take up to 90 days to review (unless noted exceptions in Section 2 apply, see below).*

c. Submit Supplemental Information for Endangered Species Review*

1. ☐ Percentage/acreage of property to be altered:

(a) within wetland Resource Area _____ percentage/acreage

(b) outside Resource Area _____ percentage/acreage

2. ☐ Assessor's Map or right-of-way plan of site

2. ☐ Project plans for entire project site, including wetland resource areas and areas outside of wetlands jurisdiction, showing existing and proposed conditions, existing and proposed tree/vegetation clearing line, and clearly demarcated limits of work **

(a) ☐ Project description (including description of impacts outside of wetland resource area & buffer zone)

(b) ☐ Photographs representative of the site

* Some projects **not** in Estimated Habitat may be located in Priority Habitat, and require NHESP review (see https://www.mass.gov/ma-endangered-species-act-mesa-regulatory-review).
Priority Habitat includes habitat for state-listed plants and strictly upland species not protected by the Wetlands Protection Act.

** MESA projects may not be segmented (321 CMR 10.16). The applicant must disclose full development plans even if such plans are not required as part of the Notice of Intent process.

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File Number
Document Transaction Number
Taunton
City/Town

C. Other Applicable Standards and Requirements (cont'd)

(c) ☐ MESA filing fee (fee information available at https://www.mass.gov/how-to/how-to-file-for-a-mesa-project-review).
Make check payable to "Commonwealth of Massachusetts - NHESP" and ***mail to NHESP*** at above address

*Projects altering **10 or more acres** of land, also submit:*

(d) ☐ Vegetation cover type map of site

(e) ☐ Project plans showing Priority & Estimated Habitat boundaries

(f) OR Check One of the Following

1. ☐ Project is exempt from MESA review.
Attach applicant letter indicating which MESA exemption applies. (See 321 CMR 10.14, https://www.mass.gov/service-details/exemptions-from-review-for-projectsactivities-in-priority-habitat; the NOI must still be sent to NHESP if the project is within estimated habitat pursuant to 310 CMR 10.37 and 10.59.)

2. ☐ Separate MESA review ongoing. a. NHESP Tracking # b. Date submitted to NHESP

3. ☐ Separate MESA review completed.
Include copy of NHESP "no Take" determination or valid Conservation & Management Permit with approved plan.

3. For coastal projects only, is any portion of the proposed project located below the mean high water line or in a fish run?

a. ☒ Not applicable – project is in inland resource area only b. ☐ Yes ☐ No

If yes, include proof of mailing, hand delivery, or electronic delivery of NOI to either:

South Shore - Bourne to Rhode Island border, and the Cape & Islands:

Division of Marine Fisheries -
Southeast Marine Fisheries Station
Attn: Environmental Reviewer
836 South Rodney French Blvd.
New Bedford, MA 02744
Email: dmf.envreview-south@mass.gov

North Shore - Plymouth to New Hampshire border:

Division of Marine Fisheries -
North Shore Office
Attn: Environmental Reviewer
30 Emerson Avenue
Gloucester, MA 01930
Email: dmf.envreview-north@mass.gov

Also if yes, the project may require a Chapter 91 license. For coastal towns in the Northeast Region, please contact MassDEP's Boston Office. For coastal towns in the Southeast Region, please contact MassDEP's Southeast Regional Office.

c. ☐ Is this an aquaculture project? d. ☐ Yes ☒ No

If yes, include a copy of the Division of Marine Fisheries Certification Letter (M.G.L. c. 130, § 57).

C. Other Applicable Standards and Requirements (cont'd)

Online Users: Include your document transaction number (provided on your receipt page) with all supplementary information you submit to the Department.

4. Is any portion of the proposed project within an Area of Critical Environmental Concern (ACEC)?

   a. ☐ Yes ☒ No If yes, provide name of ACEC (see instructions to WPA Form 3 or MassDEP Website for ACEC locations). **Note:** electronic filers click on Website.

   b. ACEC

5. Is any portion of the proposed project within an area designated as an Outstanding Resource Water (ORW) as designated in the Massachusetts Surface Water Quality Standards, 314 CMR 4.00?

   a. ☐ Yes ☒ No

6. Is any portion of the site subject to a Wetlands Restriction Order under the Inland Wetlands Restriction Act (M.G.L. c. 131, § 40A) or the Coastal Wetlands Restriction Act (M.G.L. c. 130, § 105)?

   a. ☐ Yes ☒ No

7. Is this project subject to provisions of the MassDEP Stormwater Management Standards?

   a. ☒ Yes. Attach a copy of the Stormwater Report as required by the Stormwater Management Standards per 310 CMR 10.05(6)(k)-(q) and check if:
      1. ☒ Applying for Low Impact Development (LID) site design credits (as described in Stormwater Management Handbook Vol. 2, Chapter 3)
      2. ☒ A portion of the site constitutes redevelopment
      3. ☐ Proprietary BMPs are included in the Stormwater Management System.

   b. ☐ No. Check why the project is exempt:
      1. ☐ Single-family house
      2. ☐ Emergency road repair
      3. ☐ Small Residential Subdivision (less than or equal to 4 single-family houses or less than or equal to 4 units in multi-family housing project) with no discharge to Critical Areas.

D. Additional Information

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section D and complete Appendix A: Ecological Restoration Notice of Intent – Minimum Required Documents (310 CMR 10.12).

Applicants must include the following with this Notice of Intent (NOI). See instructions for details.

Online Users: Attach the document transaction number (provided on your receipt page) for any of the following information you submit to the Department.

1. ☒ USGS or other map of the area (along with a narrative description, if necessary) containing sufficient information for the Conservation Commission and the Department to locate the site. (Electronic filers may omit this item.)

2. ☒ Plans identifying the location of proposed activities (including activities proposed to serve as a Bordering Vegetated Wetland [BVW] replication area or other mitigating measure) relative to the boundaries of each affected resource area.

F. Signatures and Submittal Requirements

I hereby certify under the penalties of perjury that the foregoing Notice of Intent and accompanying plans, documents, and supporting data are true and complete to the best of my knowledge. I understand that the Conservation Commission will place notification of this Notice in a local newspaper at the expense of the applicant in accordance with the wetlands regulations, 310 CMR 10.05(5)(a).

I further certify under penalties of perjury that all abutters were notified of this application, pursuant to the requirements of M.G.L. c. 131, § 40. Notice must be made by Certificate of Mailing or in writing by hand delivery or certified mail (return receipt requested) to all abutters within 100 feet of the property line of the project location.

1. Signature of Applicant	2. Date: 1/30/2026
3. Signature of Property Owner (if different)	4. Date
5. Signature of Representative (if any)	6. Date: 1/30/2026

For Conservation Commission:
Two copies of the completed Notice of Intent (Form 3), including supporting plans and documents, two copies of the NOI Wetland Fee Transmittal Form, and the city/town fee payment, to the Conservation Commission by certified mail or hand delivery.

For MassDEP:
One copy of the completed Notice of Intent (Form 3), including supporting plans and documents, one copy of the NOI Wetland Fee Transmittal Form, and a **copy** of the state fee payment to the MassDEP Regional Office (see Instructions) by certified mail or hand delivery.

Other:
If the applicant has checked the “yes” box in any part of Section C, Item 3, above, refer to that section and the Instructions for additional submittal requirements.

The original and copies must be sent simultaneously. Failure by the applicant to send copies in a timely manner may result in dismissal of the Notice of Intent.

d. Mailing Address

e. City/Town | f. State | g. Zip Code

h. Phone Number | i. Fax Number | j. Email Address

B. Fees

To calculate filing fees, refer to the category fee list and examples in the instructions for filling out WPA Form 3 (Notice of Intent).

Fee should be calculated using the following process & worksheet. ***Please see Instructions before filling out worksheet.***

Step 1/Type of Activity: Describe each type of activity that will occur in wetland resource area and buffer zone.

Step 2/Number of Activities: Identify the number of each type of activity.

Step 3/Individual Activity Fee: Identify each activity fee from the six project categories listed in the instructions.

Step 4/Subtotal Activity Fee: Multiply the number of activities (identified in Step 2) times the fee per category (identified in Step 3) to reach a subtotal fee amount. Note: If any of these activities are in a Riverfront Area in addition to another Resource Area or the Buffer Zone, the fee per activity should be multiplied by 1.5 and then added to the subtotal amount.

Step 5/Total Project Fee: Determine the total project fee by adding the subtotal amounts from Step 4.

Step 6/Fee Payments: To calculate the state share of the fee, divide the total fee in half and subtract $12.50. To calculate the city/town share of the fee, divide the total fee in half and add $12.50.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

NOI Wetland Fee Transmittal Form

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

B. Fees (continued)

Step 1/Type of Activity	Step 2/Number of Activities	Step 3/Individual Activity Fee	Step 4/Subtotal Activity Fee

Step 5/Total Project Fee: _____

Step 6/Fee Payments:

Total Project Fee:	FEE EXEMPT a. Total Fee from Step 5
State share of filing Fee:	FEE EXEMPT b. 1/2 Total Fee **less $**12.50
City/Town share of filling Fee:	FEE EXEMPT c. 1/2 Total Fee **plus** $12.50

C. Submittal Requirements

a.) Complete pages 1 and 2 and send with a check or money order for the state share of the fee, payable to the Commonwealth of Massachusetts.

Department of Environmental Protection
Box 4062
Boston, MA 02211

b.) **To the Conservation Commission:** Send the Notice of Intent or Abbreviated Notice of Intent; a **copy** of this form; and the city/town fee payment.

To MassDEP Regional Office (see Instructions): Send a copy of the Notice of Intent or Abbreviated Notice of Intent; a **copy** of this form; and a **copy** of the state fee payment. (E-filers of Notices of Intent may submit these electronically.)

ABUTTERS INFORMATION

Affidavit of Service
Under the City of Taunton Wetlands Protection Ordinance

(to be submitted to the Conservation Commission when filing a Notice of Intent)

I, Hannah Davis, hereby certify under the pains and penalties of perjury that on or before February 9, 2026 I gave notification to abutters in compliance with the Ordinance, which is consistent with the second paragraph of Massachusetts General Laws Chapter 131, Section 40, and the DEP Guide to Abutter Notification dated April 8, 1994, in connection with the following matter:

A Notice of Intent filed under the Ordinance by The City of Taunton in conjunction with MassDOT – Highway Division with the City of Taunton Conservation Commission on or before February 9, 2026 for The Old Colony Avenue Bridge Reconstruction Project in Taunton, Massachusetts and Raynham, Massachusetts.

The form of notification, and a list of the abutters to whom it was given and their addresses, are attached to this Affidavit of Service.

Name

2/9/2026
Date

Notification to Abutters

By Hand Delivery, Certified Mail (return receipt requested), or Certificates of Mailing

This is a notification required by law. You are receiving this notification because you have been identified as the owner of land abutting another parcel of land for which certain activities are proposed. Those activities require a permit under the City of Taunton Wetlands Protection Ordinance.

In accordance with the Ordinance, which is consistent with the second paragraph of the Massachusetts Wetlands Protection Act, and 310 CMR 10.05(4)(a) of the Wetlands Regulations, you are hereby notified that:

A. A Notice of Intent was filed with the Taunton Conservation Commission on or before February 9, 2026 seeking permission to remove, fill, dredge, or alter an area subject to protection under the Ordinance. The following is a description of the proposed activity/activities:

The Project proposes the replacement of the bridge superstructure along Old Colony Avenue and installation of riprap scour protection within the Taunton River. In addition to the repair and improvement of the bridge, the Project will also consist of paving and construction of a new sidewalk.

B. The name of the applicant is: **The City of Taunton in conjunction with MassDOT – Highway Division.**

C. The address of the land where the activity is proposed is: **Old Colony Avenue (Right-of-Way)**

D. Copies of the Notice of Intent may be examined or obtained at the office of the Taunton Conservation Commission, located at 141 Oak Street, Taunton, MA 02780. The regular business hours of the Commission are Monday, Wednesday and Thursday from 8:00 am to 4:00 pm, Tuesday from 8:00 am to 7:00 pm and Friday from 8:00 am to 12:00 pm and the Commission may be reached at (508)-821-1051.

E. Copies of the Notice of Intent may be obtained from the applicant or their representative by contacting Hannah Davis, BETA Group, Inc. at (844)-800-2382 ext. 7241 or at hdavis@BETA-Inc.com. An administrative fee may be applied for providing copies of the NOI and plans.

F. Information regarding the date, time, and location of the public hearing regarding the Notice of Intent may be obtained from the Taunton Conservation Commission. Notice of the public hearing will be published at least five business days in advance, in the **Taunton Daily Gazette**.

NARRATIVE

1.0 INTRODUCTION

On behalf of the City of Taunton, BETA Group, Inc. (BETA) is submitting this Notice of Intent (NOI) for the proposed Bridge Reconstruction of bridge R-02-003=T-01-004 (the Project) at Old Colony Avenue over the Taunton River in Taunton and Raynham, Massachusetts (the Site). The Project is being filed under the MassDOT bridge exemption as specified in the 2014 Transportation Bond Bill. The bridge replacement design is substantially the functional equivalent of and in similar alignment to, the existing bridge. Therefore, the Project is not subject to the Massachusetts Wetlands Protection Act (M.G.L. ch.131, s.40 – the Act) and this NOI is being filed under the Taunton Wetlands Protection Ordinance (Chapter 432 – the Ordinance) only.

The Project is necessary to improve safety and transportation infrastructure in Taunton and Raynham along the Taunton River. The existing bridge was constructed in 1945, and following a recent rating it was recommended the bridge be closed to vehicular traffic due to poor conditions along the bridge abutments. The Project will require demolition of the existing bridge superstructure, construction of the new bridge deck and associated structural appurtenances; installation of scour protection within the Taunton River; full depth pavement reconstruction; and grading. The Project proposes to retain the existing bridge substructure while replacing the superstructure with a deck that is one foot wider to allow for the addition of a bicycle lane. Ancillary Project facets including guardrails and a relocated sidewalk have also been incorporated into the design, and the Project will also address the addition of scour protection within the river during construction.

The Project is considered a limited project because it involves the maintenance and improvement of an existing public roadway limited to widening less than a single lane, adding shoulders, and improving the drainage system per 310 CMR 10.53(3)(f), and it involves the repair and improvement of a bridge and culvert per 310 CMR 10.53(3)(i).

The Project will consist of the following:

- Bridge deck replacement;
- Installation of scour protection within the Taunton River;
- Full depth pavement construction in the vicinity of the bridge;
- Pavement milling and overlay to the north and south of the bridge;
- Modifications to roadway geometry;
- Construction of a new sidewalk;
- Installation of new granite curbing;
- Striping of two travel lanes and a bike lane;
- Installation of Americans With Disabilities Act (ADA)-Compliant curb ramps;
- Replacement of guardrails;
- Modifications to water, sewer, gas, electric and drainage utilities; and
- Tree clearing and trimming.

The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). Accordingly, the Project will meet the Massachusetts Stream Crossing Standards to the maximum extent practicable because the existing conditions do not meet the Standards, and compliance of the existing bridge with the Standards will not change given the nature of work. Work associated with the Project will result in temporary and permanent impacts to Areas Subject to Protection under the Ordinance including Bank, Land Under Water (LUW), Bordering Land Subject to

Flooding (BLSF), Wildlife Corridor, Wetland Protection Zone, and Riverfront Area (RA) associated with the Taunton River. The Project will result in a total of 12,776 square feet (sf) and 119 linear feet (lf) of impacts to Resource Areas with the City of Taunton, further broken down as follows:

- 98 linear feet (lf) of temporary and 21 lf of permanent impact to Bank;
- 2,395 square feet (sf) of temporary and 4,171 sf of permanent[1] impact to LUW associated with a dredge volume of 1,003 cubic yards (cy);
- 1,039 sf of permanent impact to BLSF;
- 1,246 sf of permanent impact to Riverfront Area;
- 1,242 sf of permanent impact to Wildlife Corridor; and
- 1,273 sf of permanent and 705 sf of temporary impact to the Wetland Protection Zone.

It is anticipated that this Project will address the existing safety concerns while also improving non-vehicular transportation accommodations. These accommodations associated with the Project have been designed to meet standards set forth by the ADA.

Given the nature of the bridge reconstruction work, there are no feasible alternatives that avoid the impacts to Resource Areas described herein. The Project has been designed to minimize impacts and restore altered areas following construction. During construction, erosion and sedimentation controls and in-water controls including compost filter tubes, siltation fencing, and cofferdams will be installed and maintained to prevent migration of sediment into the stream. Post-construction restoration activities include regrading and stabilizing Banks with a native seed mix and placing suitable streambed material over the proposed scour protection measures within the Taunton River.

The environmental permits and reviews required to construct the Project beyond the submission of this NOI include:

- A 401 Water Quality Certification (WQC) from MassDEP for impacts to Waters of the U.S. that exceed 5,000 sf of loss and 100 cy of dredging;
- Coverage under the U.S. Army Corps of Engineers (USACE) Section 404 Massachusetts General Permit including General Permits 23: Linear Transportation Projects and Wetland/Stream Crossings and 24: Temporary Construction, Access, and Dewatering;
- Order of Conditions under the Raynham Wetlands Protection Bylaw;
- Coverage under the National Pollutant Discharge Elimination Systems (NPDES) Construction General Permit (CGP);
- National Historic Preservation Act of 1966 Section 106 review;
- Coordination with the National Parks Service due to the status of the Taunton River as a Wild and Scenic River;
- National Oceanic and Atmospheric Administration (NOAA) Section 7 review;
- U.S. Fish and Wildlife Service (USFWS) Essential Fish Habitat (EFH) Section 7 review; and
- National Environmental Policy Act (NEPA) Review through preparation of a programmatic Categorical Exclusion.

The sediment Sampling and Analysis Plan prepared as part of the Section 401 Water Quality Certification that is being filed in addition to this NOI can be made available upon request.

[1] Permanent impacts denote areas which are subject to the placement of scour protection and covered with up to two feet of compatible sediment for restoration.

2.0 SITE DESCRIPTION

2.1 PROJECT LOCUS & EXISTING CONDITIONS

The Site is located along Old Colony Avenue approximately 250 linear feet north of its intersection with Battle Row (Figure 1 – Site Locus). The Taunton River flows east/northeast through the Site towards its confluence with Mount Hope Bay in Fall River, Massachusetts. The centerline of the Taunton River is the common boundary between Taunton and Raynham; therefore, the Site includes land in both municipalities. This NOI pertains to the work proposed within the City of Taunton only.

South Street East is a two-lane road oriented in a north to south direction adjacent to the Taunton River through undeveloped forest and residential properties (Figure 1 – Site Locus). The roadway is under the jurisdiction of the Town of Raynham and is classified as an Urban Collector. Old Colony Ave is a two-lane road oriented in a north to south direction adjacent to the Taunton River through multi-family and industrial properties (Figure 1 – Site Locus). The roadway is under the jurisdiction of the City of Taunton and is classified as an Urban Collector.

The existing structure is an approximately 90’ two-span bridge with equal spans of approximately 45’ 3.5”, constructed in 1945. The structure consists of eight (8) steel beams supporting a 7” concrete deck and 2-1/4” of bituminous paving. The bridge is supported by unreinforced concrete gravity abutments and wingwalls and a reinforced concrete pier. The south abutment is founded on spread footings and the north abutment and pier are founded on timber piles. The bridge is 35’-0” wide, which includes a 26’-0” roadway, a 2’-6” safety walk and 5’-0” sidewalk with metal railing. The bridge has a skew angle of 23.6° and was designed for H20 loading. Stormwater infrastructure in the vicinity of the bridge includes two closed catch basins at the southern end of the bridge that discharge to the Taunton River through a 12-inch reinforced concrete pipe (RCP) within the southeastern wingwall. The remainder of the Site, particularly the portion in Raynham, consists of “country drainage”. A 4” Cast-Iron (CI) and an 8” Asbestos Cement (AC) sewer pipe is located within the bridge superstructure. Additionally, a 6” gas main suspected to be Ductile Iron (DI) is located within the bridge superstructure.

According to the USDA Natural Resources Conservation Service – Soil Survey and the field delineation performed by BETA Group, Inc (BETA) in March 2023, the soils on the Site and in the vicinity of the Site are classified as Birdsall Silt Loam, Urban Land, and Smoothed Udorthents.

Temporary and permanent easements are required for work within and along the Taunton River on both municipal and private properties. A total of 12 easements are required in Taunton (6 temporary, 6 permanent).

2.2 WETLAND RESOURCE AREAS

A Site inspection was conducted by BETA Wetland Scientists on March 31st 2023, to review the previously delineated boundaries of existing Resource Areas within and in the immediate vicinity of the Site. LUW boundaries were identified and delineated in accordance with the methods developed by the *U.S. Army Corps of Engineers Wetland Delineation Manual; Northeast Region* (2009).

According to the July 16, 2015 FEMA Flood Insurance Rate Map (FIRM) Number 25005C0169G, the Site is within a National Flood Insurance Program (NFIP) Special Flood Hazard) Zone AE. Zone AE areas are considered to be within the 100-year floodplain. The base flood elevation onsite is 14.8’ on the upstream side of the Old Colony Ave Bridge and 14.4’ on the downstream side of the bridge. The Taunton River has a designated Regulatory Floodway at the Site.

The Taunton River is designated as a Wild and Scenic River by the United States Congress. Within the Site, the Taunton River is classified as a "Scenic River Area." Under Sec 2. [16 U.S.C 1273].b.(2) of the Wild and Scenic Rivers Act, Scenic River Areas is defined as "Those River or sections of rivers that are free of impoundments, with shorelines or watershed still largely primitive and shorelines undeveloped, but accessible in places by roads".

Wetland and Resource Areas identified on the Site include Bank, Bordering Vegetated Wetlands (BVWs), LUW, Bordering Land Subject to Flooding (BLSF), and Riverfront Area (RA). Areas Subject to Protection under the Taunton Wetlands Protection Ordinance that are present throughout the Site include:

- Bank – Bank at the Site is associated with one (1) perennial stream (the Taunton River) and one (1) unnamed intermittent stream.
- Bordering Vegetated Wetlands (BVW) – Two (2) areas of BVW are present at the Site. The WF1 Series BVW is a scrub shrub wetland that borders on the B3/B4 Series intermittent stream. The WF2 Series BVW is a scrub shrub wetland located along the northern bank of the perennial stream (the Taunton River).
- Land Under Water (LUW) – LUW exists between the Bank boundaries below the mean annual low water level (MLW) of the streams located at the Site and generally consist of muck and gravel. The boundary of LUW is the MLW, which was not field delineated by BETA.
- Bordering Land Subject to Flooding (BLSF) – BLSF at the Site exists in the Zone AE Flood Hazard associated with the Taunton River.
- Riverfront Area (RA) – RA is present at the Site associated with mean annual high water (MAHW).
- Wetland Protection Zone (WPZ) (the Ordinance) – WPZ at the Site is located 25' from BVWs.
- Wildlife Corridor (the Ordinance) – Wildlife Corridor at the Site is located along the southern (B2 Series) Bank to the Taunton River.

The Taunton River at the Site is also mapped as a diadromous fish run.

2.2.1 BANK

Banks were delineated by BETA in the field in March 2023 as described in Table 1: Bank Boundary Description and the Resource Area Boundary Delineation Report included in Appendix A.

Table 1: Bank Boundary Description

FLAG SERIES	LOCATION	DESCRIPTION / NOTES
B1 Series Flags B1-99 to 95 and B2 Series Flags B2-91 to 99 and B2-100 to 105	Taunton River, located east, under and west of the Old Colony Ave Bridge	The northern (*B1 Series*) and southern (*B2 Series*) Banks associated with the Taunton River, a perennial stream, that generally flows west were delineated in two (2) segments along the first observable break in slope consistent with the mean annual flood level. The Bank north of the Taunton River was delineated west (*B1-99 to B1-95*) and east (*B1-100 to B1-106*) of the Old Colony Avenue Bridge in Raynham. Banks west of the bridge were generally well defined and consisted of eroded soils. Banks east of the bridge were observed to be undercut and also consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including bush honeysuckle (*Diervilla lonicera*), silky dogwood (*Cornus amomum*) and Norway maple (*Acer platanoides*). Populations of poison ivy (*Toxicodendron radicans*) were also

		observed. The Bank south of the Taunton River was delineated west (*B2-91 to 99*) and east (*B2-100 to 105*) of the Old Colony Avenue Bridge in Taunton. Banks west of the bridge were generally poorly defined and consisted of rocks and stones of various sizes. Banks east of the bridge were generally well defined and generally consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including slippery elm (*Ulmus rubra*), Norway maple, and silky dogwood. Populations of poison ivy were also observed. The channel width downstream of the Old Colony Avenue bridge is between 95 to 110 feet wide with a mucky, gravel substrate. The channel width upstream is 90 to 100 feet wide with a mixed cobble, gravel, and mucky substrate. Water depths within the Taunton River could not be determined in the field. The Taunton River is mapped as perennial on USGS topographic maps; therefore, it meets the definition of a perennial stream (River) per 310 CMR 10.58(2).
B3/B4 Series Flags B3-96 to 107 and B4-96 to 107	Northwest of Old Colony Avenue Bridge at 0 South East Street	The interior (*B4 Series*) and exterior (*B3 Series*) Banks associated with a shallow, braided intermittent stream west of South Street East were delineated along the first observable break in slope (consistent with the mean annual flood level). The *B3/B4 Series* stream flows west out of a drainage outfall associated with the closed drainage system under South Street East in Raynham, where flow becomes braided prior to reaching a confluence west of the Site. The *B3/ B4 Series* Banks were primarily vegetated with silky dogwood. The channel is approximately 3 to 5 feet wide and 2 to 6 inches deep with a substrate of sand and muck. This stream is not depicted on current USGS topographic maps or on the StreamStats program; therefore, it is presumed to be intermittent.

2.2.2 Bordering Vegetated Wetland (BVW)

BVWs[2] were delineated by BETA in the field in March 2023 as described in Table 2: BVW Boundary Description and the Resource Area Boundary Delineation Report included in Appendix A.

[2] BVWs described herein are located within the Town of Raynham but included here for completeness.

Table 2: BVW Boundary Description

Flag Series	Location	Description / Notes
WF1 Series Flags WF1-108 to 111	Northwest of Old Colony Avenue Bridge at 0 South East Street	The *WF1 Series* BVW is a scrub shrub wetland bordering on the *B3/B4 Series* intermittent stream. The attached U.S. Army Corps of Engineers Field Data Sheets describe evidence of hydrophytic vegetation, hydric soils, and indicators of hydrology at a specific data plot.
WF2 Series Flags WF2-100 to 102	Along the northern Bank of the Taunton River	The *WF2 Series* BVW is a scrub shrub wetland located along the northern bank of the Taunton River, west of the *B1 Series* Bank. Dominant hydrophytic vegetation observed within the area includes silky dogwood. Evidence of hydrology observed in the field includes sediment deposition and stressed vegetation (buttressed roots), and hydric soils indicators including sandy soils with prominent redox concentrations. A formal data plot was not performed at this location.

The dominant plant species in the *WF1 Series* BVW include silky dogwood (*Cornus amomum*) and multiflora rose (*Rosa multiflora*).

2.2.3 Land Under Water (LUW)

LUW exists between the Bank boundaries below the mean annual low water levels of the streams delineated at the Site. The boundary of LUW is the mean annual low water level. This boundary was not field delineated by BETA and is described in the Resource Area Boundary Delineation Report included in Appendix A.

2.2.4 Bordering Land Subject to Flooding (BLSF)

According to the Federal Emergency Management Agency (FEMA) FIRM Number 25005C0169G, dated July 16, 2015, a Zone AE Flood Hazard associated with the Taunton River exists at the Site with Base Flood Elevations (BFE) ranging from 14.4 feet (NAVD88) downstream of the bridge and 14.8 feet (NAVD88) upstream of the bridge. The Site is also located within the Regulatory Floodway of the Taunton River. Any work performed within BLSF (i.e. areas with a 0.1% yearly chance of flooding) is Subject to Jurisdiction under the Ordinance.

2.2.5 Riverfront Area (RA)

According to 310 CMR 10.58(2), RA is defined as the area of land between a river's mean annual high water (MAHW) line and a parallel line measured 200' away horizontally. A River is any natural flowing body of water that empties to any ocean, lake, pond, or other River flowing throughout the year and is shown as perennial on the current United States Geological Survey or more recent map provided by the Department, or has a watershed size of at least 0.50 square miles and a predicted flow rate greater than or equal to 0.01 cubic feet per second at the 99% flow duration using the USGS Stream Stats Method.

As noted in Table 2 above, the B1/B2 Series stream qualifies as a perennial stream (River) and is therefore afforded a 200' RA. The RA at the Site would be measured 200' horizontally from the MAHW flags. Descriptions of the MAHW boundaries associated with the Taunton River are provided below in Table 3: MAHW Boundary Description and the Resource Area Boundary Delineation Report included in Appendix A.

Table 3: MAHW Boundary Description

Flag Series	Waterbody	Description / Notes
B1 Series Flags B1-99 to 95, and B1-100 to 106 *B2 Series Flags B2-91 to 99, and B2-100 to 105*	Taunton River	The northern (*B1 Series*) Banks were delineated at the mean annual flood level (coincident with the mean annual high-water mark – MAHW) approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation and scour. The southern (*B2 Series*) Banks were delineated approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation, scour and the presence of debris.

2.2.6 Wetland Protection Zone (WPZ) (The Ordinance)

The WPZ allows for limitations and prohibitions on activities that may negatively impact a Resource Area. It is assumed that a 25' WPZ would be established for the Site. WPZ is present at the Site 25' from the border of BVWs.

2.2.7 Wildlife Corridor (The Ordinance)

Wildlife Corridor is a contiguous area of land within the WPZ. Wildlife Corridor is located along the *B2 Series* Bank and extends into the Taunton River.

2.3 Buffer Zones

The Project is located within the 100' Buffer Zone to Bank; however, the Buffer Zone within the Project area overlaps entirely within RA of the Taunton River. There is no additional Buffer Zones provided via the Ordinance within Taunton at the Site. Buffer Zone on the Site consists of vegetated areas, the bituminous concrete roadway, and adjacent buildings.

2.4 NHESP-Mapped Habitat and Other Sensitive Areas

The Site is not located within Natural Heritage and Endangered Species Program (NHESP)-mapped Priority Habitat of Rare Species or Estimated Habitat of Rare Wildlife. No Certified or Potential Vernal Pools are present at the Site. In addition, according to the U.S. Fish and Wildlife Service (USFWS)'s Information for Planning and Consultation (IPaC) tool, the Site is located within the range of the northern long-eared bat (*Myotis septentrionalis*) and the Plymouth redbelly turtle/cooter (*Pseudemys rubriventris bangsi*), both endangered species under the federal Endangered Species Act (ESA). The Site is also within the range of the tricolored bat (*Perimyotis subflavus*), a proposed endangered species, and the monarch butterfly (*Danaus plexippus*), a proposed threatened species. The Site is not within the vicinity of any mapped Critical Habitats for the northern long-eared bat (*Myotis septentrionalis*) or the tricolored bat (*Perimyotis subflavus*). There is final critical habitat for the Plymouth redbelly turtle/cooter, but the Project is not within this habitat.

In addition, the Taunton River is a diadromous fish run and is habitat for the Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*), an endangered species. The Project is in mapped habitat of federally listed endangered species and therefore Endangered Species Act (ESA) Section 7 consultation with NOAA and USFWS for EFH is required (Appendix G).

A Time of Year (TOY) restriction will be observed within the Taunton River from March 15th to June 30th and from September 1st to November 15th per TR-47 (pending confirmation from NOAA) in order to achieve a "Not Likely To Adversely Affect" determination via the IPaC NLEB Determination Key and to protect rare species. Water controls will be installed and removed outside of this time period. Section 7 consultation has commenced with NOAA to confirm these TOY restrictions.

The Taunton River is designated as a Wild and Scenic River with the River Classification of being a "Scenic River Area" Under Sec 2. [16 U.S.C 1273].b.(2) of the Wild and Scenic Rivers Act, Scenic River Areas is defined as "Those River or sections of rivers that are free of impoundments, with shorelines or watershed still largely primitive and shorelines undeveloped, but accessible in places by roads". Coordination with the National Park Service through the interagency review process is anticipated.

According to the latest MassGIS data, the Site is not located within NHESP mapped Priority Habitat of Rare Species or Estimated Habitat of Rare Wildlife. The Site is not located within an Area of Critical Environmental Concern (ACEC), Outstanding Resource Water (ORW) or within 200 feet of mapped Certified or Potential Vernal Pools. There are no Zone I, Zone II or IWPA groundwater protection areas or Zone A, B or C surface water protection areas.

3.0 Work Description

The Project consists of replacing the bridge superstructure while retaining the existing bridge substructure. The Project proposes to widen the bridge by 1' for curb-to-curb width of 27', which will allow a bicycle lane to be added to the roadway. The proposed sidewalk will be relocated from the east side to the west side of the roadways to connect the existing sidewalk at the condominium building south of the bridge and to Sandy Hill Street in Raynham. While the substructure will be retained, it is anticipated that in-water work will be required for placement of scour protection. Dredging will be required to install the scour protection and cofferdams will be installed within the River for control of water. Scour protection will consist of a 2'-8" layer of streambed material over 2'-0" layer of dumped riprap, which will all be over 1' of crushed stone for a total depth of 5'-8". Water controls and a dewatering system will be installed to install a the scour protection in dry conditions. Additional details on anticipated dewatering and water controls are provided in Section 7.3 below.

Specific activities associated with the Project include:

- Implementation of traffic controls and installation of erosion and sedimentation controls.
- Bridge Replacement:
    - Removal of existing Bridge superstructure.
    - Replace superstructure with the following:
        - S3-MTL4 Bridge Barrier
        - 3" Wearing surface at the roadway over an 8" cast-in-place reinforced concrete deck support by (6) W27 steel stringers;
        - Proposed superstructure will utilize the existing substructure that will remain in place;
        - Proposed low chord will match the existing low chord elevation of 14.35' and the hydraulic opening will remain unchanged;
        - Removal of debris that has accumulated at the pier.
- Full depth pavement reconstruction in the vicinity of the bridge.
- Pavement mill and overlay to the north and the south of the bridge.

  - Establishment of two 13.5’ wide travel lanes with no shoulders south of the Bridge along Old Colony Avenue.
  - Establishment of two 11’ to 11.5’ wide travel lanes with 1.5’ to 2’ shoulders north of the Bridge along South Street East.
- Construction of a 6’-wide concrete sidewalk along the east side of Old Colony Avenue.
- Construction of a 5.5’-wide concrete sidewalk along the eastern side of the Old Colony Avenue Bridge.
- Construction a 5.5’-wide concrete sidewalk along the eastern side of South Street East.
- Installation of granite curbing.
- Striping for two (2) 10’ wide travel lanes and one (1) 2’ wide bicycle lane.
- Installation of ADA Compliant Ramps.
- Installation of guardrails.
- Modifications to water, sewer, gas, electric and drainage utilities.
- Dredging of 1,003 cy of LUW and subsequent LUW/Bank restoration:
  - Installation of 1’ crushed stone scour protection.
  - Installation of 2’-0” of riprap over 1’ crushed stone scour protection.
  - Installation of 2’-8” of streambed material over 2’-0” of riprap.
  - Placement of modified rockfill over permanently impacted segments of Bank.
- Clearing, grubbing, and grading.
- Stabilization of disturbed areas.

In order to complete the work outlined above, the bridge will be closed, and a detour will be implemented during construction. The 6.5-mile detour is proposed via New State Highway (Route 44) to Church Street/ Precinct Street to Middleboro Avenue. Erosion and sedimentation control measures will be implemented as discussed in Section 6.0 – Erosion and Sediment Controls to protect adjacent Resource Areas. Material stockpiles and staging areas will be located as far from the onsite resource areas as possible and will be placed on poly fabric and surrounded with erosion and sedimentation control measures. Stockpiling and equipment storage will occur on the adjacent paved surfaces of Old Colony Avenue and South Street East.

Cofferdams will be installed in two phases associated with dewatering and scour protection installation. Phase I covers the southern cell, diverting flow through the northern cell throughout construction. Phase II will cover the southern cell. A Time of Year (TOY) restriction will be observed within the Taunton River from March 15th to June 30th and from September 1st to November 15th per TR-47 (pending confirmation from NOAA) in order to achieve a “Not Likely To Adversely Affect” determination via the IPaC NLEB Determination Key and to protect rare species. Water controls will be installed and removed outside of this time period. Given the layout of the municipal boundary in relation to the River, water control efforts will span across both municipalities.

A Water Control Plan designed by a Mass. Registered PE is required to be submitted prior to starting work on the bridge replacement. The Water Control Plan will include a Sedimentation and Erosion Control Plan, as well as a Water Flow Diversion and Containment Plan. Work within Resource Areas, including placement of fill, will only occur within dewatered areas. Final streambed restoration will be overseen by a Fluvial Geomorphologist.

3.1 Work in Buffer Zones

The Project will occur within the 100’ Buffer Zone to the Bank of Taunton River. Due to the nature of bridge work, Buffer Zone impacts are unavoidable. The Project was designed to result in the least possible impacts to Buffer Zone as practicable while still accomplishing the Project goals.

Proposed work within the 100' Buffer Zone includes the following:

- Clearing and grubbing;
- Installation of guardrails;
- Roadway, sidewalk, and curb reconstruction;
- Drainage improvements; and
- Erosion control installation.

Erosion and sedimentation control measures will be implemented as discussed in Section 4.1 to protect adjacent Resource Areas. Material stockpiles and staging areas will be located as far from the onsite Resource Areas as possible and will be surrounded with erosion and sedimentation control measures.

3.2 WORK WITHIN JURISDICTIONAL RESOURCE AREAS

Due to the nature of bridge repair activities, the Project will result in unavoidable temporary and permanent impacts to Resource Areas Subject to Protection and Jurisdiction under the City of Taunton Wetlands Protection Ordinance (City of Taunton Code (2010) §§ 16-30 to 16-38 – the Ordinance). Construction activities, including staging, dewatering, and construction work, have been designed to minimize impacts to Resource Areas to the extent practical by using appropriate erosion and sedimentation controls described in Section 4.1 and by conducting work far from the roadway when possible.

3.2.1 BANK (TO PERENNIAL STREAM, 310 CMR 10.54)

Permanent and temporary impacts to Bank will result from scour protection, clearing and grubbing, cofferdam installation, and dewatering. Table 4: Bank Impacts Summary describes the locations and areal extents of impacts.

Table 4. Bank Impacts Summary

LOCATION	BANK SERIES	IMPACT TYPE*	LENGTH (LF)
East of Station 3+00, along flags B2-102 to B2-103	BF2	Erosion control installation *	47
East of Station 3+00, along flags B2-102 to B2-100	BF2	Riprap scour construction	21
West of Station 3+00, along flags B2-99 to B2-96	BF2	Erosion control installation *	51
		TOTAL PERMANENT BANK IMPACTS:	21
		TOTAL TEMPORARY BANK IMPACTS:	98

Denotes a temporary impact that will be restored in-place per Project Specifications.

The majority of permanent impacts to Bank result from dredging and construction of the riprap scour protection. Temporary impacts result from water control through cofferdam installation and dewatering. Although riprap scour construction is considered a permanent impact, all impacts to Bank will be restored in place as described in Section 5.0.

3.2.2 Land Under Water (310 CMR 10.56)

Permanent and temporary impacts to LUW that occur within and adjacent to the Site will result from installation of water control / diversion devices, scour protection, cofferdam installation, and dewatering. A total of 6,566 square feet (sf) of LUW alteration is proposed within the Taunton River. Table 5: LUW Impacts Summary describes the locations and areal extents of impacts.

Table 5: LUW Impacts Summary

LOCATION	IMPACT TYPE*	AREA (SF)
Western side of the bridge between B2-97 and B2-96	Cofferdam installation and dewatering *	141
Western side of the bridge between B2-97 and B2-96	Dredging for access *	595
Western side of the bridge between B2-97 and B2-102	Dredging and installation of riprap scour protection	4,171
Eastern side of the bridge between B2-102 and B2-103	Cofferdam installation and dewatering *	1089
Eastern side of the bridge at B2-102	Dredging for access *	570
	TOTAL PERMANENT LUW IMPACTS:	4,171
	TOTAL TEMPORARY LUW IMPACTS:	2,395

****Denotes a temporary impact that will be restored in-place per Project Specifications.***

Permanent impacts to LUW result from dredging and the installation of riprap scour protection. 1,003 cy of material will be dredged from the Taunton River to install scour protection. Although a suitable streambed material will be placed on these impacts areas, the presence of new riprap scour protection has resulted in these impacts being qualified as permanent with in-kind restoration. Temporary impacts result from the temporary control of water through the use of a cofferdam during construction that will be restored after work is completed. Dredging to access the area of scour protection installation will be restored and results in temporary impacts.

3.2.3 Bordering Land Subject to Flooding (310 CMR 10.57)

No permanent fill is proposed within BLSF. A total of 1,039 sf of permanent BLSF impact is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing;
- Installation of riprap scour protection; and
- Updates to drainage outfalls.

3.2.4 Riverfront Area (310 CMR 10.58)

A total of 1,246 sf of permanent Riverfront Area impacts is proposed over the course of the Project. The majority of these impacts result from:

- Installation of riprap scour protection; and
- Installation of guardrails.

All temporary impacts will be restored in-place per the mitigation measures described in Section 4.0.

3.2.5 Wetland Protection Zone (The Ordinance)

A total of 705 sf of temporary and 1,273 sf of permanent impact to Wetland Protection Zone (WPZ) is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing; and
- Installation of riprap scour protection.

3.2.6 Wildlife Corridors (The Ordinance)

A total of 1,242 sf of permanent Wildlife Corridor impacts is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing;
- Installation of a new headwall and wingwalls for the existing 12" CMP outfall; and
- Installation of riprap scour protection.

3.2.7 100' Buffer Zone

A total of 705 sf of temporary impacts and 1,273 sf of permanent impacts to the 100' Buffer Zone is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing;
- Installation of guardrails;
- Roadway, sidewalk, and curb reconstruction;
- Drainage improvements; and
- Erosion control installation.

4.0 Mitigation Measures

4.1 Erosion and Sedimentation Controls

Best Management Practices (BMPs) for erosion and sedimentation controls will be adhered to for all phases of construction to minimize erosion, sedimentation, and impacts on Resource Areas.

Due to the clearing of vegetation, removal of dredged sediment and installation of stone, dust management will be necessary. Water will likely be used by contractors to minimize airborne particulate matter during construction.

Prior to final completion of construction, areas of exposed soils will be present at the Site and will require temporary stabilization. Temporary stabilization methods may include temporary seeding, application of straw mulch, and use of erosion control blankets. Erosion and sedimentation controls will be installed before any land disturbance begins and will remain in place for the duration of the Project. These control measures will be used throughout construction to prevent impacts to downgradient Resource Areas and may include compost filter tubes and siltation fencing or similar controls at the Contractor's specification. Compost filter tubes will be placed as close to the limit of soil disturbance as possible, along contours, and perpendicular to flow. Silt sacks will be used in all existing catch basins within and near the limit of work.

Erosion and sedimentation control measures will be implemented along the limit of work downgradient of the disturbed areas during construction to minimize further resource area impacts and act as a visual limit of work. Erosion and sedimentation barriers will be installed to reduce the chance of soil or sediment migration beyond the limits of work. Temporarily impacted areas will be restored to existing conditions

upon completion of the Project. Erosion and sedimentation controls will remain in place and in proper working order until the Site is completely stabilized. A stockpile of approved erosion and sedimentation control materials will be kept on-site for emergency and routine replacement.

The Contractor will be responsible for obtaining coverage under the Construction General Permit (CGP) pursuant to the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination Systems (NPDES). A Stormwater Pollution Prevention Plan (SWPPP) will be developed prior to any land disturbance. Per the SWPPP, the Contractor will monitor and assess conditions and identify problems in the field during and after construction activities.

4.2 Water Controls and Dewatering

The dredging of the streambed (LUW) and installation of riprap scour protection will require the implementation and maintenance of temporary water controls within the Taunton River so that the work can be completed in dry conditions. While the exact means and methods for water control will be determined by the contractor, it is anticipated that water controls will consist of cofferdams in the form of portadams or sandbags.

A Water Control Plan designed by a Massachusetts Registered Professional Engineer is required to be submitted prior to starting in-water work. The Water Control Plan will include a Sedimentation and Erosion Control Plan and a Water Flow Diversion and Containment plan. Work within Resource Areas, including placement of fill, will only occur within dewatered areas. Final LUW restoration will be overseen by a Fluvial Geomorphologist.

According to preliminary hydraulic studies performed for the Project, temporary closure of each half of the Taunton River will result in water levels remaining below bankfull conditions. Flow is expected to remain within the channel with no overbank flooding in response to a 2-year flood.

Cofferdams will be installed in two phases consistent with the phasing of the dredging work. Phase I addresses the southern half of the River and will divert flow through the northern cell, while Phase II addresses the northern half of the River and will divert flow through the southern cell. A Time of Year (TOY) restriction will be observed within the Taunton River from March 15th to June 30th and from September 1st to November 15th per TR-47 (pending confirmation from NOAA) to protect rare species habitat. Water controls will be installed and removed outside this period.

Dewatering of the work area will be completed to avoid an increase in turbidity over the baseline conditions. It is anticipated that the work area will be dewatered via pumping to a settling tank or dewatering system that filters the water prior to discharge back to the stream. The means and methods for dewatering will be determined by the Contractor at the time of construction based on Site-specific conditions and will be included in the prepared SWPPP which will be completed by the Contractor prior to the start of work.

4.3 Invasive Species Control

Invasive species observed at the Site by BETA include, Norway Maple (*Acer platanoides*), Garlic Mustard (*Alliera petiolata*), and Multiflora Rose (*Rosa multiflora*).

During or after construction, the contractor will employ BMPs designed to prevent further propagation of invasive plant species at the Site. These BMPs include proper disposal of any excavated invasive species, prevention of migration of rhizome fragments and seed pods, and cleaning vehicles of soil before and after accessing the Site. Any application of herbicides will be done in accordance with the practices set forth by the Massachusetts Department of Agricultural Resources.

4.4 STORMWATER MANAGEMENT

4.4.1 EXISTING STORMWATER MANAGEMENT

Stormwater runoff from the Site is described as Drainage Areas Ex-1E, Ex-2E, and Ex-3E in the Stormwater Report (Appendix B). Existing closed drainage systems are present along the roadway which convey stormwater runoff to two outfalls, one of which discharges to the Taunton River and one of which discharges to a nearby intermittent stream. No edge treatment is provided on the southern side of South Street East in Raynham, and stormwater runoff from this portion of the Site flows overland into a forested area.

4.4.2 PROPOSED STORMWATER MANAGEMENT

Stormwater management is proposed via modifications to the existing closed drainage system. Existing inlets will be replaced with deep-sump catch basins, and additional deep-sump catch basins will be installed throughout the corridor to provide more effective stormwater collection and treatment. New curbing is proposed to better direct stormwater runoff to catch basins. The majority of existing trunklines will be retained. The Project will retain existing drainage runoff patterns to the maximum extent practicable.

The Project will retain the existing outfall from the closed drainage system within the Town of Raynham and will replace the existing outfall associated with the closed drainage system within the City of Taunton. The new outfall will be increased in size from 12” to 18” and the existing headwall will be rebuilt at the same location.

The Project proposes a new 45’ 8” HDPE infiltration trench within the Town of Raynham near the northeastern limit of work. Stormwater runoff will be directed to this SCM through a new deep sump catch basin which will overflow into the existing closed drainage system.

Additionally, country drainage/pavement disconnection will be implemented for several portions of South Street East by excluding curbing to allow treatment in the grass/woodland area adjacent to the roadway. Of this, approximately 100’ of South Street East, on the eastern side of the roadway, drains to an area that meets the definition of qualifying pervious area and is comprised of approximately 1,500 sf of impervious area.

4.5 COMPLIANCE WITH STORMWATER STANDARDS

The Project complies with the MassDEP Stormwater Management Standards (the Standards).

The Project is classified as a Limited[3] and Redevelopment[4] project under section 310 CMR 10.53(3)(f) and (i). The proposed work within the roadway, such as replacing the existing catch basins with deep sump

[3]The following projects may be permitted as a limited project pursuant to 310 CMR 10.24(7) provided the project complies with all applicable provisions of 310 CMR 10.24(1) through (6) and (9) and (10): 1. Maintenance and improvement of existing public roadways, but limited to widening less than a single lane, adding shoulders, correcting substandard intersections, and improving drainage systems. 2. The maintenance, repair and improvement (but not substantial enlargement except when necessary to reduce or eliminate a tidal restriction) of structures, including buildings, piers, towers, headwalls, bridges and culverts which existed on November 1, 1987.

[4] Redevelopment means replacement, rehabilitation, or expansion of existing structures, improvement of existing roads or reuse of degraded or previously developed areas for purposes of 310 CMR 10.58, governing work in the riverfront area. For purpose of the Stormwater Management Standards as provided in 310 CMR 10.05(6)(k) through (q), redevelopment is defined to include the following projects: (a) maintenance and improvement of

catch basins, constitutes Redevelopment work because the work will substantially occur within an existing paved area. Redevelopment work is required to meet Standards 1 and 7 through 10 fully, and Standards 2 through 6 only to the maximum extent practicable.

This section details the regulatory framework for stormwater management, the existing impervious cover and stormwater system, an assessment of impacts, and the project's regulatory compliance with the Massachusetts Stormwater Standards.

4.5.1 Regulatory Framework

The Project consists of redevelopment of an existing / paved bridge and roadway, widening of roadway and installation of a bicycle pathway, relocation of an existing sidewalk from the eastern side of the bridge to the west, associate drainage infrastructure improvements, and installation of scour protection within the Taunton River. The Project complies with the MassDEP Stormwater management Standards that meets all standards to the maximum extent practicable.

The Project is classified as a Limited[5] and Redevelopment[6] project under section 310 CMR 10.53(3)(f) and (i). As a result, the Project is only required to meet Standards 1 and 7 through 10 fully, and Standards 2 through 6 only to the maximum extent practicable. The Stormwater design for these Standards is described in the following sections.

4.5.2 Regulatory Compliance

The Project will result in vegetative clearing, grading, and construction of 781 square feet of new impervious area. Accordingly, stormwater SCMs that comply with the Stormwater Management Standards are required.

The Project qualifies as Limited Redevelopment Project under the Stormwater Management Standards. This section provides a list of the Stormwater Management Standards and a brief description of the Project's compliance with the Standards to the maximum extent practicable.

LID Measures

Low Impact Development (LID) techniques utilized along portions of the Project include:

- Preservation of existing vegetation;
- Use of country drainage for portions of the Site; and
- Preservation of existing drainage patterns.

---

existing roadways including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving

[5]The following projects may be permitted as a limited project pursuant to 310 CMR 10.24(7) provided the project complies with all applicable provisions of 310 CMR 10.24(1) through (6) and (9) and (10): 1. Maintenance and improvement of existing public roadways, but limited to widening less than a single lane, adding shoulders, correcting substandard intersections, and improving drainage systems. 2. The maintenance, repair and improvement (but not substantial enlargement except when necessary to reduce or eliminate a tidal restriction) of structures, including buildings, piers, towers, headwalls, bridges and culverts which existed on November 1, 1987.

[6] Redevelopment means replacement, rehabilitation, or expansion of existing structures, improvement of existing roads or reuse of degraded or previously developed areas for purposes of 310 CMR 10.58, governing work in the riverfront area. For purpose of the Stormwater Management Standards as provided in 310 CMR 10.05(6)(k) through (q), redevelopment is defined to include the following projects: (a) maintenance and improvement of existing roadways including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving

Standard 1: No New Untreated Discharges

No new stormwater conveyances (e.g. outfalls) may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

The Project has been designed to comply with Standard 1. The Project proposes to replace the existing outfall from the City of Taunton closed drainage system. This work will include replacing the existing 12" MTL and 12" CMP outfalls with a new 18" DI outfall at the same location, replacing the existing headwall, and providing stone for pipe ends as stabilization to prevent erosion to the Taunton River. The Project proposes to retain the existing outfall from the Town of Raynham closed drainage system.

The Stormwater Management Report (Appendix B) provides supporting calculations for the outlet protection design.

Stormwater runoff will be treated by deep sump catch basins, the infiltration trench, or country drainage before discharging off-site.

See Standard 4 for the water quality treatment provided by the Project.

Standard 2: Peak Rate Attenuation

Stormwater management systems shall be designed so that the post-development peak discharge rates do not exceed pre-development peak discharge rates.

The Project has been designed to comply with Standard 2 only to the maximum extent practicable as a Redevelopment / Limited Project. This Project reduces post development peak runoff rates to below pre-development peak runoff rates for DP 3 during the 2-year and 100-year 24-hour design storm events based on NOAA Atlas 14 precipitation data as shown in Table 6. Otherwise, a net increase in peak runoff rates is anticipated for all design points and design storm events.

Table 6: Rainfall Depths (in)

DESIGN STORM EVENTS	RAINFALL DEPTH (in)
2-Year	3.42
10-Year	5.08
100-Year	7.71

Table 7 provides a summary of peak rates for each design point under existing and proposed conditions. The Stormwater Management Report (Appendix B) provides computations and supporting information regarding the hydraulic and hydrologic modeling.

Table 7: Peak Discharge Rates (cfs)

DESIGN POINT	EXISTING RATE (cfs)			PROPOSED RATE (cfs)		
	2-Year	10-Year	100-Year	2-Year	10-Year	100-Year
DP 1	1.14	2.08	3.61	1.23	2.22	3.81
DP 2	0.74	1.39	2.44	0.67	1.28	2.20
DP 3	0.52	1.11	2.14	0.39	0.90	1.81
TOTAL	2.40	4.58	8.19	2.29	4.41	7.82

The Project is unable to fully meet this standard due to constraints including right-of-way, grades, and existing developed properties. This Project includes a net increase of 781± square feet of impervious surface, which will result in minor increases to the volume and rate of stormwater runoff from the Project area. This increase in impervious area is necessary to provide sidewalks where none currently exist. Despite Project constraints and an increase in peak flow rates, the proposed deep-sump catch basins and infiltration trench will improve existing conditions throughout the Project corridor. Refer to HydroCAD calculations provided in the Stormwater Management Report (Appendix B) for additional information.

Standard 3: Recharge

Loss of annual recharge to groundwater shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The Project has been designed to meet this standard on a Project-wide basis, as the Project is a Redevelopment / Limited Project. The Project has significant right-of-way constraints, which restrict opportunities for recharge on the southern portions of the Site. Despite constraints, the proposed infiltration trench has been designed to provide the sitewide required recharge volume for new and a portion of the existing impervious area. However, the required recharge volume will not be achieved for design points DP 1 and DP 2.

Table 8 provides the required recharge volume for the Project, and Table 9 provides the recharge volumes proposed for each design point.

Table 8: Required Recharge Volume for Project

	HSG A	HSG B	HSG C	HSG D	Total
Existing Impervious (sq. ft)	26,829		1,964	2,417	31,210
Proposed Impervious (sq. ft)	27,280		2,213	2,498	31,991

Required Recharge Volume, ReV (cf)	-79.65		5.08	-3.58	-78.14
Provided Recharge Volume (cf)	0.00		0		0.00

The infiltration SCMs are designed to drain completely within 72 hours.

Standard 4: Water Quality Treatment

Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS)

The Project has been designed to comply with Standard 4 only to the maximum extent practicable as a

Redevelopment / Limited Project. Proposed drainage system improvements, including the installation of deep sump catch basins and an infiltration trench will provide treatment of stormwater runoff that does not currently exist and will improve existing conditions. The proposed Project will provide an average TSS removal rate of 20% for 31,991± sq. ft. of impervious surfaces.

The Project is located in an area with a rapid infiltration rate (>2.4 in/hr) and the required water quality volume has been calculated based on the 1.0" water quality depth.

Table 10 shows the WQV to be treated for both new and existing impervious area within each drainage area, organized by design point.

Table 10: WQV at Each Design Point

DESIGN POINT	WQV FOR NEW IA (cf)	WQV FOR EXISTING IA (cf)	TOTAL WQV (cf)

Project Total	**65.08**	**2,600.83**	**2,665.92**

Table 11 shows the WQV provided by the SCMs at each design point.

Table 11: WQV by the SCMs at Each Design Point

DESIGN POINT	PRETREATMENT (Y/N)	*WQV PROVIDED (cf)*	*MEETS TOTAL WQV (cf)*	*MEETS REQUIRED WQV for NEW IA*
DP-1		0	No	No
DP-2			No	Yes
Linear Infiltration Practice	Y	81.42	No	Yes
Total	Y	81.42		
DP-3		0		
Project Total			***No***	***Yes***

Opportunities to install treatment and recharge SCMs are limited due to the aforementioned constraints. Despite Project constraints, the proposed deep sump catch basins and linear infiltration practice will improve existing conditions throughout the Project corridor. Refer to Appendix A in the Stormwater Management Report for calculations relating to TSS Removal. Refer to Illicit Discharge Compliance Statement under Standard 10.

Appendix B includes the Long Term Pollution Prevention Plan for this Project.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

Land use with high potential pollutant loads must have source control and pollution prevention measures implemented in accordance with the Massachusetts Stormwater Handbook.

Standard 5 does not apply to the Project. There are no Land Uses with Higher Potential Pollutant Loads proposed as part of the Project.

Standard 6: Critical Areas

Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of specific source control, pollution prevention measures.

Standard 6 does not apply to the Project. There are no Critical Areas near the Project area.

Standard 7: Redevelopment

A redevelopment project is required to meet certain Stormwater Management Standards only to the maximum extent practicable.

The Project is a Redevelopment Project under the first definition: “Maintenance and improvement of existing roadways, including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving.” Proposed deep sump catch basins and infiltration trench will provide treatment to the maximum extent practicable and represent an improvement to the existing conditions. Standards 1, 8, 9, and 10 are met, Standards 3 and 4 are met on a Project-wide basis, and Standard 2 is met to the maximum extent practicable. Standards 5 and 6 are not applicable to this Project.

Standard 8: Construction Period Pollution Prevention and Erosion and Sediment Control

A plan to control construction related impacts, including erosion, sedimentation, and other pollutant sources during construction and land disturbance activities shall be developed and implemented.

The implementation of erosion and sedimentation (E&S) controls during construction is considered a standard practice for all City projects. E&S controls will be installed before any land disturbance begins for the Project and will remain in place for the duration of the Project. The E&S controls for the Project are shown on the Project plans and include perimeter sediment control barrier, tree protection, temporary cofferdam for water control, and dewatering.

The Project as currently design disturbs one or more acres of land; therefore, the Project contractor will request coverage under the NPDES Construction General Permit (CGP) and develop a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP follows the requirements of this standard and complies with the NPDES CGP.

Standard 9: Long Term Operation and Maintenance Plan

A Long-Term Operation and Maintenance Plan shall be developed and implemented to ensure that stormwater management systems function as designed.

The roadway and bridge included in this Project are located in both the City of Taunton and the Town of Raynham. Ownership is divided between the City of Taunton and the Town of Raynham. The activities included in the O&M Plan will be implemented by the municipality. Appendix B of the Stormwater Management Report (Appendix B) includes the O&M Plan for this Project.

Standard 10: Prohibition of Illicit Discharges

All illicit discharges to the stormwater management system are prohibited.

The Project's stormwater management system, as shown on the plans submitted with this report, has been designed in full compliance with Standard 10. The Project area does not have any known illicit connections. Any illicit connections to the stormwater management system found in the Project limit of work during construction will be removed and/or resolved through the City's Illicit Discharge Detention and Elimination (IDDE) Program. The Long-Term Pollution Prevention Plan, provided in Appendix B of the Stormwater Report (Appendix B), includes measures to prevent illicit discharges.

For additional details see Stormwater Report in Appendix B– Stormwater Management Report details the stormwater management improvements proposed by the Project and describes the Project's relation to the Stormwater Management Standards.

The Contractor will be responsible for obtaining a National Pollutant Discharge Elimination Systems (NPDES) Dewatering and Remediation General Permit (DRGP). A Stormwater Pollution Prevention Plan (SWPPP) will be prepared prior to any land disturbance and will be submitted to the Conservation Commission for review and approval. Per the SWPPP, the Contractor will monitor and assess conditions and identify problems in the field during and after construction activities.

4.6 Resource Area Restoration and Replication

The Project was designed to avoid, minimize, and mitigate impacts to Resource Areas, wildlife habitat, and other sensitive areas. Due to the nature of the Project being a bridge replacement within a linear corridor, avoidance of impacts is infeasible; however, they have been minimized to the extent possible. Impacts will be mitigated with LUW and BVW restoration as described below.

4.6.1 LUW Restoration

To address the proposed permanent LUW impacts, the Project will restore the LUW conditions in place through the addition of native streambed material over installed scour protections. To restore LUW, 2'-8" layer of streambed material will be placed over a 2'-0" layer of dumped Class III riprap, which will all be over 1' of crushed stone for a total depth of 5'-8". The riprap will extend the length of the channel from each abutment and will extend 25' upstream and downstream of the embankment. All 6,566 sf of permanent and temporary LUW impacts will be restored in place.

4.6.2 Bank Restoration

To address the proposed temporary Bank impacts caused by the installation of erosion controls, all 98 lf of temporary Bank impacts and 21 lf of permanent Bank impacts will be restored through the application of a native roadside part-shade seed mix. Four inches (4") of loam and seed will be applied over pavement milling mulch.

Erosion and sedimentation controls will be 100% biodegradable and left in place at the conclusion of the Project. Compost filter tubes will be overlapped by a minimum of 3' for a continuous barrier and secured using hardwood stakes. Erosion and sedimentation controls will be used to reduce flow onto work and to prevent flow off-site by placing the controls as close to the area of disturbance as possible. Compost filter tube berms will be used for slopes 2:1 or steeper and will be staked every 5' to secure the tube or per the manufacturer's instructions. Any non-biodegradable material, if used, will be removed and disposed of off-site at the Contractor's expense. Filter tube compost will be spread or raked around to eliminate berm. The restored areas will be monitored over the course of two (2) years to document adequate hydrology and plant survivability.

BMPs will be employed by the Contractor to prevent further propagation of invasive plant species at the Site. These BMPs include proper disposal of any excavated invasive species, prevention of migration of rhizome fragments and seed pods, and cleaning vehicles of soil before and after accessing the Site. Any application of herbicides will be done in accordance with the practices set forth by the Massachusetts Department of Agricultural Resources. Further details regarding invasive species control can be found in Appendix D – Project Plans.

5.0 Alternatives Analysis

The purpose of this Project is to reconstruct a structurally deficient bridge, protect the bridge from scour, and improve safety for vehicles, cyclists, and pedestrians. As described in further detail within the Alternatives Analysis prepared for the Project (Appendix G), several factors were considered when determining the scope and approach of the Project design, including cost, construction constraints, and environmental concerns.

The intent of this analysis is to demonstrate that there is no alternative to the Project with less impacts on the environment that meets the Project purpose. Accordingly, this Alternatives Analysis focuses on the considerations made during the preparation of the Bridge Reconstruction R-02-003=T-01-004 Alternatives Analysis and were used to develop this Alternatives Analysis. This Alternatives Analysis assesses the following alternatives:

- No-Build Alternative;
- 10' Travel Lanes and 4' Shoulder on Safety Curb Side (Alternative #1 – Preferred);
- 12' Travel Lanes and 2' Shoulders on Either Side (Alternative #2);
- No Scour Protection (Alternative #3); and
- Embedment Below Scour Depths (Alternative #4).

5.1 Project Construction Alternatives

5.1.1 No-Build Alternative

The No-Build Alternative was assessed as a potential Project alternative. Under the No-Build Alternative, no aspect of the Project purpose as defined above is realized. While the No-Build Alternative would not result in a loss of Resource Areas the Old Colony Avenue Bridge would remain deteriorating and insufficient for safe public transportation. Pursuing the Non-Build Alternative is not consistent with the Project purpose and would not serve the needs of the City of Taunton or the Town of Raynham, therefore, this alternative was not selected.

5.1.2 Alternative #1: 10-Foot Travel Lanes and 4-Foot Shoulder on Safety Curb Side (Preferred)

Alternative #1 features a cross-section with two 10'-wide travel lanes in each direction, accompanied by one 2' -wide shoulder on the sidewalk side and one 4'-wide shoulder on the safety curb side. Sidewalk is proposed on the west side of the roadway. The sidewalk is 6' wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5' wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative #1 will require a design justification for pedestrian accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, a 4' shoulder was provided on the east side, which is the minimum width for bicycle accomodation. A 2' shoulder was provided on the west side against the sidewalk for drainage, errant vehicles, and encroachment and off-tracking of wide vehicles. Sharrows can be added in the northbound lane.

Alternative #1 results in impacts to LUW totaling 6,566 sf (4,171 sf permanent and 2,395 square feet temporary); and impacts to Bank totaling 119 lf (21 lf permanent and 98 lf temporary). Alternative #1 and Alternative #2 result in the same impacts to Resource Areas.

Alternative #1 allows for bicycle accommodation southbound with a 4' shoulder, while still maintaining the minimum lane width for a collector of 10'. Old Colony Avenue and South Street East is a bus route on the Greater Attleboro Taunton Regional Transit Authority. Bus lanes are permitted on 10' travel lanes. The narrower 10' roadway will help reduce speeds. Alternative #1 presents an improvement upon existing bridge conditions and achieves the Project's purpose and need with no increase in Resource Area impacts compared to Alternative #2. Therefore, Alternative #1 is the preferred alternative.

5.1.3 Alternative #2: 12-Foot Travel Lanes and 2-Foot Shoulders on Either Side

Alternative #2 features a cross-section with two 11'-wide travel lanes in each direction, accompanied by two 2'-wide shoulders. Vertical granite curbing lines both sides of the roadway. Sidewalk proposed on the west side of the roadway. The sidewalk is 6' wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5' wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative #2 will require a design justification for pedestrian accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, 2' shoulders were provided on both sides of the roadway. Sharrows can be added to both travel lanes.

Alternative #2 results in impacts to LUW totaling 6,566 sf (4,171 sf permanent and 2,395 square feet temporary); and impacts to Bank totaling 119 lf (21 lf permanent and 98 lf temporary). Alternative #1 and Alternative #2 result in the same impacts to Resource Areas.

Alternative #2 presents the same conditions as existing conditions, where the lane widths are 11' wide and the shoulders are 2' wide. Alternative #2 does not propose any pedestrian or bicycle improvements in addition to addressing unsafe bridge conditions, while providing no decrease in impacts to Resource Areas. Therefore, Alternative #2 was not selected.

5.1.4 Alternative #3: No Scour Protection

Alternative #3 includes the design provisions of the preferred Alternative #1 without the addition of scour protection. In Alternative #1, scour protection consists of a 2'-8" layer of streambed material over 2'-0" layer of dumped riprap, which will all be over 1' of crushed stone for a total depth of 5'-8". Constructing the Project without scour protection eliminates the need for dredging and dewatering, reducing impacts to Resource Areas. Although Alternative #3 results in less impacts to Resource Areas, scour protection has been determined as necessary to protect the Taunton River and bridge from scour and eventual compromising of the substructure. Therefore, Alternative #3 was not selected.

5.1.5 Alternative #4: Embedment Below Scour Depths

Alternative #4 proposes to lower the bridge footings below predicted scour depths. This alternative would require the substructure to be replaced in order to embed it below the level where scour would occur.

Hydraulic analysis confirms that scour countermeasures are required around the bridge to prevent erosion. Under proposed conditions, the scour analysis predicts contraction scour of approximately 2.6' to 2.7' and worst local abutment scour of approximately 13' during the 25-year and 50-year storm events. Total predicted scour exceeds 5'. These scour depths indicate that the existing bridge is vulnerable to scour without protection. Accordingly, riprap countermeasures are required to protect the substructure and reduce erosion risk during flood events. Dredging is only proposed to install scour countermeasures. An alternative to installing scour protection would be to replace the substructure and embed it to a depth below the level where scour would occur. However, this alternative would still result in significant impacts to LUW and Bank associated with water controls and pier removal/installation and would be cost-prohibitive to the City of Taunton based on current funding. Installation of scour protection is significantly less costly than substructure replacement and the proposed 2' of native streambed material proposed over the scour protection will provide appropriate restoration in the final condition.

Alternative #1 was selected because the installation of riprap countermeasures is necessary to protect the area around the bridge from scour and results in less disturbance than Alternative #4. The proposed riprap countermeasures are consistent with the MassDOT Bridge Manual - Hundredth Anniversary Edition.

6.0 Regulatory Compliance

The Project is proposed under the provisions specified under City of Taunton Wetlands Protection Ordinance, which builds upon the provisions of the Massachusetts Wetlands Protection Act pursuant to "Home Rule". The Project was designed to meet the Performance Standards of the Act, and where more stringent, the Ordinance.

The Project will result in the following impacts:

- 98 linear feet (lf) of temporary and 21 lf of permanent impact to Bank;
- 2,395 square feet (sf) of temporary and 4,171 sf of permanent[7] impact to LUW associated with a dredge volume of 1,003 cubic yards (cy);
- 1,039 sf of permanent impact to BLSF;
- 1,246 sf of permanent impact to Riverfront Area;
- 1,242 sf of permanent impact to Wildlife Corridor; and

[7] Permanent impacts denote areas which are subject to the placement of scour protection and covered with up to two feet of compatible sediment for restoration.

- 1,273 sf of permanent and 705 sf of temporary impact to the Wetland Protection Zone.

6.1 Massachusetts Stream Crossing Standards

The Project only proposes the replacement of the superstructure and will make no changes to the existing bridge substructure. While the existing conditions do not fully meet all Massachusetts Stream Crossing Standards, the proposed Project conditions meet the Standards to the maximum extent practicable. The compliance of the existing bridge with the Standards will not change given the nature of the work being applicable only to the superstructure. Proposing improvements to the bridge to meet the Standards would require a full bridge substructure replacement which is outside the scope of the Project.

The existing structure is an approximately 90' two-span bridge with equal spans of approximately 45'. The hydraulic opening of the existing bridge is 79' with a sharp nose pier that varies in width from 3' to 2.75'. The bankfull width of the Taunton River is estimated to be approximately 99.5'. Bankfull width was calculated in AutoCAD by measuring the width between flags of the B1/B2 Series, taking the average of three (3) bankfull widths upstream of the bridge and three (3) bankfull widths downstream of the bridge. Table 12: Stream Crossing Standards Compliance demonstrates the Project's ability to comply with the Massachusetts Stream Crossing Standards as follows:

Table 12: Stream Crossing Standards Compliance

Stream Information and Standards	Existing/Proposed Project
Standard 1 **Crossing Type**	Bridge – **Met** (**Optimal Standard Met)**
Standard 2 **Embedment > 2 feet**	Crossing type is a bridge. **Not Applicable**
Standard 3 **Crossing Span >1.2*BFW**	BFW = 99.5' 1.2*99.5' = 119.4' Span = 79.0' 79.0' < 119.4' **Not Met**
Standard 4 **Substrate Type**	Simulated natural substrate will be used to restore streambed (LUW) **Met**
Standard 5 **Water Depth and Velocity**	The Project will result in water depths and velocities equivalent to existing conditions during 25/50/100-year storm events at the location of the Bridge. **Met – proposed water depths and velocity are comparable to existing conditions upstream and downstream of the bridge. See Appendix H– Hydraulic Analysis and Scour Report.**
Standard 6 **Openness Ratio > 0.82**	$\frac{15.6' \; x \; 79.0'}{37.7'}$ = 32.69 Openness Ratio: 32.69 > 1.64 (Optimal) > 0.82 Height: 15.6' > 6' (Optimal)

	Met (Optimal Standard Met)

6.2 CITY OF TAUNTON WETLANDS PROTECTION ORDINANCE (THE ORDINANCE)

The City of Taunton has individual wetland protection regulations, which outline the specific wetland protections applied within its municipal boundaries. While some of these regulations are unique to the Ordinance, it relies on the Act for the majority of the wetland protection regulations. Therefore, references to the Act Performance Standards per 310 CMR 10.00 are included below as appropriate. The Project will fully adhere to Performance Standards for Bank, LUW, and BLSF.

6.2.1 INLAND BANK – GENERAL PERFORMANCE STANDARDS – 310 CMR 10.54(4)

Work impacting Inland Bank will fully meet the Performance Standards at 310 CMR 10.54(4). Permanent impacts to Bank result from scour protection that will not impair the capacity of the Bank to provide wildlife habitat, water carrying capacity, or physical stability of the Bank. Once scour protection is placed, a typical modified rockfill detail will be used (i.e., voids will be filled with loam/compost, seeded with a native seed mix, and covered with erosion control matting if necessary). Final grades will match existing conditions and there will be no change to the geometry of the River. Temporarily impacted banks will be restored to existing grade and stabilized with a native seed mix.

6.2.2 LUW – GENERAL PERFORMANCE STANDARDS – 310 CMR 10.56(4)

The Project will involve the loss of less than 5,000 sf of LUW (4,171 sf) that shall be mitigated in accordance with the Performance Standards listed at 310 CMR 10.56(4)(a)1. through 5. There will be no loss in capacity of LUW to support the interests of the Ordinance.

Dredging will remove 1,003 cy that will be restored in-place through the placement of streambed material over the proposed scour protection, which will protect ground and surface water quality following Project completion. Temporary impacts to LUW will be restored in-place following construction activities through then restoring with native streambed material over the proposed scour protection to reestablish existing wildlife habitat functions. All temporary LUW impacts will be restored upon completion of the Project. Therefore, work impacting LUW will meet the Performance Standards at 310 CMR 10.56(4) because impacted areas will be restored in-place and stream crossing conditions will not change from existing conditions. While areas with proposed scour protection are quantified as permanent impacts, conditions at the surface of the streambed will match existing conditions.

6.2.3 BORDERING LAND SUBJECT TO FLOODING – 310 CMR 10.57(4)

Work impacting BLSF will meet the Performance Standards at 310 CMR 10.57(4) fully, as the proposed permanent impacts will not impair the capacity of the BLSF to provide wildlife habitat or flood storage. No fill is proposed within BLSF, and all land disturbances will be restored and/or stabilized.

6.2.4 RIVERFRONT AREA – 310 CMR 10.58(4)

The Project proposes temporary and permanent impacts to the RA to the Taunton River; however, the Performance Standards will be met fully. There are no practicable or substantially equivalent alternatives that would result in less adverse effects on the interest of the Act as discussed in the Alternatives Analysis provided in Section 5. All alternatives for the Project result in the same impacts to RA with the exception of the No Build Alternative, which was not selected due to it being inconsistent with the Project purpose.

The bridge carrying Old Colony Avenue over the Taunton River was constructed in 1946. Proposed impacts total less than 5,000 sf, are primarily temporary, and are proposed within an area of maintained roadway. Due to the bridge's proximity to the roadway, a 100'-wide vegetated area does not exist between the

structure and the roadway. RA in the vicinity of the Project primarily consists of maintained road, road shoulder, and vegetated areas. Roadway resurfacing was not considered in impact calculations or the assessment of Performance Standards compliance, as this activity will only occur within an existing altered footprint and will not result in new encroachment into RA. Cleared areas of vegetation will be restored following completion of the work to replace any lost wildlife habitat. There are no vernal pools in the vicinity of the Project. Temporarily cleared vegetation adjacent to the roadway will be restored using native seed mix.

The Project qualifies as a Redevelopment Project under the Massachusetts Stormwater Management Standards and will meet Standards 1 and 7 through 10 fully. Erosion and sedimentation controls will be maintained throughout the Project, and work within the Taunton River will be conducted in the dry to prevent migration of sediment into the waterway. Erosion controls will only be removed once full stabilization of the Site is achieved. Therefore, work within Riverfront Area fully complies with the Performance Standards at 310 CMR 10.58(4).

6.2.5 Wetland Protection Zone (WPZ) (The Ordinance)

The WPZ allows for limitations and prohibitions on activities that may negatively impact a Resource Area. It is assumed that a 25' WPZ would be established for the Site.

Due to the proximity of the Project area to adjacent Bank, work will occur within the WPZ to Bank at the Site. Adjacent resources areas will be protected during construction via the proper installation and maintenance of erosion controls, and all disturbed areas will be restored following construction. Given that the Project consists of bridge work within and over the Taunton River, work within the WPZ is required to complete the Project.

6.2.6 Wildlife Corridor (The Ordinance)

The Ordinance defines Wildlife Corridors as: "*contiguous areas of land within a Wetlands Protection Zone, which provide feeding areas, breeding areas, and normal home range movement for wildlife. An area will be deemed a wildlife corridor upon presentation of credible evidence of the corridors and wildlife value. Wildlife corridors may be both narrow and vulnerable. Wildlife corridors can also contain core vegetative life, which make them sensitive and important for plant diversity*." A narrow strip of contiguous area is located along the southern (B2 Series) Bank to the Taunton River located within the City of Taunton. This area is primarily developed; however, it supports vegetation that may provide habitat for wildlife and therefore may be considered a Wildlife Corridor under the Ordinance.

A total of 1,242 sf of permanent Wildlife Corridor impacts is proposed over the course of the Project. The work within the Wildlife Corridor includes clearing and grubbing, installation of a new headwall and wingwalls for the existing 12" CMP outfall, and installation of scour protection. The streambed (LUW) and Banks will be restored with native streambed material and seed mix, respectively; therefore, wildlife habitat function is not anticipated to be impacted by the Project. In addition, the ability for wildlife to be able to pass through the crossing/bridge will not be permanently impacted by the Project.

7.0 Summary

The proposed Project is anticipated to provide a critical bridge replacement to support motorist, cyclist, and pedestrian safety along Old Colony Avenue and South Street East. Construction of the Project will result in permanent and temporary impacts to jurisdictional Resource Areas, which have been minimized to the maximum extent possible and will be mitigated through in-kind restoration. The Project has been

designed to meet all local, state, and federal standards and comply with the regulations set forth in the Ordinance as described herein.

The City of Taunton respectfully requests that the Taunton Conservation Commission find these measures adequately protective of the interests of the Ordinance, the Order of Conditions approving the work as described in the Notice of Intent and accompanying plans.

APPENDIX A – Resource Area Boundary Delineation Report

IMPROVING COMMUNITIES TOGETHER

Resource Area Boundary Delineation
Old Colony Avenue Bridge
Taunton and Raynham, Massachusetts

July 01, 2024

On March 31, 2023, BETA Group, Inc. (BETA) Wetland Scientists performed Wetland Resource Area delineations near the bridge over the Taunton River along Old Colony Avenue in Taunton and South Street East in Raynham, Massachusetts (the Site). This report describes Wetland Resource Areas Subject to Protection under the Massachusetts Wetlands Protection Act (M.G.L. Chapter 131 Section 40 - the Act), the City of Taunton Wetlands Protection Ordinance (City of Taunton Code (2010) §§ 16-30 to 16-38 – the Ordinance), the Raynham Wetland Protection Bylaw (the Bylaw), the federal Clean Water Act (33 U.S.C. §1251 et seq (1972)), and the Massachusetts Clean Waters Act (MGL Chapter 21 Section 26-53) that exist on or within 100 feet of the Site as well as the methodologies used to delineate their boundaries.

Site Description

The Site consists of a two-lane bituminous concrete roadway and underlying bridge that spans the Taunton River at the municipal boundary between the City of Taunton and the Town of Raynham (Figure 1 – Site Locus). The bridge is a two-span reinforced concrete deck supported on reinforced concrete abutments and timber piles. The Site is bounded by undeveloped forest and residential housing to the north, multi-family residential and industrial properties to the south, and the Taunton River to the east and west (Figure 2 – Environmental Resources).

According to the USDA Natural Resources Conservation Service – Soil Survey, mapped soils on and within proximity to the Site are generally classified as Urban Land, Birdsall silt loam and Udorthents, smoothed. Field observations generally confirmed the soil types at the Site. The *Custom Soil Resource Report for Bristol County, Massachusetts, Northern Part* is attached.

State jurisdictional Resource Areas identified within 100 feet of the Site include Inland Bank (to perennial and intermittent streams), Bordering Vegetated Wetlands (BVW), Land Under Water (LUW), Bordering Land Subject to Flooding (BLSF), and Riverfront Area (RA). The MassGIS database was used as the initial step in identifying critical areas on or within proximity to the Site. The table below describes selected environmentally critical categories as determined through MassGIS.

Jurisdictional Wetland Resource Areas – Massachusetts Wetlands Protection Act

A Site visit was conducted by BETA Wetland Scientists on March 31, 2023 to identify and delineate the boundaries of Wetland Resource Areas at and in the immediate vicinity to the Site. Resource Area boundaries were identified and delineated in accordance with methods developed by the Massachusetts Department of Environmental Protection's *Delineating Bordering Vegetated Wetlands Under the Massachusetts Wetlands Protection Act: Second Edition*, dated September 2022, as well as definitions set forth in the Wetland Regulations, 310 CMR 10.00. Several areas subject to Protection under the Act exist along the Site and are described below.

Inland Bank (to perennial and intermittent streams) – 310 CMR 10.54

According to 310 CMR 10.54(2), the definition of a Bank is the portion of the land surface which normally abuts and confines a water body, occurring between a water body and a vegetated bordering wetland and adjacent floodplain, or, in the absence of these, it occurs between a water body and an upland. The upper boundary of a Bank is the first observable break in the slope or the mean annual flood level, whichever is lower.

BETA identified the resource Bank to one (1) perennial stream (the Taunton River) and one (1) unnamed intermittent stream within and near the Site. Banks were delineated in the field with blue flagging as described in Table 2.

Table 2: Bank Boundary Description

Flag Series	Location	Description / Notes
B1 Series *Flags* *B1-99 to 95, and B1-100 to 106* *B2 Series* *Flags* *B2-91 to 99, and 100 to 105*	Taunton River, located east, under and west of the Old Colony Ave Bridge	The northern (*B1 Series*) and southern (*B2 Series*) Banks associated with the Taunton River, a perennial stream, that generally flows west were delineated in two (2) segments along the first observable break in slope consistent with the mean annual flood level. The Bank north of the Taunton River was delineated west (*B1-99 to B1-95*) and east (*B1-100 to B1-106*) of the Old Colony Avenue Bridge in Raynham. Banks west of the bridge were generally well defined and consisted of eroded soils. Banks east of the bridge were observed to be undercut and also consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including bush honeysuckle (*Diervilla lonicera*), silky dogwood (*Cornus amomum*) and Norway maple (*Acer platanoides*). Populations of poison ivy (*Toxicodendron radicans*) were also observed. The Bank south of the Taunton River was delineated west (*B2-91 to 99*) and east (*B2-100 to 105*) of the Old Colony Avenue Bridge in Taunton. Banks west of the bridge were generally poorly defined and consisted of rocks and stones of various sizes. Banks east of the bridge were generally well defined and generally consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including slippery elm (*Ulmus rubra*),

Flag Series	Location	Description / Notes
		Norway maple, and silky dogwood. Populations of poison ivy were also observed. The channel width downstream of the Old Colony Avenue bridge is between 95 to 110 feet wide with a mucky, gravel substrate. The channel width upstream is 90 to 100 feet wide with a mixed cobble, gravel, and mucky substrate. Water depths within the Taunton River could not be determined in the field. The Taunton River is mapped as perennial on USGS topographic maps; therefore, it meets the definition of a perennial stream (River) per 310 CMR 10.58(2).
B3/B4 Series *Flags* *B3-96 to 107 and B4-96 to 107*	Northwest of Old Colony Avenue Bridge at 0 South East Street	The interior (*B4 Series*) and exterior (*B3 Series*) Banks associated with a shallow, braided intermittent stream west of South Street East were delineated along the first observable break in slope (consistent with the mean annual flood level). The *B3/B4 Series* stream flows west out of a drainage outfall associated with the closed drainage system under South Street East in Raynham, where flow becomes braided prior to reaching a confluence west of the Site. The *B3/ B4 Series* Banks were primarily vegetated with silky dogwood. The channel is approximately 3 to 5 feet wide and 2 to 6 inches deep with a substrate of sand and muck. This stream is not depicted on current USGS topographic maps or on the StreamStats program; therefore, it is presumed to be intermittent.

Bordering Vegetated Wetlands – 310 CMR 10.55

According to 310 CMR 10.55(2), the definition of BVW are freshwater wetlands which border on creeks, Rivers, streams, ponds and lakes and are areas where the soils are saturated and/or inundated such that they support a predominance of wetland indicator plants. The boundary of BVW is the line within which 50% or more of the vegetation community consists of wetland indicator plants and saturated or inundated conditions exist.

BETA identified two (2) areas of BVW within and adjacent to the Site. US Army Corps of Engineers' *Vegetated Wetland Boundary Delineation Field Data Sheets* documenting BETA's observed evidence of hydrology, soils, and hydrophytic vegetation at specific data plots are attached.

Table 3: BVW Boundary Description

Flag Series	Location	Description / Notes
WF1 Series *Flags* *WF1-108 to 111*	Northwest of Old Colony Avenue Bridge at 0 South East Street	The *WF1 Series* BVW is a scrub shrub wetland bordering on the *B3/B4 Series* intermittent stream. The attached U.S. Army Corps of Engineers Field Data Sheets describe evidence of hydrophytic vegetation, hydric soils, and indicators of hydrology at a specific data plot.

Flag Series	Location	Description / Notes
WF2 Series *Flags* *WF2-100 to 102*	Along the northern Bank of the Taunton River	The *WF2 Series* BVW is a scrub shrub wetland located along the northern bank of the Taunton River, west of the *B1 Series* Bank. Dominant hydrophytic vegetation observed within the area includes silky dogwood. Evidence of hydrology observed in the field includes sediment deposition and stressed vegetation (buttressed roots), and hydric soils indicators including sandy soils with prominent redox concentrations. A formal data plot was not performed at this location.

Land Under Water – 310 CMR 10.56

According to 310 CMR 10.56(2), the definition of LUW is the land beneath any creek, river, stream, pond or lake and may be composed of organic muck or peat, fine sediments, rocks or bedrock. LUW exists between the Bank boundaries below the mean annual low water levels of the streams delineated at the Site (Table 2). The boundary of LUW is the mean annual low water level. This boundary was not delineated in the field.

Bordering Land Subject to Flooding – 310 CMR 10.57

According to the Federal Emergency Management Agency (FEMA) FIRM Number 25005C0169G, dated July 16, 2015, a Zone AE Flood Hazard associated with the Taunton River exists at the Site with Base Flood Elevations (BFE) ranging from 14.4 feet (NAVD88) downstream of the bridge and 14.8 feet (NAVD88) upstream of the bridge. The Site is also located within the Regulatory Floodway of the Taunton River. Any work performed within BLSF (i.e. areas with a 0.1% yearly chance of flooding) is Subject to Jurisdiction under the Act.

Riverfront Area – 310 CMR 10.58

According to 310 CMR 10.58(2), RA is defined as the area of land between a river's MAHW line and a parallel line measured 200' away horizontally. A River is any natural flowing body of water that empties to any ocean, lake, pond, or other River flowing throughout the year and is shown as perennial on the current United States Geological Survey or more recent map provided by the Department, or has a watershed size of at least 0.50 square miles and a predicted flow rate greater than or equal to 0.01 cubic feet per second at the 99% flow duration using the USGS Stream Stats Method.

As noted in Table 2 above, the B1/B2 Series stream qualifies as a perennial stream (River) and is therefore afforded a 200-foot RA. The RA at the Site would be measured 200 feet horizontally from the MAHW flags. Descriptions of the MAHW boundaries associated with the Taunton River are provided below in Table 4.

Table 4: MAHW Boundary Description

Flag Series	Waterbody	Description / Notes
B1 Series *Flags* *B1-99 to 95, and B1-100 to 106* *B2 Series* *Flags* *B2-91 to 99, and 100 to 105*	Taunton River	The northern (*B1 Series*) Banks were delineated at the mean annual flood level (coincident with the mean annual high-water mark – MAHW) approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation and scour. The southern (*B2 Series*) Banks were delineated approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation, scour and the presence of debris.

Jurisdictional Wetland Resource Areas – City of Taunton

The City of Taunton protects resource areas under the City of Taunton Wetlands Protection Ordinance and Conservation Ordinance Regulations. In some instances, these regulations provide additional jurisdiction and protection beyond what is set forth in the Wetlands Regulations at 310 CMR 10.00.

Freshwater Wetland

The Ordinance and Regulations defines a freshwater wetland per the definition presented in the Act, or if it meets two of three total criteria including vegetation within the community consisting of at least 50% wetland plant species, hydric soils are present, or hydrology or field indicators of hydrology are present. BVWs delineated at the Site (Table 3) meet the Ordinance definition of a freshwater wetland.

Vernal Pool

The Ordinance and Regulations consider vernal pools to be *"any confined basin depression that has been certified as such by the Natural Heritage and Endangered Species Program or has been demonstrated by credible proof to contain obligate vernal pool breeding species".* A potential vernal pool (PVP) is mapped interior to the *WF1 Series* BVW approximately 350 feet from the Site; however, it has not been certified, nor was the area reviewed for the presence of vernal pool breeding species.

Wetland Protection Zone (WPZ)

The WPZ as defined in the Ordinance and Regulations is *"an area of no less than 25 feet and no more than 100 feet from the border of BVWs, vernal pools, lakes, ponds and ILSFs larger than a quarter acre-foot in size".* The WPZ is measured from the boundary of Bank and BVW at the Site and allows for limitations and prohibitions on activities that may negatively impact a Resource Area.

Wildlife Corridors

The Ordinance defines Wildlife Corridors as: "*contiguous areas of land within a Wetlands Protection Zone, which provide feeding areas, breeding areas, and normal home range movement for wildlife. An area will be deemed a wildlife corridor upon presentation of credible evidence of the corridors and wildlife value. Wildlife corridors may be both narrow and vulnerable. Wildlife corridors can also contain core vegetative life, which make them sensitive and important for plant diversity*." A narrow strip of contiguous area is located along the southern (B2 Series) Bank to the Taunton River, located within the City of Taunton. This area is primarily developed however it supports vegetation that may provide habitat for wildlife therefore this area may be considered a Wildlife Corridor under the Ordinance.

Jurisdictional Wetland Resource Areas – Town of Raynham

The Town of Raynham protects resource areas under the Town of Raynham Conservation Bylaw. In some instances, these regulations provide additional jurisdiction and protection beyond what is set forth in the Wetlands Regulations at 310 CMR 10.00.

Land Subject to Flooding

The Town of Raynham provides a 100 foot buffer zone to any land subject to flooding or inundation by groundwater or surface water, where a buffer zone to these resource areas is not present under the Act. The area of BLSF associated with the Taunton River has a 100-foot buffer zone under the Bylaw.

25-foot No Activity Buffer

The Bylaw provides a 25-foot "No Activity Buffer" around bordering vegetated wetlands for all construction activities. This No Activity Buffer extends 25-feet upgradient of the delineated boundaries of the WF1 and WF2 Series BVW's.

Jurisdictional Wetland Resource Areas – Federal Clean Water Act (Section 404)

The wetlands and waterways located at the Site are "Waters of the United States," and are therefore subject to the federal Clean Water Act, 33 U.S.C. §1251 et seq (1972). The boundary to "Waters of the United States" is the vegetated wetlands boundary, or, in the absence of vegetated wetlands, is the Ordinary High Water Mark (OHWM) for non-tidal rivers and streams, as specified at 33 CFR §328.4.

According to 33 CFR §328.3(c)(4), vegetated wetlands are defined as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." The wetland boundary previously described in this report was delineated in accordance with this definition. US Army Corps vegetated wetland boundary delineation field data sheets are attached documenting BETA's observations of evidence of hydrology, soils, and hydrophytic vegetation at specific data plots.

Work conducted below the boundary of Vegetated Wetlands or the OHWM is Subject to Jurisdiction under Section 404 of the Clean Water Act. Where present, Vegetated Wetland boundaries (Table 3) are the extent of federal Jurisdiction. Where streams are present and upgradient Vegetated Wetlands are absent, the OHWM coincides with the delineated boundaries of the B1/B2 Series Banks. The OHWM for the unnamed intermittent stream coincides with the delineated boundaries of the B3/B4 Series Banks.

Jurisdictional Wetland Resource Areas – Massachusetts Clean Waters Act (Section 401)

The limit of jurisdiction under the Massachusetts Clean Waters Act (Section 401), as specified in 314 CMR 9.00, is the limit of Section 404 jurisdiction under the federal Clean Water Act. Exceedances of the jurisdictional threshold under 314 CMR 9.00 require filing for a Water Quality Certification under Section 401.

Findings and Recommendations

BETA has identified areas Subject to Protection and/or Jurisdiction under the Massachusetts Wetlands Protection Act, the Taunton Conservation Ordinance, the Town of Raynham Wetland Protection Bylaw, the federal Clean Water Act, and the Massachusetts Clean Waters Act located on or within 100 feet of the Site, and has delineated the boundaries of Bank, BVW, and MAHW that exist along the Site. In order to definitively determine the extent of Conservation Commission jurisdiction, Army Corps jurisdiction, and

MassDEP jurisdiction, the boundary flags would need to be located and depicted on a to-scale plan of the Site.

WETLAND DETERMINATION DATA FORM – Northcentral and Northeast Region

Project/Site: Old Colony Avenue Bridge City/County: Taunton and Raynham Sampling Date: 3/31/23

Applicant/Owner: MassDOT State: MA Sampling Point: WF1-109 UP

Investigator(s): Tyler Drew, Jonathan Niro Section, Township, Range: Bristol County

Landform (hillside, terrace, etc.): Hillside Local relief (concave, convex, none): Convex Slope %: 10

Subregion (LRR or MLRA): LRR R, MLRA 144A Lat: 41.88676 Long: -71.03012 Datum: WGS84

Soil Map Unit Name: Udorthents, smoothed NWI classification: N/A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No ____ (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____	No X	**Is the Sampled Area**
Hydric Soil Present?	Yes ____	No X	**within a Wetland?** **Yes** ____ **No** X
Wetland Hydrology Present?	Yes ____	No X	If yes, optional Wetland Site ID: ____

Remarks: (Explain alternative procedures here or in a separate report.)

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1)
- ___ Sediment Deposits (B2)
- ___ Drift Deposits (B3)
- ___ Algal Mat or Crust (B4)
- ___ Iron Deposits (B5)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Sparsely Vegetated Concave Surface (B8)
- ___ Water-Stained Leaves (B9)
- ___ Aquatic Fauna (B13)
- ___ Marl Deposits (B15)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres on Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ___ Surface Soil Cracks (B6)
- ___ Drainage Patterns (B10)
- ___ Moss Trim Lines (B16)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Stunted or Stressed Plants (D1)
- ___ Geomorphic Position (D2)
- ___ Shallow Aquitard (D3)
- ___ Microtopographic Relief (D4)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present?	Yes ____	No X	Depth (inches): ____
Water Table Present?	Yes ____	No X	Depth (inches): ____
Saturation Present? (includes capillary fringe)	Yes ____	No X	Depth (inches): ____

Wetland Hydrology Present? **Yes** ____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

VEGETATION – Use scientific names of plants. Sampling Point: WF1-109 UP

Number of Dominant Species That Are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 3 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0.0% (A/B)

Prevalence Index worksheet:

Total % Cover of:		Multiply by:	
OBL species	0	x 1 =	0
FACW species	0	x 2 =	0
FAC species	5	x 3 =	15
FACU species	40	x 4 =	160
UPL species	50	x 5 =	250
Column Totals:	95 (A)		425 (B)

Prevalence Index = B/A = 4.47

Hydrophytic Vegetation Indicators:

___ 1 - Rapid Test for Hydrophytic Vegetation

___ 2 - Dominance Test is >50%

___ 3 - Prevalence Index is ≤3.0[1]

___ 4 - Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree – Woody plants 3 in. (7.6 cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/shrub – Woody plants less than 3 in. DBH and greater than or equal to 3.28 ft (1 m) tall.

Herb – All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft tall.

Woody vines – All woody vines greater than 3.28 ft in height.

Hydrophytic Vegetation Present? **Yes** ___ **No** X

Remarks: (Include photo numbers here or on a separate sheet.)

SOIL

Sampling Point: WF1-109 UP

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth	Matrix		Redox Features					
(inches)	Color (moist)	%	Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-4	10YR 2/1	100						Loamy Sand

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, MS=Masked Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)

United States Department of Agriculture

NRCS

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Bristol County, Massachusetts, Northern Part

January 10, 2024

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 16, Sep 10, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 14, 2022—Jul 1, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
1	Water	0.6	10.7%
9A	Birdsall silt loam, 0 to 3 percent slopes	0.7	12.5%
602	Urban land	2.3	41.8%
651	Udorthents, smoothed	1.9	35.0%
Totals for Area of Interest		**5.5**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The

delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Bristol County, Massachusetts, Northern Part

1—Water

Map Unit Setting

National map unit symbol: 997q
Frost-free period: 120 to 200 days
Farmland classification: Not prime farmland

Map Unit Composition

Water: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

9A—Birdsall silt loam, 0 to 3 percent slopes

Map Unit Setting

National map unit symbol: 997p
Elevation: 0 to 150 feet
Mean annual precipitation: 45 to 54 inches
Mean annual air temperature: 43 to 54 degrees F
Frost-free period: 145 to 240 days
Farmland classification: Not prime farmland

Map Unit Composition

Birdsall and similar soils: 80 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Birdsall

Setting

Landform: Depressions
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Concave
Across-slope shape: Concave
Parent material: Soft coarse-silty lacustrine deposits over hard coarse-silty lacustrine deposits

Typical profile

H1 - 0 to 7 inches: silt loam
H2 - 7 to 21 inches: silt loam
H3 - 21 to 60 inches: very fine sandy loam

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Very poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: About 0 inches
Frequency of flooding: None

Frequency of ponding: Frequent
Available water supply, 0 to 60 inches: Very high (about 12.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 5w
Hydrologic Soil Group: C/D
Ecological site: F144AY031MA - Very Wet Outwash
Hydric soil rating: Yes

Minor Components

Raynham

Percent of map unit: 10 percent
Landform: Depressions
Hydric soil rating: Yes

Swansea

Percent of map unit: 10 percent
Landform: Bogs
Hydric soil rating: Yes

602—Urban land

Map Unit Setting

National map unit symbol: 9999
Frost-free period: 120 to 200 days
Farmland classification: Not prime farmland

Map Unit Composition

Urban land: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

651—Udorthents, smoothed

Map Unit Setting

National map unit symbol: v4w7
Elevation: 0 to 3,000 feet
Mean annual precipitation: 45 to 54 inches
Mean annual air temperature: 43 to 54 degrees F
Frost-free period: 145 to 240 days
Farmland classification: Not prime farmland

Map Unit Composition

Udorthents and similar soils: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Udorthents

Setting

Landform position (two-dimensional): Summit
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Excavated and filled land over loose sandy and gravelly glaciofluvial deposits and/or firm loamy basal till

Typical profile

H1 - 0 to 6 inches: variable
H2 - 6 to 60 inches: variable

Properties and qualities

Slope: 0 to 15 percent
Depth to restrictive feature: More than 80 inches
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to very high (0.06 to 20.00 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6s
Hydrologic Soil Group: A
Hydric soil rating: Unranked

1

Introduction

This Stormwater Management Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards (the Standards) in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00). Appendix A includes a completed Massachusetts Department of Environmental Protection (MassDEP) Checklist for Stormwater Report, stamped by a Massachusetts registered professional engineer.

The Project follows the guidance presented in the MassDOT Stormwater Design Guide (SDG), and stormwater management systems are designed in accordance with the Standards.

2

Project Summary

The Applicant, the City of Taunton, is proposing Project 613642 for the replacement of the Old Colony Avenue Bridge (Bridge #R-02-00=T-01-004) over the Taunton River, including work along adjacent roadways (the Project) located in Raynham, MA and Taunton, MA.

As proposed, the Project generally consists of bridge replacement, roadway paving, and new sidewalk, as more fully described in Section 4. The purpose of this project is to replace a structurally deficient bridge as well as improving safety for vehicles, cyclists, and pedestrians.

The project area is an approximately 0.14-mile-long section of a roadway which is identified as Old Colony Ave within the City of Taunton and South Street East within the Town of Raynham. Old Colony Ave crosses over the Taunton River and the work includes temporary and permanent work within the river's footprint. The project also includes portions of Sandy Hill Road, an intersecting side street, and the Riverbend Condominiums driveway.

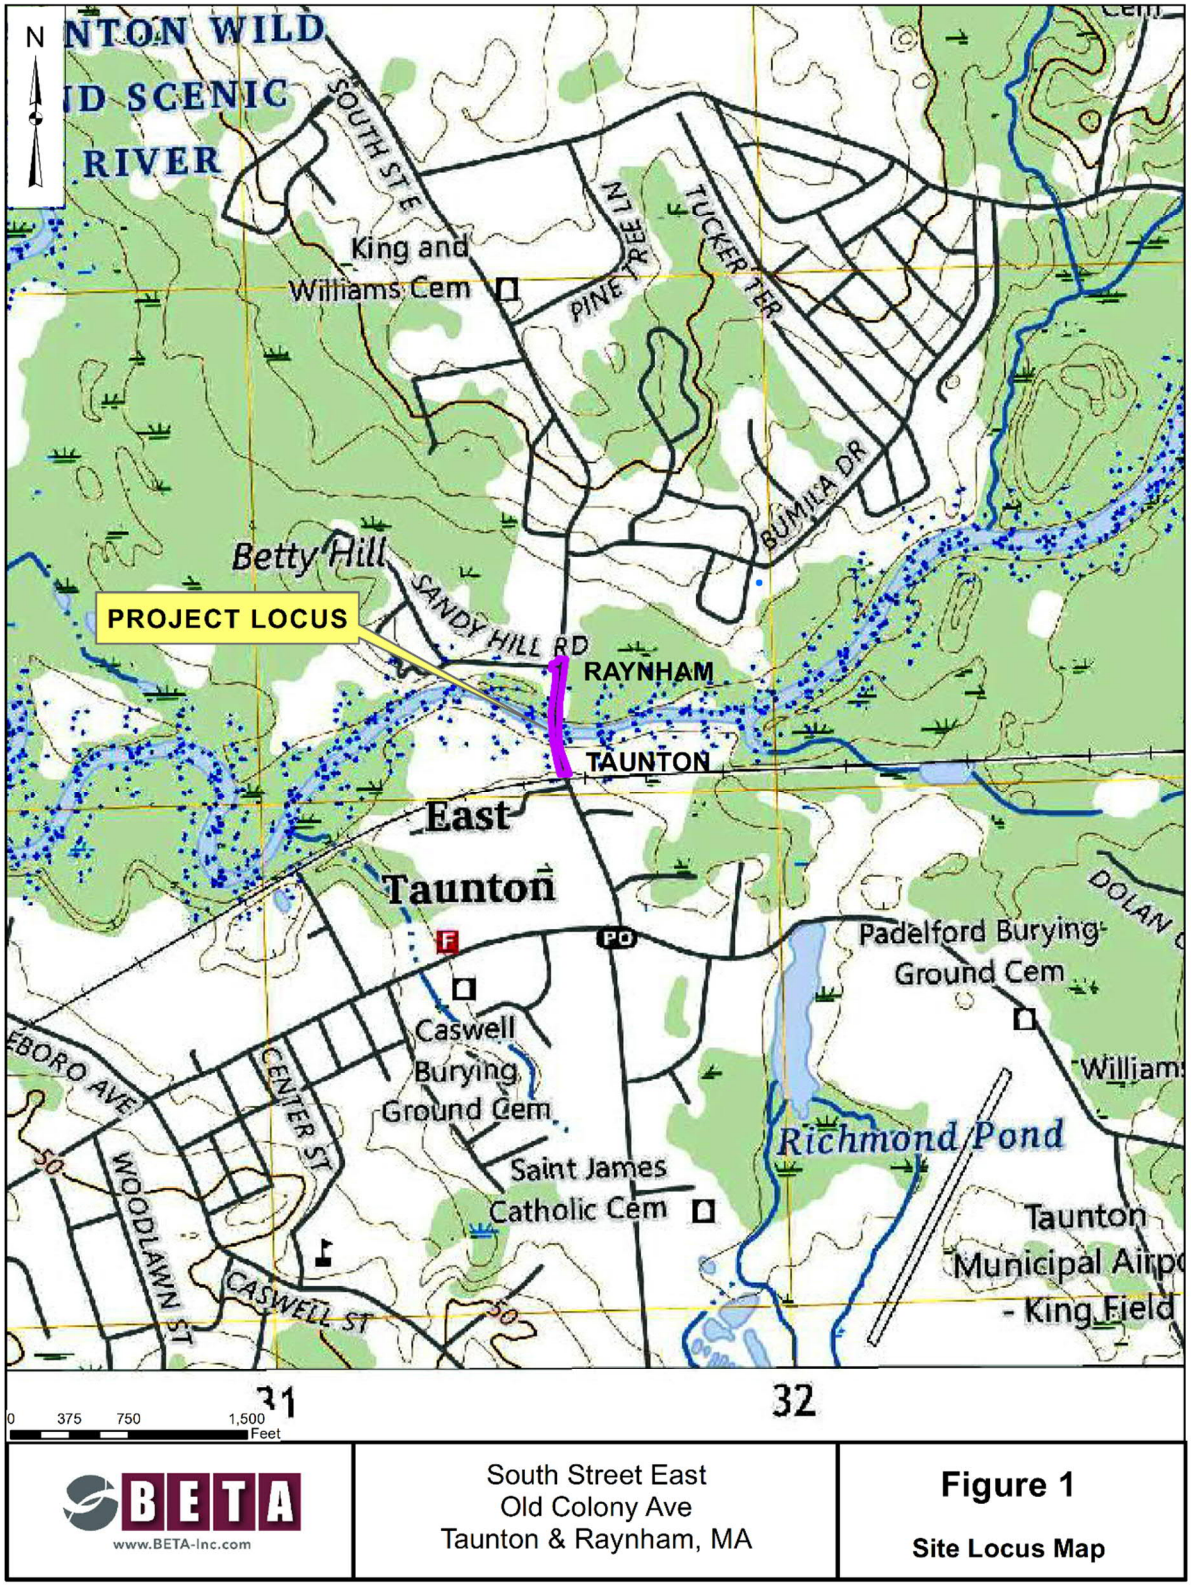
Land use on surrounding lots includes the River Bend Condominiums, several commercial properties, a pump station, a single family residence, and woodlands.

Wetland resource areas are located in proximity to the project area, notably including the Taunton River. Refer to Notice of Intent narrative for a summary of project compliance. The project is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) and the project is not located within or near to a Zone II or Interim Wellhead Protection Area, any other critical areas, or a NHESP-mapped habitat.

This stormwater analysis has been prepared to support a bridge replacement and roadway reconstruction project and associated stormwater management measures, as more fully described in Section 3.0. A total disturbance of approximately 1.05± Acres is anticipated as a result of the proposed work.

See Figure 1 for the Project Locus Map.

Figure 1 Locus Figure



3

Existing Conditions

The project includes Old Colony Ave / South Street East, a two-lane, two-way Urban Collector roadway. A bridge carries Old Colony Avenue over the Taunton River. Within the project area, the width of the roadway generally varies from 27 to 35 feet, with one lane in each direction. A short sidewalk segment is provided on the north side of the road near Riverbend Condominiums and along the south side of the bridge. Otherwise, the roadway is bordered by grass or driveways. Granite curb is provided along the north side of the roadway and along the bridge; otherwise, no edge treatment is provided.

The project corridor generally consists of an impervious roadway and pervious grass/woodland side areas or impervious driveways. Topography is generally directed away from the roadway and towards the Taunton River, and the roadway is crowned throughout the entire project limits.

Resource Areas of Interest

Wetland resource areas are located (within or in proximity to) the project area. Refer to Notice of Intent narrative for a thorough description of these areas and a summary of project compliance. Notably, the project crosses over the Taunton River, which flows east to west. A stream is located in the northwestern portion of the project.

The project is located In the IWP Priority #2: Taunton Watershed. Waterbodies located immediately downgradient of the Site include the Taunton River, a Category 5 water, which is impaired for Dissolved Oxygen, Enterococcus, and E. Coli. The Taunton River eventually discharges to Mt. Hope Bay. Refer to Section 5 for discussion of impairments and TMDLs.

Existing Stormwater Characteristics

Topography in areas adjacent to the roadway is generally directed away from the roadway. Existing closed drainage systems are present along the roadway which convey stormwater runoff to two outfalls, one of which discharges to the Taunton River and one of which discharges to a stream. As no formal edge treatment is provided on the southern side of South Street East, stormwater runoff from this portion of the Site can flow overland into an area of woodlands.

Refer to the watershed plans in Appendix F for detailed delineation of pre-development flow patterns and watershed boundaries. Refer to Appendix D for hydrologic calculations relating to existing conditions.

Table 1 presents the existing drainage areas and their characteristics. See Figure 2 for existing drainages areas and existing SCMs by design point.

Table 1 Existing Drainage Areas

Drainage Area	Design Point	Area (acres)	Curve Number
Ex-1E	DP-1L	0.576	82
Ex-2E	DP-2L	0.395	81
Ex-3E	DP-3L	0.400	74

Key features in and around the project area include the Taunton River and associated riverfront area, a stream, and vegetated wetlands, as shown on Figure 2.

The Project is partially located within the 100-year floodplain as shown on FEMA map panel 25005C0169G eff. 7/16/2015. A FEMA flood map is included in Appendix B. 100-year flood areas included a Zone AE Floodway coincident with the Taunton River (Elev. 15 ft.) and a Zone AE (Elev. 15 ft.). Refer to the Notice of Intent for an evaluation of impact to flood zones.

Review of the NRCS Soil Survey map of the project area identified three major soil groups. South Street East is mapped as Unit 651: Udorthents with Hydrologic Soil Group Rating (HSGR) A and Unit 9A: Birdsall silt loam with HSGR C/D. Old Colony Ave is mapped as 602: Urban Land with no assigned HSGR. Additionally, the footprint of the Taunton River is mapped as Unit 1: Water with no assigned HSGR. NRCS soils information is shown on the plans in Appendix F and included in Appendix B.

4

Proposed Conditions

Scope of Work

The scope of work generally consists of bridge replacement, full depth pavement construction in the vicinity of the bridge, pavement milling and overlay to the north and south of the bridge, modifications to roadway geometry (less than a single lane), construction of a sidewalk, new granite curbing, striping of two travel lanes and a bike lane, new ADA compliant ramps, replacement of guardrail, modifications to water, sewer, gas, electric, and drainage utilities, and restoration of disturbed areas.

Table 2 provides a breakdown of the impervious area for the Project.

Table 2 Impervious Area

Condition	Impervious Area (sq. ft)
Existing	31210
Proposed	31991
Net	781

Proposed Stormwater Management

Stormwater Management will be accomplished through modifications to the existing closed drainage systems. Existing inlets will be replaced, where necessary, with deep-sump catch basins, and additional deep-sump catch basins will be installed to provide more effective stormwater collection and treatment. New curbing is proposed to better direct stormwater runoff to catch basins. The majority of existing trunklines will be retained. The project will retain existing drainage grading patterns to the maximum extent practicable.

The project will retain the existing outfall from the closed drainage system within the Town of Raynham. The project will replace the existing outfall associated with the closed drainage system within the Town of Taunton. The new outfall will be increased in size from 12” to 18” and the existing headwall will be rebuilt at the same location.

The project proposes new stormwater control measures (SCM) including a new infiltration trench. This new practice is proposed within the Town of Raynham near the northeastern limit of work. Stormwater runoff will be directed to this SCM through a new deep sump catch basin which will overflow into the existing closed drainage system.

Additionally, country drainage/pavement disconnection will be implemented for several portions of South Street East by excluding curbing to allow treatment in the grass/woodland area adjacent to the roadway. Of this, approximately 100 ft. of South Street East, on the eastern side of the roadway, drains to an area that meets the definition of qualifying pervious area and is comprised of 1,500 ± sq. ft. of impervious area.

Table 3 presents the proposed drainage areas and their characteristics under proposed conditions. Refer to Appendix F for proposed drainage patterns and drainage area delineations by design point.

Table 3 Proposed Drainage Areas

Drainage Area	Design Point	Area (acres)	Curve Numbers
Pr-10P	DP-1L	0.598	83
Pr-20P/21P	DP-2L	0.410	83
Pr-30P	DP-3L	0.363	71

Project Constraints

The project is constrained by the presence of the Taunton River, presence of wetland resource areas, presence of private commercial and residential features within the Town of Taunton, and conflicts with existing utilities which restrict the opportunity to install substantial Stormwater Control Measures (SCMs). The project is also constrained by minimum required setbacks outlined in the MassDOT Stormwater Design Guide, namely the 10 foot setback to property lines, the 50 foot setback to surface waters, and the 50 foot setback to any slope greater than 15% for infiltration basins. The project area was evaluated for potential locations of SCMs and is summarized on the SCM Analysis Plan located in Appendix G. Despite constraints, the proposed stormwater management systems will provide an improvement to the existing conditions by installing deep sump catch basins and a new infiltration trench. Note the project is considered a redevelopment, as discussed in Section 7.0.

Table 4 lists the proposed SCMs and provides a description of each.

Table 4 Proposed SCMs

SCM	Description
Infiltration Trench	One infiltration trench consisting of a perforated pipe surrounded by crushed stone, located from STA 6+00 RT to STA 6+45 RT. A deep-sump catch basin is provided at STA 5+96 for pretreatment and conveyance to the infiltration trench as well to convey overflow.

LID measures incorporated at the project include the preservation of existing vegetation and maintaining pre-development drainage patterns. The use of country drainage/pavement disconnection is proposed for stormwater runoff from portions of the roadway by directing portions of South Street East to areas of pervious grass/woodlands. The reduction of impervious cover was considered; however, the introduction of new impervious area is required to replace the bridge and extend sidewalks to areas where none currently exist.

5

Impaired Waters and TMDLs

As described under the previous sections, the Project will discharge to the Taunton River, which is impaired based on the MassDEP Year 2023 Integrated List of Waters, also known as the 303(d) list.

Table 5 lists the receiving water bodies that are impaired and if the water body has a TMDL.

Table 5 Impaired Waters and TMDL Information

Water Body	303(d) Category	303(d) Impairments	TMDL	TMDL Pollutant	TMDL Report Name
Taunton River (MA62-01)	5 – Waters Requiring a TMDL	Dissolved Oxygen, Enterococcus, E. Coli	Yes	Pathogens (Fecal coliform, E. Coli, Enterococcus)	Final Pathogen TMDL for the Taunton River Watershed

Note that this segment of the Taunton River is not included in the TMDL. However, the downstream portions of the river are.

As stated in the Final Pathogen TMDL for the Taunton River Watershed, leading sources of bacterial surface water pollution include failing septic systems, combined sewer overflows (CSOs), sanitary sewer overflows (SSOs), sewer pipes connecting to storm drains, certain recreational activities, wildlife, and direct overland stormwater runoff.

The project includes relocation of a portion of the existing sanitary sewer force main. This work will not include any sanitary sewer discharges to the Taunton River. Any sanitary sewer pipes connecting to the storm drain will be eliminated, if identified. See Illicit Discharge Compliance Statement under Standard 10 in Section 6 below. All stormwater runoff discharged from the Site will receive additional treatment via deep sump catch basins, the new infiltration trench, or through country drainage. As a transportation facility, pathogen loads from the roadway surfaces are anticipated to be minimal.

The proposed infiltration trench has been selected for their capability to treat phosphorus, nitrogen, and total suspended solids. A load reduction of 0.03 lb/yr of phosphorus, 0.21 lb/yr of nitrogen, and 29 lb/yr of total suspended solids is anticipated for this SCM, as calculated based on EPA Water Quality Curves in the MassDOT Water Quality Date Form.

See Standard 4 in Section 6 below for more water quality calculations and discussion.

6

Stormwater Management Standards

As demonstrated below, the proposed Project complies with the MassDEP Stormwater Management Standards (the Standards).

The Project is classified as a limited, redevelopment under the first definition “Maintenance and improvement of existing roadways, including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving.” Work related to the maintenance, repair, and improvement of the bridge is considered a Limited Project.

Standard 1: No New Untreated Discharges

No new stormwater conveyances may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

The Project has been designed to comply with Standard 1. The project proposes to replace the existing outfall from the City of Taunton closed drainage system. This work will include replacing the existing 12” MTL and 12” CMP outfalls with a new 18” DI outfall at the same location, replacing the existing headwall, and providing stone for pipe ends as stabilization to prevent erosion to the Taunton River. The project proposes to retain the existing outfall from the Town of Raynham closed drainage system.

Appendix C provides supporting calculations for the outlet protection design.

Stormwater runoff will be treated by deep sump catch basins, the infiltration trench, or country drainage before discharging off-site.

See Standard 4 for the water quality treatment provided by the Project.

Standard 2: Peak Rate Attenuation

Stormwater management systems shall be designed so that post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for discharges to land subject to coastal storm flowage as defined in 310 CMR 10.04.

The Project has been designed to comply with Standard 2 only to the maximum extent practicable as the project is a limited, redevelopment project. This project reduces post-development peak runoff rates to below pre-development peak runoff rates for DP-2 and DP-3, as well as on a site-wide basis, during the 1-year, 2-year, 10-year, and 100-year 24-hour

design storm events based on NOAA Atlas 14 precipitation data. Minor increases in peak runoff rates are anticipated for DP-1.

Table 6 Rainfall Depths (in)

Design Storm Event	Rainfall Depth (in)
2-year	3.42
10-year	5.08
100-year	7.71

Table 7 provides a summary of peak rates for each design point under existing and proposed conditions. Appendix D provides computations and supporting information regarding the hydrologic modeling.

Table 7 Peak Discharge Rates (cfs)

Design Point	Existing			Proposed		
	2-year	10-year	100-year	2-year	10-year	100-year
DP 1	1.14	2.08	3.61	1.23	2.22	3.81
DP 2	0.74	1.39	2.44	0.67	1.28	2.20
DP 3	0.52	1.11	2.14	0.39	0.90	1.81
Total	2.40	4.58	8.19	2.29	4.41	7.82

The project is unable to fully meet this standard due to constraints at the project site as described previously. This project includes a net increase of 781± sq. ft. of impervious surface, which will result in minor increases to the volume and rate of stormwater runoff from the project area. This increase in impervious area is necessary to provide sidewalks where none currently exist. Despite project constraints and an increase in peak flow rates, the proposed deep-sump catch basins and infiltration trench will improve existing conditions throughout the project corridor. Refer to HydroCAD calculations provided in Appendix D for additional information.

Standard 3: Recharge

Loss of annual recharge to groundwater shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The project has been designed to meet this standard on a project-wide basis. The project has significant right-of-way constraints as described previously, which restrict opportunities for recharge on the southern portions of the Site. Despite constraints, the proposed infiltration trench has been designed to provide the sitewide required recharge volume for new and a portion of the existing impervious area.

Table 8 provides the required recharge volume for the Project, and Table 9 provides the recharge volumes proposed for each design point.

Table 8 Required Recharge Volume for Project

	HSG A	HSG B	HSG C	HSG D	Total
Existing Impervious (sq. ft.)	26829		1964	2417	31210
Proposed Impervious (sq. ft.)	27280		2213	2498	31991
Net Impervious Area (sq. ft.)	451		249	81	781
Target depth, F (in)	0.6	0.35	0.25	0.1	-
Required Recharge Volume, ReV (cf)	22.55		5.19	0.68	28.41

Table 9 Provided Recharge Volumes at Each Design Point

	HSG A	HSG B	HSG C	HSG D	Total
DP-1					
Net Impervious Area (sf)	461		5	705	9844
Required Recharge Volume, ReV (cf)	23.05		0.10	5.88	29.03
Provided Recharge Volume (cf)	0		0		0.00
DP-2					
Net Impervious Area (sf)	1583		0	-195	1388
Required Recharge Volume, ReV (cf)	79.15		0.00	-1.63	77.53
Provided Recharge Volume (cf)	81.42		0		81.42
DP-3					
Net Impervious Area (sf)	-1593		244	-429	-1778
Required Recharge Volume, ReV (cf)	-79.65		5.08	-3.58	-78.14
Provided Recharge Volume (cf)	0.00		0		0.00

The infiltration SCM has been designed to drain completely within 72 hours.

Appendix B provides soil evaluation information (including the geotechnical report if applicable), and Appendix C provides computations, drawdown calculations, and supporting information regarding recharge.

Standard 4: Water Quality Treatment

Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This Standard is met when:

- Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained.
- Structural stormwater best management practices are sized to capture the required water quality volume determined in accordance with the Massachusetts Stormwater Handbook.

› Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.

The Project has been designed to comply with Standard 4 on a project wide basis. Proposed drainage system improvements, including the installation of deep sump catch basins and an infiltration trench will provide treatment of stormwater runoff that does not currently exist and will improve existing conditions. The proposed project will provide an average TSS removal rate of 20% for 31,991± sq. ft. of impervious surfaces.

Note that the project is located in an area with a rapid infiltration rate (>2.4 in/hr) and the required water quality volume has been calculated based on the 1.0-inch water quality depth.

Table 10 shows the WQV to be treated for both new and existing impervious area within each drainage area, organized by design point.

Table 10 WQV at Each Design Point

Design Point	WQV for New IA (cf)	WQV for Existing IA (cf)	Total WQV (cf)
DP-1			
10P	97.58	722.75	820.33
Total	97.58	722.75	820.33
DP-2			
20P	44.75	1028.50	1073.25
21P	70.92	0.00	70.92
Total	115.67	1028.50	1144.17
DP-3			
30P	-148.17	849.58	701.42
Total	-148.17	849.58	701.42
Project Total	65.08	2600.83	2665.92

Table 11 shows the WQV provided by the SCMs at each design point.

Table 11 WQV Provided by the SCMs at Each Design Point

Design Point	Pretreatment (y/n)	WQV Provided (cf)	Meets Total WQV	Meets Required WQV for New IA
DP-1		0	No	No
DP-2			No	Yes
Linear Infiltration Practice	Y	81.42		
Total	Y	81.42		
DP-3		0	No	No
Project Total			No	Yes

As previously noted, the project is a limited, redevelopment project; therefore, the project is required to meet this standard only to the maximum extent practicable. Opportunities to install treatment and recharge SCMs are limited due to the constraints described previously. Despite project constraints, the proposed deep sump catch basins will improve existing

conditions throughout the project corridor and groundwater recharge will be provided via the new infiltration trench. Refer to Appendix C for calculations relating to TSS Removal. Refer to Illicit Discharge Compliance Statement under Standard 10.

Appendix E includes the Long Term Pollution Prevention Plan for this project.

Standard 5: Land Uses with Higher Potential Pollutant Loads

For Land Uses with Higher Potential Pollutant Loads (LUHPPLs), source control and pollution prevention shall be implemented in accordance with the Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If through source control and/or pollution prevention all LHPPLs cannot be completely protected from exposure to rain, snow, snow melt, and stormwater runoff, the proponent shall use the specific structural stormwater BMPs determined by the Department to be suitable for such uses as provided in the Massachusetts Stormwater Handbook. Stormwater discharges from LUHPPLs shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26-53 and the regulations promulgated thereunder at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.

Standard 5 does not apply to the Project. There are no Land Uses with Higher Potential Pollutant Loads within the project area.

Standard 6: Critical Areas

Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of the specific source control and pollution prevention measures and the specific structural stormwater best management practices determined by the Department to be suitable for managing discharges to such areas as provided in the Massachusetts Stormwater Handbook. A discharge is near a critical area if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters and Special Resource Waters shall be removed and set back from the receiving water or wetland and receive the highest and best practical method of treatment. A “stormwater discharge” as defined in 314 CMR 3.04(2)(a)1 or (b), to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00. Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of a public water supply.

Standard 6 does not apply to the Project. There are no Critical Areas near the project area.

Standard 7: Redevelopment

A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

The Project is a limited, redevelopment project under the first definition: “Maintenance and improvement of existing roadways, including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving.” Proposed deep sump catch basins and infiltration trench will provide treatment to the maximum extent practicable and represent an improvement to the existing conditions. Standards 1, 8, 9, and 10 are met, Standards 3 and 4 are met on a project wide basis, and Standard 2 is met to the maximum extent practicable. Standards 5 and 6 are not applicable to this project.

Standard 8: Erosion and Sediment Control

A plan to control construction related impacts, including erosion, sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan) shall be developed and implemented.

The implementation of erosion and sediment (E&S) controls during construction is considered a standard practice for all projects. E&S controls will be installed before any land disturbance begins for the Project and will remain in place for the duration of the Project. The E&S controls for the Project are shown on the project plans and include perimeter sediment control barrier, inlet protection, tree protection, temporary cofferdam for water control, and dewatering.

The Project disturbs one or more acres of land; therefore, the project contractor will request coverage under the NPDES Construction General Permit (CGP) and develop a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP follows the requirements of this standard and complies with the NPDES CGP.

Standard 9: Operation and Maintenance Plan

A long-term operation and maintenance plan shall be developed and implemented to ensure that stormwater management systems function as designed.

The roadway and bridge included in this project are located in both the City of Taunton and the Toad of Raynham. Ownership is divided between the Town of Taunton and the Town of Raynham. The activities included in the O&M Plan will be implemented by the municipality. Appendix E includes the O&M Plan for this project.

Standard 10: Prohibition of Illicit Discharges

All illicit discharges to the stormwater management system are prohibited.

Illicit Discharge Statement

The project’s stormwater management system, as shown on the plans submitted with this report, have been designed in full compliance with Standard 10. The project area does not have any known illicit connections. Any illicit connections to the stormwater management system found in the project limit of work during construction will be removed and/or resolved through the City of Taunton’s or Town of Raynham’s Illicit Discharge Detention and Elimination (IDDE) Programs. The Long-Term Pollution Prevention Plan, provided in Appendix E, includes measures to prevent illicit discharges.

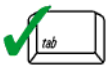
Appendix A: MassDEP Checklist for Stormwater Report

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

- ☐ New development
- ☒ Redevelopment
- ☐ Mix of New Development and Redevelopment

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- ☐ No disturbance to any Wetland Resource Areas
- ☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- ☐ Reduced Impervious Area (Redevelopment Only)
- ☒ Minimizing disturbance to existing trees and shrubs
- ☐ LID Site Design Credit Requested:
  - ☐ Credit 1
  - ☐ Credit 2
  - ☐ Credit 3
- ☒ Use of “country drainage” versus curb and gutter conveyance and pipe
- ☐ Bioretention Cells (includes Rain Gardens)
- ☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- ☐ Treebox Filter
- ☐ Water Quality Swale
- ☐ Grass Channel
- ☐ Green Roof
- ☐ Other (describe): _____

Standard 1: No New Untreated Discharges

- ☒ No new untreated discharges
- ☒ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- ☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☐ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☐ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☒ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☒ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☒ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☒ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☐ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☒ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☒ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☒ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☐ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☒ Name of the stormwater management system owners;
- ☒ Party responsible for operation and maintenance;
- ☒ Schedule for implementation of routine and non-routine maintenance tasks;
- ☒ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☒ Description and delineation of public safety features;
- ☒ Estimated operation and maintenance budget; and
- ☒ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☒ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 17, Aug 27, 2024

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 14, 2022—Jul 1, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
1	Water		0.7	9.0%
9A	Birdsall silt loam, 0 to 3 percent slopes	C/D	0.9	11.6%
256A	Deerfield loamy fine sand, 0 to 3 percent slopes	A	0.1	1.4%
602	Urban land		3.3	42.2%
651	Udorthents, smoothed	A	2.8	35.8%
Totals for Area of Interest			**7.9**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

SPECIAL FLOOD HAZARD AREAS
- Without Base Flood Elevation (BFE) *Zone A, V, A99*
- With BFE or Depth *Zone AE, AO, AH, VE, AR*
- Regulatory Floodway

OTHER AREAS OF FLOOD HAZARD
- 0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile *Zone X*
- Future Conditions 1% Annual Chance Flood Hazard *Zone X*
- Area with Reduced Flood Risk due to Levee. See Notes. *Zone X*
- Area with Flood Risk due to Levee *Zone D*

OTHER AREAS
- NO SCREEN Area of Minimal Flood Hazard *Zone X*
- Effective LOMRs
- Area of Undetermined Flood Hazard *Zone D*

GENERAL STRUCTURES
- Channel, Culvert, or Storm Sewer
- Levee, Dike, or Floodwall

OTHER FEATURES
- 20.2 Cross Sections with 1% Annual Chance
- 17.5 Water Surface Elevation
- Coastal Transect
- 513 Base Flood Elevation Line (BFE)
- Limit of Study
- Jurisdiction Boundary
- Coastal Transect Baseline
- Profile Baseline
- Hydrographic Feature

MAP PANELS
- Digital Data Available
- No Digital Data Available
- Unmapped

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/26/2025 at 11:50 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Appendix C: Supporting Calculations

PROJECT NAME:	**South Street East / Old Colony Ave**	PROJ NO.	**10887**
DESCRIPTION:	**Standards 3 & 4 Worksheet**	DATE	**01/30/26**
CALCULATED BY:	**SLB**	SHEET	**1**

Recharge Volume (Rv) and Water Quality Volume (WQv)
Provided Volumes Worksheet

Calculation of Required Recharge Volume

	Soil Group	Impervious Area (Sq. Ft.)	Runoff Depth (In.)	Recharge Volume (Cu. Ft.)
Pre-Development	Total	**31210**		
	HSG A	26829		
	HSG C	1964		
	HSG D	2417		
Post-Development	Total	**31991**		**1430.92**
	HSG A	27280	0.60	1364.00
	HSG C	2213	0.25	46.10
	HSG D	2498	0.10	20.82
Net Change	Total	**781**		**28.41**
	HSG A	451	0.60	22.55
	HSG C	249	0.25	5.19
	HSG D	81	0.10	0.68

Recharge Volume (R_V) Required = Impervious Area x Runoff Depth (from HSG)

Total Recharge Volume Required: **28 CF**

Total Recharge Volume Provided: **81 CF**

Calculation of Required Water Quality Volume

	Impervious Area (Sq. Ft.)	Runoff Depth (In.)	Water Quality Volume (Cu. Ft.)
Total Impervious Area	31991	1.0	2666
Net New Impervious Area Only	781	1.0	**65**

Water Quality Volume (WQ_V) Required = Impervious Area x Runoff Depth (0.5" or 1.0" Depth)

Total Water Quality Volume Provided: **81 CF**

PROJECT NAME:	**South Street East / Old Colony Ave**	PROJ NO.	**10887**
DESCRIPTION:	**Standards 3 & 4 Worksheet**	DATE	**01/30/26**
CALCULATED BY:	**SLB**	SHEET	**2**

Total Suspended Solids (TSS)
Provided Treatment Worksheet

Treatment Train	A: Total Removal Rate (%)	B: Total Treatment Area (Sq. Ft.)	C: A x B (Sq. Ft.)
No Treatment (30P)	0%	8417	0
Deep Sump Catch Basins (10P, 20P)	25%	22723	5681
Treatment Train - Infiltration Trench (21P)	80%	851	681
Totals:		31,991 SF	6,362 SF

Total Sitewide TSS Removal (C / B) 20%
Total of Column C divided by Total of Column B

Equivalent Area for 80% TSS Removal **7,952 SF**
Total of Column B x total TSS Rate divided by 80%

Proposed New Impervious Area: **781 SF**

PROJECT NAME:	**South Street East / Old Colony Ave**	PROJ NO.	**10887**
DESCRIPTION:	**Standards 3 & 4 Worksheet**	DATE	**01/30/26**
CALCULATED BY:	**SLB**	SHEET	**3**

Infiltration Trench
Provided Volumes & TSS Worksheet

Total Storage

Storage Within Basins	Length (Ft.)	Width (Ft.)	Depth (Ft.)	Volume - Perforated Pipe (Cu. Ft.)	Volume Stone (40% Voids) (Cu. Ft.)	Total Volume Provided (Cu. Ft.)
Infiltration Trench	45	2	2.00	15.7	65.7	81

Total Storage Volume Provided: **81 CF**

TSS Removal

Best Management Practice (BMP)	SCM Removal Rate (%)	Remaining TSS (%)	Cumulative Removal Rate (%)
Sediment Forebay (Pretreatment)	25%	75%	25%
Total Pretreatment Provided:			**25%**
Infiltration Trench	80%	20%	**80%**

Drawdown Calculations

BMP: **Infiltration Trench**

Rv (cu. ft.) =	81	Drawdown (hrs) =	**10.6**
K (in/hr) =	1.02		
Bottom Area (sq. ft.)	90	Less than 72 hrs?	**PASS**

**The hydraulic conductivity rate is based on Rawls Rate for Sandy Loam

PROJECT NAME: **South Street East / Old Colony Ave** PROJ NO. 10887
DESCRIPTION: **Standards 3 & 4 Worksheet** DATE 01/28/26
CALCULATED BY: **SLB** SHEET 1

Riprap Stone Size

$D_{50} = 0.2D(Q/(g)^{1/2}(D)^{2.5})^{4/3}(D/TW)$

D_{50} = riprap size (ft)
Q = design discharge (cfs) (10-year)
D = pipe diameter (ft)
TW = tailwater (ft) if unknown use 0.4D
g = acceleration due to gravity (32.2 ft/s^2)

Outfall No.	Q (cfs)	D (ft)	TW (ft)	$D^{2.5}$	D/TW	$g^{1/2}$	D_{50} (ft)
HW-1	16.14	1.5	0.6	2.76	2.5	5.67	**0.31**

*Flow rate is based on pipe flowing full

Riprap Parameters

Apply 1.5 Safety Factor to D50
Depth = 3.3*D50
Length = 4*D
Width (at pipe) = 3 * D
Width (Apron End) = 3 * D + 2/3 * Length

Outfall No.	1.5*D_{50} (in)	Approx. Weight (lb)	Minimum Dimensions			
			Depth (in)	Length (ft)	Width 1 (ft)	Width 2 (ft)
HW-1	5.57	37.73	18.39	6.00	4.50	8.50

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Appendix E: O&M Plan and LTPPP

1

Stormwater Management System Operation and Maintenance (O&M) Plan

This Stormwater Management System Operation and Maintenance (O&M) Plan describes the approach for inspection and maintenance of drainage infrastructure and structural stormwater control measures (SCMs) to minimize contaminant loading for South Street East / Old Colony Ave in the Town of Raynham and City of Taunton, MA. In general, inspection and maintenance activities will be conducted consistent with the National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer System (MS4).

This document has been prepared per the requirements of Massachusetts Department of Environmental Protection (MassDEP) Regulations 310 CMR 10.05 (6)(k)(9) and satisfies the requirements of Massachusetts Stormwater Standard 9.

1.1 Responsible Party

The Town of Raynham and City of Taunton will be responsible for the operation and maintenance of all stormwater management systems under their respective ownership within the project limits. Questions or concerns regarding activities associated with this O&M Plan should be addressed to the Raynham Highway Department located at 1555 King Phillip Street, Raynham, MA 02767, phone (508) 824-2718 and/or the Taunton Public Works Department located at 90 Ingell Street, Taunton, MA 02780, phone (508) 821-1431.

It shall be the responsibility of the Owner to provide a revised plan to the Conservation Commission indicating any change of ownership or responsible party. The responsible party shall also be responsible for financing maintenance and emergency repairs at the Site.

Project information is summarized in the following table:

Project Name:	South Street East / Old Colony Avenue
Project Type:	Transportation
Address:	Old Colony Ave, Taunton, MA, from approximately 75 feet north of Battle Row to the Taunton/Raynham Town Line South Street East , Raynham, MA, from the Taunton/Raynham Town Line to the north side of Sandy Hill Road.
SWMS Owner (Taunton):	Taunton Department of Public Works 90 Ingell Street, Taunton, MA
SWMS Owner (Raynham):	Raynham Highway Department 1555 King Phillip Street, Raynham, MA 02767
Responsible Party (Taunton):	Taunton Department of Public Works 90 Ingell Street, Taunton, MA
Responsible Party (Raynham):	Raynham Highway Department 1555 King Phillip Street, Raynham, MA 02767
Contact (Taunton):	Fred Cornaglia, Commissioner of Public Works (508) 821-1431
Contact (Raynham):	Norman Sturtevent, Superintendent (508) 824-2718

1.2 Inspection and Maintenance Measures and Record-Keeping

See Appendix F of the Stormwater Management Report for the proposed stormwater system within the project limits. The stormwater management system covered by this O&M Plan consists of the following measures:

- Deep Sump Catch Basins
- Infiltration Trench

The Town of Raynham and City of Taunton shall use a performance-based inspection and maintenance program for SCMs and catch basins. For SCMs, the overall approach is to inspect SCMs, and based on the results of the inspections, perform maintenance to preserve functionality. For catch basins, the overall approach is to perform maintenance at an interval that maintains the functionality of the catch basin (e.g., sump is less than 50% full of sediment). Catch basin inspections, including documentation of sediment accumulation, and maintenance will generally occur simultaneously.

The following table summarizes inspection requirements for each asset type.

Inspection Form	Applicable Stormwater Assets	Inspection Requirements
Inlets	› Catch basins	› Sediment accumulation › Trash/Debris accumulation › Signs of contamination › Frame and grate condition › Overall structure condition
SCMs	› Infiltration SCMs › Other SCMs	› SCM accessibility › Presence of standing water › Level of erosion › Sediment accumulation › Trash/Debris accumulation › Vegetation condition › Overall SCM condition
Storm Discharge Points	› Outlets to SCMs	› Presence of flow › Signs of contaminated flow › Sediment accumulation › Level of erosion › Pipe condition › Scour protection condition › Overall structure condition

Inspection and maintenance records can be made available by contacting the Town of Raynham Highway Department or the City of Taunton Department of Public Works. Representatives of each Town's Conservation Commission, MassDEP, and US EPA may obtain access to these records, upon request.

Maintenance actions will not occur at any set frequency, but rather will be based on condition and impact to functionality. Maintenance to be performed on the stormwater system includes:

Stormwater Feature	Potential Maintenance Actions	
Surface SCMs	• Remove and properly dispose of accumulated material (e.g., sediment, trash, leaf litter, debris) • Mow vegetated areas and remove and dispose of grass clippings • Regrade areas that show signs of unwanted ponding and channelization • Stabilize or reconstruct eroded areas and reseed • Replace stones/soil and/or replant vegetation	• Remove woody growth • Treat invasive plants • Address issues of standing water • Drain and reconstruct SCM • If rehabilitation is not possible, then retrofit to be a wet SCM while considering safety implications
Underground SCMs	• Remove and properly dispose of trash, sediment, debris, and root intrusions • Clean out sumps at an interval to maintain functionality (less than 50% full of sediment) • Jet and repair pipes	• Rehabilitate filtering and infiltration materials (e.g., geotextile fabric, crushed stone) • Stabilize and replace deteriorated structures • Perform evaluations (e.g., test pits) to evaluate subsurface conditions
Inlets and Outlets to SCMs	• Clear inlet and remove and properly dispose of sediment, trash, leaf litter, debris, and vegetation • Regrade areas that show signs of ponding and channelization • Repair or replace structural components • Repair damaged or eroded areas	• Provide or rehabilitate erosion control at the outlet • Regrade and replace the channel materials • Remove woody growth • Stabilize or reconstruct eroded areas • Treat invasive plants.

Based on the results of the inspection, repairs will be made in accordance with Town/City standard practices. Maintenance will be prioritized given the urgency of the required maintenance and availability of staff, contracts, etc. Maintenance may require contracting if existing maintenance personel are unavailable to perform the work. More intensive remedial activities may require permitting and/or an engineering solution.

Inspection, maintenance, and record keeping on will be performed in conjunction with the Town of Raynham / Taunton MS4 compliance requirements.

1.3 Erosion and Sediment Control Measures during Maintenance Activities

For maintenance activities that could result in discharges of sediments or other contaminants into wetlands, waterways, or other resource areas regulated under 310 CMR 10.00, the responsible maintenance personnel will employ measures to prevent migration of these sediments/contaminants. Such temporary measures may include, but are not necessarily limited to, the use of siltation barriers, catch basin silt sacks/filter bags, pipe plugs, cofferdams deployed within the stormwater structure, turbidity curtains, or other practices designed to prevent such discharges.

Where maintenance occurs in areas that are confined, with no risk of discharge to adjacent water bodies, no special measures may be needed. Examples include, but are not limited to: (1) cleaning of a forebay under dry conditions when the work can be completed and exposed surfaces stabilized prior to placing it back into service; and (2) catch basin cleaning where the activity is limited to removing material from a sump below the elevation of the outlet pipe.

1.4 O&M Budget

The Town of Raynham and City of Taunton perform maintenance for stormwater management systems as part of their routine operation and maintenance budget for roadways and bridges.

2

Long-Term Pollution Prevention Plan

This Long-Term Pollution Prevention Plan (LTPPP) describes the approach for pollution prevention and related maintenance activities for South Street East / Old Colony Ave in the Town of Raynham and City of Taunton, MA. In general, long-term pollution prevention and related maintenance activities will be conducted consistent with:

- The National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer System (MS4),
- Measures outlined in the Town of Raynham's and City of Taunton's Stormwater Management Plans (SWMP).

This LTPPP satisfies the requirements related to pollution prevention under Massachusetts Stormwater Standards 4, 5, 6, and 10.

2.1 Practices for Long-Term Pollution Prevention

For the facilities covered, long-term pollution prevention includes the following measures.

2.1.1 Litter Pick-up

The municipalities will conduct litter pick-up from the stormwater management facilities in conjunction with routine road maintenance activities.

2.1.2 Material Storage and Handling

The following storage and handling practices shall be implemented at the Site:

- Avoid stockpiling of soil or materials within 100 feet of wetland resources and wellhead protection areas. If necessary, provide sufficient erosion controls to prevent migration of sediments.
- All materials shall be stored or disposed in accordance with all local, state, and federal regulations.
- All sand piles shall be contained and stabilized to prevent the discharge of sand to wetlands or water bodies and, where feasible, covered.
- Minimize hazardous materials stored on site. All materials stored on site shall be stored in original containers and sealed.
- All solid waste, if encountered, shall be handled and disposed of in accordance with all local, state, and federal regulations.
- No snow shall be stored within waterbodies, resource areas, wellhead protection areas, or associated buffer zones.

2.1.3 Inspection and Maintenance of Stormwater Assets

The municipalities will conduct inspection and maintenance of drainage infrastructure and the stormwater control measures (SCMs) in accordance with the O&M Plan, as described in Section 1.

2.1.4 Maintenance of Landscaped Areas

Routine mowing will be conducted according to standard Town practices. SCM basin bottoms and embankments designed to impound water should be mowed as required to prevent establishment of woody vegetation.

2.1.5 Snow and Ice Management

Snow and Ice Management will be conducted consistent with Town/City Snow and Ice Policy and Procedures.

2.1.6 Street Sweeping

Operations on Town-owned roadways with be conducted in accordance with Town Standard Operating Procedures.

2.1.7 Prohibition of Illicit Discharges

The MassDEP Stormwater Management Standard 10 prohibits illicit discharges to the stormwater management system. Illicit discharges are discharges that do not consist entirely of stormwater, except for certain specified non-stormwater discharges.

In accordance with the existing MS4 permit, examples of discharges from the following sources are not considered illicit discharges:

- Firefighting activities*
- Foundation drains
- Water line flushing
- Footing drains
- Landscape irrigation
- Individual residential car washing
- Uncontaminated groundwater
- Rising groundwater
- Diverted stream flows
- Flows from riparian habitats/wetlands
- Potable water sources
- Dechlorinated swimming pool water
- Street wash waters
- Wash water from residential buildings (no detergents)
- Condensation from air conditioning units
- Run-on from private driveways caused by precipitation
- Lawn watering
- Water from crawl space pumps

*Water from firefighting activities is allowed and need only be addressed where they are identified as significant sources of pollutants to waters of the United States.

Based on plan review and existing survey, there are no known or proposed illicit connections associated with the project. Should an interconnection to the stormwater management system be identified, the Town/City will determine if the connections are authorized. For unauthorized

connections, the Town/City will investigate the connections and if they are determined to be illicit, the connections will be managed through Town's/City's Illicit Discharge Detection and Elimination (IDDE) program.

2.1.8 Spill Prevention and Response

The following spill prevention and response measures shall be implemented at the Site:

- Refuel construction equipment off-site.
- Any spills of hazardous materials shall be reported, contained, and removed in accordance with local, State, and Federal regulations.
- Review on-site equipment and activities to ensure no illicit discharges are created.

3

Construction Period Pollution Prevention and Erosion and Sediment Control Plan

3.1.1 Introduction

The project is anticipated to disturb greater than one acre; therefore, filing a Notice of Intent with EPA and developing of a Stormwater Pollution Prevention Plan (SWPPP) is required. The SWPPP will be provided as part of the construction documents and will be submitted to the Town of Raynham and the City of Taunton Conservation Commission prior to commencement of construction. The following plan provides general guidance for the prevention of pollution and erosion and sedimentation during construction.

Potential Erosion and Sedimentation

Portions of the project involve soil disturbance in areas upgradient of stormwater collection systems and wetland resources. Site preparation, scheduling, and construction practices need to be carefully planned to prevent construction debris and erosion caused by stormwater runoff over exposed soils from causing degradation of downstream wetland resources. Although it is not always possible to avoid impacts from storm events, the following guidelines shall be followed:

- Minimize land disturbance area and soil exposure to stormwater and wind erosion.
- Minimize time that area is disturbed.
- Avoid routing stormwater runoff or dewatering flows through disturbed areas.
- Inspect and maintain erosion controls until all soils are stabilized.
- Maintain good housekeeping practices.
- Stabilize disturbed soils as soon as possible to limit exposure.

Erosion and Sedimentation Plan

This Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan has been prepared in accordance with the Department of Environmental Protection's Massachusetts Erosion and Sedimentation Guidelines for Urban and Suburban Areas.

Extent of Disturbance

The total area of disturbance is approximately 1.05± acres. The project has been designed to minimize disturbance to existing woodlands and the majority of proposed work is within an existing roadway and its associated right-of-way. The existing Site will be impacted by tree clearing/trimming, grading, roadway widening, sidewalk and shared use path construction, utility installation, and other associated activities. Off-site areas are not proposed to be

directly altered but may be impacted by erosion and sedimentation if the controls described in this plan are not followed. No off-site land disturbance is proposed.

Refer to construction drawings for locations of all proposed erosion and sedimentation controls and the proposed area of disturbance.

Pre-Construction and Site Preparation

- Install all erosion control barrier in accordance with the construction documents prior to commencing any land disturbance activity.
- Inspect and maintain erosion controls until all soils are stabilized.
- Monitor weather reports daily and stabilize/prepare site if storm event in excess of the 2-year storm is expected.
- Maintain an inspection logbook on-site at all times. The specific location of the logbook shall be conveyed to the Town.

3.1.2 Planned Erosion and Sedimentation Control Practices

Catch Basin Inlet Protection

Inlet protection is proposed at all existing and proposed drain inlets within the project area. Inlet protection shall also be provided at off-site drain inlets located immediately downgradient of the area of disturbance, pending coordination with the Town and/or abutting property owners.

The purpose of inlet protection is to intercept and capture sediment that would otherwise enter the drainage system. Inlet protection shall consist of manufactured polyproplylene fabric consistent with the construction details.

Inspection and maintenance shall consist of checking for sediment accumulation and removing sediment when the protection device is at least one-half full.

Sediment Control Barrier

Sediment control barrier is proposed along the downgradient limit of work, as depicted on the construction plans. Additional erosion control barrier may be required at other locations as needed.

The purpose of erosion control barrier is to intercept and capture sediment that would otherwise migrate off-site. Erosion control barrier shall consist of compost filter tubes, straw wattles, and silt fence.

Inspection and maintenance:

- Check for sedimentation accumulation and removing sediments when they reach excessive volumes (approximately 1/3 the height of the barrier).
- Remove sediments when runoff ponds for 24 or more hours to prevent potential mosquito breeding habitat. Restake/replace controls as necessary to maintain their effectiveness.

Control of Water

Control of water is proposed along the Taunton River upstream and downstream of the proposed bridge rehabilitation.

The purpose of control of water is redirect flows around the work area to prevent sedimentation transport downstream. The means and methods of the controls shall be the responsibility of contractor and will be based on their construction operations and the conditions at the site. Methods are anticipated to include temporary cofferdams and dewatering.

Inspection and maintenance, as applicable:

- Check for sediment accumulation, plant growth, or debris behind the control.
- Check for stability at anchoring points and identify any breaks in the control.
- Identify any areas where turbid water is passing through the control.
- Repair as necessary to maintain effectiveness.

Tree Protection

Tree protection is proposed at existing trees to remain near to the area of disturbance, as noted on the construction plans.

The purpose of tree protection is to minimize risk of damage to trees designated to remain. Tree protection shall consist of armoring, pruning, and/or fencing consistent with the construction details.

Temporary Seeding

Temporary seeding is proposed for disturbed areas which have remained exposed for more than 14 days.

The purpose of temporary seeding is to provide vegetative stabilization of loose soil to mitigate risk of erosion.

Inspection and maintenance:

- Confirm that vegetation has been established
- Provide additional seeding as needed

3.1.3 Additional Control Measures

Good Housekeeping

- Minimize hazardous materials stored on site. All materials stored on site shall be stored in original containers and sealed.
- Refuel construction equipment off-site.
- Any spills of hazardous materials shall be reported, contained, and removed in accordance with local, State, and Federal regulations.

Material Stockpiling

All construction materials shall be stored in designated stockpile areas. Stockpiles shall be surrounded with silt fence, straw wattles, and/or compost filter tubes to mitigate erosion potential. All waste materials shall be removed from the Site or placed in approved receptacles at the conclusion of each workday. Disposal of waste materials shall be in accordance with relevant local, state, and federal regulations.

Protection of Infiltration Areas

To protect the infiltrative capacity of proposed infiltration areas, SCMs shall be excavated as late as practicable in the construction sequence.

Potential Construction Site Pollutants

Pollutant-Generating Activity	Pollutants or Pollutant Constituents	Location on Site
Equipment Re-fueling	Diesel Fuel, Gasoline	Laydown Area
Leaking or Broken Hydraulic Lines	Hydraulic Oil	Building Work Areas and Laydown Area
Minor Equipment Maintenance	Diesel Fuel, Gasoline, Hydraulic Oil, Motor Oil, Anti-Freeze	Laydown Area
Applying Fertilizer	Nitrogen, Phosphorous	Newly Seeded Areas
Portable Sanitary Toilets	Bacteria, Parasites and Viruses	Laydown Area
Vehicle Accident	Diesel Fuel, Gasoline	Entire Site
Trash Containers/Dumpsters	Paper, Plastic, and Food Waste	Laydown Area

Refer to Long-Term Pollution Prevention Plan, included as Section 2, for measures to be implemented to minimize pollutant discharges.

IMPROVING COMMUNITIES TOGETHER

July 31, 2025

City of Taunton
Taunton Conservation Commission
141 Oak Street
Taunton, MA 02780

Attn: Steven Turner, Chair

Re: Request for Emergency Certification for South St E / Taunton River Bridge Closure and Repairs
Raynham: South St E / Taunton River
Bridge No: R-02-003 = T-01-004
BIN No: 3M4
Structure No: R02003-3M4-MUN-NBI

Dear Mr. Steven Turner:

This letter serves to notify the Taunton Conservation Commission of proposed emergency repairs to the Old Colony Avenue Bridge (identified as South Street in Raynham) necessitated by unsafe structural conditions that pose immediate risk to public safety and access.

The Massachusetts Department of Transportation (MassDOT) – Highway Division has undertaken the inventory, inspection, and rating of locally owned bridges to assist the City of Taunton in complying with State and Federal Legislation. In accordance with the provisions of **M.G.L.C. 85, sub-section 35**, the MassDOT – Highway Division determined the maximum load which the subject bridge may safely carry. The structure was recently rated and it is recommended that the bridge be closed to vehicular traffic due to the poor condition of the ends of beams 1, 2, 5, and 7 at the South Abutment, and beam 2 at the North Abutment.

Pursuant to **310 CMR 10.06(1) and (2)** of the Massachusetts Wetlands Protection Act, this work qualifies as an emergency exempt from prior permitting requirements for the protection of the safety of the citizens of the Commonwealth. The poor condition of the bridge requires prompt action to prevent collapse, injury, and loss of access.

Proposed emergency work includes:

- Concrete repairs along beams 1, 2, 5, and 7 at the South Abutment;
- Concrete repairs along beam 2 at the North Abutment; and
- Temporary scaffolding / staging that will be partially located within Land Under Water (LUW) but will not require permanent alterations.

Work on the bridge will need to be performed in and around the Taunton River, within NFHL 100 Year Flood Zone AE (i.e., Bordering Land Subject to Flooding), and within the 100-foot Buffer Zone to two (2) Bordering Vegetated Wetlands. All reasonable measures will be taken to minimize impacts to resource areas. Emergency repair work shall not exceed thirty (30) days. Only work necessary to abate the emergency will be performed on the subject bridge. Following the completion of emergency repairs, documentation will be submitted as required, and coordination with the Commission will continue to ensure full compliance.

BRIDGE CLOSURE

Raynham: SOUTH ST E / TAUNTON RIVER
Bridge No: R-02-003 = T-01-004
BIN No: 3M4
Structure No: R02003-3M4-MUN-NBI

Dear Select Board:

The Massachusetts Department of Transportation (MassDOT) - Highway Division has undertaken the inventory, inspection, and rating of locally owned bridges to assist the cities and towns in complying with State and Federal Legislation. In accordance with the provisions of **M.G.L.C 85, sub-section 35**, the MassDOT - Highway Division has determined the maximum load which the subject bridge may safely carry.

The above structure was recently rated, and it is recommended that the bridge be **CLOSED** to vehicular traffic.

The reason for this recommendation is due to the poor condition of the ends of beams 1, 2, 5 and 7 at the South Abutment, and beam 2 at the North Abutment.

Your immediate action is requested. Please coordinate with the District Bridge Engineer, Shane Sousa, at (781)853-7065 on your action taken so the Bridge Inspection Unit can document the closure.

A copy of the Rating Report regarding this recommendation is on file at our District office. Mary-Joe Perry, the District Highway Director, will be pleased to review the report with you and advise you of any programs available regarding this bridge.

Thank you for your cooperation.

Sincerely,

Alexander K. Bardow, P.E.
State Bridge Engineer

BIN No: 3M4
Structure No: R02003-3M4-MUN-NBI

Dear Mr. David McRae:

This letter serves to notify the Raynham Conservation Commission of proposed emergency repairs to the Old Colony Avenue Bridge (identified as South Street in Raynham) necessitated by unsafe structural conditions that pose immediate risk to public safety and access.

The Massachusetts Department of Transportation (MassDOT) – Highway Division has undertaken the inventory, inspection, and rating of locally owned bridges to assist the Town of Raynham in complying with State and Federal Legislation. In accordance with the provisions of **M.G.L.C. 85, sub-section 35**, the MassDOT – Highway Division determined the maximum load which the subject bridge may safely carry. The structure was recently rated and it is recommended that the bridge be closed to vehicular traffic due to the poor condition of the ends of beams 1, 2, 5, and 7 at the South Abutment, and beam 2 at the North Abutment.

Pursuant to **310 CMR 10.06(1) and (2)** of the Massachusetts Wetlands Protection Act, this work qualifies as an emergency exempt from prior permitting requirements for the protection of the safety of the citizens of the Commonwealth. The poor condition of the bridge requires prompt action to prevent collapse, injury, and loss of access.

Proposed emergency work includes:

- Concrete repairs along beams 1, 2, 5, and 7 at the South Abutment;
- Concrete repairs along beam 2 at the North Abutment; and
- Temporary scaffolding / staging that will be partially located within Land Under Water (LUW) but will not require permanent alterations.

Work on the bridge will need to be performed in and around the Taunton River, within NFHL 100 Year Flood Zone AE (i.e., Bordering Land Subject to Flooding), and within the 100-foot Buffer Zone to two (2) Bordering Vegetated Wetlands. All reasonable measures will be taken to minimize impacts to resource areas. Emergency repair work shall not exceed thirty (30) days. Only work necessary to abate the emergency will be performed on the subject bridge. Following the completion of emergency repairs,

July 18, 2025

Town of Raynham
Board of Selectmen
558 South Main St.
Raynham, MA 02767

Attn: Norm Sturtevant, Highway Superintendent

SUBJECT: NATIONAL BRIDGE INSPECTION STANDARDS (NBIS)
BRIDGE CLOSURE

Raynham: SOUTH ST E / TAUNTON RIVER
Bridge No: R-02-003 = T-01-004
BIN No: 3M4
Structure No: R02003-3M4-MUN-NBI

Dear Select Board:

The Massachusetts Department of Transportation (MassDOT) - Highway Division has undertaken the inventory, inspection, and rating of locally owned bridges to assist the cities and towns in complying with State and Federal Legislation. In accordance with the provisions of **M.G.L.C 85, sub-section 35**, the MassDOT - Highway Division has determined the maximum load which the subject bridge may safely carry.

The above structure was recently rated, and it is recommended that the bridge be **CLOSED** to vehicular traffic.

The reason for this recommendation is due to the poor condition of the ends of beams 1, 2, 5 and 7 at the South Abutment, and beam 2 at the North Abutment.

Your immediate action is requested. Please coordinate with the District Bridge Engineer, Shane Sousa, at (781)853-7065 on your action taken so the Bridge Inspection Unit can document the closure.

A copy of the Rating Report regarding this recommendation is on file at our District office. Mary-Joe Perry, the District Highway Director, will be pleased to review the report with you and advise you of any programs available regarding this bridge.

Thank you for your cooperation.

Sincerely,

Alexander K. Bardow, P.E.
State Bridge Engineer

1.0 EXISTING CONDITIONS

1.1 STUDY AREA

The project is located at the bridge carrying South Street East / Old Colony Ave over the Taunton River in Raynham Taunton. The project limits are from the intersection with Sandy Hill Road approximately 380 feet north of the bridge to the railroad grade crossing approximately 200 feet south of the bridge.

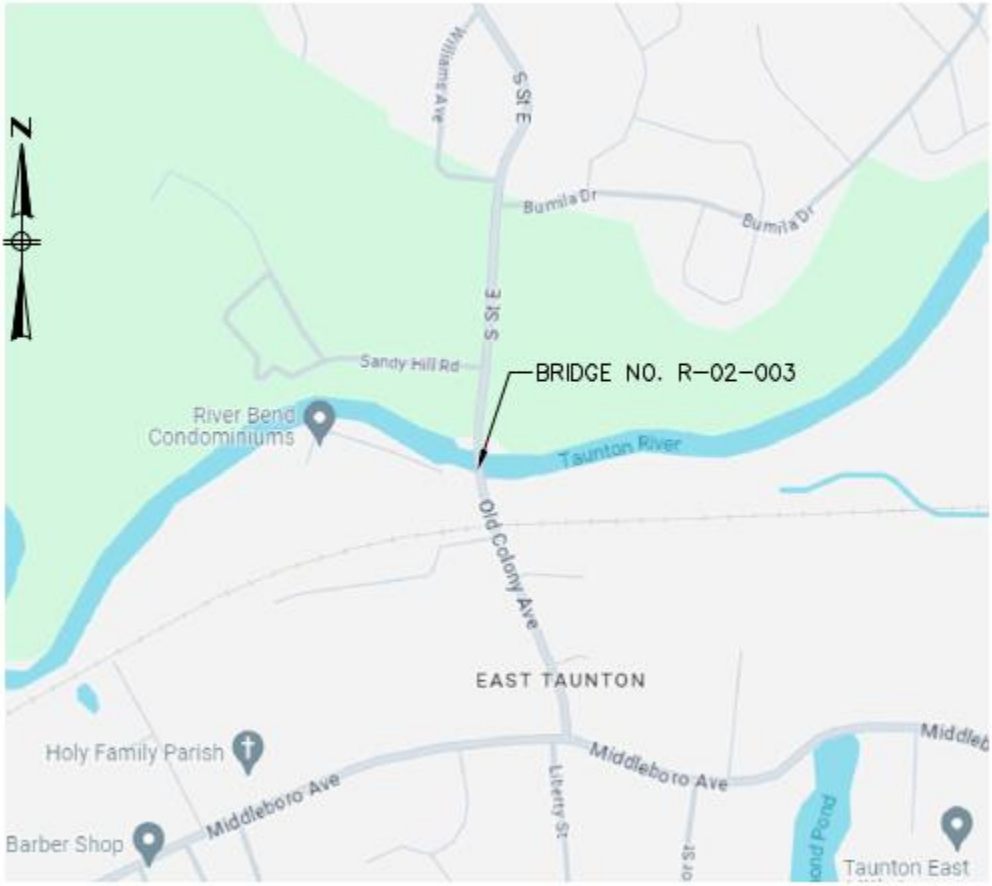

Figure 1 Location Map

1.2 BRIDGE

The existing structure is an approximately 89'-6" two span bridge with equal spans of approximately 44'-9", constructed in 1945. The structure consists of eight (8) 27 WF steel beams spaced at 4'-6 ½" on center supporting a 7" concrete deck and 2-1/4" of bituminous paving. The bridge is supported by unreinforced concrete gravity abutments and wingwalls and a reinforced concrete pier. The south abutment is founded on spread footings and the north abutment and pier are founded on timber piles. The bridge is 35'-0" wide, which includes a 26'-0" roadway, a 2'-6" safety walk and 5'-0" sidewalk with metal railing. The bridge has a skew angle of 23.6° and was designed for H20 loading.

1.3 ROADWAY

Old Colony Ave is a 0.3-mile-long (0.5 km) road in Taunton, Massachusetts, that runs north-south adjacent to the Taunton River. The roadway is under the jurisdiction of the City of Taunton. Old Colony Ave is classified as an Urban Collector.

Old Colony Ave within the study area consists of approximately (2) 13.5-foot-wide travel lanes with no shoulders on the approach to the bridge and over the bridge (2) 11.5-foot-wide travel lanes with 1 to 2-ft shoulders. Directional flow along the roadway is separated by a double yellow line and there are no bicycle accommodations within the project area. The legal speed regulation along the roadway in the study area is 30 miles per hour (mph).

South Street East is a 1.5-mile-long (2.4 km) road in Raynham, Massachusetts, that runs north-south adjacent to the Taunton River. The roadway is under the jurisdiction of the Town of Raynham. South Street East is classified as an Urban Collector.

South Street East within the study area consists of approximately (2) 11- to 11.5-foot-wide travel lanes with 1.5- to 2-ft shoulders. Guardrail exists on the southbound side of the roadway leading up to the bridge. Directional flow along the roadway is separated by a double yellow line and there are no bicycle accommodations within the project area. The legal speed regulation along the roadway in the study area is 30 miles per hour (mph).

1.4 SAFETY ANALYSIS

Crash data for the major intersections included within the detour limits was obtained for the five most recent years available, January 2019 through December 2023, from the MassDOT IMPACT Crash Portal. Refer to Section 3.0 of this report for further discussion of the four intersections used for the detour.

A review of the MassDOT crash data revealed that there were 49 crashes that occurred at the intersection of New State Hwy (Route 44) and Orchard St, 33 crashes at the intersection of New State Hwy (Route 44) and Church St, 31 crashes at the intersection of Middleboro Ave and Old Colony Ave/Liberty St and 6 crashes at the intersection of Middleboro Ave and Precinct St/South Precinct St. No fatalities were reported within the analysis limits. Most crashes within the intersections (95 out of 119) were either angle crashes or rear-end crashes. Furthermore, most crashes within the study area occurred during clear/dry weather. **Table 1** provides a summary of the roadway crash history.

Table 1: Roadway Crash Summary

	ROADWAY	New State Hwy (Route 44)@ Orchard St	New State Hwy (Route 44)@ Church St	Middleboro Ave @ Old Colony Ave/Liberty St	Middleboro Ave @ Precinct St/South Precinct St	TOTAL
Number of Crashes	Total	49	33	31	6	119

2.0 ENVIRONMENTAL

2.1 ENVIRONMENTAL PERMITTING ASSESSMENT

The following Table is a list of applicable permits and reviews for the Project:

Table 2 Regulatory Permits and Reviews

Permit or Review	Yes	No	Notes:
Bridge Exempt	✓		The Project is considered "bridge exempt" and therefore does not require permitting under the Massachusetts Wetlands Protection Act, the Massachusetts Public Waterfront Act, or the Massachusetts Environmental Policy Act.
Wetlands Protection Act (WPA)		✓	
Chapter 91		✓	
Environmental Justice Community		✓	None mapped within 1 mile of the Site.
Massachusetts Environmental Policy Act (MEPA)		✓	

National Environmental Policy Act (NEPA)	✓		Categorical Exclusion (CE) required.
Section 401 Water Quality Certification (WQC)		✓	Should any wetland or waterway impacts be necessary based on Project scope revisions, a 401 WQC will be required if the "bridge exemption" is claimed for Massachusetts Wetlands Protection Act permitting. Otherwise, the Order of Conditions would serve as the 401 WQC.
Section 404 Army Corps General Permit		✓	
U.S. Coast Guard Bridge Permit		✓	
Coastal Zone Management (CZM) Federal Consistency Review		✓	
Essential Fish Habitat		✓	
Section 7 Endangered Species Act	✓		Consultation required.
Natural Heritage and Endangered Species Program (NHESP) Estimated or Priority Habitat		✓	
Section 106	✓		Project Notification Form required.
Adjacent Parkland or Wildlife Refuges for Section 4(f)	✓		Land to the north of the site is publicly owned and may be considered subject to Section 4(f); however, it does not appear to be protected open space based on cursory online research.
Wild and Scenic River	✓		Coordination with the National Parks Service will be required during design.
Adjacent Section 6(f) Properties		✓	
Article 97		✓	
Other		✓	

The differences in proposed work under the Alternatives presented in this report are related to striping and lane width; under either Alternative, the bridge superstructure will be replaced. Therefore, it is not anticipated that the selection of an Alternative will result in changes to the permitting requirements for the Project. The Project will not result in direct Resource Area impacts (e.g., fill and/or alteration). As summarized in Table 1 above, the following environmental permits/reviews are anticipated to be required under either Alternative:

Categorical Exclusion (MassDOT / FHWA)

The Project will be funded by a federal Community Project Funding Grant routed through the Federal Highway Administration (FHWA); therefore, documentation of compliance with the National Environmental Policy Act (NEPA) will be required. It is anticipated that the Project will require the

submission of a Categorical Exclusion (CE) pursuant to the FHWA's list of CE-eligible activities and that no Environmental Assessment or Environmental Impact Study will be required.

Section 7 – Endangered Species Act (USFWS)

As part of Project's environmental review process, coordination with the U.S. Fish and Wildlife Service (USFWS) under Section 7 of the federal Endangered Species Act will be undertaken. At a minimum, it is anticipated that the Project will require securing a "Not Likely to Adversely Affect" determination due to the Project Area being within the range of the Northern long-eared bat (*Myotis septentrionalis*), the Plymouth redbelly turtle (*Pseudemys rubriventris bangsi*), and the Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*).

Project Notification Form (State Historic Preservation Officer / Bureau of Underwater Archaeological Resources / Relevant Tribes)

Due to the use of federal funding, the Project will require the submission of a Project Notification Form (PNF) to the State Historic Preservation Officer (SHPO), Bureau of Underwater Archaeological Resources (BUAR), and all relevant Tribes to demonstrate compliance with Section 106 of the National Historic Preservation Act.

The Project will be constructed within/adjacent to the Old Colony Iron Works – Nemasket Mill Complex National Register Historic District (TAU.AA). Based on mapping reviewed via the Massachusetts Cultural Resources Information System (MACRIS), only roadway approach work within Taunton will be located within this Historic District. Both MACRIS mapping and the Massachusetts Historical Commission Inventory Form do not indicate that the bridge itself is a historic or cultural resource. Nearby historic and cultural resources associated with this Historic District include TAU.630 and TAU.628.

2.2 HAZMAT

The selection of a specific alternative will not affect the hazardous materials due diligence required for the Project.

2.2.1 HISTORIC AND CURRENT LAND USE

Historic and current land uses near the Project Area consist of residential and industrial properties to the south (within Taunton) and undeveloped woodlands and residential properties to the north (within Raynham).

2.2.2 ADJACENT RELEASE SITES AND CONTAMINATION SOURCES

According to the Massachusetts Underground Storage Tank (UST) Facility Search there is one (1) UST facilities within 0.25-miles of the Project Corridor, the Amaros Market Inc. (Facility ID #3854) located at 508 Middleboro Ave in Taunton.

According to MassDEP's Searchable Sites Database, the following releases have been reported within the vicinity of the Project Area:

RTN 4-0000160 – 103 Old Colony Avenue, Taunton

In July of 1992, a Phase I Environmental Site Assessment (ESA) was completed at the former Bacon Felt Facility located at 103 Old Colony Avenue in Taunton due to soil and groundwater contamination associated with a former leaching tank. Contaminants noted in the Phase 1 ESA included elevated levels of toluene and Volatile Organic Compounds (VOCs). Due to the limited vertical and horizontal spread of the contaminants per monitoring well data and surface water sampling, the property was assigned a Tier II classification.

Given the scope of the Project, there is currently no anticipated excavation of soils; therefore, management of contaminated media is unlikely.

2.2.3 Known or suspected Contamination Sites

A search for known oil and hazardous material releases in proximity of Project limits was conducted using online resources as noted above. No superfund sites are present within the Project Area.

2.2.4 Active Use Limitations (AUL)

There are no AUL Deed Restrictions within or adjacent to the Project limits that may be impacted by construction.

2.2.5 Excavation Work

The Project does not propose excavation into soils; only full-depth pavement construction will be conducted.

2.2.6 Excess Soil Generation

The Project does not propose activity that will generate excess soil.

2.2.7 Rail trail Projects

The Project is not a rail trail project.

2.2.8 Dewatering Contaminated groundwater

The Project does not propose any dewatering of polluted groundwater.

2.2.9 Hazardous Building Materials

Due to the age of the bridge, there is the potential for asbestos within concrete, joint caulking materials, gunite patches on the concrete, or the asphalt road surface. There is also potential for the presence of Polychlorinated biphenyls (PCBs) in paint and/or joint caulking materials. Lead paint may also be present on bridge surfaces.

3.0 Temporary Traffic Management

3.1 Detour Route

The construction staging alternative under consideration for the bridge and roadway construction involves a full bridge closure with traffic detours. Based on traffic counts conducted in May of 2024, the Old Colony Ave Bridge experiences a heavy vehicle percentage of approximately 0.8% in the northbound direction and 0.7% in the southbound direction.

The proposed detour would be via New State Highway (US Route 44), Church Street/Precinct Street and Middleboro Ave. Vehicles typically utilizing the Pleasant Street Bridge northbound approach would follow the detour route on Middleboro Ave and turn left onto Precinct Street, continue onto Church Street and turn left onto New State Highway. Vehicles destined in the southbound direction over the bridge would use the same route in the opposite direction. The two intersections on Middleboro Ave are stop controlled. The two study intersections on New State Highway (US Route 44) are signalized.

3.2 OPERATIONS ANALYSIS

Traffic Operations Analysis

Capacity analyses were conducted to assess the quality of traffic flow at four study intersections. This analysis was performed for existing Year 2024 volume conditions and Year 2024 detour volume conditions during the weekday AM and PM peak hours.

Capacity analysis was performed using Trafficware's Synchro software package (Version 12.0). The Synchro software analysis utilizes methodologies contained in the *Highway Capacity Manual, 7th Edition (HCM7)* published by the Transportation Research Board.

Six levels of service (LOS), "A"-"F", have been established with "A" representing very good operation and "F" representing very poor operation. For signalized and unsignalized intersections, level of service is defined in terms of total delay and is computed for individual intersection turning movements. Delay is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The relationship between LOS and delay for signalized intersections are summarized in Error! Reference source not found.**3**. The relationship between LOS and delay for unsignalized intersections are summarized in Error! Reference source not found.4. In addition to delay and level of service, the analysis examined the volume to capacity ratio (v/c) and 95th percentile queues for each lane group. Capacity analysis worksheets are provided in **Appendix C.**

Table 3: Signalized Intersection Level of Service Criteria

LOS	**Signalized Intersection Criteria Average Total Delay** (Seconds per Vehicle)	**General Description**
A	< 10.0	Free Flow
B	10.1 to 20.0	Stable flow (slight delays)
C	20.1 to 35.0	Stable flow (acceptable delays)
D	35.1 to 55.0	Approaching unstable flow (tolerable delay)
E	55.1 to 80.0	Unstable flow (intolerable delay)
F	> 80.0	Forced flow (jammed)

Table 4: Unsignalized Intersection Level of Service Criteria

LOS	Unsignalized Intersection Criteria Average Total Delay (Seconds per Vehicle)	General Description
A	< 10.0	Free Flow
B	10.1 to 15.0	Stable flow (slight delays)
C	15.1 to 25.0	Stable flow (acceptable delays)
D	25.1 to 35.0	Approaching unstable flow (tolerable delay)
E	35.1 to 50.0	Unstable flow (intolerable delay)
F	> 50.0	Forced flow (jammed)

Traffic Capacity Analysis Results

Intersection capacity and Level of Service (LOS) analysis was conducted for the Existing and Detour conditions for the AM and PM weekday commuting peak hours. Summaries of this analysis are provided in **Tables 5 and 6**.

Table 5: Level of Service Summary – Signalized Intersections

a. Delay measured in seconds per vehicle
b. v/c represents Volume to Capacity Ratio
c. 95th Percentile Queue measured in vehicles

Route 44 at Orchard Street

At the Route 44 signalized intersection with Orchard Street, the traffic operations with the proposed detour in place is projected to operate at a slightly improved level of service over existing conditions for the overall intersection. A few of the individual lane movements are projected to experience a slight increase in delay, but all will operate at LOS E or better.

Route 44 at Church Street

At the Route 44 signalized intersection with Church Street, the traffic operations with the proposed detour in place is projected to operate at a worse level of service over existing conditions for the overall intersection due to the additional traffic volume that will need to be processed by the traffic signal. The overall intersection and the EB, WB, and NB approaches are projected to operate at LOS F, have a volume to capacity ratio over 1.0 and have longer queues when compared with existing conditions. A potential mitigation measure is for a traffic control officer to be present to monitor peak time periods. An additional mitigation strategy is to adjust the traffic signal timing while the detour is in place.

Middleboro Ave at Old Colony Ave/Liberty Street

At the Middleboro Ave unsignalized intersection with Old Colony Ave/Liberty Street, the traffic operations with the proposed detour in place is projected to operate at significantly improved level of service over existing conditions for the overall intersection due to the full closure of the Old Colony Ave bridge over the Taunton River just north of this intersection. A few of the individual lane movements are projected to experience a slight increase in delay, but all will operate at LOS C or better.

Middleboro Ave at Precinct Street/S Precinct Street

At the Middleboro Ave unsignalized intersection with Precinct Street/ S Precinct Street, the traffic operations with the proposed detour in place is projected to operate at a worse level of service over existing conditions due to the additional traffic volume that will need to be processed through the intersection. The NB and SB stop-controlled approaches are projected to operate at LOS F, have a volume to capacity ratio well over 1.0 and have longer queues when compared with existing conditions. A potential mitigation measure is for a traffic control officer be present during peak time periods to mitigate the anticipated side street delay.

4.0 Utilities

Underground utilities within the project area include water, sewer, and gas. Gas and sewer are carried on the bridge superstructure and will be relocated from the east sidewalk to the west sidewalk so that service can be maintained during construction. An additional utility bay will be added to the bridge for a future water main.

Overhead utility poles will be permanently relocated from the west side of the roadway to the east side for bridge construction and for sidewalk clearance within project limits.

5.0 Right of Way

The existing Right of Way is municipal owned and varies in width starting from approximately 38’ at the beginning of the project and widening to up to 58’ over the bridge on the Taunton Side. On the Raynham side the Right of Way also varies in width. The Right of Way goes from 73’ by the sewer pump station. to 45’ wide by Sandy Hill Street.

Both alternatives presented below will have the same Right of Way impacts. A permanent easement will be required for proposed pedestrian curb ramp at #96 Old Colony Avenue. Permanent utility easements will be required for overhead wires that are being relocated from the west to the east side of the roadway. Temporary easements will be required for slope work, driveway work, sediment control barriers, and construction access.

6.0 Alternatives

6.1 General

There are two alternatives under consideration. Both alternatives were chosen based on the constraint that the existing bridge substructure be retained and only the superstructure be replaced. This restricts the cross-section of the roadway to approximately 26 ft curb to curb with a 6 ft sidewalk on one side of

the roadway. Both alternatives are proposing relocating the sidewalk from the east side to the west side of the roadway so that the sidewalk connects to the existing sidewalk at the condominium on the south side of the bridge. The sidewalk will be extended to Sandy Hill Street in Raynham.

The difference in the two alternatives are the lane and shoulder widths. Alternative 1 offers a narrower lane width with larger shoulder on the bridge curb side. Alternative 2 offers a more typical lane width with narrow shoulders on both sides of the roadway. Both alternatives will require design justifications for pedestrian and bicycle accommodation.

6.2 ALTERNATIVE 1

Alternative 1 features a cross-section with two 10-foot-wide travel lanes in each direction, accompanied by one 2-foot-wide shoulder on the sidewalk side and one 4-foot-wide shoulder on the safety curb side. Sidewalk is proposed on the west side of the roadway. The sidewalk is 6 feet wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5 feet wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative 1 will require a design justification for pedestrian accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, a 4-foot shoulder was provided on the east side, which is the minimum width for bicycle accomodation. A 2-foot shoulder was provided on the west side against the sidewalk for drainage, errant vehicles, and encroachment and off-tracking of wide vehicles. Sharrows can be added in the northbound lane.

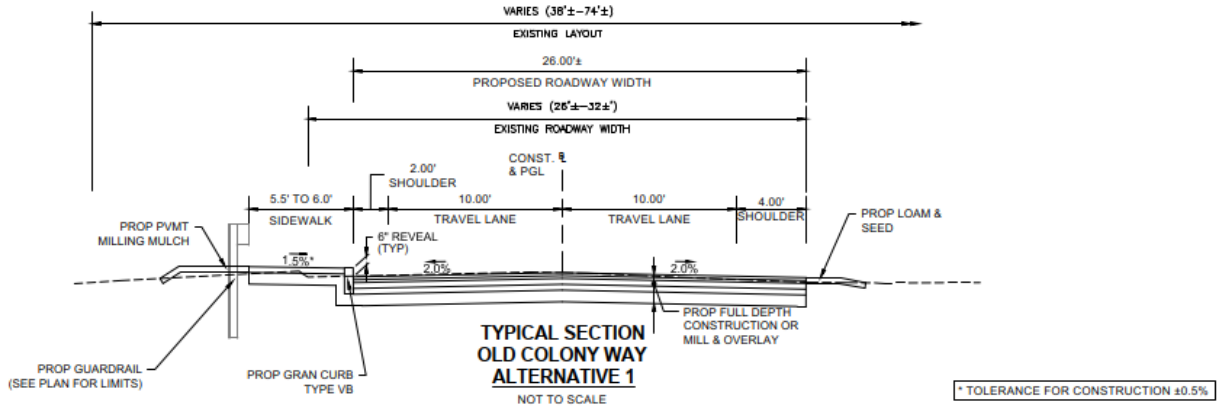

Figure 2 Typical Section Alternative 1

6.3 ALTERNATIVE 2

Alternative 2 features a cross-section with two 11-foot-wide travel lanes in each direction, accompanied by two 2-foot-wide shoulders. Vertical granite curbing lines both sides of the roadway. Sidewalk proposed on the west side of the roadway. The sidewalk is 6 feet wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5 feet wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative 2 will require a design justification for pedestrian

accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, 2- foot shoulders were provided on both sides of the roadway. Sharrows can be added to both travel lanes.

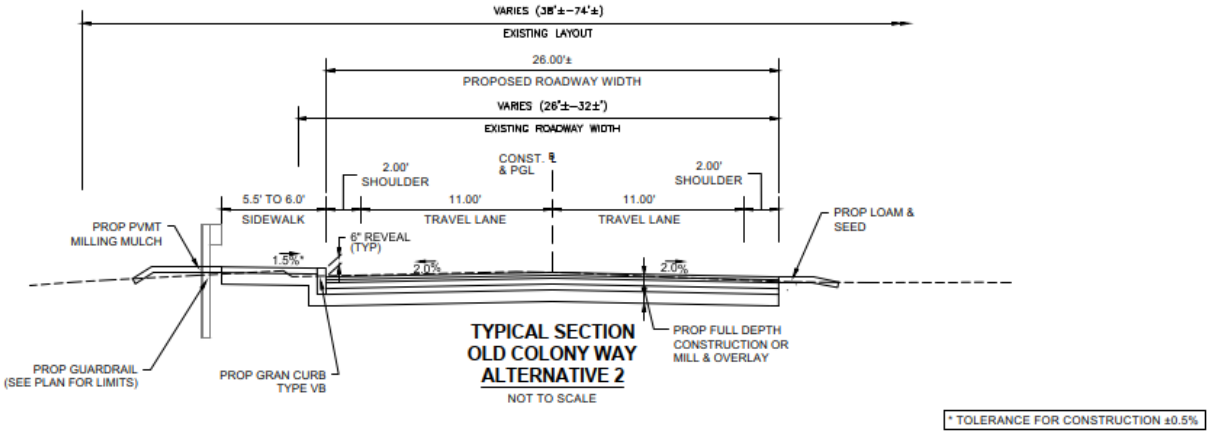

Figure 3 Typical Section Alternative 2

7.0 Opinion of Cost

The cost in both alternatives is the same because the cross-sectional width of the roadway, bridge, sidewalk and project limits are not different. The total estimated construction cost is $6,510,000.

8.0 Conclusion

Both alternatives require design justification for pedestrian and bicycle accommodation. Both have the same cost and impacts to utilities and properties. The only difference between the two are lane and shoulder configuration. Alternative 1 allows for bicycle accommodation southbound with a 4’ shoulder, while still maintaining the minimum lane width for a collector of 10-foot. Old Colony Avenue and South Street East is a bus route on the Greater Attleboro Taunton Regional Transit Authority. Bus lanes are permitted on 10’ travel lanes. The narrower 10’ roadway will help reduce speeds. Alternative 2 is like existing conditions where the lane widths are close to 11-feet and the shoulders are close 2-feet. Sharrows can be added to both lanes to signify that vehicles will be sharing the roadway with bicyclists.

APPENDIX G – EFH & USFWS Section 7 Documentation

- NOAA Section 7 Consultation
- USFWS Essential Fish Habitat Coordination Sediment Sample Test Results

In Reply Refer To: 12/18/2025 17:10:42 UTC
Project code: 2026-0024808
Project Name: 613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER

Subject: Not Likely to Adversely Affect Concurrence verification letter for the '613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER' project under the December 13, 2024, FHWA, FRA, FTA Programmatic Biological Opinion for Transportation Projects within the Range of the Indiana Bat, Northern Long-eared Bat, and Tricolored Bat.

To whom it may concern:

This letter records the determination of effects to federally listed (or proposed) bat species anticipated to result from the 613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER (the Project). This determination is based upon information you entered into the assisted determination key (Dkey) associated with the above referenced Programmatic Biological Opinion/Conference Opinion (PBO/PCO) in the U.S. Fish and Wildlife Service's (Service) Information for Planning and Consultation (IPaC) system on the date listed above to verify that the Project may rely on the concurrence provided in the PBO/PCO to satisfy requirements under section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (16 USC 1536), as amended.

Ensuring Accurate Determinations When Using IPaC:

The Service developed the IPaC system and this Dkey in accordance with the ESA and based on the PBO/PCO. All information submitted by the project proponent into IPaC must accurately represent the full scope and details of the Project.

Failure to accurately represent or implement the Project as detailed in the Dkey invalidates this letter. Answers to certain questions in the Dkey commit the project proponent to implementation of conservation measures that must be followed for the ESA determinations to remain valid. Carefully review this letter, your ESA requirements are <u>NOT</u> yet complete.

Determinations:

Based on the information you provided (Project Description shown below), you have determined that the Project is within the scope and adheres to the criteria of the PBO/PCO, including the adoption of applicable avoidance and minimization measures. Based on your IPaC submission and the PBO/PCO, the Project is consistent with the following effect determinations:

Species	Listing Status	Determination
Northern Long-eared Bat (*Myotis septentrionalis*)	Endangered	NLAA
Tricolored Bat (*Perimyotis subflavus*)	Proposed Endangered	NLAA

The tricolored bat is proposed for listing as endangered under the ESA, but not yet listed. For actions that may affect a proposed species, agencies cannot consult, but they can confer under the authority of section 7(a)(4) of the ESA. Such conferences can follow the procedures for a consultation and be adopted as such if the proposed species is listed. Should the tricolored bat be listed, agencies must review projects that are not yet complete, or projects with ongoing effects within the tricolored bat range that previously received a no effect or not likely to adversely affect (NLAA) determination from the key to confirm that the determination is still accurate.

The Service has 14 calendar days to notify the lead Federal action agency or designated non-federal representative if we determine that the Project does not meet the criteria for a NLAA determination under the PBO/PCO. **If the Service does <u>not</u> notify the lead Federal action agency or designated non-federal representative within that timeframe, you may proceed with the Project under the terms of the NLAA concurrence provided in the PBO/PCO**. This verification period allows Service Field Offices to apply local knowledge to implementation of the PBO, as we may identify a small subset of actions having impacts that were unanticipated. In such instances, Service Field Offices may request additional information that is necessary to verify inclusion of the proposed action under the PBO/PCO.

If the Project is modified, or new information reveals that it may affect the Indiana bat, northern long-eared bat, or tricolored bat in a manner or to an extent not considered in the PBO/PCO, further review to conclude the requirements of ESA section 7(a)(2) may be required.

For Proposed Actions that include bridge/culvert or structure removal, replacement, and/or maintenance activities:

If your initial bridge, culvert, or structure assessment failed to detect Indiana bat, northern long-eared bat, or tricolored bat use or occupancy, yet bats are later detected prior to, or during construction, promptly notify the local Service Field Office within 2 working days of the discovery. In addition, please document whether incidental take occurred, and if so, the type (i.e. kill or harm) and amount (i.e. number of individuals) and submit documentation to the local Service Field Office within 5 working days from the completion of the bridge, culvert, or structure construction (use Appendix E - Post Assessment Discovery of Bats at Bridge/Culvert or Structure Form in the User's Guide). In these instances, potential incidental take of Indiana bats, northern long-eared bats, or tricolored bats may be exempted provided that the take is reported to

the Service. In these instances, potential incidental take of Indiana bats, northern long-eared bats, or tricolored bats may be exempted provided that the take is reported to the Service.

If the Project may affect any other federally listed or proposed species and/or designated critical habitat, additional consultation between the lead Federal action agency and this Service Field Office is required for those species/designated critical habitat. If the Project has the potential to take bald or golden eagles, additional coordination with the Service under the Bald and Golden Eagle Protection Act may also be required. In either of these circumstances, please advise the lead Federal action agency to contact this Service Field Office

The following species may occur in your project area and **are not** covered by this determination:

- Monarch Butterfly *Danaus plexippus* Proposed Threatened
- Plymouth Redbelly Turtle = Plymouth Redbelly Cooter *Pseudemys rubriventris bangsi* Endangered

PROJECT DESCRIPTION

The following project name and description was collected in IPaC as part of the endangered species review process.

NAME

613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER

DESCRIPTION

RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003=T-01-004 (3M4), SOUTH STREET EAST OVER THE TAUNTON RIVER

The proposed project consists of replacing the bridge deck, increasing safety, and improving operations of the roadway. The proposed design relocates the existing bridge sidewalk from the east to the west side of the bridge to connect to an existing sidewalk on the southwest approach. A 5-foot shoulder for a bike lane in the northbound direction improves safety by providing dedicated space for cyclists, separating them from vehicular traffic. This separation reduces the risk of conflicts between cyclists and vehicles.

Monarch Butterfly: Proposed Threatened Species only. The project action will not jeopardize the continued existence of the proposed species.

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@41.88630155,-71.03005054127355,14z

DETERMINATION KEY RESULT

Based on your answers provided, this project(s) may affect, but is not likely to adversely affect the Indiana bat, northern long-eared bat or tricolored bat, therefore, consultation with the U.S. Fish and Wildlife Service pursuant to Section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended 16 U.S.C. 1531 et seq.) is required. However, also based on your answers provided, this project may rely on the concurrence provided in the Programmatic Biological Opinion/Conference Opinion for Transportation Projects in the Range of the Indiana bat, northern long-eared bat, and tricolored bat, dated December 13, 2024.

QUALIFICATION INTERVIEW

1. Which Federal Agency is the lead federal agency the action?

   A) Federal Highway Administration (FHWA)

2. Does the Action Area intersect the species list area of the Northern long-eared bat?

   Automatically answered
   Yes

3. Does the Action Area intersect the species list area of the tricolored Bat (TCB)?

   Automatically answered
   Yes

4. [Semantic] Is any portion of the action area within a 0.5 mile radius of an entrance/opening to any known NLEB or TCB hibernacula?

   Note: The map queried for this question contains proprietary information and cannot be displayed. If you need additional information, please contact the Field Office listed in the letterhead of this letter.

   Automatically answered
   No

5. Does your project's activities include raising the road profile above the tree canopy in documented habitat for the Indiana bat, NLEB, or TCB?

   Note: For the definition of documented habitat, refer to Appendix A: https://www.fws.gov/media/users-guide-range-wide-programmatic-consultation-indiana-bat-and-northern-long-eared-bat

   No

6. Is your project located within a karst area?

   No

7. Will the project include bridge, culvert, or structure removal, replacement, and/or alteration activities?

   Note: For definitions of bridge, culvert, and structure, refer to Appendix A: https://www.fws.gov/media/users-guide-range-wide-programmatic-consultation-indiana-bat-and-northern-long-eared-bat.

   Yes

8. Do your project's activities involve tree removal/trimming, temporary lighting, new/ additional permanent lighting, ground disturbance, percussives that involves noise/ vibration above existing background levels, vibrations, or slash pile burning?

   Yes

9. Is there suitable summer habitat for the Indiana bat, NLEB, or TCB within the project action area?

   Note: See the Service's summer survey guidance for current definitions of suitable habitat [https://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html].

   Yes

10. Have P/A surveys for the Indiana bat, NLEB, or TCB been conducted within the suitable summer habitat located within your project action area? This refers to mist-netting or acoustic surveys, not bridge assessments.

    Note: See the Service's survey guidance https://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html

    Yes

    SUBMITTED DOCUMENTS

    - *Raynham_613642_memo_20251027.pdf https://ipac.ecosphere.fws.gov/project/A3767GZ2FBHULEJFUCBVE3PERE/projectDocuments/173932326*

11. Did the P/A surveys detect Indiana bats, NLEBs, or TCBs?

    Note: If Indiana bats, NLEBs, or TCBs are detected, the action area is considered **documented habitat.**

    No

12. Did the local Service Field Office verify that this P/A survey can be used to determine Indiana bat, NLEB, and TCB are **not likely to be present** within the suitable summer habitat located within your project area?

    Yes

13. Will the project include **bridge** removal, replacement, and/or alteration activities?

    Yes

14. Has a Bridge Bat Assessment been conducted **within the last 24 months** to determine if the bridge is being used by the Indiana bat, NLEB, or TCB? If yes, upload assessment.

    Note: Refer to the Service's current survey guidance for acceptable assessment practices and validity timeframe of bridge/culvert and structure bat assessments: https://www.fws.gov/library/collections/range-wide-indiana-bat-and-northern-long-eared-bat-survey-guidelines.

    Yes

    SUBMITTED DOCUMENTS

    - *Raynham_613642_memo_20251027.pdf https://ipac.ecosphere.fws.gov/project/A3767GZ2FBHULEJFUCBVE3PERE/projectDocuments/173932326*

15. Please select one of the following results of the Bridge Bat Assessment:

    c) *Indicates the* ***absence*** *of Indiana bats, NLEBs, or TCBs roosting in/under the bridge (no bats, guano, etc.)?*

16. Does the project include **culvert** removal, replacement, and/or alteration activities?

    No

17. Does the project include **structure** removal, replacement, and/or alteration activities?

    No

18. Does the Action Area intersect the species list area of the tricolored Bat (TCB)?

    Automatically answered
    Yes

19. Does the Action Area intersect the species list area of the northern long-eared bat (NLEB)?

    Automatically answered
    Yes

PROJECT QUESTIONNAIRE

1. Have you made a No Effect determinations for all other species included on the FWS IPaC generated species list?

   Yes

2. Have you made a May Affect determination for any other species on the FWS IPaC generated list?

   No

3. Please enter the date of the bridge assessment.

   6/2/2025

AVOIDANCE AND MINIMIZATION MEASURES (AMMS)

This determination key result includes the commitment to implement the following Avoidance and Minimization Measures (AMMs):

GAMM1

Ensure all operators, employees, and contractors working in areas of Indiana bat, NLEB, or TCB suitable habitat are aware of all Transportation Agency environmental commitments, including all applicable AMMs.

DETERMINATION KEY DESCRIPTION: FHWA, FRA, FTA PROGRAMMATIC CONSULTATION FOR TRANSPORTATION PROJECTS AFFECTING IBAT, NLEB, OR TCB

This key was last updated in IPaC on September 11, 2025. Keys are subject to periodic revision.

This decision key is intended for projects/activities funded or authorized by the Federal Highway Administration (FHWA), Federal Railroad Administration (FRA), and/or Federal Transit Administration (FTA), which may require consultation with the U.S. Fish and Wildlife Service (Service) under Section 7 of the Endangered Species Act (ESA) and may affect the federally listed endangered Indiana bat (*Myotis sodalis*), northern long-eared bat (*Myotis septentrionalis*), and/or federally proposed endangered tricolored bat (*Perimyotis subflavus*).

This decision key should only be used to verify project applicability with the Service's Programmatic Biological Opinion/Conference Opinion for Transportation Projects in the Range of the Indiana bat, northern long-eared bat, and tricolored bat, dated December 13, 2024. The programmatic consultation limited transportation activities that may affect the covered bat species and addresses situations that are both likely and not likely to adversely affect the covered bat species. This decision key will assist in identifying the effect of a specific project/activity and the applicability of the programmatic consultation. The programmatic consultation is not intended to cover all types of transportation actions. Activities outside the scope of the programmatic consultation, or that may affect ESA-listed species other than the Indiana bat, northern long-eared bat, or tricolored bat, or their designated critical habitat, may require additional ESA Section 7 consultation.

IPAC USER CONTACT INFORMATION

Appendix A. Verification Form (updated January 2025)

Federal Highway Administration (FHWA) or the applicable state Department of Transportation (DOT) shall submit a signed version of this completed form, together with any project plans, maps, supporting analyses, etc., to NOAA's National Marine Fisheries Service (NMFS), Greater Atlantic Regional Fisheries Office, Protected Resources Division (GARFO PRD) at nmfs.gar.esa.section7@noaa.gov with "FHWA GARFO NLAA Program: [Project Title or Number]" in the subject line. **Note:** project design contractors and/or consultants may assist in preparing the form, but only FHWA/DOT staff shall sign off on it on the final page.

Project Activity Type (check all that apply to the entire action):

- [x] 1. Bridge repair, demolition, or replacement project
- [ ] 2. Culvert repair or replacement project
- [ ] 3. Dock, pier, or waterway access project (includes construction, demolition, and repairs)
- [ ] 4. Slope stabilization project

Transportation Project Information

Name of Project:	613642 RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003=T-01-004		
Reinitiation (Yes/No):	No		
State DOT/Program:	MassDOT		
DOT ID Code:	613642		
Contact Person:	Dave Paulson		
Phone:	+ 1 857 262 3378	Email:	david.j.paulson@dot.state.ma.
Project Latitude (e.g., 42.625884):		41.886006	
Project Longitude (e.g., -70.646114):		-71.030015	
Maximum Water Depth (m)		2.3	
Anticipated Project Start Date:	Decemeber 2026	Anticipated Project End Date:	October 2028
City/Town:	Taunton/ Raynham MA	Water body:	Taunton River
Project/Action Description and Purpose:	The Massachusetts Department of Transportation (MassDOT – Highway Division) Is proposing a reconstruction of the Old Colony Avenue Bridge over the Taunton River. The overall project limits extend 250' north of the intersection of Old Colony Avenue and Battle Row in Taunton, MA; along the Old Colony Avenue Bridge; and 370' to the intersection of South Street East and Sandy Hill Road, in Raynham, MA . The total length of the Project is approximately 790' along Old Colony Avenue and South Street East. The Project will consist of several activities including: Bridge deck replacement; Full depth pavement construction in the vicinity of the bridge; Pavement milling and overlay to the north and south of the bridge; Modifications to roadway geometry; Construction of a new sidewalk; New granite curbing; Striping of two travel lanes and a bike lane; Installation of Americans With Disabilities Act (ADA)-Compliant Ramps; Replacement of Guardrails; Paving of an existing town-owned gravel area associated with the pump station; Modifications to water, sewer, gas, electric and drainage utilities; Installation of a sediment forebay and leaching basins; Placement of riprap scour protection within the Taunton River; and Tree clearing and trimming. The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). The project will result in temporary and permanent impacts to federally jurisdictional Waters of the U.S. including the land below Ordinary High Water (Streambank and Streambed) associated with the Taunton River. The Project will result in a total of 13,270		

ESA-listed species and/or critical habitats in the action area (Check all that apply)

☑	Atlantic sturgeon (all DPSs)	☐	Kemp's ridley sea turtle
☐	Atlantic sturgeon critical habitat Indicate which DPS (GOM, NYB, Chesapeake Bay DPSs): Select DPS	☐	Loggerhead sea turtle (Northwest Atlantic DPS)
☐	Shortnose sturgeon	☐	Leatherback sea turtle
☐	Atlantic salmon (GOM DPS)	☐	North Atlantic right whale
☐	Atlantic salmon critical habitat (GOM DPS)	☐	North Atlantic right whale critical habitat
☐	Green sea turtle (North Atlantic DPS)	☐	Fin whale

* Please consult GARFO PRD's ESA Section 7 Mapper for ESA-listed species and critical habitat information for your action area at: https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-species-critical-habitat-information-maps-greater.

The following stressors are applicable to the action:

- ☐ Underwater Noise
- ■ Impingement/Entrainment and Entanglement
- ■ Water Quality/Turbidity
- ■ Habitat Alteration
- ☐ Vessel Traffic

Impacts Table

Habitat Alteration		
	Permanent (acres)	Temporary (acres)
Sand (saline)		
Silt/Mud/Clay (saline)		
Hard bottom (saline)		
Submerged Aquatic Vegetation (SAV) (saline)		
Sand (freshwater)		
Silt/Mud/Clay (freshwater)	0.19	0.10
Hard bottom (freshwater)		
Submerged Aquatic Vegetation (SAV) (freshwater)		
Total amount of habitat alteration	0.19	0.10

In-water Construction Impacts	
	Amount in meters
Width of water body in action area (m)	27.0
Stressor category that extends furthest distance into water body (e.g.; underwater noise, turbidity plume)	Turbidity
Maximum extent of stressor into the water body (m)	92.0

Project Design Criteria (PDC) Checklist
FHWA/DOT shall incorporate all general PDCs and all applicable PDCs in the appropriate stressor categories. For any PDCs that are not incorporated, additional justification is required for a project to be eligible for the NLAA Program. FHWA/DOT shall check the corresponding box for each PDC that is, or will be, incorporated into the project or indicate if not applicable.

GENERAL PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	1.	Ensure all operators, employees, and contractors are aware of all FHWA environmental commitments, including these PDC, when working in areas where ESA-listed species may be present or in critical habitat.
☑		2.	No portion of the proposed action will individually or cumulatively have an adverse effect on ESA-listed species or critical habitat.
☐	☑	3.	No portion of the proposed action that may affect the GOM DPS of Atlantic salmon will occur in the tidally influenced portion of rivers/streams where their presence is possible from April 10 through November 7. The range of the GOM DPS only occurs in Maine. **Note**: If the project will occur within the geographic range of the GOM DPS Atlantic salmon but their presence is not expected following the best available commercial scientific data, the work window does not need to be applied. Please attach best available information (i.e. local fisheries biologist correspondence).
☐	☑	4.	No portion of the proposed action that may affect shortnose or Atlantic sturgeon will occur in areas identified as spawning grounds as follows: i. Gulf of Maine: Apr 1-Aug 31 ii. Southern New England/New York Bight: Mar 15-Aug 31 iii. Chesapeake Bay: Mar 15-Jul 1 and Sep 15-Nov 1 **Note**: If river specific information exists that provides better or more refined time of year information, those dates may be substituted with NMFS approval.
☐	☑	5.	No portion of the proposed action that may affect shortnose or Atlantic sturgeon will occur in areas identified as overwintering grounds where dense aggregations are known to occur as follows: i. Gulf of Maine: Oct 15-Apr 30 ii. Southern New England/New York Bight: Nov 1-Mar 15 iii. Chesapeake Bay: Nov 1-Mar 15 **Note**: If river specific information exists that provides better or more refined time of year information, those dates may be substituted with NMFS approval.
☐	☑	6.	Within designated critical habitat for Atlantic sturgeon, no work will affect hard bottom substrate (e.g., rock, cobble, gravel, limestone, boulder, etc.) in low salinity waters (i.e., 0.0-0.5 parts per thousand) (PBF 1).
☑		7.	Work will result in no or only temporary/short-term changes in water temperature, water flow, salinity, or dissolved oxygen levels.

Yes	N/A	PDC #	PDC Description
☑		8.	If ESA-listed species are (a) likely to pass through the action area at the time of year when project activities occur; and/or (b) the project will create an obstruction to passage when in-water work is completed, then a zone of passage (~50% of water body) with appropriate habitat for ESA-listed species (e.g., depth, water velocity, etc.) must be maintained (i.e., physical or biological stressors such as turbidity and sound pressure must not create barrier to passage).
☑		9.	The project will not adversely impact any submerged aquatic vegetation (SAV) or oyster reefs.
☑		10.	No blasting or use of explosives will occur.
☑		11.	No in-water work on large dams or tide gates (small dam and tide gate repairs may be permitted with prior review and approval from NMFS).

UNDERWATER NOISE PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	12.	If pile driving is occurring during a time of year when ESA-listed species may be present, and the anticipated noise is above the behavioral noise threshold, a "soft start" is required to allow animals an opportunity to leave the project vicinity before sound pressure levels increase. *In addition to using a soft start at the beginning of the work day for pile driving, one must also be used at any time following cessation of pile driving for a period of 30 minutes or longer.* <u>For impact pile driving</u>: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving. <u>For vibratory pile installation</u>: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.

Yes	N/A	PDC #	PDC Description
☐	☑	13.	All underwater noise is below the injury thresholds of ESA-listed species in the action area. Attach your calculations to this verification form supporting this.
☐	☑	14.	Any new pile-supported structure must involve the installation of no more than 50 piles (below MHW).

Information for Pile Driving:
If your project includes **pile driving of any kind**, please attach your calculation to this verification form to verify that it fits within the scope of the behavioral/injury threshold analysis for ESA-listed species in the action area. The NMFS Office of Protected Resources Acoustic Calculator is available as one source, should you not have other information:
https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-effects-analysis-acoustics-greater-atlantic-region

Pile material (e.g., steel pipe, concrete)	Pile diameter/ width (in)	Number of piles	Installation method (e.g., impact hammer, vibratory start and then impact hammer to depth, drilling)

IMPINGEMENT/ENTRAINMENT AND ENTANGLEMENT PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	15.	If excavating or dredging, only mechanical buckets, hydraulic cutterheads, or low volume hopper dredges (e.g., CURRITUCK, ≤300 cubic yard maximum bin capacity) may be used. **Note**: We consider excavating a smaller scale form of mechanical dredging.
☑	☐	16.	No new excavation or dredging in Atlantic sturgeon or salmon critical habitat (excavation in a prior construction footprint or maintenance dredging is permitted, but still must meet all other PDCs). New excavation or dredging outside Atlantic sturgeon or salmon critical habitat is limited to one-time events (e.g., burying a cable or utility line) and minor (≤2 acres) expansions of areas already subject to prior excavation or maintenance dredging. Locating a replacement bridge within 250 feet (centerline to centerline) of an existing bridge and excavation of sediment around bridge piers are considered work in a previous construction footprint. **Note**: We consider excavating a smaller scale form of mechanical dredging.

Yes	N/A	PDC #	PDC Description
☑	☐	17.	Temporary intakes related to construction are prohibited in sturgeon and salmon spawning, rearing, or overwintering habitat during the time of year windows identified in General PDCs 3-5. If utilized outside those areas and times of year and in an area with anticipated sturgeon and salmon presence, temporary intakes must be equipped with 2-millimeter wedge wire mesh screening and must not have greater than 0.5 feet per second intake velocities, to prevent impingement or entrainment of juvenile and early life stages of these species.
☑	☐	18.	Work behind cofferdams, turbidity curtains, or other instruments that prevent access of animals to the project area is required when ESA-listed species are likely to be present (if presence is limited to rare, transient individuals, access control measures are not necessary). Once constructed, work inside a cofferdam at any time of year may be permitted with NMFS approval, provided the cofferdam is installed/removed outside the time-restricted period.
☑	☐	19.	No new permanent surface water withdrawal, water intakes, or water diversions.
☑	☐	20.	Turbidity control measures, including cofferdams, must be designed to not entangle or entrap ESA-listed species.
☐	☑	21.	Any in-water lines, ropes, or chains must be made of materials and installed in a manner to minimize or avoid the risk of entanglement by using thick, heavy, and taut lines that do not loop or entangle. Lines can be enclosed in a rigid sleeve.

WATER QUALITY/TURBIDITY PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	22.	In-water offshore disposal may only occur at designated disposal sites that have already been the subject of ESA section 7 consultation with NMFS and where a valid consultation is in place.
☐	☑	23.	Any temporary discharges must meet state water quality standards (e.g., no discharges of substances in concentrations that may cause acute or chronic adverse reactions, as defined by EPA water quality standards criteria).
☑	☐	24.	Only repair, upgrades, relocations, and improvements of existing discharge pipes or replacement in-kind are allowed; no new construction of untreated discharges.
☑	☐	25.	Work behind cofferdams, turbidity curtains, or other instruments to control turbidity is required when operationally feasible and ESA-listed species are likely to be present (if presence is limited to rare, transient individuals, turbidity control methods are not necessary).

HABITAT ALTERATION PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	26.	Minimize all new waterward encroachment and permanent fill.
☐	☑	27.	In Atlantic salmon critical habitat, stream simulation design with a minimum span of 1.2 bankfull width will be used in areas with minimal tidal influence. In tidal areas, a design that allows for unimpeded flow will be used (no delay in water entering or exiting the area upstream of the crossing).
☐	☑	28.	In Atlantic salmon critical habitat, no culvert end extensions, invert line culvert rehabilitation, or slipline culvert rehabilitation may occur.

VESSEL TRAFFIC PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	29.	Maintain project (i.e., construction) vessels operating within the action area to speed limits below 10 knots and dredge vessels to speeds of 4 knots maximum, while dredging.
☐	☑	30.	Maintain a 1,500-foot buffer between project (i.e., construction) vessels and ESA-listed whales and a 300-foot buffer between project vessels and sea turtles. This also applies to dredge vessels.
☐	☑	31.	The number of project (construction) vessels must be limited to the greatest extent possible, as appropriate to size and scale of project.
☐	☑	32.	The project must not result in the permanent net increase of commercial vessels.

Justification for NLAA Determination if not Incorporating All PDC
If the project is not in compliance with all of the general and stressor-based PDCs, but you can provide justification and/or special conditions to demonstrate why the project still meets the NLAA determination and is consistent with the aggregate effects considered in the programmatic consultation, you may still certify your project through the NLAA program using this verification form. Please identify which PDCs your project does not meet (e.g., PDC 9, PDC 15, PDC 22, etc.) and provide your rationale and justification for why the project is still eligible for the verification form. Project modifications must not result in different effects not already considered.

To demonstrate that the project is still NLAA, you must explain why the effects on ESA-listed species or critical habitat are **insignificant** (i.e., too small to be meaningfully measured or detected) or **discountable** (i.e., extremely unlikely to occur). **Please use this language in your justification.**

PDC#	Justification

FHWA/DOT Verification of Determination (To be filled out by FHWA/DOT staff only)
By submitting this Verification Form, FHWA, or the state DOT as FHWA's designated non-federal representative, indicates that they determined that the proposed activity described above is not likely to adversely affect (NLAA) ESA-listed species or designated critical habitat under NMFS jurisdiction in accordance with the Program, and all effects (direct, indirect, interrelated, and interdependent) are either insignificant (so small they cannot meaningfully be measured, detected, or evaluated) or discountable (extremely unlikely to occur).

☑	In accordance with the FHWA GARFO NLAA Program, we have determined that the action complies with all applicable PDCs and is not likely to adversely affect listed species.
☐	In accordance with the FHWA GARFO NLAA Program, we have determined that the action is not likely to adversely affect listed species per the justifications and/or special conditions provided above.

FHWA/DOT Signature:	Date:
	01/09/2026

By providing your determination and signature, you are certifying that to the best of your knowledge the information provided in this form is accurate and based upon the best available scientific information. This form must be filled out and signed by FHWA or state DOT staff, as an officially designated non-federal representative.

GARFO PRD Concurrence (To be filled out by GARFO PRD)
After receiving the Verification Form, GARFO PRD will contact FHWA/DOT with any concerns and indicate whether GARFO PRD concurs with FHWA/DOT's determination.

☑	In accordance with the FHWA GARFO NLAA Program, GARFO PRD concurs with FHWA/DOT's determination that the action complies with all applicable PDCs and is not likely to adversely affect listed species or critical habitat.
☐	In accordance with the FHWA GARFO NLAA Program, GARFO PRD concurs with FHWA/DOT's determination that the action is not likely to adversely affect listed species or critical habitat per the justifications and/or special conditions provided above.
☐	GARFO PRD does not concur with FHWA/DOT's determination that the action complies with the applicable PDCs (with or without justifications), and recommends an individual Section 7 consultation to be completed independent from the FHWA GARFO NLAA Program.

GARFO PRD Signature:	Date:
	01/12/2026

Appendix B. Verification Form

This form demonstrates compliance with the FHWA/NMFS GARFO EFH Programmatic Consultation dated 1/16/24. The applicable state Department of Transportation (state DOT) will complete this form and enter the project details into the ESA/EFH webtool (https://www.environment.fhwa.dot.gov/esawebtool/) to apply the programmatic consultation to a transportation project. FHWA will receive and review the completed forms before a final NEPA decision as part of the overall environmental review process. FHWA with the assistance of VOLPE will compile the information provided by all covered state DOTs on the completed Verification Forms and ESA/EFH webtool for the purposes of tracking and annual monitoring. FHWA/state DOT must include the completed Verification Form as part of a permit application with any other federal agency, such as U.S. Army Corps of Engineers or U.S. Coast Guard, to confirm that EFH consultation is complete.

Projects that are unable to meet the mandatory conservation recommendations in **bold** the state DOT will work with their FHWA Division Office to complete individual EFH consultation with NMFS.

Project Activity Type

1. ☒ Bridge repair, demolition, and replacement
2. ☐ Culvert repair and replacement
3. ☐ Docks, piers, and waterway access projects
4. ☐ Slope stabilization

Transportation Project Information

Project Name:	RAYNHAM- TAUNTON- BI	Project Number:	613642
Project Sponsor:	MassDOT	Contact Person:	Dave Paulson
Email:	david.j.paulson@dot.state.	Phone:	+ 1 857 262 3378
Latitude (e.g., 42.625884):		41.886005903543975	
Longitude (e.g., -70.646114):		71.0300152141668	
City/Town, State:	Taunton/ Raynham MA	Waterway:	Taunton River
Project Description and Purpose:	The Massachusetts Department of Transportation (MassDOT – Highway Division) Is proposing a reconstruction of the Old Colony Avenue Bridge over the Taunton River. The overall project limits extend 250' north of the intersection of Old Colony Avenue and Battle Row in Taunton, MA; along the Old Colony Avenue Bridge; and 370' to the intersection of South Street East and Sandy Hill Road in Raynham MA. The total length of the Project		
Anticipated Project Start Date:	Dec 2026	Anticipated Project End Date:	October 2028
Total area of impact to EFH (in acres): Include locus map with area of impact.		0.29	
Area of impacts to sensitive habitats (in square feet):		No impacts to submerged aquatic vegetation (SAV) or oyster reefs allowed.	
Natural rocky habitat (e.g., bedrock, boulders, cobble, and/or gravel):		0	
Salt marsh:		0	
Areas containing shellfish (excluding oyster reefs):		0	
Intertidal mudflats:		0	
Area of impact to diadromous fish habitat:		0.29	

Potential Stressors Caused by the Activity (Check all that apply based on activity type)

☐ Underwater Noise
☒ Impingement/Entrainment and Entanglement
☒ Water Quality/Turbidity
☒ Habitat Alteration
☐ Vessel Traffic

EFH Conservation Recommendation Checklist

FHWA/state DOT will indicate how the project addresses each of the programmatic EFH conservation recommendations, by selecting the appropriate check box and providing a brief explanation where necessary. **Bolded CRs are required.** If the project is not in compliance with any additional programmatic EFH conservation recommendation and FHWA/state DOT has still determined that the effects of a project on EFH are not substantial and the project is otherwise consistent with the FHWA programmatic EFH consultation, provide justification below under the conservation recommendations that are not included.

Underwater Noise

☒ Check here if the EFH conservation recommendations in this section are not applicable because the project will not create underwater noise as a stressor. Proceed to the next stressor.

1. Use a vibratory hammer to the maximum extent practicable.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans
☐ Included in description, other terms and conditions

2. For impact driving, an initial set of three strikes would be made by the hammer at 40 percent energy, followed by a 1-minute wait period, then two subsequent 3-strike sets at 40 percent energy, with 1-minute waiting periods, before initiating continuous impact driving. In addition to a soft start at the beginning of the day for impact pile driving, a soft start must also be used at any time following cessation of impact pile driving for a period of thirty minutes or longer and if any increase in pile installation or removal intensity is required. Build up power slowly from a low energy start-up over a 20-minute period to warn fish to leave the vicinity. This buildup shall occur in uniform stages to provide a constant increase in output. This should be done in accordance with the methods outlined in the NMFS GARFO/FHWA Best Management Practices (BMP) Manual.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

3. Avoid the use of hollow steel pipe piles when possible.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

4. Do not undertake noise-generating work in diadromous streams within the spring diadromous fish TOY restriction listed in Appendix C unless it is isolated behind sealed, dewatered cofferdams, to avoid impeding fish migration.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and condition

Impingement/Entrainment and Entanglement

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not lead to impingement/entrainment and entanglement as a stressor. Proceed to the next stressor.

5. **Turbidity control measures must be properly installed, secured and regularly monitored to ensure aquatic species are not entangled or trapped in the project area.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

6. **No new permanent surface water withdrawal, water intakes, or water diversions. (Permanent surface water intakes do not include dry hydrants.)**

☐ Not met: Project requires individual consultation with NMFS

☒ Met
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

7. Install and operate temporary intakes related to construction in accordance with the NMFS GARFO/FHWA Best Management Practices (BMP) Manual and equip intakes with mesh size screening and approach velocity appropriate for the species and life stage anticipated to be present during construction. Temporary pumping/intakes related to construction water handling will be based on the resource present and be in accordance with state fisheries consultation (with documentation provided) where such consultation is available. In addition,
   a) Per the NMFS Anadromous Salmonid Passage Facility Design manual, screen openings must not exceed 3/32 inch and screen approach velocity must be less than 0.25 feet per second (ft. /sec) in waters supporting anadromous salmonids.
   b) The use of 2 millimeter (mm) wedge wire screens must be used with a maximum intake velocity of 0.5 feet per second (ft. /sec).
   c) In Virginia, a 1 mm wedge wire screen with a maximum intake velocity of 0.25 ft. /sec) is required.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

Water Quality/Turbidity

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not negatively affect water quality or create turbidity. Proceed to the next stressor.

8. **Install soil erosion, sediment, and turbidity controls and maintain them in effective operating condition during construction. Remove controls upon completion of work, after all exposed soil and other fills, as well as any work waterward of ordinary high water or the high tide line, are permanently stabilized.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☒ Shown on project plans
- ☒ Included in description, other terms and conditions

9. **Prevent construction debris and sediment from entering aquatic areas and remove all construction debris and excess/deteriorated materials and dispose of in an appropriate upland area.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

10. **Dredged and/or excavated materials, including any fine-grained materials removed from inside culverts, shall either be moved to an upland location and stabilized to prevent reentry into the waterway or disposed of at a previously approved disposal site.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

11. **Completely remove and do not reuse existing creosote piles that are affected by project activities and do not install new creosote piles. Piles that break or cannot be removed due to site conditions must be cut off at the mudline.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

12. **Ensure that raw concrete does not contact the water; wet pours of concrete must be confined within sealed forms until the concrete is set or pre-cast members installed. Ensure grout bags are watertight.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

13. Install and remove any in-water soil erosion, sediment, and turbidity controls outside of the TOY restrictions listed in Appendix C.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

14. Conduct in-water work that produces turbidity or sedimentation in diadromous streams or EFH outside of the TOY restriction(s) in Appendix C.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

15. Do not use any creosote, coal tar epoxy, or other hydrocarbon-based coatings on any in-water structures or overwater structures. Dispose of any demolished structures treated with creosote, coal tar epoxy, or other hydrocarbon-based coatings in an approved upland disposal site.

☒ Not met:
- ☒ Not applicable, provide reasoning:
  Project does not propose any hydrocarbon-based coatings
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

16. In NJ only, in areas mapped as shellfish beds pursuant to N.J.A.C 7:7-9.2
    - All structures should be constructed with alternative materials, such as plastic, natural cedar or other untreated wood, or pressure-treated wood, coated offsite with an impact resistant, biologically inert substance to minimize leachate into shellfish areas.

- Coat any chemically or pressure treated piles (CCA, ACQ, etc.) with an impact-resistant, biologically inert substance. Coating should be applied during the manufacturing process, not post-manufacturing by a third party or contractor.

☒ Not met:

☒ Not applicable, provide reasoning:

Project action area is not in New Jersey

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

Habitat Alteration

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not cause habitat alteration. Proceed to the next stressor.

17. **Remove temporary and/or obsolete structures and fills in their entirety. Use geotextile barriers prior to placement of temporary fill material to ensure complete removal.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

18. **Return areas impacted by temporary activities, fills, or structures to pre-construction or better condition, including elevations and substrate, and replant with native species.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

19. **Temporary monitoring devices, if used in-water as part of an activity, shall be removed and the substrate restored to pre-construction elevations no later than 24 months from initial installation, or upon completion of data acquisition.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

20. **Pipelines and cables that cross a waterway must not rest on the substrate. They may be**

attached to an overwater structure or be buried to allow an area to return to preexisting conditions.

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

21. **Any fill, including planting media and placement of any seed shellfish, spatted-shell, or cultch must be free of all non-native or invasive species and/or contaminants. An invasive species control plan must be part of the project if the transportation agency cannot guarantee this.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

22. **Prevent dislodging of coir logs, mats, or native oyster shell.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

23. **Lowermost section of floating docks and vessels must be ≥18 inches above the substrate at all times.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

24. **Avoid propeller scour and grounding of all project vessels and floating docks.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

25. Provide compensatory mitigation for all permanent impacts to aquatic habitats and for temporary impacts in place over 12 months to address the temporal loss of aquatic habitat functions. This could include a contribution to an existing in-lieu fee program. Because compensatory mitigation is intended to offset adverse effects of an action, it

cannot be viewed separately from an action causing the effect.

When impacts are unavoidable:

a) Conduct a pre-biological survey to map the coverage of the sensitive habitats;
b) Develop a compensatory mitigation plan for biological resource losses, including success criteria, monitoring and adaptive management plans, and long-term maintenance plan. Use the 2008 Final Rule, Compensatory Mitigation for Losses of Aquatic Resources under Clean Water Act Section 404 (33 CFR Parts 325 and 332, 40 CFR Part 230) and NOAA's Mitigation Policy as guides for the development of the compensatory mitigation plan.
c) Undertake compensatory mitigation prior to or concurrent with any impacts to sensitive habitat.

☒ Not met:

◉ Not applicable, provide reasoning:

The project does not propose any loss of aquatic resources

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans
☐ Included in description, other terms and conditions

26. Prior to construction, identify and mark in the field any SAV and wetlands at the project site. An SAV survey is required for activities adjacent to mapped or known SAV if a survey has not been conducted in the previous three years.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans
☒ Included in description, other terms and conditions

27. Locate temporary structures, anchors, spud barges, and construction, access, and dewatering activities outside of special aquatic sites.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

28. All in-water work, including dredging or discharge of fill material will be undertaken at, or approximating, low tide and using low ground pressure equipment to prevent compaction. Low ground pressure is defined as < 3 psi. Where construction requires heavy equipment operation in or across wetlands or mudflats, the equipment shall be placed on construction timber mats that are adequate to support the equipment; be operated on dry or frozen wetlands such that shear pressure does not cause subsidence of the wetlands immediately beneath equipment and upheaval of adjacent wetlands. Construction mats must not be dragged into position.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

29. Remove temporary and/or obsolete structures and fills in their entirety, unless the structure or fill is to be left in place in order to comply with conditions imposed by other state or federal permits. Obsolete structures do not include any structures that are repurposed or preserved to prevent habitat degradation (e.g., abutments or sheet piling that remain in place for habitat or scour protection).

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

30. If rock relocation is necessary, move them to an area of equivalent depth and substrate.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

31. The height of docks and piers must be at least four feet above salt marsh substrate and must be greater than or equal to the width of the deck to minimize shading impacts. The height must be measured from the marsh substrate to the bottom of the longitudinal support beam.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

32. The lowermost part of floating docks must be greater than or equal to 18 inches above the substrate at all times to avoid grounding and propeller scour and to provide adequate circulation and flushing.

☒ Not met:

☒ Not applicable, provide reasoning:

Floating docks not proposed

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

33. Habitat restoration or mitigation projects must not result in a permanent conversion or loss of sensitive habitats such as SAV, natural rocky habitats, areas containing shellfish, mudflats, and riffle and pool complexes.

☒ Not met:

☒ Not applicable, provide reasoning:

No SAS in action area

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

34. Grain size of any sediment used as part of habitat restoration must be the same size or larger than the native material at the site. Material must be free from toxic chemicals (in excess of ERM values in NOAA SQuiRT tables), asphalt, and other trash or anthropogenic debris.

☐ Not met:

☐ Not applicable, provide reasoning:

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

35. The following buffers apply between the following habitats and the top of slope of the area to be dredged/excavated.:

a) In New England, setbacks of 100 ft. from tidal SAV or 25 ft. from natural rocky habitats, Special Aquatic Sites (wetlands, mudflats, riffle/pool complexes) and areas containing shellfish.
b) In NY, NJ, DE and PA, dredging shall not occur within 25 ft. from the edge of vegetated wetlands.
c) In NY and NJ, dredging shall not occur within 500 ft. of SAV in sediments greater than or equal to 90% sand and 250 ft. of SAV if sediments are less than 90% sand during the growing season (April 15-October 15) to minimize impacts to SAV due to turbidity.
d) In Virginia and Maryland, dredging shall not occur in areas within the distance from wetlands equal to four times the depth of the dredging.
e) In Maryland, dredging shall not occur within 500 yds. of a natural oyster beds between December 16 to March 14 and June 1 to September 30.

Fish Passage/Migration Habitat

37. Design replacement crossings to provide anadromous and resident fish and aquatic organism passage to the maximum extent possible. Use the Federal Interagency Nature-like Fishway Passage Design Guidelines for Atlantic Coast Diadromous Fishes and Culvert Design For Aquatic Organism Passage FHWA-HIF-11-008) for design guidance. In addition, structures must:
    - provide sufficient water depth and maintain suitable water velocities during migration periods; and
    - maintain or replicate natural stream channel and flow conditions.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☒ Shown on project plans
☒ Included in description, other terms and conditions

38. Replaced or upgraded crossings must be a similar or improved structure type and must be designed to provide diadromous and resident fish organism passage by providing sufficient water depth, maintaining suitable water velocities during migration periods, and maintaining or replicating natural stream channel and flow conditions. Upgraded crossings must be designed in accordance with the order of preference set out in NMFS' Anadromous Salmonid Passage Facility Design, unless such design is otherwise approved by the State Fisheries Agency.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
☒ Shown on project plans
☒ Included in description, other terms and conditions

39. For activities that require soil erosion, sediment, and turbidity controls, prevent impeding the run by incorporating the following:
    a) in non-tidal streams containing diadromous fish
        i. the activities must not encroach >25% of the stream width measured from ordinary high water during the anadromous TOY restriction unless such encroachment is otherwise approved by State Fisheries; and
        ii. In waterways supporting diadromous fish, the activities must maintain safe, timely, and effective downstream fish passage throughout the project.
    b) in tidal waters:
        i. The activities must not encroach >50% of a tidal stream's width as measured from mean high water unless such encroachment is otherwise approved by the State Fisheries Agency.

☐ Not met:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans
☒ Included in description, other terms and conditions

40. Incorporate climate change and sea level rise projections into the project design as appropriate to address changing hydrologic conditions (increased precipitation and stream flow, altered tidal regimes, etc.). Guidance can be found in NOAA Fisheries' national Procedure for Addressing Climate Change in NMFS Essential Fish Habitat Consultations and GARFO's Guidance for Integrating Climate Change Information in Greater Atlantic Region Habitat Conservation Division Consultation Processes, including the recommendation to use relevant local or regional climate prediction models where available as well as emission and climate projection scenarios on a global scale from the Intergovernmental Panel on Climate Change (IPCC). The use of a "high" (e.g., RCP/SSP8.5) and an "intermediate" (e.g., RCP/SSP 4.5 or RCP 6.0) scenario (IPCC 2021) is suggested. For SLR projections, at a minimum the 1.0 m mean global scenario is recommended with the relevant downscaled projections for the closest tide gauge location identified in Sweet et al. (2022).

☒ Not met:
☒ Not applicable, provide reasoning:

Climate change analysis was not done due to the project keeping existing abutments.

☐ Project is unable to accommodate, provide justification:

☐ Met:
☐ Shown on project plans
☐ Included in description, other terms and conditions

Vessel Interactions

☒ Check here if the EFH conservation recommendations in this section are not applicable because the project will not use vessels.

41. Project vessels shall be operated in adequate water depths in the action area to avoid propeller scour and grounding at all tides. Shallow draft vessels will be used in shallow areas to maximize the navigational clearance between the vessel and the bottom substrate. Spuds may be used to elevate the vessel.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

Activities that Require Individual Consultation

1. Any work (including anchoring) that results in temporary or permanent impacts to:
    a) Existing or historically mapped submerged aquatic vegetation (SAV) beds or areas within 100 feet of existing or historically mapped SAV beds unless otherwise confirmed to be absent by survey.
    b) ≥ 1,000 SF of tidal SAS (except tidal SAV, see 1 above), natural rocky habitats, or freshwater SAV.
2. Stream channelization.
3. Any temporary structures, construction access, and dewatering activities proposed to be in place for ≥ two years
4. Slip-lining or invert lining existing culverts in tidal waters or non-tidal waters that support diadromous fishes. Resources to assist in the identification of these waters can be found in Appendix H and from State fishery agencies.
5. Structures (docks, piers, walkways) or temporary structures: Less than 1:1 height/width ratio or wider than 4 ft. over salt marsh waterward of MHW. The height should be measured from the substrate to the bottom of the longitudinal support beam lowermost portion of the deck structure.
6. Construction of new or expansion of existing boating facilities. For the purposes of this programmatic EFH consultation, a boating facility is boat docking or mooring space for more than two non-commercial vessels.
7. Excavation for the purpose of establishing new or improved navigation channels (e.g. dredging), exceeding the thresholds listed under number 1 above.
8. Any nearshore disposal or beach nourishment activities.
9. New fill or stabilization structures placed below mean low water in excess of 200 linear feet (lf).
10. Replacement of:
    a) slope stabilization structures > 200 lf. *and* waterward of the existing toe, or
    b) vertical structures > 18 inches waterward of the existing face *and* > 200 lf.
11. in layer deposition as a part of wetland restoration.
12. Placement of any seed shellfish, spatted-shell, or cultch in the following sensitive habitats: fish and wildlife sanctuaries and refuges, mudflats, SAV beds, riffle/pool complexes, natural rocky habitats, intertidal areas, and areas containing shellfish.
13. In-water utility lines ≥100 linear feet (LF) installed by trench excavation; or where installed by jet-plow, fluidization or other direct burial methods:
    a) installed in mud, clay, or silt substrates; or
    b) ≥200 LF when installed in sandy substrates (e.g. >/= 90% coarse grained sand habitats (Wentworth <35 ASTM No. US Standard)). Direct burial methods do not include jacking or directional drilling/boring.
14. Airgun seismic activities.
15. Any new permanent surface water withdrawal, water intakes, or water diversions.
16. All work to tide gates without a USACE-approved operation and maintenance plan or alterations to tide gates that will affect the hydraulic regime. This does not include work on tide gates (e.g., duckbills, flap gates, etc.) that solely convey stormwater and/or NPDES-permitted discharges. See The Effects of Tide Gates on New England Wetlands and Other Tidal Resources. Greater Atlantic Region Policy Series [23-01] for additional information on tide gates and associated BMPs.
17. In-water blasting that affects EFH or diadromous species habitat, or out-of-water blasting with the discharge of blasted material in water.

18. Construction of new bridges or culverts, where no crossing existed previously.
19. Any new or replacement causeways (raised roadways across waters or wetlands). Temporary causeways do not require project specific consultation (i.e., they are covered under the programmatic consultation), provided they do not exceed the above listed threshold or include other excluded activities.
20. Dam and flood control or levee repairs that will alter water levels or flood elevations during the diadromous time of year (TOY) restriction provided in App C.
21. Living shoreline >500 linear feet in length located below OHW or the HTL and/or includes beach nourishment/ land reclamation activities.
22. Living shorelines with structure and/or fill area that extends into the waterbody more than 30 FT from the MLW line, including sand fills, sills, breakwaters, or reefs, or any living shoreline that proposes to impact SAV.
23. Excavated materials, stored, deposited, and retained anywhere but an upland area that prevents sediments from reentering aquatic habitats, except as authorized/required by the terms of a USACE or USCG approval.

DOT Determination of Effects to Essential Fish Habitat and Signature
After reviewing the programmatic EFH conservation recommendations in Section 6.0 and Appendix B, state DOT will select the appropriate determination:

☒ The activity is in compliance with all programmatic EFH conservation recommendations in the FHWA programmatic EFH consultation and adverse effects to EFH will not be substantial.

☐ The activity is not in compliance with all of the programmatic EFH conservation recommendations in the FHWA programmatic EFH consultation and individual consultation with NMFS is needed.

Use the electronic fillable fields to include the name and signature of the state DOT preparing this Verification Form, along with the date.

State DOT Name Massachusetts Department of Transportation

Signature David Paulson

Digitally signed by David Paulson
Date: 2025.12.19 10:03:33 -05'00'

Date 12/19/2025

By providing your determination and signature, you are certifying that to the best of your knowledge the information provided in this form is accurate and based upon the best available scientific information. This form must be filled out and signed state DOT staff, as an officially designated non-federal representative. Email this Verification Form to your FHWA Division Office.

FHWA Review
After receiving the Verification Form, the FHWA Division Office will contact the state DOT with any concerns. FHWA will review this form before a final NEPA decision. FHWA will email the signed form back to the state DOT for record keeping.

☐ FHWA concurs with state DOT's determination that the proposed project is consistent with the programmatic EFH consultation (without the need for justification).

☒ FHWA concurs with state DOT's determination that the proposed project is consistent with the programmatic EFH consultation, with justification described above.

☐ FHWA does not concur with state DOT's determination that the project is consistent with the programmatic EFH consultation. FHWA/state DOT must conduct additional coordination with GARFO HCD and a separate individual EFH consultation may be required.

f. Additional Plan or Document Title | g. Date

B. Findings

1. Findings pursuant to the Massachusetts Wetlands Protection Act:

Following the review of the above-referenced Notice of Intent and based on the information provided in this application and presented at the public hearing, this Commission finds that the areas in which work is proposed is significant to the following interests of the Wetlands Protection Act (the Act). Check all that apply:

a. ☐ Public Water Supply b. ☐ Land Containing Shellfish c. ☒ Prevention of Pollution
d. ☐ Private Water Supply e. ☒ Fisheries f. ☒ Protection of Wildlife Habitat
g. ☒ Groundwater Supply h. ☒ Storm Damage Prevention i. ☒ Flood Control

2. This Commission hereby finds the project, as proposed, is: (check one of the following boxes)

Approved subject to:

a. ☒ the following conditions which are necessary in accordance with the performance standards set forth in the wetlands regulations. This Commission orders that all work shall be performed in accordance with the Notice of Intent referenced above, the following General Conditions, and any other special conditions attached to this Order. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, these conditions shall control.

B. Findings (cont.)

Denied because:

b. ☐ the proposed work cannot be conditioned to meet the performance standards set forth in the wetland regulations. Therefore, work on this project may not go forward unless and until a new Notice of Intent is submitted which provides measures which are adequate to protect the interests of the Act, and a final Order of Conditions is issued. **A description of the performance standards which the proposed work cannot meet is attached to this Order.**

c. ☐ the information submitted by the applicant is not sufficient to describe the site, the work, or the effect of the work on the interests identified in the Wetlands Protection Act. Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides sufficient information and includes measures which are adequate to protect the Act's interests, and a final Order of Conditions is issued. **A description of the specific information which is lacking and why it is necessary is attached to this Order as per 310 CMR 10.05(6)(c).**

3. ☐ Buffer Zone Impacts: Shortest distance between limit of project disturbance and the wetland resource area specified in 310 CMR 10.02(1)(a) — a. linear feet

Inland Resource Area Impacts: Check all that apply below. (For Approvals Only)

Resource Area	Proposed Alteration	Permitted Alteration	Proposed Replacement	Permitted Replacement

* **#23**. If the project is for the purpose of restoring or enhancing a wetland resource area in addition to the square footage that has been entered in Section B.5.c (BVW) or B.17.c (Salt Marsh) above, please enter the additional amount here.

23. ☐ Restoration/Enhancement *:

a. square feet of BVW | b. square feet of salt marsh

24. ☐ Stream Crossing(s):

a. number of new stream crossings | b. number of replacement stream crossings

C. General Conditions Under Massachusetts Wetlands Protection Act

The following conditions are only applicable to Approved projects.

1. Failure to comply with all conditions stated herein, and with all related statutes and other regulatory measures, shall be deemed cause to revoke or modify this Order.
2. The Order does not grant any property rights or any exclusive privileges; it does not authorize any injury to private property or invasion of private rights.
3. This Order does not relieve the permittee or any other person of the necessity of complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.
4. The work authorized hereunder shall be completed within three years from the date of this Order unless either of the following apply:
   a. The work is a maintenance dredging project as provided for in the Act; or
   b. The time for completion has been extended to a specified date more than three years, but less than five years, from the date of issuance. If this Order is intended to be valid for more than three years, the extension date and the special circumstances warranting the extended time period are set forth as a special condition in this Order.
   c. If the work is for a Test Project, this Order of Conditions shall be valid for no more than one year.
5. This Order may be extended by the issuing authority for one or more periods of up to three years each upon application to the issuing authority at least 30 days prior to the expiration date of the Order. An Order of Conditions for a Test Project may be extended for one additional year only upon written application by the applicant, subject to the provisions of 310 CMR 10.05(11)(f).
6. If this Order constitutes an Amended Order of Conditions, this Amended Order of Conditions does not extend the issuance date of the original Final Order of Conditions and the Order will expire on _____ unless extended in writing by the Department.
7. Any fill used in connection with this project shall be clean fill. Any fill shall contain no trash, refuse, rubbish, or debris, including but not limited to lumber, bricks, plaster, wire, lath, paper, cardboard, pipe, tires, ashes, refrigerators, motor vehicles, or parts of any of the foregoing.

C. General Conditions Under Massachusetts Wetlands Protection Act

8. This Order is not final until all administrative appeal periods from this Order have elapsed, or if such an appeal has been taken, until all proceedings before the Department have been completed.

9. No work shall be undertaken until the Order has become final and then has been recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land upon which the proposed work is to be done. In the case of the registered land, the Final Order shall also be noted on the Land Court Certificate of Title of the owner of the land upon which the proposed work is done. The recording information shall be submitted to the Conservation Commission on the form at the end of this Order, which form must be stamped by the Registry of Deeds, prior to the commencement of work.

10. A sign shall be displayed at the site not less then two square feet or more than three square feet in size bearing the words,

"Massachusetts Department of Environmental Protection" [or, "MassDEP"]

"File Number N/A"

11. Where the Department of Environmental Protection is requested to issue a Superseding Order, the Conservation Commission shall be a party to all agency proceedings and hearings before MassDEP.

12. Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8A) to the Conservation Commission.

13. The work shall conform to the plans and special conditions referenced in this order.

14. Any change to the plans identified in Condition #13 above shall require the applicant to inquire of the Conservation Commission in writing whether the change is significant enough to require the filing of a new Notice of Intent.

15. The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.

16. This Order of Conditions shall apply to any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.

C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

17. Prior to the start of work, and if the project involves work adjacent to a Bordering Vegetated Wetland, the boundary of the wetland in the vicinity of the proposed work area shall be marked by wooden stakes or flagging. Once in place, the wetland boundary markers shall be maintained until a Certificate of Compliance has been issued by the Conservation Commission.

18. All sedimentation barriers shall be maintained in good repair until all disturbed areas have been fully stabilized with vegetation or other means. At no time shall sediments be deposited in a wetland or water body. During construction, the applicant or his/her designee shall inspect the erosion controls on a daily basis and shall remove accumulated sediments as needed. The applicant shall immediately control any erosion problems that occur at the site and shall also immediately notify the Conservation Commission, which reserves the right to require additional erosion and/or damage prevention controls it may deem necessary. Sedimentation barriers shall serve as the limit of work unless another limit of work line has been approved by this Order.

19. The work associated with this Order (the “Project”)
    (1) ☒ is subject to the Massachusetts Stormwater Standards
    (2) ☐ is NOT subject to the Massachusetts Stormwater Standards

    If the work is subject to the Stormwater Standards, then the project is subject to the following conditions:

    a) All work, including site preparation, land disturbance, construction and redevelopment, shall be implemented in accordance with the construction period pollution prevention and erosion and sedimentation control plan and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollution Discharge Elimination System Construction General Permit as required by Stormwater Condition 8. Construction period erosion, sedimentation and pollution control measures and best management practices (BMPs) shall remain in place until the site is fully stabilized.

    b) No stormwater runoff may be discharged to the post-construction stormwater BMPs unless and until a Registered Professional Engineer provides a Certification that:

    i. all construction period BMPs have been removed or will be removed by a date certain specified in the Certification. For any construction period BMPs intended to be converted to post construction operation for stormwater attenuation, recharge, and/or treatment, the conversion is allowed by the MassDEP Stormwater Handbook BMP specifications and that the BMP has been properly cleaned or prepared for post construction operation, including removal of all construction period sediment trapped in inlet and outlet control structures;

    ii. as-built final construction BMP plans are included, signed and stamped by a Registered Professional Engineer, certifying the site is fully stabilized;

    iii. any illicit discharges to the stormwater management system have been removed, as per the requirements of Stormwater Standard 10;

Massachusetts Department of Environmental Protection

C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

iv. all post-construction stormwater BMPs are installed in accordance with the plans (including all planting plans) approved by the issuing authority, and have been inspected to ensure that they are not damaged and that they are in proper working condition;

v. any vegetation associated with post-construction BMPs is suitably established to withstand erosion.

c) The landowner is responsible for BMP maintenance until the issuing authority is notified that another party has legally assumed responsibility for BMP maintenance. Prior to requesting a Certificate of Compliance, or Partial Certificate of Compliance, the responsible party (defined in General Condition 18(e)) shall execute and submit to the issuing authority an Operation and Maintenance Compliance Statement ("O&M Statement) for the Stormwater BMPs identifying the party responsible for implementing the stormwater BMP Operation and Maintenance Plan ("O&M Plan") and certifying the following:

i.) the O&M Plan is complete and will be implemented upon receipt of the Certificate of Compliance, and

ii.) the future responsible parties shall be notified in writing of their ongoing legal responsibility to operate and maintain the stormwater management BMPs and implement the Stormwater Pollution Prevention Plan.

d) Post-construction pollution prevention and source control shall be implemented in accordance with the long-term pollution prevention plan section of the approved Stormwater Report and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollution Discharge Elimination System Multi-Sector General Permit.

e) Unless and until another party accepts responsibility, the landowner, or owner of any drainage easement, assumes responsibility for maintaining each BMP. To overcome this presumption, the landowner of the property must submit to the issuing authority a legally binding agreement of record, acceptable to the issuing authority, evidencing that another entity has accepted responsibility for maintaining the BMP, and that the proposed responsible party shall be treated as a permittee for purposes of implementing the requirements of Conditions 19(f) through 19(k) with respect to that BMP. Any failure of the proposed responsible party to implement the requirements of Conditions 19(f) through 19(k) with respect to that BMP shall be a violation of the Order of Conditions or Certificate of Compliance. In the case of stormwater BMPs that are serving more than one lot, the legally binding agreement shall also identify the lots that will be serviced by the stormwater BMPs. A plan and easement deed that grants the responsible party access to perform the required operation and maintenance must be submitted along with the legally binding agreement.

f) The responsible party shall operate and maintain all stormwater BMPs in accordance with the design plans, the O&M Plan, and the requirements of the Massachusetts Stormwater Handbook.

C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

g) The responsible party shall:
1. Maintain an operation and maintenance log for the last three (3) consecutive calendar years of inspections, repairs, maintenance and/or replacement of the stormwater management system or any part thereof, and disposal (for disposal the log shall indicate the type of material and the disposal location);
2. Make the maintenance log available to MassDEP and the Conservation Commission ("Commission") upon request; and
3. Allow members and agents of the MassDEP and the Commission to enter and inspect the site to evaluate and ensure that the responsible party is in compliance with the requirements for each BMP established in the O&M Plan approved by the issuing authority.

h) All sediment or other contaminants removed from stormwater BMPs shall be disposed of in accordance with all applicable federal, state, and local laws and regulations.

i) Illicit discharges to the stormwater management system as defined in 310 CMR 10.04 are prohibited.

j) The stormwater management system approved in the Order of Conditions shall not be changed without the prior written approval of the issuing authority.

k) Areas designated as qualifying pervious areas for the purpose of the Low Impact Site Design Credit (as defined in the MassDEP Stormwater Handbook, Volume 3, Chapter 1, Low Impact Development Site Design Credits) shall not be altered without the prior written approval of the issuing authority.

l) Access for maintenance, repair, and/or replacement of BMPs shall not be withheld. Any fencing constructed around stormwater BMPs shall include access gates and shall be at least six inches above grade to allow for wildlife passage.

Special Conditions (if you need more space for additional conditions, please attach a text document):

Attachment A

20. For Test Projects subject to 310 CMR 10.05(11), the applicant shall also implement the monitoring plan and the restoration plan submitted with the Notice of Intent. If the conservation commission or Department determines that the Test Project threatens the public health, safety or the environment, the applicant shall implement the removal plan submitted with the Notice of Intent or modify the project as directed by the conservation commission or the Department.

D. Findings Under Municipal Wetlands Bylaw or Ordinance

1. Is a municipal wetlands bylaw or ordinance applicable? ☒ Yes ☐ No

2. The Raynham Conservation Commission hereby finds (check one that applies):

   a. ☐ that the proposed work cannot be conditioned to meet the standards set forth in a municipal ordinance or bylaw, specifically:

   1. Municipal Ordinance or Bylaw | 2. Citation

   Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides measures which are adequate to meet these standards, and a final Order of Conditions is issued.

   b. ☐ that the following additional conditions are necessary to comply with a municipal ordinance or bylaw:

   1. Municipal Ordinance or Bylaw | 2. Citation

3. The Commission orders that all work shall be performed in accordance with the following conditions and with the Notice of Intent referenced above. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, the conditions shall control.

   The special conditions relating to municipal ordinance or bylaw are as follows (if you need more space for additional conditions, attach a text document):

F. Appeals

The applicant, the owner, any person aggrieved by this Order, any owner of land abutting the land subject to this Order, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate MassDEP Regional Office to issue a Superseding Order of Conditions. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and a completed Request for Departmental Action Fee Transmittal Form, as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Order. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant, if he/she is not the appellant.

Any appellants seeking to appeal the Department's Superseding Order associated with this appeal will be required to demonstrate prior participation in the review of this project. Previous participation in the permit proceeding means the submission of written information to the Conservation Commission prior to the close of the public hearing, requesting a Superseding Order, or providing written information to the Department prior to issuance of a Superseding Order.

The request shall state clearly and concisely the objections to the Order which is being appealed and how the Order does not contribute to the protection of the interests identified in the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), and is inconsistent with the wetlands regulations (310 CMR 10.00). To the extent that the Order is based on a municipal ordinance or bylaw, and not on the Massachusetts Wetlands Protection Act or regulations, the Department has no appellate jurisdiction.

G. Recording Information

Prior to commencement of work, this Order of Conditions must be recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land subject to the Order. In the case of registered land, this Order shall also be noted on the Land Court Certificate of Title of the owner of the land subject to the Order of Conditions. The recording information on this page shall be submitted to the Conservation Commission listed below.

CONSERVATION COMMISSION

ATTACHMENT A

ORDER OF CONDITIONS REPORTING, MONITORING, AND RECORDING INFORMATION:

1. All work must conform to the plan referenced in this Order of Conditions (OR any subsequent revisions as approved by the Raynham Conservation Commission) and the Notice of Intent. The provisions of this Order shall apply to and be binding upon the applicant, its employees, and all successors and assigns in interest or control.

2. **This Order of Conditions must be recorded at the Registry of Deeds, a copy of the receipt providing the recording information shall be submitted to the Conservation Commission prior to the receiving a signature on the building permit and commencement of construction, or within sixty (60) days of the issuance of this Order if construction is not commenced.**

3. **The Raynham Conservation Commission shall be notified in writing at least forty-eight (48) hours prior to the start of any construction.**

4. Members of the Conservation Commission or its Agent shall have the right to enter and inspect the property to determine and evaluate compliance with this Order.

5. Issuance of this Order does not in any way imply or certify that the site or downstream areas will not be subject to flooding, storm damage, or any other form of damage due to wetness.

6. Site Work shall not commence until all federal, state and local permits are issued including without limitation NPDES permits.

7. **The applicant shall photocopy a copy of the Order of Conditions and add it to the set of project plan sheets prior to a sign off on the Building Permit by the Conservation Agent and prior to breaking ground on the project IF A BUILDING PERMIT IS REQUIRED.**

8. There shall be no increase in the post-development discharges from the storm drainage system or any other changes in post-development conditions that alter the post-development watershed boundaries as currently depicted in the Notice of Intent and approved by this Order of Conditions, unless specifically approved in writing by the Commission.

9. A **copy of this Order shall be on-site** while activities regulated by this Order are being performed.

10. The applicant or its successors shall notify the Conservation Commission **in writing of the identity of the on-site construction supervisor hired to coordinate construction** during the work on the site and to ensure compliance with this Order.

11. **Commencing with the issuance of this Order, and continuing through the existence of the same, the applicant shall submit to the Conservation Commission written progress reports each month detailing what work has been done.**

12. A **Massachusetts registered professional engineer must submit written certification to the Conservation Commission that all erosion control measures are properly installed** before the beginning of any work. The location of the erosion control measures shall be certified by a Massachusetts registered land surveyor prior to star of any site work.

13. The applicant shall designate an Erosion Control Monitor to oversee any emergency placement of controls and regular inspection or replacement of erosion and sedimentation control devices. **The name and phone number of the Monitor must be provided to the Commission in the event that this person has to be contacted, due to an emergency at the site, during any 24 hour period, including weekends.** This Monitor shall be given authority to stop construction for erosion control purposes. The erosion control Monitor will be required to inspect all such erosion control measures and oversee cleaning and the proper disposal of waste products. Cleaning shall include removal of any entrapped silt. The provisions of this Order shall apply to and be binding upon the applicant, its employees, and all successors and assigns in interest or control.

14. ~~**In conjunction with the sale of any lot governed by this Order the applicant shall submit to the Conservation Commission a signed statement by the buyer that he/she is aware of an outstanding Order of Conditions on the development and has received a copy of this Order of Conditions.**~~

15. In advance of any work on this project, the applicant shall notify the Raynham Conservation Commission, **and at the request of the Raynham Conservation** Commission, shall arrange an on-site conference among the Conservation Commission, the contractor and the applicant to ensure that all of the conditions of this Order are understood. This Order shall also be made a part of the contractor's written contract.

ORDER OF CONDITIONS EROSION CONTROL AND SOILSTABILIZATION:

16. Prior to any construction on site, the approved erosion control barrier shall be placed between all construction areas and wetland areas and as defined within the approved plan of record. This barrier shall be inspected and approved by the Conservation Commission or its Agent prior to the start of construction. The approved erosion control barrier shall be placed end to end and double staked. The approved erosion control barrier shall remain intact until all disturbed areas have been mulched, seeded and stabilized to prevent erosion.

17. There shall be **NO** disturbance of any wetland areas past the approved erosion control barrier, unless approved through a special condition.

18. Any additional erosion prevention and sedimentation protection measures found necessary during construction, by the Conservation Commission, will be implemented at the discretion of the Commission or its Agent(s).

19. **Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8) to the Conservation Commission. This request shall include a letter to the RCC with an original seal and signature of a registered professional**

engineer certifying that the work is in compliance with the plans and conditions thereof. The request for Certificate of Compliance shall be submitted along with two copies of an as-built topographic site plan certified by a registered professional engineer and a registered professional land surveyor.

20. The provision of the Order of Conditions shall apply to and be binding upon its applicant, its employees, and any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.

~~21. Prior to the start of work, any required permanent markers for the wetlands and the 25 foot no activity boundary shall be installed by the applicant and inspected by the Conservation Commission or its authorized agent.~~

22. In advance of any work on the project the applicant shall notify the Raynham Conservation Commission (RCC), and at the request of the RCC, shall arrange an on-site conference among the RCC, the contractor and the applicant to ensure that the conditions of this Order are understood. This Order also shall also be made a part of the contractor's written contract.

23. The applicant or its successors, shall notify the RCC in writing of the identity of the on-site construction supervisor hired to coordinate construction during the work on the site and to ensure compliance with this Order.

~~24. Prior to construction, permanent 3-foot schedule PVC pipes will be driven into the ground at 30 foot intervals along the wetlands line as indicated on the plan. The pipes will remain exposed 1 foot above the ground and the tops shall be capped and spray painted green for future reference. (Not applicable for this project.)~~

25. Any replication area is to be prepared prior to the destruction of the resource area being replicated. (Not applicable for this project.)

~~26. All detention basins and/or retention areas are to be completed before installation of any impervious material or structures discharging surface water runoff.~~

27. There shall be no stockpiling of soil or other materials within 25 feet of the resource area.

28. Upon completion of construction and grading, all disturbed areas located outside the resource areas shall be stabilized permanently against erosion. This shall be done either by sodding or by loaming, seeding and mulching according to Soil Conservation Standards. If the latter is chosen, stabilization will be considered once the surface shows complete vegetative cover has been achieved.

29. After proper grading, all disturbed areas located within a resource area, except those areas designated as compensatory wetlands, shall be loamed and seeded with not less than four (4) inches of good quality loam and a vegetated cover established.

30. No earthen embankment in the Buffer Zone shall have a slope steeper than 2:1.

31. All facilities and equipment used within or as part of this project shall be continually maintained and operated so as to comply with this Order and the Wetlands Protection Act. No equipment refueling or servicing shall be conducted within 25 linear feet of the project locus.

32. Any errors found in the plans or information submitted by the applicant shall be considered as changes, and the aforementioned procedures outlined for changes shall be followed.

33. The Conservation Commission shall be notified in writing of any lot line or lot number changes with a copy of the plan showing these changes prior to any work on these lots.

34. All conditions are ongoing and do not expire at the end of three years or with the issuance of a Certificate of Compliance.

35. In the opinion of the Raynham Conservation Commission, the information submitted with the Notice of Intent for this project along with the results of field inspections and evaluation of the site by members of the Commission and/or its agent(s) justify issuance of this Order of Conditions. The Raynham Conservation Commission does, however, reserve the right to raise additional issues and present further evidence as may be appropriate should there be further proceedings pertaining to the Notice of Intent filing for which the Commission has issued this Order of Conditions.

36. Noncompliance with or violation of this Order of Conditions or any part thereof may be deemed reasonable cause by the Raynham Conservation Commission to issue a Notice of Noncompliance and/or an Enforcement Order to the applicant/owner. Continued violation of, or noncompliance with the Order of Conditions shall constitute adequate basis for the imposition of the maximum penalty allowed under the law and the Raynham Conservation Commission may take any other actions necessary to ensure compliance with the Order of Conditions by the applicant.

37. **Special conditions**

    a. The Water Quality Certification issued by the DEP, along with any conditions of approval appended thereto are incorporated herein by reference and made part of this Order of Conditions.

Good Morning,

Please see the responses in red below.

- SC #27: With regard to the condition requiring stockpiles be maintained at least 25 feet away from resource areas, we respectfully request that this be revised to state *"…as feasible"*. Given the constraints at the site, stockpiling within 25 feet of resource areas will likely be unavoidable for the project to be constructable; however, they can be sited as far from Resource Areas as feasible. In addition, supplemental protections for stockpiles can be provided (e.g., use of surrounding compost filter tubes and installation of tarps when piles are

not in use).

Material stockpiling can be reviewed and reviewed on site by the Commission without any need for modification of the approval.

Acknowledged.

- SC #13: For the Erosion Control Monitor condition, we respectfully request that the Commission finds and approves the SWPPP Inspector as a suitable alternative to an Erosion Control Monitor. We would like to request that SC 13, as well as SC 12, be revised to reflect that the SWPPP Inspector will fulfill this role and would be the individual to certify to the Commission that all controls are properly in place (in lieu of a P.E.).

  The requirement for PE certification needs to remain because of the scale of the project - as a PE would be an individual who has demonstrated technical skills, training and expertise.

  Acknowledged. We will plan to have the SWPPP Inspector monitor erosion controls, but are including a requirement in the Special Provisions stating that the Contractor is responsible for hiring a P.E. to certify erosion and sedimentation controls.

- The OOC states "N/A" under the DEP File #, but we wanted to inquire about how the Commission would like to identify the Project under the Bylaw. Taunton provided us with a file number under the local approval so that we could install signage at the site, similar to a DEP file # sign. Please advise.

  Conservation does not currently have a numbering system in place since this is the first time an Order of Conditions was issued only for reasons of Town Bylaw and not DEP. An opinion I received in feedback was to put something along the lines of "Approved by Town of Raynham Wetlands Protection Bylaw Ch. 336 on date: 4-27-2026". If any further comments come in on my end about that I will let you know.

Acknowledged. The Project Special provisions currently provide this language for the signage.

- SC #4: MassDOT and the City of Taunton respects the Commission's right to inspect the site. However, we respectfully request that the Commission gives a 24-hour notice before any personnel visit the site. Due to the use of heavy equipment and other threats to safety, we want to ensure that the open construction site is safe for Commission members.

  The Commission has no problem providing at least 24 hour notice before any scheduled inspection. Please provide specific information of who is to be contacted and how.

  Acknowledged. We can provide the contact information prior to construction.

RE: Old Colony Avenue Bridge over the Taunton River, NOI, N1394 LOCAL ONLY

Attached you will find the **original** Order of Conditions for the location noted above **which needs to be recorded at the Registry of Deeds within 40 days of receipt.** Upon recording, please forward a copy of the receipt showing date, book, and page to this office for our records. Be sure to also include the DEP number listed above. You can email a copy to Jenna Freitas at jfreitas@taunton-ma.gov.
(If you ask the registry to make a photocopy of the front page after they stamp it in this will have the information we need to close the filing.)
Attached are the Standard Conditions (see pages 5-9) and Special Conditions (see end of decision) to be complied with for this Order of Conditions.

This must be recorded before the start of any work onsite and applying for any needed building permits/accessory structure applications. This approval is based on the site plan titled "Old Colony Avenue over Taunton River Bridge" created on 01/28/2026. Once work is completed a Certificate of Compliance must be filed to close this Order of Conditions with the Conservation Commission.

If you have any questions please do not hesitate to give this office a call. Thanks for your assistance in this matter.

Sincerely,

Jenna Freitas

B. Findings

1. Findings pursuant to the Massachusetts Wetlands Protection Act:

Following the review of the above-referenced Notice of Intent and based on the information provided in this application and presented at the public hearing, this Commission finds that the areas in which work is proposed is significant to the following interests of the Wetlands Protection Act (the Act). Check all that apply:

a. ☐ Public Water Supply b. ☐ Land Containing Shellfish c. ■ Prevention of Pollution
d. ■ Private Water Supply e. ☐ Fisheries f. ☐ Protection of Wildlife Habitat
g. ■ Groundwater Supply h. ■ Storm Damage Prevention i. ■ Flood Control

2. This Commission hereby finds the project, as proposed, is: (check one of the following boxes)

Approved subject to:

a. ■ the following conditions which are necessary in accordance with the performance standards set forth in the wetlands regulations. This Commission orders that all work shall be performed in accordance with the Notice of Intent referenced above, the following General Conditions, and any other special conditions attached to this Order. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, these conditions shall control.

Denied because:

b. ☐ the proposed work cannot be conditioned to meet the performance standards set forth in the wetland regulations. Therefore, work on this project may not go forward unless and until a new Notice of Intent is submitted which provides measures which are adequate to protect the interests of the Act, and a final Order of Conditions is issued. **A description of the performance standards which the proposed work cannot meet is attached to this Order.**

c. ☐ the information submitted by the applicant is not sufficient to describe the site, the work, or the effect of the work on the interests identified in the Wetlands Protection Act. Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides sufficient information and includes measures which are adequate to protect the Act's interests, and a final Order of Conditions is issued. **A description of the specific information which is lacking and why it is necessary is attached to this Order as per 310 CMR 10.05(6)(c).**

3. ☐ Buffer Zone Impacts: Shortest distance between limit of project disturbance and the wetland resource area specified in 310 CMR 10.02(1)(a) — a. linear feet

B. Findings (cont.)

* **#23.** If the project is for the purpose of restoring or enhancing a wetland resource area in addition to the square footage that has been entered in Section B.5.c (BVW) or B.17.c (Salt Marsh) above, please enter the additional amount here.

23. ☐ Restoration/Enhancement *:

a. square feet of BVW _____ b. square feet of salt marsh _____

24. ☐ Stream Crossing(s):

a. number of new stream crossings _____ b. number of replacement stream crossings _____

C. General Conditions Under Massachusetts Wetlands Protection Act

The following conditions are only applicable to Approved projects.

1. Failure to comply with all conditions stated herein, and with all related statutes and other regulatory measures, shall be deemed cause to revoke or modify this Order.
2. The Order does not grant any property rights or any exclusive privileges; it does not authorize any injury to private property or invasion of private rights.
3. This Order does not relieve the permittee or any other person of the necessity of complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.
4. The work authorized hereunder shall be completed within three years from the date of this Order unless either of the following apply:
   a. The work is a maintenance dredging project as provided for in the Act; or
   b. The time for completion has been extended to a specified date more than three years, but less than five years, from the date of issuance. If this Order is intended to be valid for more than three years, the extension date and the special circumstances warranting the extended time period are set forth as a special condition in this Order.
   c. If the work is for a Test Project, this Order of Conditions shall be valid for no more than one year.
5. This Order may be extended by the issuing authority for one or more periods of up to three years each upon application to the issuing authority at least 30 days prior to the expiration date of the Order. An Order of Conditions for a Test Project may be extended for one additional year only upon written application by the applicant, subject to the provisions of 310 CMR 10.05(11)(f).
6. If this Order constitutes an Amended Order of Conditions, this Amended Order of Conditions does not extend the issuance date of the original Final Order of Conditions and the Order will expire on _____ unless extended in writing by the Department.
7. Any fill used in connection with this project shall be clean fill. Any fill shall contain no trash, refuse, rubbish, or debris, including but not limited to lumber, bricks, plaster, wire, lath, paper, cardboard, pipe, tires, ashes, refrigerators, motor vehicles, or parts of any of the foregoing.

C. General Conditions Under Massachusetts Wetlands Protection Act

8. This Order is not final until all administrative appeal periods from this Order have elapsed, or if such an appeal has been taken, until all proceedings before the Department have been completed.

9. No work shall be undertaken until the Order has become final and then has been recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land upon which the proposed work is to be done. In the case of the registered land, the Final Order shall also be noted on the Land Court Certificate of Title of the owner of the land upon which the proposed work is done. The recording information shall be submitted to the Conservation Commission on the form at the end of this Order, which form must be stamped by the Registry of Deeds, prior to the commencement of work.

10. A sign shall be displayed at the site not less then two square feet or more than three square feet in size bearing the words,

"Massachusetts Department of Environmental Protection" [or, "MassDEP"]

"File Number N1394 LOCAL ONLY "

11. Where the Department of Environmental Protection is requested to issue a Superseding Order, the Conservation Commission shall be a party to all agency proceedings and hearings before MassDEP.

12. Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8A) to the Conservation Commission.

13. The work shall conform to the plans and special conditions referenced in this order.

14. Any change to the plans identified in Condition #13 above shall require the applicant to inquire of the Conservation Commission in writing whether the change is significant enough to require the filing of a new Notice of Intent.

15. The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.

16. This Order of Conditions shall apply to any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.

C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

17. Prior to the start of work, and if the project involves work adjacent to a Bordering Vegetated Wetland, the boundary of the wetland in the vicinity of the proposed work area shall be marked by wooden stakes or flagging. Once in place, the wetland boundary markers shall be maintained until a Certificate of Compliance has been issued by the Conservation Commission.

18. All sedimentation barriers shall be maintained in good repair until all disturbed areas have been fully stabilized with vegetation or other means. At no time shall sediments be deposited in a wetland or water body. During construction, the applicant or his/her designee shall inspect the erosion controls on a daily basis and shall remove accumulated sediments as needed. The applicant shall immediately control any erosion problems that occur at the site and shall also immediately notify the Conservation Commission, which reserves the right to require additional erosion and/or damage prevention controls it may deem necessary. Sedimentation barriers shall serve as the limit of work unless another limit of work line has been approved by this Order.

19. The work associated with this Order (the "Project")
    (1) ■ is subject to the Massachusetts Stormwater Standards
    (2) ☐ is NOT subject to the Massachusetts Stormwater Standards

    If the work is subject to the Stormwater Standards, then the project is subject to the following conditions:

    a) All work, including site preparation, land disturbance, construction and redevelopment, shall be implemented in accordance with the construction period pollution prevention and erosion and sedimentation control plan and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollution Discharge Elimination System Construction General Permit as required by Stormwater Condition 8. Construction period erosion, sedimentation and pollution control measures and best management practices (BMPs) shall remain in place until the site is fully stabilized.

    b) No stormwater runoff may be discharged to the post-construction stormwater BMPs unless and until a Registered Professional Engineer provides a Certification that:
    i. all construction period BMPs have been removed or will be removed by a date certain specified in the Certification. For any construction period BMPs intended to be converted to post construction operation for stormwater attenuation, recharge, and/or treatment, the conversion is allowed by the MassDEP Stormwater Handbook BMP specifications and that the BMP has been properly cleaned or prepared for post construction operation, including removal of all construction period sediment trapped in inlet and outlet control structures;
    ii. as-built final construction BMP plans are included, signed and stamped by a Registered Professional Engineer, certifying the site is fully stabilized;
    iii. any illicit discharges to the stormwater management system have been removed, as per the requirements of Stormwater Standard 10;

C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

iv. all post-construction stormwater BMPs are installed in accordance with the plans (including all planting plans) approved by the issuing authority, and have been inspected to ensure that they are not damaged and that they are in proper working condition;

v. any vegetation associated with post-construction BMPs is suitably established to withstand erosion.

c) The landowner is responsible for BMP maintenance until the issuing authority is notified that another party has legally assumed responsibility for BMP maintenance. Prior to requesting a Certificate of Compliance, or Partial Certificate of Compliance, the responsible party (defined in General Condition 18(e)) shall execute and submit to the issuing authority an Operation and Maintenance Compliance Statement ("O&M Statement) for the Stormwater BMPs identifying the party responsible for implementing the stormwater BMP Operation and Maintenance Plan ("O&M Plan") and certifying the following:

i.) the O&M Plan is complete and will be implemented upon receipt of the Certificate of Compliance, and

ii.) the future responsible parties shall be notified in writing of their ongoing legal responsibility to operate and maintain the stormwater management BMPs and implement the Stormwater Pollution Prevention Plan.

d) Post-construction pollution prevention and source control shall be implemented in accordance with the long-term pollution prevention plan section of the approved Stormwater Report and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollution Discharge Elimination System Multi-Sector General Permit.

e) Unless and until another party accepts responsibility, the landowner, or owner of any drainage easement, assumes responsibility for maintaining each BMP. To overcome this presumption, the landowner of the property must submit to the issuing authority a legally binding agreement of record, acceptable to the issuing authority, evidencing that another entity has accepted responsibility for maintaining the BMP, and that the proposed responsible party shall be treated as a permittee for purposes of implementing the requirements of Conditions 19(f) through 19(k) with respect to that BMP. Any failure of the proposed responsible party to implement the requirements of Conditions 19(f) through 19(k) with respect to that BMP shall be a violation of the Order of Conditions or Certificate of Compliance. In the case of stormwater BMPs that are serving more than one lot, the legally binding agreement shall also identify the lots that will be serviced by the stormwater BMPs. A plan and easement deed that grants the responsible party access to perform the required operation and maintenance must be submitted along with the legally binding agreement.

f) The responsible party shall operate and maintain all stormwater BMPs in accordance with the design plans, the O&M Plan, and the requirements of the Massachusetts Stormwater Handbook.

C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

g) The responsible party shall:
1. Maintain an operation and maintenance log for the last three (3) consecutive calendar years of inspections, repairs, maintenance and/or replacement of the stormwater management system or any part thereof, and disposal (for disposal the log shall indicate the type of material and the disposal location);
2. Make the maintenance log available to MassDEP and the Conservation Commission ("Commission") upon request; and
3. Allow members and agents of the MassDEP and the Commission to enter and inspect the site to evaluate and ensure that the responsible party is in compliance with the requirements for each BMP established in the O&M Plan approved by the issuing authority.

h) All sediment or other contaminants removed from stormwater BMPs shall be disposed of in accordance with all applicable federal, state, and local laws and regulations.

i) Illicit discharges to the stormwater management system as defined in 310 CMR 10.04 are prohibited.

j) The stormwater management system approved in the Order of Conditions shall not be changed without the prior written approval of the issuing authority.

k) Areas designated as qualifying pervious areas for the purpose of the Low Impact Site Design Credit (as defined in the MassDEP Stormwater Handbook, Volume 3, Chapter 1, Low Impact Development Site Design Credits) shall not be altered without the prior written approval of the issuing authority.

l) Access for maintenance, repair, and/or replacement of BMPs shall not be withheld. Any fencing constructed around stormwater BMPs shall include access gates and shall be at least six inches above grade to allow for wildlife passage.

Special Conditions (if you need more space for additional conditions, please attach a text document):

20. For Test Projects subject to 310 CMR 10.05(11), the applicant shall also implement the monitoring plan and the restoration plan submitted with the Notice of Intent. If the conservation commission or Department determines that the Test Project threatens the public health, safety or the environment, the applicant shall implement the removal plan submitted with the Notice of Intent or modify the project as directed by the conservation commission or the Department.

D. Findings Under Municipal Wetlands Bylaw or Ordinance

1. Is a municipal wetlands bylaw or ordinance applicable? ■ Yes ☐ No

2. The TAUNTON Conservation Commission hereby finds (check one that applies):

   a. ☐ that the proposed work cannot be conditioned to meet the standards set forth in a municipal ordinance or bylaw, specifically:

   _____ (1. Municipal Ordinance or Bylaw) _____ (2. Citation)

   Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides measures which are adequate to meet these standards, and a final Order of Conditions is issued.

   b. ■ that the following additional conditions are necessary to comply with a municipal ordinance or bylaw:

   TAUNTON CONSERVATION ORDINANCE (1. Municipal Ordinance or Bylaw) CHAP. 16 SEC. 30-38 (2. Citation)

3. The Commission orders that all work shall be performed in accordance with the following conditions and with the Notice of Intent referenced above. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, the conditions shall control.

   The special conditions relating to municipal ordinance or bylaw are as follows (if you need more space for additional conditions, attach a text document):

F. Appeals

The applicant, the owner, any person aggrieved by this Order, any owner of land abutting the land subject to this Order, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate MassDEP Regional Office to issue a Superseding Order of Conditions. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and a completed Request for Departmental Action Fee Transmittal Form, as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Order. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant, if he/she is not the appellant.

Any appellants seeking to appeal the Department's Superseding Order associated with this appeal will be required to demonstrate prior participation in the review of this project. Previous participation in the permit proceeding means the submission of written information to the Conservation Commission prior to the close of the public hearing, requesting a Superseding Order, or providing written information to the Department prior to issuance of a Superseding Order.

The request shall state clearly and concisely the objections to the Order which is being appealed and how the Order does not contribute to the protection of the interests identified in the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), and is inconsistent with the wetlands regulations (310 CMR 10.00). To the extent that the Order is based on a municipal ordinance or bylaw, and not on the Massachusetts Wetlands Protection Act or regulations, the Department has no appellate jurisdiction.

SPECIAL CONDITIONS FOR ORDERS OF CONDITIONS

Address: Old Colony Avenue Bridge **Parcel ID:** Roadway **LOCAL#: N1394**
Plan: "OLD COLONY AVENUE OVER TAUNTON RIVER BRIDGE" plotted on 01/28/2026.

- ✓ SC1 – Any change in the plans or any change in construction from the proposed plans shall require the Applicant to file a notice of project change with this Commission via a written inquiry as to whether the change is significant enough to require filing an amendment or a new Notice of Intent. If a minor/insignificant revision, no meeting will be required. Should the house footprint be changed without permission, or found by TCC to be changed in any way from the approved plan, all work shall immediately cease until approved by the TCC. Noncompliance with this condition shall automatically stop any permit process by this office for this Applicant.
- ✓ SC2 – A copy of this Order of Conditions and the Plans of Record shall be available on site at all times until the project is completed.
- ✓ SC3 – Best management practices as referenced by the Commission and the City Engineer shall be used to prevent any form of flooding to adjacent properties, wetlands, or watersheds as a result of this project's work. The Applicant shall be fully responsible for any damage due to improper construction or poor engineering on the site, and shall take immediate steps to correct any flooding problems resulting from work on this project. Corrective measures shall be approved by this Commission on an emergency basis if needed.
- ✓ SC4 – Any debris, fill, or excavated material shall be stockpiled on the upland side of the siltation barriers and at a location which prevents sediment from entering the wetlands.
- ✓ SC5 – All disturbed areas on this site shall be permanently stabilized either by sodding, loaming and seeding, loaming and hydro-seeding, mulching and planting, or by stone placement or other method approved by the Commission. Vegetative or other site stabilization must be uniform and complete before a final Certificate of Compliance is issued.
- ✓ SC6 - All road construction should be timed so that the binder coat can be in place prior to the closing of the asphalt plants of the winter.
- ☐ SC7 - Storm drains and catch basins must be protected from silt during the construction phase of the project.
- ☐ SC8 - An acceptable dewatering plan must be submitted and approved by the Director of Conservation Services prior to the beginning of work.
- ☐ SC9 - No water resulting from dewatering may be discharged into the Resource Area.
- ✓ SC10 - All hazardous materials on site must be disposed of properly and evidence of such disposal presented for the COC.
- ☐ SC11 - No water may be discharged into the detention structures until those structures have been fully stabilized (Growth has been established)
- ☐ SC12 - A fence must be installed between the limit of work and Resource Area.
- ☐ SC13 - Any pre-existing violations must be repaired.
- ☐ SC14 –The following replication area conditions shall apply:
  a) Replication areas must be completed first in sequence prior to construction.
  b) Replication areas should be in place and functional for two growing seasons prior to the issuance of a Certificate of Compliance.
  c) Replication area must be at least twice as large as the disturbed wetlands they are intended to replace (2:1 replication).

d) Replication area must reflect the characteristics of the displaced wetland area.
e) An acceptable Replication Plan must be on file with the Taunton Conservation Commission Office.
f) Wetlands replication area must be located in the same Bordering Vegetated Wetlands system as the altered wetlands.
g) Wetlands replication area must be on the property owned by the applicant.
h) Replication construction must be supervised by a certified wetland biologist/specialist.

- ☐ SC15 - TCC to inspect proposed washout area.
- ☐ SC16 - TCC to be notified when ownership of the property changes.
- ☐ SC17 - New owners to made aware of the Order of Conditions.
- ☐ SC18 - Deed Restriction. Homeowner Association responsible for detention basin maintenance.
- ✓ SC19 – Siltation barrier to be installed and inspected prior to construction.
- ☐ SC20 - Ongoing maintenance for all conservation structures.
- ☐ SC21 - Evidence of recording within 40 days of issuance.
- ☐ SC22- 6" of topsoil required around conservation structures.
- ☐ SC23 - Roof drains into dry wells.
- ☐ SC24 - Keep washout area outside of buffer zone.
- ✓ SC25 – The Applicant shall notify this Commission in writing of the name, address, business and home telephone numbers of the Project Supervisor and/or Contractor who shall be responsible for ensuring compliance with this Order, and who shall notify this Commission in writing at least three (3) days before any activity commences on the project site.
- ✓ SC26 – A PDF file of the plans should be submitted prior to the release of the Order of Conditions.
- ✓ SC27 – A PDF file of the AS-Built plan should be submitted when submitting a Request for Certificate of Compliance.
- ☐ SC28 – Provide a copy of each deed for the file.
- ☐ SC29 – Operations and Maintenance Plan to be followed in perpetuity.
- ☐ SC30 – Snow to be remove from site for large storm events of 3" or more.
- ☐ SC31 – Only environmentally friendly chemicals be used on site in perpetuity.
- ☐ SC32 – Police area for trash.
- ☐ SC33 – Updated plan (PDF and 1 hard copy) to be submitted prior to receipt of Amended OOC.
- ☐ SC34 – Copy of the NPDES permit to be submitted for the file.
- ☐ SC35 – Copy of the Homeowner's Association Agreement to be submitted for the file.
- ☐ SC36 – All current pervious areas are to remain pervious.
- ☐ SC37 – ZBA decisions to be submitted prior to any sign-offs.
- ☐ SC38 – No additional structures are to be built/added in perpetuity.
- ☐ SC39 – Snow storage area to be outside the 100-foot buffer zone.
- ☐ SC40 – NHESP letter to be received prior to issuance of Order of Conditions.
- ✓ SC41 – Refresh Wetland Flags prior to commencement of work.
- ☐ SC42- Compensatory storage details to be shown on plan or in separate documentation.
- ✓ SC43 – Provide Conservation Office monthly updates of the actions going on, along with anything else that happens in the meantime that is pertinent to keep the Office posted

massDOT Massachusetts Department of Transportation Highway Division

Number: P-22-001
Date: 9/23/22

POLICY DIRECTIVE

Jonathan Gulliver (signature on original)
HIGHWAY ADMINISTRATOR

Off-Site Stockpiling of Soil from MassDOT Construction Projects

Purpose

The purpose of this Policy Directive is to formally establish a policy and procedures for managing and stockpiling soil generated and transported from MassDOT construction projects. This Policy Directive does not supersede any Federal, State, or Local regulations.

Date of Effect

This Policy Directive is effective immediately for all projects, including active construction projects.

For active construction projects and for other projects advertised prior to October 15, 2022, changes to the contract documents needed to implement the requirements of this Policy Directive will be considered on a case-by-case basis and shall be approved by the District Highway Director, as necessary.

For projects advertised on or after October 15, 2022, MassDOT will include the requirements and implementation procedures of this Policy Directive in the construction contract documents.

Policy Requirements

This policy is intended to prevent the off-site relocation of excavated soil generated from MassDOT projects to areas near residential receptors and to control potential fugitive dusts and/or contaminants. To that end, excavated soil may not be moved from the project site without knowledge of the content of the material. Knowledge may include visual field observations for presence of staining, odor, and/or debris, screening with a photoionization detector (PID), laboratory analysis, and/or site history. Pavement millings and other non-soil materials are not subject to the requirements of this Policy Directive.

Moving soil from a MassDOT project site to a temporary off-site storage location must be approved in writing by the District Highway Director.

The Contractor must select a storage location that is at least 500 feet away from residential receptors, as defined herein to include, but not be limited to, residential dwellings, residentially

zoned property, schools, daycare facilities, playgrounds, parks, recreational areas, hospitals, elderly housing and convalescent facilities.

Temporary off-site storage of excavated soil from a MassDOT project is only permissible at a location approved and permitted by MassDOT. The temporary storage location should be located within the same municipality where the soil was excavated, where possible. Stockpiled soil must be securely covered, and appropriate measures must be taken to minimize fugitive dust and erosion.

Signs indicating the source of the soil, the date the soil was generated, and contact information must be erected and maintained until the stockpiled soils are transported to a disposal facility or reused on the project site.

Implementation Procedures

To ensure that off-site storage of excavated soils is managed properly on MassDOT projects, this policy requires the following:

1. **Off-Site Stockpile Storage Locations**
    a. The Contractor shall provide proposed off-site storage locations to the Engineer for approval at least 30 days prior to transporting soil off site. Off-site storage locations should be in the same municipality as the work site.
    b. The Contractor shall keep excavated soil on site until adequately characterized to the satisfaction of the Engineer.
    c. The Contractor shall provide notification of the approved off-site storage location to the local Board of Health and the Town Manager's/Mayor's Office at least 7-days prior to transporting soil off site.
    d. The Contractor shall provide the Engineer with at least 3-days' notice prior to transporting soil off site.
    e. For off-site storage locations on MassDOT property, the Contractor is required to obtain an Access Permit through the District Permits Office prior to storage of soil or other materials. MassDOT will issue these permits at no cost to the Contractor. Information to be submitted by the Contractor as part of the permit application shall include:
        i. A description of material to be stored off-site, including available analytical data;
        ii. A figure of the location with distances to residences and residential receptors; and
        iii. Anticipated duration of temporary storage.
    f. Stockpile locations should not be within 500 feet of residential receptors (e.g., residential dwellings, residentially zoned property, schools, daycare facilities, playgrounds, parks, recreational areas, hospitals, elderly housing and convalescent facilities).
        i. If the stockpile location must be within 500 feet of residential receptors, then soil must be less than RCS-1 (per 310 CMR 40.1600) and free of potentially hazardous or regulated items.

g. For off-site storage locations on non-MassDOT property, the Contractor must notify the property owner(s) at least 7 days prior to transporting material.
h. Exceptions to these rules will be reviewed by MassDOT and may be approved by the District Highway Director on a case-by-case basis.

2. Off-Site Stockpile Management

a. The Contractor shall keep soil stockpiles on impermeable surfaces (e.g., asphalt or concrete) or on 10-mil polyethylene sheeting.
b. The Contractor shall cover soil stockpiles with 10-mil polyethylene sheeting and surround with a berm made of hay bales, straw wattles, or similar.
    i. Piles that are actively being worked on must be covered and re-secured at the end of the work shift.
c. The Contractor shall label stockpiles with signs, including:
    i. Location of origin (including any Release Tracking Numbers)
    ii. Stockpile ID number (including MassDOT District office-assigned tracking ID, if different)
    iii. Date of initial accumulation
    iv. Applicable telephone numbers for the Contractor and MassDOT.
d. The Contractor shall mitigate fugitive dust at storage locations under the direction of an appropriately trained/certified environmental professional.
e. The Contractor shall remedy noncompliance with this policy within 48 hours.
f. The Contractor shall remedy noncompliance with this policy on the SAME DAY for potentially hazardous material, as determined by the Engineer.
g. The Contractor shall handle excavated soil according to federal, state, and local regulations.
h. The Contractor shall use appropriate shipping documents for all movements of excavated soil on public roadways (e.g., Bill of Lading, Material Shipping Record, Manifest, Asbestos Waste Shipment Record, etc.).

HIGHWAY ADMINISTRATOR

Use of MassDOT Property for Staging and other Construction-Related Operations

Purpose

This Policy Directive is intended to address the use of MassDOT property by MassDOT Contractors for construction staging and other construction-related operations that are not specifically defined in the construction contract. Such use of MassDOT property will only be allowed if permitted by the District Office in accordance with 700 CMR 13.00, Approval of Access to MassDOT Highways and Other Property. This includes the use of MassDOT property for staging, laydown, and storage of equipment and materials, including soil excavated from a project site.

This Policy Directive requires the Contractor/applicant to obtain a Non-Vehicular Access Permit from MassDOT to use MassDOT property for these purposes.

This Policy Directive is effective immediately and applies to all MassDOT construction projects.

General Permit Considerations and Conditions

In addition to other normal MassDOT Access Permit procedures, MassDOT shall consider the following during the application, review, implementation and monitoring processes of Access Permits required by this Policy Directive:

- Storage and placement of the Contractor's equipment and materials should not be allowed within the clear zone of the roadway.
- Stockpiled soils should not be located within 500 feet of residential receptors, as defined herein to include, but not be limited to, residential dwellings, residentially zoned property, schools, daycare facilities, playgrounds, parks, recreational areas, hospitals, elderly housing and convalescent facilities.
- The Contractor/applicant shall identify the access/egress locations of the proposed storage areas. MassDOT will only approve locations determined to be safe for roadway users, construction workers and the general public.
- The Contractor may be required to submit a Traffic Management Plan and/or Lighting Plan for MassDOT review and approval as part of the permit application, depending on the proposed use of the area.

- The Contractor shall submit the permit application through MassDOT's online State Highway Access Permit System (SHAPS).
- MassDOT will waive the permit application fee for any application received from a MassDOT Contractor for any permit required by this Policy Directive and will waive any subsequent amendment and extension fees that may otherwise be required.
- MassDOT will review the permit application in accordance with applicable standard procedures and will apply standard permit terms and conditions, as necessary.
- The Resident Engineer will verify that the permit is approved before allowing the Contractor to use the affected area for the requested purpose.
- Areas permitted are for use by the approved applicant only and are not to be shared with or used by other vendors. Subcontractors specifically engaged with the applicant working on the specific MassDOT project will be allowed to use the area in accordance with the terms of the permit.
- Permits are issued on an annual basis and will require the Contractor to file for an extension each year to continue use.

Exemptions from Permit Requirements

Equipment and materials being used for active construction operations and located within the work zone of the construction contract are exempt from this permit requirement, provided they do not interfere with the safety or operation of the roadway or the work zone. Examples of these types of exempt uses are:

- Equipment and materials parked or stored within a protected (barriered) work zone.
- Materials placed in the work zone prior to same-day installation or use.
- Soils excavated temporarily and scheduled to be replaced, such as for trenching operations or for installation of drainage structures.

DEFICIENCY: A defect in a structure that requires corrective action.

CATEGORIES OF DEFICIENCIES:

M= Minor Deficiency — Deficiencies which are minor in nature, generally do not impact the structural integrity of the bridge and could easily be repaired. Examples include but are not limited to: Spalled concrete, Minor pot holes, Minor corrosion of steel, Minor scouring, Clogged drainage, etc.

S= Severe/Major Deficiency — Deficiencies which are more extensive in nature and need more planning and effort to repair. Examples include but are not limited to: Moderate to major deterioration in concrete, Exposed and corroded rebars, Considerable settlement, Considerable scouring or undermining, Moderate to extensive corrosion to structural steel with measurable loss of section, etc.

C-S= Critical Structural Deficiency — A deficiency in a structural element of a bridge that poses an extreme unsafe condition due to the failure or imminent failure of the element which will affect the structural integrity of the bridge.

C-H= Critical Hazard Deficiency — A deficiency in a component or element of a bridge that poses an extreme hazard or unsafe condition to the public, but does not impair the structural integrity of the bridge. Examples include but are not limited to: Loose concrete hanging down over traffic or pedestrians, A hole in a sidewalk that may cause injuries to pedestrians, Missing section of bridge railing, etc.

URGENCY OF REPAIR:

I = Immediate- [Inspector(s) immediately contact District Bridge Inspection Engineer (DBIE) to report the Deficiency and to receive further instruction from him/her].

A = ASAP- [Action/Repair should be initiated by District Maintenance Engineer or the Responsible Party (if not a State owned bridge) upon receipt of the Inspection Report].

P = Prioritize- [Shall be prioritized by District Maintenance Engineer or the Responsible Party (if not a State owned bridge) and repairs made when funds and/or manpower is available].

REMARKS

BRIDGE ORIENTATION

This two span structure carries South Street East over the Taunton River (flows tidally from east to west). According to the bridge design plans the abutments are labeled north and south. The eight beams are numbered from west to east (see sketches 1 and 2). For this report the seven bays are numbered from west to east and the two spans are numbered from south to north.

GENERAL REMARKS

Structure was recently opened to traffic after repairs had been made to the beams at both abutments. The purpose of this inspection was to document the repairs made to the beams since the previous inspection and their current condition.

Access:

A lightweight B - 32 Aspen was used for this inspection.

ITEM 59 - SUPERSTRUCTURE

Item 59.4 - Girders or Beams

The beams consist of rolled 27 WF 91 with an original web thickness of 0.483'' and an original bottom flange thickness of 0.712''.

Since the previous inspection there have been numerous beam end repairs with encased concrete at both abutments (encasement was measured at approximately 2' long from the end of each beam) (see sketch 3 for locations and photos 1 - 2).

There are areas of moderate corrosion/pitting (typically 1/16'' - 1/8'' deep) throughout with several areas having heavy to severe corrosion (worse at Beam 7) (see sketch 3 and photo 3).

Specific deficiencies are listed below:

South Abutment:

- Beam 1, corrosion at encased beam end with 0.47'' remaining at web (see sketch 4 and photo 4).

- Beam 2, corrosion at encased beam end with 0.43'' remaining at web (see sketch 4 and photo 5).

- Beam 6, corrosion at encased beam end with 0.46'' remaining at web (see sketch 4 and photo 6).

- Beam 7, heavy corrosion at encased beam end with corrosion holes at web and bottom flange and at least 0.18'' remaining at web (see sketch 5 and photos 7 - 8).

Span 1 Mid Span:

- Beam 1 bottom flange at 11.5' from Pier, moderate to heavy corrosion with at least 0.57'' remaining.

- Beam 7 West Face, heavy corrosion along the upper web, lower web, and bottom flange (see photo 9).

Pier:

- Beam 5 West Face, corrosion with area of web section loss along the top and lower edge measuring approximately 5' long x up to 2'' high x at least 0.35'' remaining. Bottom flange has section loss with at least 0.50'' remaining adjacent to the bearing.

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**OCT 10, 2025**

REMARKS

- Beam 7 West Face, corrosion with area of web section loss along the top and lower edge measuring approximately 12' long x up to 5" high x at least 0.37" remaining. Bottom flange has section loss with at least 0.25" remaining adjacent to the bearing (see photo 10).

Span 2 Mid Span:

- Beam 7 West Face adjacent to Splice Plate Connection, severe corrosion along the web and flanges with web section loss measuring approximately 21' long x full height with at least 0.141" remaining (see photos 11 and 12 and sketch 6).

- Beam 7 splice plate, minor corrosion along the lower edge and rivets.

- Beam 8 splice plate, east face, moderate corrosion along the lower edge and rivets.

North Abutment:

- Beam 1, corrosion at encased beam end with 0.31" remaining at web (see sketch 5 and photo 13).

- Beam 2, corrosion at encased beam end with 0.483" remaining at web (see sketch 5).

- Beam 3, corrosion with area of web section loss measuring approximately 1' long x up to 4" high x at least 0.42" remaining. West face is encased in concrete (see photo 14).

- Beam 7, corrosion with area of web section loss with at least 0.257" remaining (see sketch 4 and photo 15).

- Beam 8, corrosion with area of web section loss measuring approximately 1.5' long x 2" high x at least 0.28" remaining.

DEFICIENCY REPORTING GUIDE

DEFICIENCY: A defect in a structure that requires corrective action.

CATEGORIES OF DEFICIENCIES:

M= Minor — Deficiencies which are minor in nature, generally do not impact the structural integrity of the bridge and could easily be repaired. Examples include but are not limited to: Spalled concrete, Minor scouring, etc.

S= Severe/Major Deficiency- — Deficiencies which are more extensive in nature and need more planning and effort to repair. Examples include but are not limited to: Moderate to major deterioration in concrete, Exposed and corroding rebars, Deteriorated timber piles, Considerable settlement, Considerable scouring or undermining, etc.

C-S= Critical Structural Deficiency- A deficiency in a structural element of a bridge that poses an extreme unsafe condition due to the failure or imminent failure of the element which will affect the structural integrity of the bridge.

C-H= Critical Hazard Deficiency- A deficiency in a component or element of a bridge that poses an extreme hazard or unsafe condition to the public, but does not impair the structural integrity of the bridge. Examples include but are not limited to: Any part of piles or fender system which are projecting outward and may become a safety hazard for the navigational traffic, etc.

URGENCY OF REPAIR:

I=Immediate- [Inspector(s) immediately contact District Bridge Inspection Engineer (DBIE) to report the Deficiency and to receive further instruction from him/her.]

A=ASAP- [Action/Repair should be initiated by District Maintenance Engineer or the responsible party (if not a State owned bridge) upon receipt of the Inspection Report.]

P=Prioritize- [Shall be prioritized by District Maintenance Engineer or the Responsible Party (if not a State owned bridge) and repairs made when funds and/or manpower is available.]

REMARKS

GENERAL REMARKS
This bridge is a two-span structure with concrete abutments and pier, dated 1945. It is on the Raynham/ Taunton town line.

Orientation:
1. Abutments are labeled left and right, looking downstream.
2. Sta 10+00 is at the upstream end. Sta 10+40 is at the downstream end.

ITEM 60 - SUBSTRUCTURE

Item 60.1 - Abutments
Item 60.1.d - Breastwalls
Right Abutment:
There is minor concrete abrasion approximately 5' high in the vicinity of the waterline.

Left Abutment:
There is minor concrete abrasion approximately 3' high from the mudline up.

Item 60.1.f - Slope Paving/Rip-Rap
The riprap is slumped and displaced at both abutments.

Item 60.1.i - Piles
According to plans dated April, 1945 the Right Abutment is pile supported and the Left Abutment is not pile supported.

Item 60.1.j - Scour
Left Abutment:
From Sta 10+16 to Sta 10+42 there is zig-zag steel sheeting exposed with a toe of 1.5’ (Inside zig-zag distance) and a maximum outside height of 1.1’.

Item 60.2 - Piers or Bents
Item 60.2.d - Stems/Webs/Pierwalls
There is minor concrete abrasion approximately 5' high in the vicinity of the waterline.
A steel angle plate with 0.5' wide legs extends down the nose at the upstream end.

Left Side:
There is concrete deterioration at the upstream end at the mudline, beginning at the upstream nose at the steel angle. The deterioration measures 3.0' Long along the upstream angle (from the nose of the pier to the angle point). This void goes behind the steel angle plate into the void described on the right side.
Starting at the angle point, concrete deterioration measures 1.0' Long, 1.2' High and 0.7' Penetration.
At Sta 10+09 there is concrete deterioration 1.5' above the mudline measuring 1.8' Long, 0.5' High and 0.2' Penetration.

Right Side:
There is concrete deterioration at the upstream end at the mudline beginning at the upstream nose at the steel angle. The deterioration measure 3.0' Long along the upstream angle (from the nose of the pier to the angle point). The void went behind the steel angle plate into the void described on the left side.
Starting at the angle point, concrete deterioration measures 2.9' Long, 0.8' High and 0.6' Penetration.
At Sta 10+22 there is concrete deterioration at the mudline measuring 1.5' Long, 1.2' High and 0.3' Penetration.

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**APR 28, 2026**

REMARKS

Item 60.2.f - Footing
Left Side:
No footing is exposed.

Right Side:
The footing is exposed from Sta 10+28 to Sta 10+42 with a maximum exposed height of 1.5'. The toe width varies from 1.7' to 2.4'. According to plans dated April, 1945 the footing height is 3.0'.

Item 60.2.g - Piles
According to plans dated April, 1945 the Pier is pile supported.

Item 60.2.h - Scour
Left Side:
No footing is exposed.

Right Side:
The footing is exposed from Sta 10+28 to Sta 10+42 with a maximum exposed height of 1.5'. The toe width varies from 1.7' to 2.4'. According to plans dated April, 1945 the footing height is 3.0'.

ITEM 61 - CHANNEL AND CHANNEL PROTECTION

Item 61.1 - Channel Scour
Left Abutment:
From Sta 10+16 to Sta 10+42 there is zig-zag steel sheeting exposed with a toe of 1.5' (Inside zig-zag distance) and a maximum outside height of 1.1'.

Pier:
Left Side:
No footing is exposed.

Right Side:
The footing is exposed from Sta 10+28 to Sta 10+42 with a maximum exposed height of 1.5'. The toe width varies from 1.7' to 2.4'. According to plans dated April, 1945 the footing height is 3.0'.

Item 61.2 - Embankment Erosion
There is slope erosion at the upstream right embankment.

Item 61.3 - Debris
There are some old piles 2.6' above the mudline which are trapping debris along both sides of the pier.
A large amount of debris consisting of branches, trees and auto parts along both sides of the pier had been building up since the 8/11/92 inspection. The heavy tree debris across the upstream nose was making the upstream right side of the nose and angle point inaccessible to divers. Divers removed most of the debris in order to fully inspect the underwater elements.
See Photos 1-5.

Item 61.6 - Rip-Rap/Slope Protection
The riprap is slumped and displaced at both the upstream and downstream embankments.

CONDITION RATING GUIDE

(For Items 58, 59, 60 and 61)

	CODE	CONDITION	DEFECTS
	N	NOT APPLICABLE	
G	9	EXCELLENT	Excellent condition.
G	8	VERY GOOD	No problem noted.
G	7	GOOD	Some minor problems.
F	6	SATISFACTORY	Structural elements show some minor deterioration.
F	5	FAIR	All primary structural elements are sound but may have minor section loss, cracking, spalling or scour.
P	4	POOR	Advanced section loss, deterioration, spalling or scour.
P	3	SERIOUS	Loss of section, deterioration, spalling or scour have seriously affected primary structural components. Local failures are possible. Fatigue cracks in steel or shear cracks in concrete may be present.
C	2	CRITICAL	Advanced deterioration of primary structural elements. Fatigue cracks in steel or shear cracks in concrete may be present or scour may have removed substructure support. Unless closely monitored it may be necessary to close the bridge until corrective action is taken.
C	1	"IMMINENT" FAILURE	Major deterioration or section loss present in critical structural components or obvious vertical or horizontal movement affecting structure stablility. Bridge is closed to traffic but corrective action may put it back in light service.
	0	FAILED	Out of service - beyond corrective action.

DEFICIENCY REPORTING GUIDE

DEFICIENCY: A defect in a structure that requires corrective action.

CATEGORIES OF DEFICIENCIES:

M= Minor Deficiency — Deficiencies which are minor in nature, generally do not impact the structural integrity of the bridge and could easily be repaired. Examples include but are not limited to: Spalled concrete, Minor pot holes, Minor corrosion of steel, Minor scouring, Clogged drainage, etc.

S= Severe/Major Deficiency — Deficiencies which are more extensive in nature and need more planning and effort to repair. Examples include but are not limited to: Moderate to major deterioration in concrete, Exposed and corroded rebars, Considerable settlement, Considerable scouring or undermining, Moderate to extensive corrosion to structural steel with measurable loss of section, etc.

C-S= Critical Structural Deficiency — A deficiency in a structural element of a bridge that poses an extreme unsafe condition due to the failure or imminent failure of the element which will affect the structural integrity of the bridge.

C-H= Critical Hazard Deficiency — A deficiency in a component or element of a bridge that poses an extreme hazard or unsafe condition to the public, but does not impair the structural integrity of the bridge. Examples include but are not limited to: Loose concrete hanging down over traffic or pedestrians, A hole in a sidewalk that may cause injuries to pedestrians, Missing section of bridge railing, etc.

URGENCY OF REPAIR:

I = Immediate- [Inspector(s) immediately contact District Bridge Inspection Engineer (DBIE) to report the Deficiency and to receive further instruction from him/her].

A = ASAP- [Action/Repair should be initiated by District Maintenance Engineer or the Responsible Party (if not a State owned bridge) upon receipt of the Inspection Report].

P = Prioritize- [Shall be prioritized by District Maintenance Engineer or the Responsible Party (if not a State owned bridge) and repairs made when funds and/or manpower is available].

REMARKS

BRIDGE ORIENTATION
This two span structure carries South Street East over the Taunton River (flows tidally from east to west). According to the bridge design plans the abutments are labeled north and south. The eight beams are numbered from west to east, see sketches 1 and 2. For this report the seven bays are numbered from west to east and the two spans are numbered from south to north.

GENERAL REMARKS
For underwater deficiencies see the latest underwater inspection dated 3/1/2023.

Access:
District 3 Aspen-62 was used for this inspection.

ITEM 58 - DECK

Item 58.1 - Wearing surface
See photo 1 for general topside.

There are areas of minor wheel rutting throughout both travel lanes, minor to moderate debris along both curb lines with evidence of ponding in span 1 at the SW and SE gutters. Numerous partially settled asphalt patches in span 1, **see photos 2, 3, 4, and 5.**

Adjacent to both curb lines the wearing surface is delaminated along the full length of the structure with areas of heaving up to 1' wide.

Specific deficiencies are listed below:

Span 1:
- Northbound travel lane adjacent to the south abutment and SE curb, partially settled asphalt patches and heaving, cracking (up to 1/8"W) measuring 3' x 5' long, **see photo 2.** Previously exposed deck has been patched since the last inspection.

- Northbound shoulder over the south abutment, a thru hole up to 3" in diameter, **see photo 3.**

- Northbound travel lane adjacent to the pier, several partially settled asphalt patches each up to 1.5' in diameter, **see photo 4.**

- Southbound travel lane adjacent to the south abutment, area of partially settled asphalt patches measuring up to 4' wide x 10' wide with a 1' diameter pothole x 2" deep, **see photo 5.**

- Southbound travel lane at mid span, several partially settled asphalt patches each measuring up to 1.5' in diameter, **see photo 5.**

Item 58.2 - Deck Condition
There are areas of minor to heavy hairline diagonal transverse cracking with minor to heavy efflorescence and rust bleed along top flanges.

See item 58.1 Wearing Surface for associated deficiencies.

Specific deficiencies are listed below:

Span 1:

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**MAY 24, 2024**

REMARKS

- West deck overhang, longitudinal hairline cracking with efflo throughout with areas of scale and spalls with exposed rebar at midspan and near south abutment, respectively, **see photo 6** for general underside. Scale at midspan up to 8'L x 10"H x 8"W x 3"D. Spall near south abutment up to 4'L x 10"H x 8"W x 3"D with exposed rebar, **see photo 7.**

- **See photo 8** for general underside of bays 1 through 4.

- S/P - Bays 1 and 2 have minor to heavy hairline diagonal transverse cracking with minor to heavy efflorescence and rust bleed along top flanges at southern ends of the bays, heaviest at the south abutment with evidence of active leakage, **see photos 9, 10, and 11.**

- **See photo 12** for general underside of bays 4 through 7.

- S/P - Bay 7 has irregular moderate hairline cracking with minor to heavy efflorescence and rust bleed along the top flange of beam 7 throughout with evidence of some active leakage, **see photos 13 and 14.**

- East deck overhang has hairline map cracking along east face with areas of longitudinal hairline cracking with efflo on the underside, **see photo 15** for general underside.

Pier:
- Bay 2 spall with exposed rebar measuring 1' in diameter x up to 2" deep, **see photo 16.**

- Bay 4 small spall (6" diameter x 2"D) with exposed rebar with adjacent associated delamination up to 2' diameter, **see photo 17.**

- Bay 5 has a partial width hairline transverse crack with efflo adjacent to deck construction joint, **see photo 18.**

Span 2:
- West deck overhang, has longitudinal hairline cracking with efflo throughout. Adjacent to the north abutment, spall/delamination with exposed rebar measuring 4' long x 5" high & wide x up to 2" deep, **see photo 19.**

- **See photos 20 and 21** for general underside of span 2.

- Bay 6 has irregular longitudinal and diagonal hairline cracking with minor to heavy efflorescence and rust bleed along beam top flanges, **see photo 22 for example.**

- Bay 7 has several transverse spalled areas with exposed sidewalk angles, up to 6" long x full width x 1.5" deep, **see photo 23.**

Item 58.4 - Curbs
Both curbs have minor areas chipping and rust staining.

Item 58.6 - Sidewalks
See photo 4 for and overview of the east sidewalk.

There is some scattered minor hairline cracking along the curb.

There is an isolated spall along the east edge over the pier measuring 1' in diameter x 2" deep, **see photo 24.**

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**MAY 24, 2024**

REMARKS

Item 58.8 - Railing
There is moderate to heavy corrosion throughout both railings with areas of severe corrosion and section loss.

West Railing lower horizontal rail has failed between the 3rd and 4th posts and between the 6th and 7th posts (counted from the south abutment) see photo 2 for an overview.

The steel endposts at both rails have severe corrosion and losses at the bases, see photo 25 for worst example at the SW endpost.

Throughout both railings at majority of the connection of the horizontal rails and posts there are corrosion holes measuring up to 6" in diameter, see photos 27 and 28 for overview examples.

Item 58.10 - Drainage System
All deck drains lack extensions and have up to 100% section loss, see photo 14 for typical example and sketch 2 for design locations.

Deck drain locations and deficiencies are a main contributor to the severe active corrosion and section loss along beam 7 in both spans and some associated beam ends at the abutments. See Item 59.4 - Girders or Beams.

Item 58.12 - Utilities
There are areas of active leakage onto the utilities with areas of minor corrosion.

APPROACHES

Approaches a - Appr. pavement condition
Both approaches have minor to moderate wheel rutting and random areas of minor to moderate partially sealed cracking (up to 1/8" wide). **See photo 1** for an overview of the south approach.

At both abutments there is transverse partially sealed cracking measuring full width x 1/8" wide, **see photos 2 and 29** for overview of the south and north approaches, respectively. In addition at the south abutment there are some asphalt patches each measuring up to 1.5' in diameter overlapping into the wearing surface.

Approaches b - Appr. Roadway Settlement
There are areas of minor settlement along both approaches.

S/P - At the south approach of the NB lane there is general settlement along the SE approach curb and catch basin that extends out to a manhole in the NB lane, **see photos 1 and 28** for overviews.

Approaches c - Appr. Sidewalk Settlement
S/P - The east approach sidewalks and curbs have settled up to 2-1/2". In addition at the SE there is 2" diameter thru hole at the curb, **see photo 30.**

The west approach safetywalk curbs are settled up to 4" lower than the bridge curbs, **see photo 29** for example.

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**MAY 24, 2024**

REMARKS

ITEM 59 - SUPERSTRUCTURE

Item 59.4 - Girders or Beams
The beams consist of rolled 27 WF 91 with an original web thickness of 0.483'' and an original bottom flange thickness of 0.712''.

There are areas of moderate corrosion throughout with several areas having heavy to severe active corrosion (see photos 12, 20, and sketch 3).

The worst locations are typically located at both abutments and along the west face of Beam 7 below the deck drains.

At the Pier typical section losses/pitting are typically 1/16'' to 1/8'' deep along the lower and upper web.

Specific deficiencies are listed below:

South Abutment:
- Beam 1, heavy corrosion with area of web section loss measuring approximately 3' long x 6'' high with previously 0.25'' remaining. Currently there are three holes up to 1'' diameter above the bearing, see sketch 4 and photos 31, 32, and 33.

- Beam 2, heavy corrosion with area of web section loss measuring approximately 2.5' long x 6'' high with 0.235'' of the web left over the bearing, see sketch 4 and photos 34 and 35. There is several linear feet of heavy laminated rust in the web and top & bottom flanges extending to north along the east face, see photo 36.

- Beams 3 and 4, minor to moderate corrosion with area of web section loss measuring up to 2' long x up to 4'' high with at least 0.32'' remaining.

- Beam 5, heavy corrosion with area of web section loss measuring approximately 2' long x 6'' high with 0.141'' remaining over the bearing see photo 39.

- Beam 6, heavy corrosion with area of web section loss measuring approximately 3' long x 6'' high along west face with previously 0.28'' remaining. Currently there is a hole up to 3.5''L x 1''H above the bearing, see sketch 4 and photos 40 and 41. Heavy corrosion in the web and top & bottom flanges extends several feet to the north along the west face, see photo 42 and sketch 3.

- Beam 7, heavy to severe corrosion with area of web section loss measuring approximately the full length of the beam x 8'' high with typically 0.17'' remaining. Above the bearing there is 1.5'' long x 1.5'' high corrosion hole with a 3'' long x 1'' high corrosion hole beyond the bearing. The east bottom flange has a knifed edge up to 4' long with at least 0.43'' remaining. The west bottom flange has section loss measuring approximately 13.5' long with typically 0.17'' remaining and a corrosion hole at 2' from the bearing measuring 1.5' long x 2'' wide, see sketch 5 and photos 43 and 44.
In addition, heavy corrosion with laminated rust in the web and top & bottom flanges extends throughout span 1 and into span 2 along the west face, see photo 45 and sketch 3.

- Beam 8, minor to moderate corrosion with area of web section loss measuring approximately 8'' long x 3'' high with at least 0.37'' remaining, see photo 46.

Span 1 Mid Span:

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**MAY 24, 2024**

REMARKS

- Beam 1 west face, bottom flange has moderate to heavy corrosion with at least 0.57'' remaining at midspan, see photo 47.

- Beam 7 West Face, heavy corrosion along the upper web, lower web, and bottom flange see photo 45.

Pier:
- Beam 1, minor to moderate corrosion and laminated rust along lower web and bottom flange, see photo 48.

- Beam 5 west face, moderate corrosion with area of web section loss along the top and lower edge measuring approximately 5' long x up to 2'' high with at least 0.35'' remaining, see photo 49. The west bottom flange has section loss with at least 0.50'' remaining adjacent to the bearing. Beam 6 has similar corrosion.

- Beam 7 West Face, moderate corrosion with area of web section loss along the top and lower edge measuring approximately 12' long x up to 5'' high with at least 0.37'' remaining. The west bottom flange (north of bearing) has section loss with at least 0.25'' remaining adjacent to the bearing, see photo 50.

Span 2 Mid Span:
- Beam 7 west face adjacent to splice plate connection (north and south), severe corrosion along the web and flanges with web section loss measuring approximately 21' long x full height with generally 0.30'' remaining. However at 11' from the pier web measured .141 remaining and at midspan measured .181'' remaining. The west bottom flange has section loss with at least 0.25'' remaining measuring approximately 13' long, however at 11' from the pier there is an area of the flange that is knifing, see sketch 6 and photos 51, 52, and 53.

- Beam 7 splice plate, minor corrosion along the lower edge and rivets.

- Beam 8 splice plate, east face, moderate corrosion along the lower edge and rivets, **see photo 54.**

North Abutment:
- Beam 1, heavy corrosion with area of web section loss measuring approximately 2.5' long x 4'' high with at least 0.28'' remaining, see sketch 5 and photos 55, 56, 57, and 58.

- Beam 2, heavy corrosion with area of web section loss measuring approximately 1.5' long x 4'' high with .122'' remaining over the bearing, see sketch 5 and photos 59 and 60.

- Beam 3, moderate corrosion with area of web section loss measuring approximately 1' long x up to 4'' high with at least 0.42'' remaining.

- Interior beam ends 4 through 7 have minor surface corrosion **see photo 61** for an overview

- Beam 8, moderate corrosion with area of web section loss measuring approximately 1.5' long x 2'' high with at least 0.28'' remaining, see photo 62.

Item 59.9 - Bearing Devices
The bearing have minor to moderate corrosion with the worst areas at the beam ends with significant section loss.

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**MAY 24, 2024**

REMARKS

Item 59.11 - Rivets & Bolts
See Item 59.4 - Girder or Beams - Splice plates rivets comments.

Item 59.14 - Paint/Coating
The paint system has failed throughout the superstructure. See Item 59.4 - Girder or Beams.

ITEM 60 - SUBSTRUCTURE

Item 60.1 - Abutments
Item 60.1.b - Bridge Seats
Both bridge seats have areas of moderate to heavy sand/debris with the worst areas adjacent to the facia beams.

Along the north abutment there is some scattered collapsed timber formwork.

Item 60.1.c - Backwalls
Both backwalls have random honeycombing and moderate deterioration of the utility block outs (see photo 23).

At the south abutment there is heavy scaling/honeycombing in bays 3 and 4, **see photo 63.**

Item 60.1.d - Breastwalls
Both abutments have minor abrasion along the waterline, **see photos 64 and 65** for overviews of the south and north breastwalls, respectively.

At the north abutment there is an area of honey combing at the east corner.

Item 60.1.e - Wingwalls
At the southwest wingwall along the top edge there is a spall with exposed rebar measuring 4' long x 1' high x up to 4" deep, **see photo 31.**

Item 60.1.f - Slope Paving/Rip-Rap
The rip rap at the south abutment has minor to moderate settlement/shifting, **see photo 64** for an overview.

The riprap along the north abutment was not visible during this inspection, **see photo 65** for an overview. See Underwater Inspection report dated 3/1/23.

Item 60.1.h - Footings
The top of PZ steel sheeting is exposed along the south abutment, **see photo 64.**
See Underwater Inspection report dated 3/1/23.

Item 60.1.j - Scour
See Underwater Inspection report dated 3/1/23.

Item 60.2 - Piers or Bents
Item 60.2.d - Stems/Webs/Pierwalls
There is minor to moderate abrasion along the waterline, **see photo 66** for an overview.

Item 60.2.f - Footing
See Underwater Inspection report dated 3/1/23.

CITY/TOWN	B.I.N.	BR. DEPT. NO.	8.-STRUCTURE NO.	INSPECTION DATE
RAYNHAM=TAUNTON	**3M4**	**R-02-003=T-01-004**	**R02003-3M4-MUN-NBI**	**MAY 24, 2024**

REMARKS

Item 60.2.g - Piles
See Underwater Inspection report dated 3/1/23.

Item 60.2.h - Scour
See Underwater Inspection report dated 3/1/23.

SubStructure Scour Notes
See Underwater Inspection dated 2/11/2020 for deficiencies.

ITEM 61 - CHANNEL AND CHANNEL PROTECTION

Item 61.1 - Channel Scour
See Underwater Inspection report dated 3/1/23.

Item 61.2 - Embankment Erosion
See Underwater Inspection report dated 3/1/23.

Item 61.3 - Debris
Upstream at the pier and in span 1 there is an area of heavy debris that extends up to 2/3 of the way across the width of the channel, see photo 67.

Item 61.6 - Rip-Rap/Slope Protection
The rip rap at the south abutment has minor to moderate settlement/shifting.

TRAFFIC SAFETY

Item 36a - Bridge Railing
The bridge railing consists of four horizontal steel rails mounted on steel posts (Type B), non standard.

See item 58.8 Railing for condition.

Item 36b - Transitions
There are no transitions for this structure (non standard).

Item 36c - Approach Guardrail
The northern approach guardrails consist of W beam mounted on timber posts and spacers with gloved ends at the bridge rail end posts (non standard).

The southeastern transition consists of W beam panels mounted on steel posts and spacers with no connection to the bridge rail end post (non standard).

There are no traffic safety feature at the southwestern corner.

Item 36d - Approach Guardrail Ends
The approach guardrail ends are gloved (non standard).

The northeastern approach guardrail is sloped away from traffic.

The southeastern guardrail end has some minor damage.

1.0 INTRODUCTION AND PURPOSE

This Sampling and Analysis Plan (SAP) was prepared in support of the Taunton & Raynham – Superstructure Replacement Project, South Street East Over the Taunton River (the Project) (MassDOT Project #613642), which proposes to replace the superstructure and perform substructure repairs of the bridge carrying South Street East/ Old Colony Avenue over the Taunton River in Raynham and Taunton, Massachusetts (Figure 1). As outlined in 314 CMR 9.07(1)C, the Project anticipates removing and disposing of up to **2,000 cubic yards (cy)** of dredged material and is subsequently required to conduct sediment sample collection and analysis to ensure the protection of human health, public safety, public welfare, and the environment.

In total, three (3) composite samples and four (4) grab samples will be collected for analysis. The samples will be collected by TG&B Marine Services, Inc. and overseen by a BETA scientist. Each sample will be advanced to the proposed dredging depth within the river (6 feet) using geoprobe hand tools and a sediment samplers. Sampling locations are identified on the Sediment Sampling Plan (Figure 4) and will be GPS located at time of sampling. Following collection, the samples will be sent to ESS Laboratory **|** A division of the RISE Group in Cranston, RI.

The composite samples will be tested for the following:

- Conductivity
- MCP 14 Metals (includes arsenic, cadmium, chromium, copper, lead, mercury, nickel and zinc as required by 314 CMR 9.07))
- Ignitability
- Reactive Sulfide/cyanides
- Pesticides/herbicides to meet Aggregate reporting limits
- VOCs (volatile organic compounds) (Grab sample based upon highest PID)
- PCBs (polychlorinated biphenyls by EPA Method 8082 and NOAA analysis for congeners) **
- Total SVOCs (semi-volatile organic compounds)
    - (PAH (polynuclear aromatic hydrocarbons) results will be a subset of the total SVOC results; Total SVOC results to conform with MassDEP Policy # Comm-97-001)
- Extractable Petroleum Hydrocarbons (EPH)
- TPH (total petroleum hydrocarbons)
- Total Organic Carbon
- volatile solids (percent)
- water (percent)
- TCLP, as applicable

** PCB analysis will be conducted using EPA Method 8270C Modified (EPA Method 680); results will include the “NOAA” list of 22 congeners.

Additionally, each composite sediment sample will be analyzed for cyanide.

The grab samples will be tested for:

- VOCs
- EPH with PAHs

The Sediment Sampling Figure showing the sampling locations and a description of any compositing or subsampling conducted will be submitted along with the analytical results. In addition, a copy of the report

of sample analysis from the performing laboratory will be provided including quality assurance/quality control information and methods of analysis used.

1.1 Sampling Equipment & Additional Materials Required

The sampling will be conducted using the following equipment:

- Geoprobe hand tools;
- Sediment Sampler;
- Chest waders or equivalent wet weather gear;
- Small watercraft;
- Disposable Nitrile Gloves;
- GPS Unit
- Plastic Zip-lock bags or glass jars depending on lab requirements.

1.2 Site Contacts

The consultant Project Manager (PM) from BETA Group Inc will be Chistopher Jones, PE. They can be contacted at the phone number and email listed below:

Phone Number: 781.255.1982 x. 7017

Email: cjones@beta-inc.com

In the event of “suspect” contamination or previously unknown condition, contact the Project Manager.

1.3 Health and Safety

Field personnel assigned to conduct or inspect drilling and sampling operations shall be appropriately trained for the subject investigation and shall have successfully completed health and safety training in accordance with the "HAZWOPER" Standard promulgated by the Occupational Safety and Health Administration (OSHA) as 29 CFR Part 1910.120(e). Documentation shall include the initial 40-hour training and 8-hour annual refresher training demonstrating compliance within the current work period.

2.0 Sediment Sampling Oversight

2.1 Sediment Sampling Scope

The total volume of sediment to be dredged from below the Mean High-Water elevation of the Taunton River is estimated to be approximately 2,000 cubic yards. BETA is proposing sampling for parameters outlined in the Water Quality Certification regulation and COMM-97 disposal parameters to evaluate likely off-site disposal alternatives for the generated sediment.

The samples submitted for analysis will be a combination of composite and grab samples, based upon the sample location. Based upon the dredging depth within the stream and in order to provide sufficient information to evaluate sediment volume and off-site management options, BETA has proposed collection of 9 sediment cores to a depth of 6 feet (three from upstream of the bridge, three from the area underneath the bridge, and three from downstream of the bridge) which will be composited to create three composite samples. One grab sample will also be collected in an area underneath the CMP drainage outfall, and three additional grab samples will be collected (one from upstream of the bridge, one from the area underneath the bridge, and one from downstream of the bridge). The location of all sediment sampling locations is available in the attached Sediment Sampling Plan (Figure 4).

The sediment samples will be analyzed based on the requirements for the 401 Water Quality Certification (WQC), as well as COMM-97 standards to evaluate potential off-site management alternatives as described in Section III below.

Each sample will be advanced to a depth representative of the sediment depth within the River using geoprobe hand tools and a sediment sampler. Sampling locations will be GPS located at time of sampling.

3.0 SAMPLING PLAN

The application for a 401 Water Quality Certification (WQC) for Dredging requires the physical and chemical analysis of sediment samples. Samples will be collected to adequately represent the sediment to be dredged and evaluate off-site management alternatives. The locations of the cores from which WQC samples will be collected are shown on Figure 4.

One (1) grab sample from each of the 3 sample areas (upstream, underneath the bridge and downstream) shown in Figure 4 will be collected, 1 grab sample from the area below the drainage outfall, and 3 composite samples made up of 3 core samples collected from each sample area, as depicted on Figure 4 will be collected and submitted for laboratory analysis, as described below.

If a 0–6-foot depth is infeasible at any of the identified sampling sites, the field personnel responsible for taking the sample will find a representative site as close as possible to the identified site. The Field personnel is responsible for noting the change in sampling location, the impetuous for that change, and the distance of the new location from the previously identified one.

Sample Collection and Analysis will be performed in accordance with MassDEP standard operating procedures. The analytical laboratory will be instructed that the testing must meet the reporting limits indicated in the table above and can also be found under Section 9.07(2)(b)6 of the 401 Water Quality Certification Regulations [314 CMR 9.07(2)(b)6].

A plan showing the sampling locations and a description of any compositing or subsampling conducted will be submitted along with the analytical results. In addition, a copy of the report of sample analysis from the performing laboratory will be provided including quality assurance/quality control information and methods of analysis used.

3.1 GRAB SAMPLES

Grab Samples will be collected in compliance with WQC and COMM-97 standards. Four (4) grab samples will be collected including:

- One sample upstream of the bridge (GS1);
- One sample underneath the bridge (GS2);
- One sample downstream of the bridge (GS3); and,
- One outfall sample (GS 4).

According to 314 CMR 9.07(2) - Sampling and Analysis Requirements, samples collected for analysis of volatile organic compounds are obtained from an individual core and not composited from multiple cores. In areas adjacent to the , the core selected for VOC analysis will be selected based upon the highest field PID reading of the two cores collected from each sample area. If all PID readings are 0, VOC samples will be selected to be spatially representative of the future dredging area.

3.2 COMPOSITE SAMPLES

Composite samples will be collected in accordance with 314 CMR 9.07(b)(4), which states:

> "*For projects up to 10,000 cubic yards, one core for every 1000 cubic yards of dredged material shall be collected. Up to three cores may be composited to create a single sample, provided:*
>
> *a. The grain-size distribution and likelihood of contamination are similar based on depositional characteristics, spill history, and location of point source discharges;*
> *b. Cores are composited from the same reach; and*
> *c. Samples collected for analysis of volatile compounds are obtained from an individual core and not composited from multiple cores.*
>
> *For all projects, a minimum of two representative samples shall be characterized physically and chemically."*

The limits of dredging have been subdivided into 3 distinct composite areas that correlate with the downstream, upstream, and below-bridge reaches. Within each composite area, the streambed has consistent grain size distribution, likelihood of contamination, and location of point source discharges. All samples submitted for volatile compounds are to be obtained from an individual core sample and will not be composited from multiple cores.

In total, 3 composite samples will be submitted for WQC parameters and reporting limits in accordance with 314 CMR 9.07. These composite samples will be collected downstream of the bridge (CS1), in the area underneath the bridge (CS2) and upstream (CS3) of the bridge. Each composite sample will consist of 3 core samples located within their respective composite area as designated on the included Sampling and Analysis Plan.

Composite samples will be composed of the following core samples:

- Composite Sample 1 (CS1);
  - Core Sample 1 (S1)
  - Core Sample 2 (S2)
  - Core Sample 3 (S3)
- Composite Sample 2 (CS2);
  - Core Sample 4 (S4)
  - Core Sample 5 (S5)
  - Core Sample 6 (S6)
- Composite Sample 3 (CS3);
  - Core Sample 7 (S7)
  - Core Sample 8 (S8)
  - Core Sample 9 (S9)

In total, 9 core samples will be collected in their respective locations. Each set of three cores, (S1-S3, S4-S6, and S7-S9) will be combined to create the three composite samples (CS1, CS2, and CS3) respectively. Under no circumstances are the three composite samples (CS1, CS2, and CS3) to be combined. All 3 shall be submitted separately for chemical analysis.

The composite sediment samples will also be analyzed for chemical constituents required by Section D of the WQC Application, and COMM-97 parameters. The COMM-97 parameters is one sample per 500 CY of material so three samples composited from each of the 9 core samples should be sufficient for evaluating disposal options.

3.3 SEDIMENT SAMPLING PARAMETERS

The results of analysis will be reported in units of mg/kg (ppm) dry weight. The table below is a list following of the constituents that all sediment samples will be analyzed for:

Sample Locations	Parameter	Reporting Limit mg/kg (dry weight)	Method
GS4, CS1, CS2, CS3	Arsenic	0.5	6010B
GS4, CS1, CS2, CS3	Cadmium	0.1	6010B
GS4, CS1, CS2, CS3	Chromium	1.0	6010B
GS4, CS1, CS2, CS3	Copper	1.0	6010B
GS4, CS1, CS2, CS3	Lead	1.0	6010B
GS4, CS1, CS2, CS3	Mercury	0.02	6010B
GS4, CS1, CS2, CS3	Nickel	1.0	6010B
GS4, CS1, CS2, CS3	Zinc	1.0	6010B
CS1, CS2, CS3	Polycyclic Aromatic Hydrocarbons (PAHs)	0.02	8270
CS1, CS2, CS3	Polychlorinated Biphenyls (PCBs) – by NOAA Summation of Congeners	0.01	NOAA
GS4, CS1, CS2, CS3	Extractable Petroleum Hydrocarbons	25	MassDEP EPH
CS1, CS2, CS3	Total Semi-Volatile Organic compounds (SVOCs)		8270
CS1, CS2, CS3	Total Petroleum Hydrocarbons (TPH)		8100
CS1, CS2, CS3	Percent Volatile Solids		
GS1, GS2, GS3, GS4	Volatile Organic Compounds (VOCs)	0.1	8260
CS1, CS2, CS3	Total Organic Carbon	0.1%	
CS1, CS2, CS3	Percent Water	1.0%	
CS1, CS2, CS3	Toxicity Characteristic Leaching Procedure	As applicable	
CS1, CS2, CS3	Conductivity		General Chemistry
CS1, CS2, CS3	Ignitability		General Chemistry
CS1, CS2, CS3	Reactive Sulfide/Cyanides		
CS1, CS2, CS3	Pesticides/Herbicides

RE: Bridge Reconstruction Over Taunton River (10887)
ESS Laboratory Work Order Number: 25L0055

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED
By ESS Laboratory at 5:08 pm, Dec 19, 2025

Analytical Summary
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

Sample Receipt

The following samples were received on December 01, 2025 for the analyses specified on the enclosed Chain of Custody Record.

Samples 25L0055-01 and 25L0055-02 for Metals were oven dried at 60 degrees Celsius prior to digestion and relogged in as samples 25L0055-04 and 25L0055-05. This was done to increase the dry weight of the sample digested which decreases variability of results and lowers the detection limits for samples with high water content.

Lab Number	Sample Name	Matrix	Analysis
25L0055-01	CS1	Soil	1010A, 2540 G, 2540G, 7.3.3.2, 7.3.4.1, 8081B, 8082A Cong, 8100M, 8151A, 8270E, 9050A, EPH8270, EPH8270SIM, LK, MADEP-EPH
25L0055-02	GS4	Soil	8260D Low, EPH8270, EPH8270SIM, MADEP-EPH
25L0055-03	GS1	Soil	8260D Low
25L0055-04	CS1 - OVEN DRIED	Soil	6010D, 7471B
25L0055-05	GS4 - OVEN DRIED	Soil	6010D, 7471B

Notes and Definitions

X*	RSD of replicate analysis > 20%. Reanalysis produced similar results.
WL	Results obtained from a deionized water leach of the sample.
U	Analyte included in the analysis, but not detected
Q	Calibration required quadratic regression (Q).
EL	Elevated Method Reporting Limits due to sample matrix (EL).
D+	Relative percent difference for duplicate is outside of criteria (D+).
D	Diluted.
CD+	Continuing Calibration %Diff/Drift is above control limit (CD+).
CD-	Continuing Calibration %Diff/Drift is below control limit (CD-).
B-	Blank Spike recovery is below lower control limit (B-).
B	Present in Method Blank (B).
>	Greater than.
ND	Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
MDL	Method Detection Limit
MRL	Method Reporting Limit
LOD	Limit of Detection
LOQ	Limit of Quantitation
DL	Detection Limit
I/V	Initial Volume
F/V	Final Volume
§	Subcontracted analysis; see attached report
1	Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
2	Range result excludes concentrations of target analytes eluting in that range.
3	Range result excludes the concentration of the C9-C10 aromatic range.
Avg	Results reported as a mathematical average.
NR	No Recovery
[CALC]	Calculated Analyte
SUB	Subcontracted analysis; see attached report
RL	Reporting Limit
EDL	Estimated Detection Limit
MF	Membrane Filtration
MPN	Most Probable Number
TNTC	Too numerous to Count
CFU	Colony Forming Units

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northeast, LLC Project Manager.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

MassDEP Analytical Protocol Certfication Form

Laboratory Name: Eurofins Rhode Island | Project #: 620-31612-1

Project Location: 25L0055 | RTN:

This Form provides certifications for the following data set: list Laboratory Sample ID Number(s):
620-31612-1

Matrices: ☐ Groundwater/Surface Water ☑ Soil/Sediment ☐ Drinking Water ☐ Air ☐ Other:

CAM Protocol (check all that apply below:)

8260 VOC CAM II A ☐	7470/7471 Hg CAM III B ☐	MassDEP VPH (GC/PID/FID) CAM IV A ☐	8082 PCB CAM V A ☐	9014 Total Cyanide/PAC CAM VI A ☐	6860 Perchlorate CAM VIII B ☐
8270 SVOC CAM II B ☐	7010 Metals CAM III C ☐	MassDEP VPH (GC/MS) CAM IV C ☐	8081 Pesticides CAM V B ☐	7196 Hex Cr CAM VI B ☐	MassDEP APH CAM IX A ☐
6010 Metals CAM III A ☐	6020 Metals CAM III D ☐	MassDEP EPH CAM IV B ☐	8151 Herbicides CAM V C ☑	8330 Explosives CAM VIII A ☐	TO-15 VOC CAM IX B ☐

Affirmative Responses to Questions A through F are required for "Presumptive Certainty" status

A	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	☑ Yes ☐ No
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	☑ Yes ☐ No
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	☑ Yes ☐ No
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?	☑ Yes ☐ No
E	VPH, EPH, APH, and TO-15 only a. VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications). b. APH and TO-15 Methods only: Was the complete analyte list reported for each method?	☐ Yes ☐ No ☐ Yes ☐ No
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	☑ Yes ☐ No

Responses to Questions G, H and I below are required for "Presumptive Certainty" status

G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	☑ Yes ☐ No[1]

Data User Note: Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.

H	Were **all** QC performance standards specified in the CAM protocol(s) achieved?	☐ Yes ☑ No[1]
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	☑ Yes ☐ No[1]

1 All negative responses must be addressed in an attached laboratory narrative.

I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, is accurate and complete.

Signature: Michael Chang | **Position:** Project Manager II

Printed Name: Michael Chang | **Date:** 12/15/2025

Case Narrative

Client: Eurofins Environment Testing Northeast LLC
Project: 25L0055

Job ID: 620-31612-1

Job ID: 620-31612-1 — Eurofins Rhode Island

Job Narrative
620-31612-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The sample was received on 12/5/2025 9:30 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.0°C.

Herbicides
Method 8151MCP: The continuing calibration verification (CCV) associated with batch 460-1079381 recovered outside acceptance criteria, low biased, for Dalapon. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte, the data are reported.

Method 8151MCP: The continuing calibration verification (CCV) associated with batch 460-1079381 recovered above the upper control limit for Dinoseb and Dalapon. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 460-1079381/25).

Method 8151MCP: The continuing calibration verification (CCV) associated with batch 460-1079381 recovered above the upper control limit for 2,4,5-T. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 460-1079381/35).

Method 8151MCP: The continuing calibration verification (CCV) associated with batch 460-1079381 recovered above the upper control limit for Dalapon, Dicamba, Dichlorprop and Dinoseb. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 460-1079381/35).

Method 8151MCP: The continuing calibration verification (CCV) associated with batch 460-1079656 recovered outside acceptance criteria, low biased, for Dalapon. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8151MCP: The continuing calibration verification (CCV) associated with batch 460-1079656 recovered above the upper control limit for MCPP. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCVRT 460-1079656/2).

Method 8151MCP: The continuing calibration verification (CCV) for Dalapon recovered outside the lower control limit on the primary column but within control limits on the secondary column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported for Dalapon on the secondary column. (CCV 460-1079656/18)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client: Beta Engineering - ML/TB

Shipped/Delivered Via: Client

ESS Project ID: 25L0055
Date Received: 12/1/2025
Project Due Date: 12/8/2025
Days for Project: 5 Day

1. Air bill manifest present? No
   Air No.: NA
2. Were custody seals present? No
3. Is radiation count <100 CPM? Yes
4. Is a Cooler Present? Yes
   Temp (°C): 10 Iced with: Ice
5. Was COC signed and dated by client? Yes
6. Does COC match bottles? Yes
7. Is COC complete and correct? Yes
8. Were samples received intact? Yes
9. **Were labs informed about short holds & rushes?** (Yes) / No / NA
10. Were any analyses received outside of hold time? Yes / (No)

11. Any Subcontracting needed? (Yes) / No
    ESS Sample IDs: (illegible)
    Analysis: (illegible)
    TAT: STD
12. Were VOAs received? (Yes) / No
    a. Air bubbles in aqueous VOAs? Yes / (No)
    b. Does methanol cover soil completely? (Yes) / No / NA
13. Are the samples properly preserved? (Yes) / No
    a. If metals preserved upon receipt: Date: _____ Time: _____ By/Acid Lot#: _____
    b. If dissolved metals are requested, are they: Field Filtered / To Be Lab Filtered
    c. Low Level VOA vials frozen: Date: 12/1/25 Time: 1848 By: AD

Sample Receiving Notes:

14. Was there a need to contact Project Manager? Yes / (No)
    a. Was there a need to contact the client? Yes / No
    Who was contacted? _____ Date: _____ Time: _____ By: _____

PROPOSAL

RAYNHAM-TAUNTON

For: **Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River**

COMMONWEALTH OF MASSACHUSETTS

LOCATION

The work referred to herein is in the Town of RAYNHAM and City of TAUNTON in Bristol County, in the Commonwealth of Massachusetts, and is shown by the locus map (Document 00331) in the Proposal Pamphlet, the work locations extend as follows:

Old Colony Avenue (Taunton)	**South Street East (Raynham)**
Beginning – Station 1+10.00 +/-	**Taunton**
Bridge # R-02-003 = T-01-004	
Ending –Station 8+51.00 +/-	**Raynham**

The contract prices shall include the furnishing of all materials (except as otherwise herein specified), the performing of all the labor requisite or proper, the providing of all necessary machinery, tools, apparatus and other means of construction, the doing of all the abovementioned work in the manner set forth, described and shown in the specifications and on the drawings for the work, and in the form of contract, and the completion thereof within **1,310 CALENDAR DAYS** upon receipt of a Notice to Proceed, except that if the completion date falls between December 1 and March 15 then the same number of days beyond December 1st will be extended after March 15th.

The Work of this project is described by the following Items and quantities.

THIS PAGE INTENTIONALLY LEFT BLANK

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
101.	0.2	CLEARING AND GRUBBING AT _____ PER ACRE		
102.2	1	TREE TRIMMING AT _____ LUMP SUM		
102.3	20	HERBICIDE TREATMENT OF INVASIVE PLANTS AT _____ PER HOUR		
102.33	10	INVASIVE PLANT MANAGEMENT STRATEGY AT _____ PER HOUR		
102.511	2	TREE PROTECTION - ARMORING AND PRUNING AT _____ EACH		
102.521	50	TREE AND PLANT PROTECTION FENCE AT _____ PER FOOT		
105.	1	STUMP REMOVED AT _____ EACH		
106.29	340	GRAFFITI REMOVAL BY APPLICATION OF COATING AT _____ PER SQUARE FOOT		
107.855	30	PRESSURE INJECTION OF CRACKS AT _____ PER FOOT		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
114.2	1	DEMOLITION OF SUPERSTRUCTURE OF BRIDGE NO. R-02-003=T-01-004 (3M4) AT _____ LUMP SUM		
120.1	700	UNCLASSIFIED EXCAVATION AT _____ PER CUBIC YARD		
123.	350	MUCK EXCAVATION AT _____ PER CUBIC YARD		
127.1	80	REINFORCED CONCRETE EXCAVATION AT _____ PER CUBIC YARD		
127.122	30	REINFORCED CONCRETE EXCAVATION FOR REPAIRS AT _____ PER CUBIC FOOT		
140.	380	BRIDGE EXCAVATION AT _____ PER CUBIC YARD		
141.	40	CLASS A TRENCH EXCAVATION AT _____ PER CUBIC YARD		
141.1	30	TEST PIT FOR EXPLORATION AT _____ PER CUBIC YARD		
142.	10	CLASS B TRENCH EXCAVATION AT _____ PER CUBIC YARD		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
143.	2,090	CHANNEL EXCAVATION AT _____ PER CUBIC YARD		
144.	5	CLASS B ROCK EXCAVATION AT _____ PER CUBIC YARD		
146.	2	DRAINAGE STRUCTURE REMOVED AT _____ EACH		
151.	420	GRAVEL BORROW AT _____ PER CUBIC YARD		
151.1	10	GRAVEL BORROW FOR BRIDGE FOUNDATION AT _____ PER CUBIC YARD		
151.2	130	GRAVEL BORROW FOR BACKFILLING STRUCTURES AND PIPES AT _____ PER CUBIC YARD		
151.9	880	STREAMBED RESTORATION AT _____ PER CUBIC YARD		
156.	670	CRUSHED STONE AT _____ PER TON		
163.1	1	DEFORMATION AND VIBRATION MONITORING AT _____ LUMP SUM		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
164.	6	PRE- AND POST-CONSTRUCTION CONDITION SURVEYS AT _____ EACH		
170.	1,500	FINE GRADING AND COMPACTING - SUBGRADE AREA AT _____ PER SQUARE YARD		
180.01	1	ENVIRONMENTAL HEALTH AND SAFETY PROGRAM AT _____ LUMP SUM		
180.02	10	PERSONAL PROTECTION LEVEL C UPGRADE AT _____ PER HOUR		
180.03	60	LICENSED SITE PROFESSIONAL SERVICES AT _____ PER HOUR		
181.01	1	PHASE II SAMPLING AND ANALYSIS PLAN AT _____ LUMP SUM		
181.11	1,930	DISPOSAL OF UNREGULATED SOIL AT _____ PER TON		
181.12	260	DISPOSAL OF REGULATED SOIL - IN-STATE FACILITY AT _____ PER TON		
181.13	260	DISPOSAL OF REGULATED SOIL - OUT-OF-STATE FACILITY AT _____ PER TON		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
181.14	130	DISPOSAL OF HAZARDOUS WASTE AT _____ PER TON		
182.1	1	INSPECTION AND TESTING FOR ASBESTOS AT _____ LUMP SUM		
182.2	30	REMOVAL OF ASBESTOS AT _____ PER FOOT		
184.1	1	DISPOSAL OF TREATED WOOD PRODUCTS AT _____ PER TON		
201.	8	CATCH BASIN AT _____ EACH		
202.	2	MANHOLE AT _____ EACH		
202.15	1	MANHOLE - 5 FOOT DIAMETER AT _____ EACH		
204.11	1	GUTTER INLET - SPECIAL AT _____ EACH		
210.02	1	SANITARY SEWER MANHOLE REMOVED AT _____ EACH		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
220.	17	DRAINAGE STRUCTURE ADJUSTED AT _____ EACH		
220.2	10	DRAINAGE STRUCTURE REBUILT AT _____ PER FOOT		
220.5	1	DRAINAGE STRUCTURE REMODELED AT _____ EACH		
222.3	13	FRAME AND GRATE (OR COVER) MUNICIPAL STANDARD AT _____ EACH		
223.2	4	FRAME AND GRATE (OR COVER) REMOVED AND DISCARDED AT _____ EACH		
227.3	34	REMOVAL OF DRAINAGE STRUCTURE SEDIMENT AT _____ PER CUBIC YARD		
227.31	100	REMOVAL OF DRAINAGE PIPE SEDIMENT AT _____ PER FOOT		
227.4	5	MASONRY PLUG AT _____ PER SQUARE FOOT		
238.10	5	10 INCH DUCTILE IRON PIPE AT _____ PER FOOT		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
238.18	30	18 INCH DUCTILE IRON PIPE AT _____ PER FOOT		
241.15	5	15 INCH REINFORCED CONCRETE PIPE CLASS III AT _____ PER FOOT		
241.18	15	18 INCH REINFORCED CONCRETE PIPE CLASS III AT _____ PER FOOT		
243.12	170	12 INCH REINFORCED CONCRETE PIPE CLASS IV AT _____ PER FOOT		
258.	10	STONE FOR PIPE ENDS AT _____ PER SQUARE YARD		
269.08	45	8 INCH SLOT-PERFORATED CORRUGATED PLASTIC PIPE (SUBDRAIN) AT _____ PER FOOT		
271.1	60	DRAINAGE PIPE REMOVED AND DISCARDED AT _____ PER FOOT		
302.041	200	4 INCH DUCTILE IRON SEWER PIPE (RUBBER GASKET) AT _____ PER FOOT		
302.06	10	6 INCH DUCTILE IRON WATER PIPE (RUBBER GASKET) AT _____ PER FOOT		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
309.	700	DUCTILE IRON FITTINGS FOR WATER PIPE AT _____ PER POUND		
336.1	20	1 INCH PLASTIC WATER PIPE AT _____ PER FOOT		
349.04	2	4 INCH GATE VALVE AT _____ EACH		
350.06	1	6 INCH GATE AND GATE BOX AT _____ EACH		
372.02	120	2 INCH SEWER PIPE INSULATION AT _____ PER FOOT		
376.1	1	HYDRANT - EXCLUDING COST OF HYDRANT AT _____ EACH		
376.3	1	HYDRANT - REMOVED AND STACKED AT _____ EACH		
390.01	100	IRRIGATION SYSTEM REMOVED AND RESET AT _____ PER FOOT		
402.1	170	DENSE GRADED CRUSHED STONE FOR SUB-BASE AT _____ PER TON		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON				
Description : Bridge Replacement, R-02-003=T-01-004 (3M4), South Street East over the Taunton River				
ITEM #	**QUANTITY**	**ITEM WITH UNIT BID PRICE WRITTEN IN WORDS**	**UNIT PRICE**	**AMOUNT**
402.13	310	PAVEMENT MILLING MULCH FOR SHOULDERS AT _____ PER FOOT		
415.2	1,400	PAVEMENT FINE MILLING AT _____ PER SQUARE YARD		
431.	110	HIGH EARLY STRENGTH CEMENT CONCRETE BASE COURSE AT _____ PER SQUARE YARD		
443.	10	WATER FOR ROADWAY DUST CONTROL AT _____ PER 1000 GALLONS		
450.23	250	SUPERPAVE SURFACE COURSE - 12.5 (SSC - 12.5) AT _____ PER TON		
450.32	200	SUPERPAVE INTERMEDIATE COURSE - 19.0 (SIC - 19.0) AT _____ PER TON		
450.42	200	SUPERPAVE BASE COURSE - 37.5 (SBC - 37.5) AT _____ PER TON		
450.601	26	SUPERPAVE BRIDGE SURFACE COURSE - 9.5 POLYMER (SSC-B - 9.5 - P) AT _____ PER TON		
450.701	26	SUPERPAVE BRIDGE PROTECTIVE COURSE - 9.5 POLYMER (SPC-B - 9.5 - P) AT _____ PER TON		

Project # 613642	Contract # 136413			
Location : RAYNHAM - TAUNTON
