Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum Class B flow critical depth
computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section  At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
```

```
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 25.1
 El of the toe of the abutment = 11.1
 Right Embankment

```
 El of the top of the embankment = 25.1
 El of the toe of the abutment = 11.1
 Abutment Type = 4 Vert. abutments and sloping embankments with wingwalls
Slope of abutments =
 Top with of embankment = 35
 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls
 Width = 12
 Angle = 45
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =   Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters  Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable submergence for weir flow = .98
Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 25
 El of the toe of the abutment = 4.5
 Right Embankment
 El of the top of the embankment = 25
 El of the toe of the abutment = 4.5 Abutment Type = 4 Vert. abutments and sloping embankments with wingwalls Slope of abutments =
 Top with of embankment = 53
 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls
 Width = 5
 Angle = 45
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method

Pressure and Weir flow Submerged Inlet Cd =
Submerged Inlet + Outlet Cd = .8
Max Low Cord =

Additional Bridge Parameters
Add Friction component to Momentum
Do not add Weight component to Momentum
Class B flow critical depth computations use critical depth
inside the bridge at the upstream end
Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge  Use Geometric mean as
Friction Slope Method

Selected Low Flow Methods = Energy

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream
Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable
submergence for weir flow = .98
Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 13.8
 El of the toe of the abutment = -5.88
 Right Embankment
 El of the top of the embankment = 13.8
 El of the toe of the abutment = -5.88
 Abutment Type = 1 Vert. abutments and vert. embankments with or without wingwalls Slope of abutments =
 Top with of embankment = 30 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls
 Width = 35
 Angle = 20
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At upstream inside (BU)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Angle =

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
```

Energy Only

Additional Bridge Parameters
Add Friction component to Momentum
Do not add Weight component to Momentum
Class B flow critical depth computations use critical depth
inside the bridge at the upstream end
Criteria to check for pressure flow = Upstream energy grade line

Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream
Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable
submergence for weir flow = .98 Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

Low Flow Methods and Data
 Energy
Selected Low Flow Methods = Highest Energy Answer

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Angle =

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Flow File : \\beta-inc.com\ma\Projects\10800s\10887 - Taunton, MA - Old
Colony Ave Bridge\Engineering\Hydraulics\HECRAS\10887 - Taunton_River.f01

Plan Description:
Proposed Conditions

Plan Summary Information: Number of: Cross Sections = 158 Multiple Openings =
0
 Culverts = 0 Inline Structures = 1
```

Bridges = 20 Lateral Structures = 0

Computational Information
Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 40
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options
Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method

```
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end  Criteria to check for pressure flow =
Upstream energy grade line

 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth

inside the bridge at the upstream end
Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank  At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream
Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable
submergence for weir flow = .98
Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

```
Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 26.2
 El of the toe of the abutment = 12.4
 Right Embankment
 El of the top of the embankment = 26.2
 El of the toe of the abutment = 12.4
 Abutment Type = 4 Vert. abutments and sloping embankments with wingwalls
Slope of abutments =
 Top with of embankment = 35
 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls  Width = 16
 Angle = 45
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum  Class B flow critical depth
computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section  At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
```

```
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 25.1
 El of the toe of the abutment = 11.1
 Right Embankment

```
 El of the top of the embankment = 25.1
 El of the toe of the abutment = 11.1
 Abutment Type = 4 Vert. abutments and sloping embankments with wingwalls
Slope of abutments =
 Top with of embankment = 35
 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls
 Width = 12
 Angle = 45
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =   Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
```

```
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters  Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Pressure and Weir flow Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable submergence for weir flow = .98
Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 25
 El of the toe of the abutment = 4.5
 Right Embankment
 El of the top of the embankment = 25
 El of the toe of the abutment = 4.5 Abutment Type = 4 Vert. abutments and sloping embankments with wingwalls Slope of abutments =
 Top with of embankment = 53
 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls
 Width = 5
 Angle = 45
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method

```
 Pressure and Weir flow  Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Optional Contraction and expansion coefficients
 At approach Section
 At Guide Bank
 At upstream outside
 At upstream inside (BU)
 At downstream inside (BD)
 Piers are Continuous for the width of the bridge  Use Geometric mean as
Friction Slope Method

Selected Low Flow Methods = Energy

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream
Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable
submergence for weir flow = .98
Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

Low Flow Methods and Data
 Energy
 W.S. Pro Method

 W.S.Pro Data
 Left Embankment
 El of the top of the embankment = 13.8
 El of the toe of the abutment = -5.88
 Right Embankment
 El of the top of the embankment = 13.8
 El of the toe of the abutment = -5.88
 Abutment Type = 1 Vert. abutments and vert. embankments with or without wingwalls Slope of abutments =
 Top with of embankment = 30 Centroid station of bridge opening =
 Wing Wall Type = Angular wing walls
 Width = 35
 Angle = 20
 Radius =
 Guide Banks Type = No Guide Bank present
 Length =
 Offset =
 Angle =
 Optional Contraction and expansion coefficients
 At upstream inside (BU)
 Piers are Continuous for the width of the bridge
 Use Geometric mean as Friction Slope Method

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Angle =

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
```

Energy Only

Additional Bridge Parameters
Add Friction component to Momentum
Do not add Weight component to Momentum
Class B flow critical depth computations use critical depth
inside the bridge at the upstream end
Criteria to check for pressure flow = Upstream energy grade line

Upstream Embankment side slope = 0 horiz. to 1.0 vertical Downstream
Embankment side slope = 0 horiz. to 1.0 vertical Maximum allowable
submergence for weir flow = .98 Elevation at which weir flow begins =
Energy head used in spillway design =
Spillway height used in design =
Weir crest shape = Broad Crested

Number of Bridge Coefficient Sets = 1

Low Flow Methods and Data
 Energy
Selected Low Flow Methods = Highest Energy Answer

High Flow Method
 Pressure and Weir flow
 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

Selected Low Flow Methods = W.S.Pro Method

High Flow Method
 Energy Only

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

 Submerged Inlet Cd =
 Submerged Inlet + Outlet Cd = .8
 Max Low Cord =

Additional Bridge Parameters
 Add Friction component to Momentum
 Do not add Weight component to Momentum
 Class B flow critical depth computations use critical depth
 inside the bridge at the upstream end
 Criteria to check for pressure flow = Upstream energy grade line

CCI	0.75	0.61	0.56	0.50

APPENDIX D

SCOUR COMPUTATIONS

Hydraulic Analysis Report

Contraction Scour

1. Determine return fredquency for the Scour Design Flood and Scour Check Flood using Table 1.3.4-1:

Highway Functional Classification:	Urban Collector Street
Scour Design Flood Return Frequency:	25
Scour Check Flood Return Frequency:	50

2. Determine routine

$$v_C = K_u \times y_1^{1/6} \times D_{50}^{1/3}$$ Equation 1: Critical Velocity

v_c = Critical Velocity (ft/s)
K_u = 11.17 (Constant)
y_1 = Average Depth of flow upstream of the bridge (ft)
D_{50} = Particle Size (ft)

Parameters	25-Year Channel	50-Year Channel
K_u	11.17	11.17
y_1(ft)	10.96	11.41
D_{50} (mm)	2.50	2.50
D_{50} (ft)	0.01	0.01
V_c (ft/s)	3.36	3.38
V_0 (ft/s)	3.43	3.58
V_c - V_0	-0.07	-0.20
Routine:	LIVE	LIVE

Equation 1
v_o = Veclocity in the approach section(ft/s) [Value is from the model]

Clear = $V_c > V_0$; Live = $V_c < V_0$

3. Calculate Contraction Sour Based on Routine

$$\frac{y_2}{y_1} = \left(\frac{Q_2}{Q_1}\right)^{\frac{6}{7}} \times \left(\frac{W_1}{W_a}\right)^{k_1}$$ Equation 2: Average depth in contracted section

$$y_s = y_2 - y_0$$ Equation 3: Contraction Scour

Table 1		
V*/T	k1	Mode of Bed Material Transport
<0.5	0.59	Mostly contact bed material
0.5	0.64	Some suspended bed material discharge
>2.0	0.69	Mostly suspended bed material discharge

Q_1 = Flow in upstream channel (cfs)
Q_2 = Flow in contracted channel (cfs)
W_1 = Bottom width of upstream main channel (ft)
W_2 = Bottom width of main channel in contracted section (ft)
K_1 = Exponent from Table 1
y_0 = Existing depth in contracted section before scour (ft)
y_1 = Average Depth of flow upstream of the bridge (ft)
y_2 = Average depth in contracted section (ft)
y_s = Average contraction scour depth (ft)

V^* = $(\vartheta o/\Delta)^{1/2} = (g y_1 S_1)^{1/2}$, shear velocity in the upstream section, ft/s (m/s)
T = Fall velocity of bed material based on the D50, m/s (Figure 6.8)
For fall velocity in English units (ft/s) multiply T in m/s by 3.28
g = Acceleration of gravity (32.2 ft/s^2) (9.81 m/s^2)
$S1$ = Slope of energy grade line of main channel, ft/ft (m/m)
ϑo = Shear stress on the bed, (lb/ft2) (Pa (N/m2))
Δ = Density of water (1.94 slugs/ft3) (1000 kg/m3)

Live-Water Routine		
Channel Parameters	25-Year	50-Year
Q_1 (cfs)	4812	5430
Q_2 (cfs)	4812	5430
W_1 (ft)	127.52	131.34
W_2 (ft)	84.18	84.18
K_1	0.69	0.69
y_0 (ft)	11.99	12.83
y_2 (ft)	14.60	15.51
y_s(ft)	2.61	2.68

Channel Depth Average inside bridge opening
Equation 2
Equation 3

	25-Year	50-Year
Contraction Scour Y_s =	2.61	2.68

Abutment Scour

1. Determine Computation Type and Method

Computation Method: NCHRP 24-20 Mehtod

L/B is >75%

Scour Condition (a) live-bed scour

2. Calculate Total Scour at the Abutment

$$y_{max} = \propto_A \times y_c$$ Equation 4

y_{max} = Maximum flow depth resulting fromabutment scour (ft)
α_A = Amplification factor for live-bed conditions
y_c = Flow dpeth including live-bed or clear water contraction scour (ft)

$$y_c = y_1 \left(\frac{q_{2c}}{q_1}\right)^{6/7}$$ Equation 5

y_1 = Upstream flow depth (ft)
q_1 = Upstream unit discharge (ft^2/s)
q_{2c} = Unit discharge in the constricted opening (ft^2/s)

	25-Year			50-Year		
	CFS	Width	Unit Discharge (ft^2/s)	CFS	Width (ft)	Unit Discharge (ft^2/s)
Bridge (q_{2c})	4812	84.18	57.16	5430.00	84.19	64.50
Approach (q_1)	4812	127.52	37.74	5430.00	131.34	41.34

	25-Year	50-Year	
q_1 / q^{2c}	1.5	1.6	
α_A	1.60	1.6	
y_1 (ft)	10.96	11.4	
y_c (ft)	15.65	16.70	Equation 5
y_0 (ft)	11.99	12.83	
y_{max} (ft)	25.03	25.89	Equation 4

3. Calculate Abutment Scour Depth

$$y_s = y_{\max} - y_0$$ Equation 6

y_s = Abutment scour depth, ft (m)

	25-Year	50-Year	
y_{max} (ft)	25.03	25.89	
y_0 (ft)	11.99	12.83	
y_s (ft)	13.04	13.06	Equation 6

	25-Year	50-Year
Abutment Scour Y_s =	13.04	13.06

Pier Scour

Existing Pier Scour with Debris

	25-Year	50-Year
a	3.00	3.00
K_1	0.79	0.79
H	2.50	2.50
W	28.00	28.00
y (ft)	10.96	11.41
a^*_d	7.51	7.33

$$a^*_d = \frac{K_1(HW) + (y - K_1H)a}{y} \qquad (7.32)$$

where:

a^*_d = Effective width of pier when debris is present, ft (m)
a = Width of pier perpendicular to flow, ft (m)
K_1 = 0.79 for rectangular debris, 0.21 for triangular debris
H = Height (thickness) of the debris, ft (m)
W = Width of debris perpendicular to the flow direction, ft (m)
y = Depth of approach flow, ft (m)

	25-Year	50-Year
y_s (ft)	4.45	4.48
y_1 (ft)	10.96	11.41
K_1	0.90	0.90
K_2	1.00	1.00
K_3	1.10	1.10
a	7.51	7.33
Fr	0.22	0.23
L	35.00	35.00
V	4.19	4.35

In terms of y_s/a, Equation 7.1 is:

$$\frac{y_s}{a} = 2.0\,K_1\,K_2\,K_3\left(\frac{y_1}{a}\right)^{0.35} Fr_1^{0.43} \qquad (7.3)$$

where:

y_s = Scour depth, ft (m)
y_1 = Flow depth directly upstream of the pier, ft (m)
K_1 = Correction factor for pier nose shape from Figure 7.3 and Table 7.1
K_2 = Correction factor for angle of attack of flow from Table 7.2 or Equation 7.4
K_3 = Correction factor for bed condition from Table 7.3
a = Pier width, ft (m)
L = Length of pier, ft (m)
Fr_1 = Froude Number directly upstream of the pier = $V_1/(gy_1)^{1/2}$
V_1 = Mean velocity of flow directly upstream of the pier, ft/s (m/s)
g = Acceleration of gravity (32.2 ft/s^2) (9.81 m/s^2)

Proposed Pier Scour

	25-Year	50-Year
y_s (ft)	2.45	2.51
y_1 (ft)	10.96	11.41
K_1	0.90	0.90
K_2	1.00	1.00
K_3	1.10	1.10
a	3.00	3.00
Fr	0.22	0.23
L	35.00	35.00
V	4.19	4.35

$$\frac{y_s}{y_1} = 2.0\,K_1\,K_2\,K_3\left(\frac{a}{y_1}\right)^{0.65} Fr_1^{0.43} \qquad (7.1)$$

As a Rule of Thumb, the maximum scour depth for round nose piers aligned with the flow is:

$y_s \le 2.4$ times the pier width (a) for $Fr \le 0.8$
$y_s \le 3.0$ times the pier width (a) for $Fr > 0.8$ (7.2)

In terms of y_s/a, Equation 7.1 is:

$$\frac{y_s}{a} = 2.0\,K_1\,K_2\,K_3\left(\frac{y_1}{a}\right)^{0.35} Fr_1^{0.43} \qquad (7.3)$$

where:

y_s = Scour depth, ft (m)
y_1 = Flow depth directly upstream of the pier, ft (m)
K_1 = Correction factor for pier nose shape from Figure 7.3 and Table 7.1
K_2 = Correction factor for angle of attack of flow from Table 7.2 or Equation 7.4
K_3 = Correction factor for bed condition from Table 7.3
a = Pier width, ft (m)
L = Length of pier, ft (m)
Fr_1 = Froude Number directly upstream of the pier = $V_1/(gy_1)^{1/2}$
V_1 = Mean velocity of flow directly upstream of the pier, ft/s (m/s)
g = Acceleration of gravity (32.2 ft/s^2) (9.81 m/s^2)

Countermeasures

1. Calculate Froude Numbers using Equaition 1

$$\left(\frac{V}{(g \times y)^{1/2}}\right)$$ Equation 1

V= characteristic average velocity in the contracted section, ft/s (m/s) [Total Discharge through bridge (Q)/Cross Sectional Area (A)]
y= Flow depth in bridge opening, ft (m)
g= gravitational acceleration, ft/s^2 (m/s^2)

V (ft/s)	6.00
y (ft)	12.83
g (ft/s^2)	32.20
FR #	0.30

Equation 2

Froude Number is less than or equal to 0.8. Use Equation 14.1

HEC -23 Equation 14.1

$$\frac{D_{50}}{y} = \frac{K}{(S_s - 1)}\left[\frac{V^2}{g \times y}\right]$$ Equation 14.1

D_{50} = median stone diameter, ft (m)
V= characteristic average velocity in the contracted section, ft/s (m/s)
S_s = specific gravity of rock riprap
y= Flow depth in bridge opening, ft (m)
g= gravitational acceleration, ft/s^2 (m/s^2)
K= 0.89 for a spill-through abutment
1.02 for a vertical wall abutment

Abutment Type: Vertical Wall

V (ft/s)	6.00
S_s	2.65
y (ft)	12.83
g (ft/s^2)	32.20
K	1.02
D_{50} (ft)=	0.69
D_{50} (in)=	9.00
Thickness (in)	18.00

D_{50} *(in)*	3.33
D_{50} *(ft)*	0.28
V (ft/s)	4.35
K	1.5
S_S	2.65
g (ft/s^2)	32.2

5.2.3 Riprap for Bridge Piers

According to Hoffmans and Verheij (1997) riprap can be sized using either the Isbash or Shields stability criteria if turbulence intensity is incorporated into the velocity component. The effect of turbulence is to increase instantaneous velocities well above the levels for unobstructed flow. This concept is particularly applicable to the pier riprap equations.

The standard Isbash (1936) formula for sizing riprap on a channel bed is:

$$D_{50} = \frac{0.692(KV)^2}{(2g(S_s - 1))} \qquad (5.1)$$

where:

D_{50} = Riprap size, ft (m)
V = Velocity, ft/s (m/s)
S_s = Specific gravity of the riprap (usually 2.65)
K = 1.0

To incorporate the effects of turbulence intensity, Hoffmans and Verheij (1997) recommend that the value of K be adjusted above a value of 1.0. In the specific case of circular piers, they recommend using the local velocity upstream of the pier and values of K up to 2.0. This amount of adjustment is equivalent to increasing shear stress by a factor of four.

This approach is similar to the equations presented in Design Guideline 8 and in the riprap sizing formula presented by Parola (1993). The only difference is the recommended values of K in the design guideline are 1.5 for circular piers and 1.7 for square piers. The recommended values of K by Parola ranged from 1.44 to 1.90 depending on pier and footing geometry and approach flow angle of attack.

Re: Sediment Sample Test Results
South St. East & Old Colony Ave. Over Taunton River Bridge (Bridge No. R-2-3=T-1-4)
Taunton, Massachusetts

Dear Mr. Jones:

This letter presents the results of our laboratory testing on the soil samples collected from the Taunton River upstream of Bridge R-2-3=T-1-4 in Taunton, Massachusetts (Fig. 1). We understand that the test results will be used for scour evaluation.

Sediment samples were collected on August 2 and August 7, 2024. We collected samples at five locations (SS-101, SS-102, SS-103, SS-104, and BB-102). The samples were collected in accordance with the locations shown in Figure 1.3.1-2 of the Massachusetts Department of Transportation (MassDOT) Bridge Manual – Hundredth Anniversary Edition (2024). Samples SS-101 through SS-104 were collected using a 2-7/8 inch outside diameter vibracore and BB-102 was collected using a 2-inch-diameter split-spoon. The sample locations are shown on Fig. 2.

The samples collected for the scour evaluation were tested by GEI in our Woburn, Massachusetts laboratory. We performed eight grain size with hydrometer analyses (ASTM D7928) and three Atterberg Limits tests on the collected samples. The results of the laboratory tests are attached. D10, D15, D30, D50, D60, and D85 particle sizes for the samples are provided in the Particle Size Distribution Reports. Liquid Limit, Plastic Limit, and Plasticity Index of Soils are provided in the Atterberg Limits Reports.

Please call Joe Giampa at 781-721-4037 or Steve Sarandis at 781-721-4048 if you have any questions.

Sincerely,

GEI Consultants, Inc.

Hi Courtney,

I have reviewed the PCN for the Old Colony Avenue bridge over the Taunton River. We have assigned this project Corps file number NAE-2025-02437. I have just a few comments/questions that need to be addressed before we can consider this a complete application, as follows:

1. The Taunton River is non-navigable at this location, and as such Corps jurisdiction is limited to reviewing discharges of fill pursuant to Section 404 of the CWA. We have no Section 10 authority over dredging in this location. The environmental impact plans will need to be revised to not depict impacts due to dredging. Please clarify the work occurring within the yellow hatched area labeled “dredging for access – to be restored” so we can determine if there are any 404 discharges of fill involved. We do consider dewatered areas behind cofferdams to be temporary 404 impacts, so if the area will be dewatered it may be sufficient to simply change the label. Placing streambed material back after removing it could safely be called a temporary 404 impact as well. I am happy to discuss our jurisdiction if more clarification is needed.

2. Please number the plans to form a sequentially numbered set (e.g. 1 of 10 through 10 of 10).

3. I was unable to find an effects determination for Plymouth redbelly turtle. FHWA, or MassDOT on their behalf, needs to provide an effects determination for this species for our records (e.g. No Effect, NLAA, etc.).

4. The NMFS ESA form was not signed by either MassDOT or NMFS on my end. If the form was signed, somehow the signatures dropped out when it was transmitted to me. Can you please re-send the form showing the signatures? If NMFS has not signed yet, please just let me know and send the form to me once it is signed.

If you have any questions please let me know.

Thank you,
Dan

Subject: [Non-DoD Source] Pre-Construction Notification Application - Raynham/Taunton - - BRIDGE REPLACEMENT, R-02-003=T-01-004 (3M4), SOUTH STREET EAST OVER THE TAUNTON RIVER

Good afternoon,

The City of Taunton in connection with the Massachusetts Department of Transportation is submitting a Pre-Construction Notification application for a bridge replacement on South Street East over the Taunton River in Raynham and Taunton, MA.

The Project will require demolition of the existing bridge superstructure, construction of the new bridge deck and associated structural appurtenances; installation of scour protection within the Taunton River; full depth pavement reconstruction; and grading. The Project proposes to retain the existing bridge substructure while replacing the

superstructure with a deck that is one foot wider to allow for the addition of a bicycle lane. Ancillary Project facets including guardrails and a relocated sidewalk have also been
incorporated into the design, and the Project will also address the addition of scour protection within the river during construction.

As a result of the proposed work the following impacts to resource areas are expected:
• 164 linear feet of temporary and 72 linear feet (lf) of permanent impact to Streambank; and
• 4,699 square feet (sf) of temporary and 8,570 sf of permanent impact to Streambed associated with a dredge volume of 2,055 cubic yards (cy).

The project was filed on the RRS system on 1/30/26 (see email attached).

Please let me know if you would like a separate PDF copy. I can send via the share filed system if needed. We look forward to your review.

Thank you,
Courtney

RE: 401 WATER QUALITY CERTIFICATION
BRP WW 10, Major Fill Project
BRP WW 08, Minor Dredge
Old Colony Ave Bridge (R-02-003=T-01-004) replacement over the Taunton River
Raynham and Taunton, MA

401 WQC Filing Number: 26-WW26-0004-APP
USACE Application No. NAE-2025-02437
MassDOT File Number: 613642

Dear Mr. Niro:

The Massachusetts Department of Environmental Protection (MassDEP) has reviewed your application for a Water Quality Certification (WQC), as referenced above. The WQC application was deemed complete on March 20, 2026. In accordance with the provisions of MGL Ch. 21, §§26-53 and Section 401 of the Federal Clean Water Act as amended (33 U.S.C. §1251 et seq.), it has been determined there is reasonable assurance the proposed project will be conducted in a manner which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law.

The project proposes the replacement of the existing Old Colony Avenue Bridge (R-02-003=T-01-004) superstructure over the Taunton River, as well as scour protection installation, full depth road reconstruction, and stormwater improvements in Raynham and Taunton (the Project).

The original bridge, constructed in 1945, consists of a two-span reinforced concrete deck supported by reinforced concrete abutments and timber piles with an overall bridge span of 90 feet and width of 35 feet. This bridge carries two 10-foot travel lanes, two 2.5-foot shoulders, and a 5-foot sidewalk. The bridge rests on two concrete abutments and a single pier. The

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

project currently collects stormwater through two closed catch basins at the southern end of the bridge that discharge to the Taunton River through a 12-inch reinforced concrete pipe. The remainder of the site consists of country drainage.

The Project will occur within a diadromous fish run and is habitat for Atlantic Sturgeon (*Acipenser oxyrinchus*). Accordingly, in order to protect diadromous fish migration, MassDEP has conditioned this WQC to require compliance with the conditions outlined in the MA Division of Marine Fisheries (DMF) letter of February 24, 2026. This includes a prohibition of in-water work between March 1st and July 15th for the spring and September 1st to November 15th for the fall.

The Project will occur within a Federal Emergency Management Agency (FEMA) 1% annual chance of flooding zone (Zone AE) associated with the Taunton River but will not impact the Base Flood Elevation or regulatory floodway. The Taunton River is classified as a "Wild and Scenic River".

The Project will replace the bridge superstructure while retaining the existing bridge substructure. The new bridge width will have the same span and increase the width by one foot to incorporate a bicycle lane. The sidewalk will be relocated to the west side of the roadway. To avoid anticipated scour, 8,570 square feet (sf) of riprap will be installed across the river at a depth of 2 feet, and will be topped with 2 feet, 8 inches of streambed material. A wildlife shelf will be provided along the streambank via a 3-foot level riprap landing adjacent to the face of the south abutment. Approximately 790 feet of full depth roadway construction will occur, which includes the bridge and two approaches.

In total, 8,570 sf of permanent impacts and 4,699 sf of temporary impacts to Land Under Water (LUW) are required to complete the project. Permanent impacts are due to the placement of riprap scour countermeasures, and the temporary impacts are due to dewatering for access and riprap placement.

Installation of riprap scour protection will require dredging of approximately 2,075 cubic yards (cy) of material. The Project area is anticipated to have elevated levels of contamination. Sampling was conducted but did not adhere to the approved sampling plan due to hazardous water conditions at the time of sampling. The samples that were collected show low levels of contaminants, but nothing above the reportable limit. To verify these samples and also collect the number of soils samples as required by 314 CMR 9.07, additional sampling is proposed. Prior to dredge work, a Phase II Sampling and Analysis Plan shall be submitted for approval and implemented.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

An alternatives analysis was completed in accordance with 314 CMR 9.00. Four alternatives were considered, and the chosen alternative was picked to minimize impacts to the Taunton River while still implementing scour protection. The chosen alternative also minimizes the increase in impervious area. The no-build alternative is not practicable to meet the project goal of replacing the bridge superstructure.

The Project qualifies as a redevelopment project as defined at 314 CMR 9.02 and meets the Stormwater Management Standards to the maximum extent practicable. The one foot widening of the bridge to incorporate a bike path will increase impervious surface within the Project limits by 781 sf. The proposed stormwater improvements include eight new deep sump catch basins. Two existing catch basins will be replaced with deep sump catch basins on the south side of the bridge and the remaining six new deep sump catch basins will be installed at the northern and southern approach. Curbing will be added to direct flow to these new closed systems. A 45-foot-long infiltration trench will also be installed at the northwestern limit of the project. These new drainage systems will direct water to the Taunton River. Due to steep slopes and adjacent private property, no other stormwater control measures could be considered.

The Project will comply with the Stream Crossing Standards to the maximum extent practicable. All standards will be met except for Standard 3. Bankfull width of the Taunton River is 99.5 feet, requiring a span of 119.42 feet to satisfy 1.2 times bankfull width. The current span of 79 feet will not change because the existing abutments will be utilized for the proposed bridge.

Based on a review of information provided by the applicant, MassDEP finds that this project complies with the standards described under 314 CMR 9.06 and 9.07. Public notice was provided in the Taunton Daily Gazette on January 28, 2026. No comment letters were received during the public comment period.

Therefore, based on information currently in the record, MassDEP grants a WQC for this project subject to the following conditions to maintain water quality, to minimize impact on waters and wetlands, and to ensure compliance with appropriate state law. MassDEP further certifies in accordance with 314 CMR 9.00 that there is reasonable assurance the project or activity will be conducted in a manner which will not violate applicable water quality standards (314 CMR 4.00) and other applicable requirements of state law. Finally, the Department has determined that upon satisfying the conditions and mitigation requirements of this approval, the project provides a level of water quality necessary to protect existing uses and accordingly finds that the project to be implemented satisfies the Surface Water Quality Standards at 314 CMR 4.00.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

Pursuant to 314 CMR 9.09(1)(d); 314 CMR 9.06(6)(a); 310 CMR 9.06(2); 314 CMR 9.07; 314 CMR 9.07(1); 314 CMR 9.09(7)(5)(c); 314 CMR 9.11; and 314 CMR 9.09(1)(e), the following Special Conditions are necessary to ensure that construction practices and stormwater controls are implemented in such a manner as to prevent degradation to wetlands and waters; ensure that practicable steps have been taken which will avoid and minimize impacts to wetlands and waters; minimize turbidity and sediment caused by construction activities; ensure that water quality is not degraded, and that biology of the waters are not negatively impacted by potential discharges; and/or maintain a record of the dredged material for reference and to ensure accountability in its transportation.

Those Special Conditions that require direct submittals to MassDEP for either review, or review and approval, are denoted by the following notation (Submittal) at the end of the condition and are summarized in Attachment A. In addition, those conditions with the (Submittal) designation shall be included in the Special Provisions and, as applicable, reviewed at the Pre-Construction Meeting.

1. All work shall be performed in accordance with the following documents and plans:

    a. Application for Water Quality Certification. “Old Colony Avenue Bridge Reconstruction R-02-003=T-01-004” in Raynham and Taunton, MA. Prepared by BETA Group, Inc. on behalf of MassDOT, dated January 2026, with cover letter and attachments. 401 WQC Filing Number: 26-WW26-0004-APP.

    b. MassDEP Technical Review, 401 Water Quality Certification, “Old Colony Avenue Bridge Reconstruction R-02-003=T-01-004” in Raynham and Taunton, MA. Dated February 24, 2026.

    c. Responses to MassDEP Technical Review, 401 Water Quality Certification, “Old Colony Avenue Bridge Reconstruction R-02-003=T-01-004” in Raynham and Taunton, MA. Prepared and signed by Jonathan Niro of BETA Group, Inc. on behalf of MassDOT, dated March 20, 2026.

Pre-Construction

2. A qualified **Fluvial Geomorphologist** (FGM) with a minimum of five years of relevant professional experience in stream replication and restoration projects shall be employed to oversee all LUW replication and restoration activities as proposed in the WQC application and approved herein. The name, contact information, and qualifications of the FGM shall be provided to MassDEP for review and approval with a copy to the

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

Raynham and Taunton Conservation Commissions prior to the Pre-Construction Meeting required in Condition 5. The FGM shall either attend the Pre-Construction Meeting or a separate virtual or onsite meeting with MassDEP, MassDOT, and the Contractor prior to any LUW replacement or restoration work. **(Submittal)**

3. One individual with at least three years of experience with construction period erosion and sedimentation controls shall be employed to be responsible for Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan (CP/PP) inspections (CP/PP Inspector). The name, contact information, and qualifications of the CP/PP Inspector shall be provided to MassDEP for review and approval with a copy to the Raynham and Taunton Conservation Commissions prior to the Pre-Construction Meeting required in Condition 5. **(Submittal)**

4. Prior to the Pre-Construction Meeting required in Condition 5, the applicant shall provide MassDEP with the name and contact information of the Resident Engineer (RE) responsible for ensuring that all work complies with the conditions of this WQC. **(Submittal)**

5. A minimum of 21 days prior to the start of ground disturbance or vegetation clearing, MassDOT shall contact MassDEP to schedule an onsite Pre-Construction Meeting to review the approved plans and terms and conditions of this WQC. The RE, the construction contractor (Contractor), the CP/PP inspector, a representative from the MassDOT Environmental Section and/or the District Environmental Engineer shall attend the Pre-Construction Meeting. **No work shall commence prior to the Pre-Construction Meeting.**

6. MassDEP shall be copied on applicable submittals to the U.S. Army Corps of Engineers (USACE). These include but are not limited to: Self-Verification Notification Form (SVNF); Pre-Construction Notification (PCN); Work-Start Notification Form; Mitigation Work-Start Notification Form; and Compliance Certification Form. The Work-Start Notification Form shall be submitted at least 14 days before the anticipated start of work and the Compliance Certification Form shall be submitted within 30 days following the completion of the authorized work. **(Submittal)**

7. A CP/PP shall be developed and implemented as required by 314 CMR 9.06(6)(a)8. A minimum of 14 days prior to the start of work, MassDOT shall submit the CP/PP for review and approval. If the U.S. Environmental Protection Agency (EPA) Construction General Permit (CGP) applies, the Stormwater Pollution Prevention Plan (SWPPP) may serve as the CP/PP, providing it includes the measures required to be in the CP/PP per

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

these Special Conditions, in addition to the measures specifically required by the CGP. Any subsequent changes to the approved CP/PP (defined herein as including the construction period SWPPP if applicable) must be approved by MassDEP. **(Submittal)**

8. Training regarding erosion and sedimentation controls is required. The CP/PP Inspector and any other relevant personnel responsible for erosion and sedimentation controls shall complete the EPA CGP Inspector Training, or other training that meets the CGP requirements, as well as complete a comprehensive review of the approved CP/PP. Proof of completion of the training shall be submitted to MassDEP prior to the start of work. **(Submittal)**

9. The CP/PP shall identify, but shall not be limited to, staging and laydown areas in relation to LUW, proposed dewatering methods and locations, proposed stockpile locations and their proximity to catch basins or other drainage conveyances that discharge to wetland resource areas, and the location of construction-period erosion and sedimentation controls. Stockpiles shall be located no less than 50 feet from LUW, catch basins, or other drainage conveyances that discharge to LUW.

10. A minimum of 14 days prior to the start of work, MassDOT shall submit a Control of Water Plan for review and approval. The Plan shall include a description of proposed methods to isolate and dewater work areas within streams while maintaining stream flow, including but not limited to the method of isolation (e.g., steel sheeting or sandbag cofferdam), dewatering methods and locations and specifications for stream bypass systems as applicable. The Control of Water Plan shall include a plan depicting LUW boundaries, and the location of all relevant methods and materials which shall be located within the LUW impact areas approved herein. The plan shall meet the requirements of the CP/PP and be specific to the Project. Dewatering and stream bypasses shall be conducted under the supervision of the RE or other project staff with knowledge of these practices and comply with the applicable conditions identified herein. **(Submittal)**

11. Prior to the start of work, approved erosion and sedimentation control measures shall be installed per the approved CP/PP and as applicable, the manufacturer specifications. Erosion and sedimentation control measures may consist of, but are not limited to, silt fence, staked straw bales, silt/turbidity curtains, compost filter tubes, etc.

12. Prior to the Pre-Construction Meeting, the boundaries of LUW shall be re-flagged where they are within 50 feet of the limits of work. All boundary markers, once in place, shall

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

remain in place throughout construction until all disturbed surfaces have been permanently stabilized. Boundary markers shall be fully evaluated annually and refreshed where needed. Implementation of and compliance with this requirement shall be documented by the RE. All construction personnel shall be made aware of these markers.

13. Prior to any work within the 1% annual chance of flooding zone within Project limits, including mobilization or storage of equipment and materials, a Flood Contingency Plan shall be submitted to MassDEP for review and approval that includes at a minimum the following information and provisions: **(Submittal)**

    a. The RE and/or Contractor shall monitor the National Weather Service forecast daily, and upon issuance of a flood watch or flood warning for the Project area, the Flood Contingency Plan shall be implemented.

    b. Upon implementation of the Flood Contingency Plan, all construction equipment and materials located below the Base Flood Elevation (BFE) shall be removed and placed in an upland location above the BFE and outside of LUW.

    c. Anchored stationary equipment may remain below the BFE if demonstrated to be required and upon written approval from MassDEP. In the event semi-stationary equipment cannot be feasibly removed before the arrival of the storm, they shall be adequately secured and MassDEP shall be notified prior to the storm.

    d. A requirement to inspect and maintain all erosion and sedimentation controls, and stabilize all exposed soils as needed below the BFE prior to the storm shall be included.

    e. A plan depicting at a minimum, but not limited to, LUW boundaries, the Project limits, and the BFE boundary based on ground elevations shall be included.

    f. Staff and materials must be available 24 hours per day, seven days per week to implement the Flood Contingency Plan. The name, affiliation, title, email address, and phone number of each person responsible for implementing the Flood Contingency Plan shall be included.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

g. No work shall commence until the flood watch or flood warning has ended, all areas below the BFE have been inspected, and erosion and sedimentation controls are maintained as needed.

14. The Contractor shall develop an Invasive Plant Management Strategy (IPMS) to be submitted to MassDEP for review and approval prior to the Pre-Construction Meeting. The IPMS shall be implemented as approved. **(Submittal)**

15. If needed, use of herbicides to control invasive species shall be implemented in accordance with the approved IPMS and with the following requirements:

    a. Herbicides shall only be applied by a Licensed Applicator;

    b. Only herbicides registered with the Massachusetts Pesticide Board Subcommittee shall be applied to the targeted area/species;

    c. The manufacturer's label directions must be followed, in addition to any conditions imposed by other state or local authorities;

    d. Herbicide application shall use no more than the minimum application rate to accomplish removal of the target species; and

    e. Applicants must obtain a BRP WM04 Herbicide Permit from the MassDEP Wetlands Program Dredge Unit before performing herbicide application in waterbodies (traditionally lakes and ponds).

16. A minimum of 21 days prior to the start of demolition work, a Demolition Plan shall be submitted for review and approval describing how the existing bridge will be demolished and what measures will be taken to ensure that demolition material, including but not limited to any pollutants, construction debris, toxic or hazardous substances, and airborne dust, is properly contained and does not enter the Taunton River. **(Submittal)**

17. Final Construction Plans (the plans provided to the Contractor) shall be submitted for review at least 30 days prior to the Pre-Construction Meeting. Sufficient supporting information, explanation, and documentation shall be provided to MassDEP and the Raynham and Taunton Conservation Commissions outlining any deviations from the plans approved herein, and MassDEP may at its discretion require additional supporting documentation as a condition of review. The updated set of plans shall become the

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

"Final Plan of Record." The Plan shall be prepared and signed by a Professional Engineer in the Commonwealth of Massachusetts and shall incorporate all revisions and additions to the original plans that have been approved as discussed herein. **(Submittal)**

Construction Period

18. No more than **8,570 sf** of permanent impacts and **4,699 sf** of temporary impacts to LUW shall occur. No more than **2,075 cy** of dredging in LUW shall occur. All dredging activities shall avoid unapproved impacts to LUW.

19. Under the direction of the CP/PP Inspector, inspection and maintenance of erosion and sediment controls in active work areas may be performed by both the Contractor and RE or other MassDOT project staff. Maintenance is the responsibility of the Contractor; however, the permittee shall be ultimately responsible for erosion and sedimentation control failure. The RE and/or contractor shall immediately notify MassDEP and the Raynham and Taunton Conservation Commissions if any unauthorized discharges to LUW occur.

20. CP/PP inspections shall occur at least once every seven calendar days and within 24 hours of a storm event that produces 0.5 inches or more of rain within a 24-hour period, or at a more stringent frequency if the CP/PP requires.

21. Copies of CP/PP Inspection and Maintenance Log Forms shall be submitted to MassDEP within 14 days upon request.

22. Disturbed areas shall be stabilized immediately after activities have permanently ceased or will be temporarily inactive for 14 or more calendar days. The installation of stabilization measures shall be implemented as soon as practicable, but no later than 14 calendar days after disturbed areas have been inactive.

23. Work within LUW shall be conducted in low or no-flow conditions to the extent practicable. Notice shall be provided to MassDEP and the Raynham and Taunton Conservation Commissions within 24 hours prior to the commencement of dewatering. Dewatering methods and location(s) shall be approved by the RE or other project staff with knowledge of these practices prior to use to ensure consistency with the approved Control of Water Plan, and shall be documented in the CP/PP. There shall be no discharge of untreated dewatered stormwater or groundwater to LUW. Any discharges shall be visibly free of sediment.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

24. Additional erosion and sedimentation control materials shall be stored on-site at all times for emergency and routine replacement. Materials shall be kept covered, dry, and accessible at all times. The CP/PP Inspector shall be responsible for anticipating the need for and installation of additional erosion and sedimentation controls and shall have the authority to require additional erosion control measures to protect wetland resource areas beyond what is shown on the plans if field conditions or professional judgment dictate that additional protection is necessary.

25. The Contractor shall monitor the National Weather Service forecast for updates, and upon issuance of a flood watch for the 1% annual chance of flooding zone, shall implement the flood contingency plan referenced in Condition 13.

26. Any storm drains with potential to receive discharge from stockpiled materials or construction operations shall be managed to inhibit the inflow of sediment while not increasing the likelihood of roadway flooding during periods of precipitation. The CP/PP shall specify measures to implement this. Filter fabric stretched under storm drain inlet grates are not acceptable for this purpose.

27. Stockpiles shall be located no less than 50 feet from LUW, catch basins, or other drainage conveyances that discharge to LUW.

28. The contractor shall have designated washout areas for concrete equipment that will be comprised of impermeable material and sized to contain project concrete wastes and wash water. Concrete wash out areas shall be located no less than 50 feet from LUW and catch basins or other drainage conveyances that discharge directly or indirectly to LUW.

29. Refueling, washing, and cleaning of vehicles and other construction equipment shall not take place within 50 feet of LUW and any wash water shall be contained such that it does not drain toward LUW. MassDEP shall explicitly approve in writing any deviation to this condition for oversized stationary vehicles.

30. The contractor shall have spill containment kits on site. In the event of a release of fuels and/or oils, the local fire department, MassDEP Emergency Response and MassDEP Wetlands Program Highway Unit shall be immediately contacted, and in addition, the MassDEP Bureau of Waste Site Cleanup shall be notified per the requirements of the Massachusetts Contingency Plan, 310 CMR 40.0000.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

31. No in-water, silt-producing work shall occur during the Time of Year (TOY) restriction between the dates of March 1st and July 15th and September 1st to November 15th. Work may proceed behind dewatered cofferdams at any time, provided they are installed and removed outside of the TOY restriction.

32. All work shall be completed in accordance with the recommendations of DMF, which are hereby incorporated into this WQC through inclusion in the 'Responses to MassDEP Technical Review, 401 Water Quality Certification', dated March 20, 2026.

33. Construction vehicles and equipment shall not enter the LUW unless authorization is provided by way of this permit or amendment. The Contractor shall use equipment with boom reach capabilities and other measures to avoid inadvertent impacts to jurisdictional resource areas as a result of excavation, riprap placement, and/or bridge/pier demolition materials.

34. Sheet piles shall be fully removed from LUW upon stabilization of the area as required. No portion of sheet piles shall remain unless approved by MassDEP in writing prior to installation. A request to leave sheet piles shall include, but not be limited to, demonstration that full removal of the sheet piles is not feasible or practicable, and an alternatives analysis demonstrating alternative methods to isolate the work area(s) are not feasible or practicable.

35. A temporary shielding or containment system shall be in place beneath the bridge structure prior to removal to prevent debris from falling into the water below. In the event that any debris accidentally enters The Taunton River, it shall be immediately retrieved. Notice shall be provided to MassDEP if debris enters the river and that it has been removed with photo-documentation (if practicable) submitted by email.

36. Test pit information confirming Estimated Seasonal High Groundwater shall be provided to MassDEP once test pits are excavated. **(Submittal)**

Dredging

37. MassDEP shall be notified one week prior to the start of dredging so that staff may inspect the work for compliance throughout the project.

38. A Phase II Sampling and Analysis Plan (SAP II) shall be developed and submitted to MassDEP for review and approval. At a minimum, SAP II should include samples from three locations around the project dredge area. **Results of the chemical analysis shall**

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

be submitted to MassDEP for review at least 10 days prior to dredging, and dredging shall not commence until MassDEP provides written approval. If sediment samples are found to be contaminated, additional conditions may be required by MassDEP as a contingency plan to protect the environmental and public health from contaminated sediments. **(Submittal)**

39. No later than 21 days prior to commencement of dredging activity, a Dredged Material Dewatering Plan shall be submitted to MassDEP for review and approval. At a minimum, the Plan shall include but not be limited to the type of containment, method of dewatering (i.e. mechanical or by gravity), method of collecting the dewatered effluent and method of disposal. **(Submittal)**

40. All handling of contaminated sediment exceeding MCP RCS-1 criteria and authorized by this WQC shall be conducted under the direction of a Licensed Site Professional (LSP). Prior to the Pre-Construction Meeting required in Condition 5, the applicant shall provide MassDEP with the name, qualifications, and contact information of the LSP. **(Submittal)**

41. An Environmental Health & Safety Plan shall be required for the protection of workers from any exposure to known/suspected contaminants present in environmental media (including sediment which has been characterized as exceeding MCP RCS-1 criteria). A copy shall be provided to MassDEP at least two weeks prior to the commencement of the dredging operation.

42. Dredged sediment shall be sampled to determine the suitability for reuse or if offsite disposal is required. Sampling data including sampling methods and laboratory QA/QC data shall be provided to MassDEP within 48 hours once available from the analytical laboratory for review. Results of the chemical analysis shall be compared to the reuse levels in Policy COMM-97-001- Reuse and Disposal of Contaminated Soil at Massachusetts Landfills for reuse as landfill daily cover and to the Massachusetts Contingency Plan (MCP) RCS-1 criteria. The approved LSP required by Condition 40 will review the data to determine if the sediment exceeds these criteria and requires disposal at an out-of-state facility within ten calendar days. The data and LSP determination shall be submitted to MassDEP prior to transportation of this material. MassDOT shall implement the determination of the LSP and of any further requirements by MassDEP regarding the disposal of all dredged sediment. **(Submittal)**

43. Best Management Practices (BMPs) shall be employed by the contractor to protect resource areas located adjacent to the proposed staging/temporary dredged material

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

stockpiling and dewatering areas. Sediment stockpiles shall be constructed in accordance with the MassDEP approved project plans, stabilized, bottom-lined if not placed on paved surfaces and securely covered with wind tear resistance tarpaulin, polyethylene sheeting or similar impermeable material at all times, and properly labeled. Stockpile covers shall be securely weighed down. Stockpiles shall also be secured to restrict access by the public and shall be set back at least 10 feet from temporary construction access roads or other areas and activities which could disturb the stockpiles and associated erosion controls; if the 10-foot setback cannot be met, then a MassDEP-approved barrier shall be provided. Inspection of the sediment containment and dewatering location and associated erosion controls shall be conducted daily and within 24 hours of a storm that produces 0.5 inches or more of rain. Any observed deficiency shall be corrected or repaired in a timely manner.

44. In the event of a precipitation or storm event, the site shall be secured beforehand in such a way as to protect resource areas and waters on site and downstream of the site, including covering of stockpiles of dredged material. Sediment stockpile areas shall be inspected in line with the frequency of the CP/PP required in Condition 7. Any observed deficiency shall be corrected or repaired in a timely manner to prevent discharge from the stockpiled material. If stormwater runoff and erosion is observed from stockpiled dredged material, additional erosion and/or damage prevention controls measures shall be implemented.

45. Dredging, stockpiling of dredged material, and offsite transport of dredged material shall be sequenced and conducted in a manner to limit stockpiling time. Sediment characterized as having concentrations exceeding the RCS-1 criteria shall not be stockpiled at the site longer than 90 days from the date of generation. Extensions may be requested to accommodate unforeseen delays subject to MassDEP approval.

46. Measures shall be in place to prevent turbid waters, due to dredging, demolition, or debris removal activities, from extending past the limits of work into the Taunton River. These measures can be items such as turbidity curtains and/or sheet piles.

47. If visual turbidity escapes the controls in place, as described in Condition 42, work shall stop immediately and MassDEP shall be notified within 24 hours. Work shall not resume until the issue is corrected and to the satisfaction of MassDEP.

48. All turbidity controls shall be inspected daily by the RE or a designated MassDOT Project Staff. If any damage is observed the controls in place will be replaced or repaired immediately.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

49. If dredged sediment is disposed of off-site, MassDEP shall be notified in writing of the name and location of the upland licensed facilities accepting the dredged material for disposal or reuse for review and approval. If the licensed facility is located out of state, documentation shall be provided to MassDEP that the dredged material disposal/reuse has been approved and will be accepted by the receiving State. The dredged material shall not be transported to the facility without concurrence of MassDEP.

50. If dredged sediment is disposed of off-site, Transportation and disposal of the dredged material shall be overseen by the LSP of record. A Bill-of-Lading (BOL) or a Material Shipping Record (MSR) shall be used to track the dredged material to the licensed disposal facility and/or proposed intermediate (stockpiling /dewatering) facility. A fully executed copy of the BOL or MSR shall be provided to MassDEP within 30 days of final shipment to the reused location or facility.

51. If dredged sediment is disposed of off-site, Best Management Practices (BMPs) shall be implemented during transportation of the dredged material to the licensed receiving facility. At a minimum, when transported upon public roadways, all dredged material shall have no free liquid as determined by the Paint Filter Test or other suitably analogous methodology acceptable to MassDEP, and a tarpaulin or other means shall be used to cover the dredged material during transport.

Stream Mitigation

52. The FGM shall oversee all LUW restoration. Placement of streambed materials shall take place in no- or low-flow conditions. The Control of Water Plan required in Condition 10 shall include measures to create no-flow conditions for this work such as a pump bypass system or other dewatering method, if needed. Placement of streambed materials during greater than low-flow conditions shall require a placement plan, with a narrative describing turbidity control measures, submitted to MassDEP for review and approval.

53. A minimum of 14 days prior to installation of the streambed materials, the FGM shall meet with the contractor to determine the suitability of stockpiled streambed material for reuse and whether there is sufficient stockpiled material to complete streambed restoration.

54. Water shall be slowly introduced back into the restored and dewatered LUW work areas as to not cause erosion and sedimentation. This work shall be overseen by the FGM. The FGM shall provide final approval of the streambed restoration upon re-wetting of

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

banks and removal of water controls (photographs will suffice unless otherwise determined by the FGM).

55. Upon completion of the LUW restoration, the FGM shall provide photographs and a summary of the completed work to MassDEP and the Raynham and Taunton Conservation Commissions. **(Submittal)**

56. MassDEP reserves the right to determine the success or failure of the LUW restoration areas and reserves the right to require additional measures deemed necessary to promote success.

57. The surface of the wildlife shelf at the southern abutment shall be levelled out with chinked-in stones.

Post-Construction

58. All temporary erosion and sedimentation controls shall be removed at the conclusion of work once the surrounding area has achieved final stabilization.

59. Mulch used as an erosion or sedimentation control may be spread in upland areas at a depth that will not inhibit vegetative growth and shall not be spread in LUW.

General Conditions

60. Any proposed plan changes or amendment requests, as well as any required submittals shall be sent by email for review and approval to heidi.davis@mass.gov and tyler.lewis@mass.gov. **(Submittal)**

61. This WQC remains in effect for the same duration as the Section 404 permit that requires it.

62. No Special Condition set forth herein shall be construed or operate to prohibit MassDEP from taking enforcement against MassDOT or its contractors for any failure to comply with the terms and requirements of this WQC.

63. No activity authorized by this WQC may begin prior to expiration of the 21-day appeal period, or until a final decision is issued by MassDEP in the event of an appeal.

Failure to comply with this Certification is grounds for enforcement, including civil and criminal penalties, under MGL Ch. 21 §42, MGL Ch. 21A §16, or other possible actions/penalties as authorized by the General Laws of the Commonwealth.

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

This Certification does not relieve the applicant of the obligation to comply with other appropriate state or federal statutes or regulations.

NOTICE OF APPEAL RIGHTS

a.) Appeal Rights and Time Limits

Certain persons shall have a right to request an adjudicatory hearing concerning certifications by MassDEP when an application is required: (a) the applicant or property owner; (b) any person aggrieved by the decision who has submitted written comments during the public comment period; (c) any ten (10) persons of the Commonwealth pursuant to M.G.L. c.30A where a group member has submitted written comments during the public comment period; or (d) any governmental body or private organization with a mandate to protect the environment which has submitted written comments during the public comment period. Any person aggrieved, any ten (10) persons of the Commonwealth, or a governmental body or private organization with a mandate to protect the environment may appeal without having submitted written comments during the public comment period only when the claim is based on new substantive issues arising from material changes to the scope or impact of the activity and not apparent at the time of public notice. To request an adjudicatory hearing pursuant to M.G.L. c.30A, § 10, a Notice of Claim must be made in writing, provided that the request is made by certified mail or hand delivery to MassDEP, with the appropriate filing fee specified within 310 CMR 4.10 along with a DEP Fee Transmittal Form within twenty-one (21) days from the date of issuance of this Certificate, and addressed to:

Case Administrator
Department of Environmental Protection
100 Cambridge Street, 9th Floor
Boston, MA 02114

A copy of the request shall at the same time be sent by certified mail or hand delivery to the Department of Environmental Protection at:

Department of Environmental Protection
Wetlands Program, Highway Unit
100 Cambridge Street, 8th floor
Boston, MA 02114

b.) Contents of Hearing Request

The Commonwealth of Massachusetts
Department of Environmental Protection

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

A Notice of Claim for Adjudicatory Hearing shall comply with MassDEP's Rules for Adjudicatory Proceedings, 310 CMR 1.01(6), and shall contain the following information pursuant to 314 CMR 9.10(3):

1. the 401 Certification Transmittal Number;
2. the complete name of the applicant and address of the project;
3. the complete name, address, and fax and telephone numbers of the party filing the request, and, if represented by counsel or other representative, the name, fax and telephone numbers, and address of the attorney;
4. if claiming to be a party aggrieved, the specific facts that demonstrate that the party satisfies the definition of "aggrieved person" found at 314 CMR 9.02;
5. a clear and concise statement that an adjudicatory hearing is being requested;
6. a clear and concise statement of (1) the facts which are grounds for the proceedings, (2) the objections to this Certificate, including specifically the manner in which it is alleged to be inconsistent with the MassDEP's Water Quality Regulations, 314 CMR 9.00, and (3) the relief sought through the adjudicatory hearing, including specifically the changes desired in the final written Certification; and
7. a statement that a copy of the request has been sent by certified mail or hand delivery to the applicant, the owner (if different from the applicant), the conservation commission of the city or town where the activity will occur, the Department of Conservation and Recreation (when the certificate concerns projects in Areas of Critical Environmental Concern), the public or private water supplier where the project is located (when the certificate concerns projects in Outstanding Resource Waters), and any other entity with responsibility for the resource where the project is located.

c.) Filing Fee and Address

The hearing request along with a DEP Fee Transmittal Form and a valid check or money order payable to the Commonwealth of Massachusetts in the amount of one hundred dollars ($100) must be mailed to:

Commonwealth of Massachusetts
Department of Environmental Protection
Commonwealth Master Lockbox
PO Box 4062
Boston, MA 02211

The request will be dismissed if the filing fee is not paid, unless the appellant is exempt or granted a waiver. The filing fee is not required if the appellant is a city or town (or municipal

Address: 100 Cambridge Street, Suite 900, Boston, MA 02114
Phone: 617-292-5500

agency), county, or district of the Commonwealth of Massachusetts, or a municipal housing authority. MassDEP may waive the adjudicatory hearing filing fee pursuant to 310 CMR 4.06(2) for a person who shows that paying the fee will create an undue financial hardship. A person seeking a waiver must file an affidavit setting forth the facts believed to support the claim of undue financial hardship together with the hearing request as provided above.

Should you have any questions relative to this permit, please contact myself or at heidi.davis@mass.gov and Tyler Lewis tyler.lewis@mass.gov.

Very truly yours,

Good morning, Jonathan –

My apologies for not getting back to you sooner, this got lost in the email deluge.

Regarding #33, no, we did not intend this condition to prohibit on excavators entering the river within dewatered areas behind cofferdams to complete the dredging within the approved impact areas, as the WQC has authorized these impacts. We understand that the contractor will be required to use a mixed staging approach consisting of equipment both on land and within the cofferdam to complete the work.

Regarding #47, this condition is intended to refer to turbidity discharges associated with cofferdam/water control failure, rather than the eventual slow removal of cofferdams/water

controls.

Thanks,
Heidi

Subject: RE: 401 WATER QUALITY CERTIFICATION/Old Colony Ave Bridge (R-02-003=T-01-004) replacement over the Taunton River, Raynham and Taunton

Hi Heidi,

Thank you again for sending this over. We have reviewed with MassDOT and just wanted to get clarification of a couple of conditions:

33. *Construction vehicles and equipment shall not enter the LUW unless authorization is provided by way of this permit or amendment. The Contractor shall use equipment with boom reach capabilities and other measures to avoid inadvertent impacts to jurisdictional resource areas as a result of excavation, riprap placement, and/or bridge/pier demolition materials.*

    We would like to confirm if this provides a prohibition on excavators entering the River (only within dewatered areas behind cofferdams) to complete the dredging within the approved impact areas. Given the dimensions of the dredging area, we are anticipating that the contractor will be required to use a mixed staging approach consisting of equipment both on land and within the cofferdam to complete the work.

47. If visual turbidity escapes the controls in place, as described in Condition 42, work shall stop immediately and MassDEP shall be notified within 24 hours. Work shall not resume until the issue is corrected and to the satisfaction of MassDEP.

    We would like to confirm if this is intended to refer to turbidity discharges associated with cofferdam/water control failure, rather than the eventual slow removal of cofferdams/water controls. While slow removal will be required to minimize downstream turbidity, some level of turbidity is anticipated to be unavoidable when demobilizing.

Thank you, and please let us know if you would like to discuss via a call if you have any additional questions based on the notes above!

Best,

Jonathan Niro, PWS

Good afternoon, Jonathan –

Attached please find the 401 Water Quality Certification for the replacement of the Old Colony Avenue Bridge (R-02-003=T-01-004) over the Taunton River in Raynham and Taunton.

Please contact me at heidi.davis@mass.gov or Tyler Lewis at tyler.lewis@mass.gov if you have any questions concerning this document.

Best regards,
Heidi

Heidi M. Davis

VERIFICATION FORMS

THIS PAGE INTENTIONALLY LEFT BLANK

Appendix A. Verification Form (updated January 2025)

Federal Highway Administration (FHWA) or the applicable state Department of Transportation (DOT) shall submit a signed version of this completed form, together with any project plans, maps, supporting analyses, etc., to NOAA's National Marine Fisheries Service (NMFS), Greater Atlantic Regional Fisheries Office, Protected Resources Division (GARFO PRD) at nmfs.gar.esa.section7@noaa.gov with "FHWA GARFO NLAA Program: [Project Title or Number]" in the subject line. **Note:** project design contractors and/or consultants may assist in preparing the form, but only FHWA/DOT staff shall sign off on it on the final page.

Project Activity Type (check all that apply to the entire action):

- [x] 1. Bridge repair, demolition, or replacement project
- [ ] 2. Culvert repair or replacement project
- [ ] 3. Dock, pier, or waterway access project (includes construction, demolition, and repairs)
- [ ] 4. Slope stabilization project

Transportation Project Information

Name of Project:	613642 RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003=T-01-004		
Reinitiation (Yes/No):	No		
State DOT/Program:	MassDOT		
DOT ID Code:	613642		
Contact Person:	Dave Paulson		
Phone:	+ 1 857 262 3378	Email:	david.j.paulson@dot.state.ma.
Project Latitude (e.g., 42.625884):		41.886006	
Project Longitude (e.g., -70.646114):		-71.030015	
Maximum Water Depth (m)		2.3	
Anticipated Project Start Date:	Decemeber 2026	Anticipated Project End Date:	October 2028
City/Town:	Taunton/ Raynham MA	Water body:	Taunton River
Project/Action Description and Purpose:	The Massachusetts Department of Transportation (MassDOT – Highway Division) Is proposing a reconstruction of the Old Colony Avenue Bridge over the Taunton River. The overall project limits extend 250' north of the intersection of Old Colony Avenue and Battle Row in Taunton, MA; along the Old Colony Avenue Bridge; and 370' to the intersection of South Street East and Sandy Hill Road, in Raynham, MA . The total length of the Project is approximately 790' along Old Colony Avenue and South Street East. The Project will consist of several activities including: Bridge deck replacement; Full depth pavement construction in the vicinity of the bridge; Pavement milling and overlay to the north and south of the bridge; Modifications to roadway geometry; Construction of a new sidewalk; New granite curbing; Striping of two travel lanes and a bike lane; Installation of Americans With Disabilities Act (ADA)-Compliant Ramps; Replacement of Guardrails; Paving of an existing town-owned gravel area associated with the pump station; Modifications to water, sewer, gas, electric and drainage utilities; Installation of a sediment forebay and leaching basins; Placement of riprap scour protection within the Taunton River; and Tree clearing and trimming. The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). The project will result in temporary and permanent impacts to federally jurisdictional Waters of the U.S. including the land below Ordinary High Water (Streambank and Streambed) associated with the Taunton River. The Project will result in a total of 13,270		

ESA-listed species and/or critical habitats in the action area (Check all that apply)

☑	Atlantic sturgeon (all DPSs)	☐	Kemp's ridley sea turtle
☐	Atlantic sturgeon critical habitat Indicate which DPS (GOM, NYB, Chesapeake Bay DPSs): Select DPS	☐	Loggerhead sea turtle (Northwest Atlantic DPS)
☐	Shortnose sturgeon	☐	Leatherback sea turtle
☐	Atlantic salmon (GOM DPS)	☐	North Atlantic right whale
☐	Atlantic salmon critical habitat (GOM DPS)	☐	North Atlantic right whale critical habitat
☐	Green sea turtle (North Atlantic DPS)	☐	Fin whale

* Please consult GARFO PRD's ESA Section 7 Mapper for ESA-listed species and critical habitat information for your action area at: https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-species-critical-habitat-information-maps-greater.

The following stressors are applicable to the action:

- ☐ Underwater Noise
- ■ Impingement/Entrainment and Entanglement
- ■ Water Quality/Turbidity
- ■ Habitat Alteration
- ☐ Vessel Traffic

Impacts Table

Habitat Alteration		
	Permanent (acres)	Temporary (acres)
Sand (saline)		
Silt/Mud/Clay (saline)		
Hard bottom (saline)		
Submerged Aquatic Vegetation (SAV) (saline)		
Sand (freshwater)		
Silt/Mud/Clay (freshwater)	0.19	0.10
Hard bottom (freshwater)		
Submerged Aquatic Vegetation (SAV) (freshwater)		
Total amount of habitat alteration	0.19	0.10
In-water Construction Impacts		
	Amount in meters	
Width of water body in action area (m)	27.0	
Stressor category that extends furthest distance into water body (e.g.; underwater noise, turbidity plume)	Turbidity	
Maximum extent of stressor into the water body (m)	92.0	

Project Design Criteria (PDC) Checklist
FHWA/DOT shall incorporate all general PDCs and all applicable PDCs in the appropriate stressor categories. For any PDCs that are not incorporated, additional justification is required for a project to be eligible for the NLAA Program. FHWA/DOT shall check the corresponding box for each PDC that is, or will be, incorporated into the project or indicate if not applicable.

GENERAL PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	1.	Ensure all operators, employees, and contractors are aware of all FHWA environmental commitments, including these PDC, when working in areas where ESA-listed species may be present or in critical habitat.
☑		2.	No portion of the proposed action will individually or cumulatively have an adverse effect on ESA-listed species or critical habitat.
☐	☑	3.	No portion of the proposed action that may affect the GOM DPS of Atlantic salmon will occur in the tidally influenced portion of rivers/streams where their presence is possible from April 10 through November 7. The range of the GOM DPS only occurs in Maine. **Note**: If the project will occur within the geographic range of the GOM DPS Atlantic salmon but their presence is not expected following the best available commercial scientific data, the work window does not need to be applied. Please attach best available information (i.e. local fisheries biologist correspondence).
☐	☑	4.	No portion of the proposed action that may affect shortnose or Atlantic sturgeon will occur in areas identified as spawning grounds as follows: i. Gulf of Maine: Apr 1-Aug 31 ii. Southern New England/New York Bight: Mar 15-Aug 31 iii. Chesapeake Bay: Mar 15-Jul 1 and Sep 15-Nov 1 **Note**: If river specific information exists that provides better or more refined time of year information, those dates may be substituted with NMFS approval.
☐	☑	5.	No portion of the proposed action that may affect shortnose or Atlantic sturgeon will occur in areas identified as overwintering grounds where dense aggregations are known to occur as follows: i. Gulf of Maine: Oct 15-Apr 30 ii. Southern New England/New York Bight: Nov 1-Mar 15 iii. Chesapeake Bay: Nov 1-Mar 15 **Note**: If river specific information exists that provides better or more refined time of year information, those dates may be substituted with NMFS approval.
☐	☑	6.	Within designated critical habitat for Atlantic sturgeon, no work will affect hard bottom substrate (e.g., rock, cobble, gravel, limestone, boulder, etc.) in low salinity waters (i.e., 0.0-0.5 parts per thousand) (PBF 1).
☑		7.	Work will result in no or only temporary/short-term changes in water temperature, water flow, salinity, or dissolved oxygen levels.

Yes	N/A	PDC #	PDC Description
☑		8.	If ESA-listed species are (a) likely to pass through the action area at the time of year when project activities occur; and/or (b) the project will create an obstruction to passage when in-water work is completed, then a zone of passage (~50% of water body) with appropriate habitat for ESA-listed species (e.g., depth, water velocity, etc.) must be maintained (i.e., physical or biological stressors such as turbidity and sound pressure must not create barrier to passage).
☑		9.	The project will not adversely impact any submerged aquatic vegetation (SAV) or oyster reefs.
☑		10.	No blasting or use of explosives will occur.
☑		11.	No in-water work on large dams or tide gates (small dam and tide gate repairs may be permitted with prior review and approval from NMFS).

UNDERWATER NOISE PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	12.	If pile driving is occurring during a time of year when ESA-listed species may be present, and the anticipated noise is above the behavioral noise threshold, a "soft start" is required to allow animals an opportunity to leave the project vicinity before sound pressure levels increase. *In addition to using a soft start at the beginning of the work day for pile driving, one must also be used at any time following cessation of pile driving for a period of 30 minutes or longer.* For impact pile driving: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving. For vibratory pile installation: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.

Yes	N/A	PDC #	PDC Description
☐	☑	13.	All underwater noise is below the injury thresholds of ESA-listed species in the action area. Attach your calculations to this verification form supporting this.
☐	☑	14.	Any new pile-supported structure must involve the installation of no more than 50 piles (below MHW).

Information for Pile Driving:
If your project includes **pile driving of any kind**, please attach your calculation to this verification form to verify that it fits within the scope of the behavioral/injury threshold analysis for ESA-listed species in the action area. The NMFS Office of Protected Resources Acoustic Calculator is available as one source, should you not have other information:
https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-effects-analysis-acoustics-greater-atlantic-region

Pile material (e.g., steel pipe, concrete)	Pile diameter/ width (in)	Number of piles	Installation method (e.g., impact hammer, vibratory start and then impact hammer to depth, drilling)

IMPINGEMENT/ENTRAINMENT AND ENTANGLEMENT PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	15.	If excavating or dredging, only mechanical buckets, hydraulic cutterheads, or low volume hopper dredges (e.g., CURRITUCK, ≤300 cubic yard maximum bin capacity) may be used. **Note**: We consider excavating a smaller scale form of mechanical dredging.
☑	☐	16.	No new excavation or dredging in Atlantic sturgeon or salmon critical habitat (excavation in a prior construction footprint or maintenance dredging is permitted, but still must meet all other PDCs). New excavation or dredging outside Atlantic sturgeon or salmon critical habitat is limited to one-time events (e.g., burying a cable or utility line) and minor (≤2 acres) expansions of areas already subject to prior excavation or maintenance dredging. Locating a replacement bridge within 250 feet (centerline to centerline) of an existing bridge and excavation of sediment around bridge piers are considered work in a previous construction footprint. **Note**: We consider excavating a smaller scale form of mechanical dredging.

Yes	N/A	PDC #	PDC Description
☑	☐	17.	Temporary intakes related to construction are prohibited in sturgeon and salmon spawning, rearing, or overwintering habitat during the time of year windows identified in General PDCs 3-5. If utilized outside those areas and times of year and in an area with anticipated sturgeon and salmon presence, temporary intakes must be equipped with 2-millimeter wedge wire mesh screening and must not have greater than 0.5 feet per second intake velocities, to prevent impingement or entrainment of juvenile and early life stages of these species.
☑	☐	18.	Work behind cofferdams, turbidity curtains, or other instruments that prevent access of animals to the project area is required when ESA-listed species are likely to be present (if presence is limited to rare, transient individuals, access control measures are not necessary). Once constructed, work inside a cofferdam at any time of year may be permitted with NMFS approval, provided the cofferdam is installed/removed outside the time-restricted period.
☑	☐	19.	No new permanent surface water withdrawal, water intakes, or water diversions.
☑	☐	20.	Turbidity control measures, including cofferdams, must be designed to not entangle or entrap ESA-listed species.
☐	☑	21.	Any in-water lines, ropes, or chains must be made of materials and installed in a manner to minimize or avoid the risk of entanglement by using thick, heavy, and taut lines that do not loop or entangle. Lines can be enclosed in a rigid sleeve.

WATER QUALITY/TURBIDITY PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	22.	In-water offshore disposal may only occur at designated disposal sites that have already been the subject of ESA section 7 consultation with NMFS and where a valid consultation is in place.
☐	☑	23.	Any temporary discharges must meet state water quality standards (e.g., no discharges of substances in concentrations that may cause acute or chronic adverse reactions, as defined by EPA water quality standards criteria).
☑	☐	24.	Only repair, upgrades, relocations, and improvements of existing discharge pipes or replacement in-kind are allowed; no new construction of untreated discharges.
☑	☐	25.	Work behind cofferdams, turbidity curtains, or other instruments to control turbidity is required when operationally feasible and ESA-listed species are likely to be present (if presence is limited to rare, transient individuals, turbidity control methods are not necessary).

HABITAT ALTERATION PDCs			
Yes	N/A	PDC #	PDC Description
☑	☐	26.	Minimize all new waterward encroachment and permanent fill.
☐	☑	27.	In Atlantic salmon critical habitat, stream simulation design with a minimum span of 1.2 bankfull width will be used in areas with minimal tidal influence. In tidal areas, a design that allows for unimpeded flow will be used (no delay in water entering or exiting the area upstream of the crossing).
☐	☑	28.	In Atlantic salmon critical habitat, no culvert end extensions, invert line culvert rehabilitation, or slipline culvert rehabilitation may occur.

VESSEL TRAFFIC PDCs			
Yes	N/A	PDC #	PDC Description
☐	☑	29.	Maintain project (i.e., construction) vessels operating within the action area to speed limits below 10 knots and dredge vessels to speeds of 4 knots maximum, while dredging.
☐	☑	30.	Maintain a 1,500-foot buffer between project (i.e., construction) vessels and ESA-listed whales and a 300-foot buffer between project vessels and sea turtles. This also applies to dredge vessels.
☐	☑	31.	The number of project (construction) vessels must be limited to the greatest extent possible, as appropriate to size and scale of project.
☐	☑	32.	The project must not result in the permanent net increase of commercial vessels.

Justification for NLAA Determination if not Incorporating All PDC
If the project is not in compliance with all of the general and stressor-based PDCs, but you can provide justification and/or special conditions to demonstrate why the project still meets the NLAA determination and is consistent with the aggregate effects considered in the programmatic consultation, you may still certify your project through the NLAA program using this verification form. Please identify which PDCs your project does not meet (e.g., PDC 9, PDC 15, PDC 22, etc.) and provide your rationale and justification for why the project is still eligible for the verification form. Project modifications must not result in different effects not already considered.

To demonstrate that the project is still NLAA, you must explain why the effects on ESA-listed species or critical habitat are **insignificant** (i.e., too small to be meaningfully measured or detected) or **discountable** (i.e., extremely unlikely to occur). **Please use this language in your justification.**

PDC#	Justification

FHWA/DOT Verification of Determination (To be filled out by FHWA/DOT staff only)
By submitting this Verification Form, FHWA, or the state DOT as FHWA's designated non-federal representative, indicates that they determined that the proposed activity described above is not likely to adversely affect (NLAA) ESA-listed species or designated critical habitat under NMFS jurisdiction in accordance with the Program, and all effects (direct, indirect, interrelated, and interdependent) are either insignificant (so small they cannot meaningfully be measured, detected, or evaluated) or discountable (extremely unlikely to occur).

☑	In accordance with the FHWA GARFO NLAA Program, we have determined that the action complies with all applicable PDCs and is not likely to adversely affect listed species.
☐	In accordance with the FHWA GARFO NLAA Program, we have determined that the action is not likely to adversely affect listed species per the justifications and/or special conditions provided above.

FHWA/DOT Signature:	Date:
David Paulson Digitally signed by David Paulson Date: 2026.01.09 15:45:25 -05'00'	01/09/2026

By providing your determination and signature, you are certifying that to the best of your knowledge the information provided in this form is accurate and based upon the best available scientific information. This form must be filled out and signed by FHWA or state DOT staff, as an officially designated non-federal representative.

GARFO PRD Concurrence (To be filled out by GARFO PRD)
After receiving the Verification Form, GARFO PRD will contact FHWA/DOT with any concerns and indicate whether GARFO PRD concurs with FHWA/DOT's determination.

☑	In accordance with the FHWA GARFO NLAA Program, GARFO PRD concurs with FHWA/DOT's determination that the action complies with all applicable PDCs and is not likely to adversely affect listed species or critical habitat.
☐	In accordance with the FHWA GARFO NLAA Program, GARFO PRD concurs with FHWA/DOT's determination that the action is not likely to adversely affect listed species or critical habitat per the justifications and/or special conditions provided above.
☐	GARFO PRD does not concur with FHWA/DOT's determination that the action complies with the applicable PDCs (with or without justifications), and recommends an individual Section 7 consultation to be completed independent from the FHWA GARFO NLAA Program.

GARFO PRD Signature:	Date:
ROOSEVELT.MESA 2026.01.12 11:52:06 -05'00'	01/12/2026

THIS PAGE IS INTENTIONALLY LEFT BLANK

Appendix B. Verification Form

This form demonstrates compliance with the FHWA/NMFS GARFO EFH Programmatic Consultation dated 1/16/24. The applicable state Department of Transportation (state DOT) will complete this form and enter the project details into the ESA/EFH webtool (https://www.environment.fhwa.dot.gov/esawebtool/) to apply the programmatic consultation to a transportation project. FHWA will receive and review the completed forms before a final NEPA decision as part of the overall environmental review process. FHWA with the assistance of VOLPE will compile the information provided by all covered state DOTs on the completed Verification Forms and ESA/EFH webtool for the purposes of tracking and annual monitoring. FHWA/state DOT must include the completed Verification Form as part of a permit application with any other federal agency, such as U.S. Army Corps of Engineers or U.S. Coast Guard, to confirm that EFH consultation is complete.

Projects that are unable to meet the mandatory conservation recommendations in **bold** the state DOT will work with their FHWA Division Office to complete individual EFH consultation with NMFS.

Project Activity Type

1. ☒ Bridge repair, demolition, and replacement
2. ☐ Culvert repair and replacement
3. ☐ Docks, piers, and waterway access projects
4. ☐ Slope stabilization

Transportation Project Information

Project Name:	RAYNHAM- TAUNTON- B	Project Number:	613642
Project Sponsor:	MassDOT	Contact Person:	Dave Paulson
Email:	david.j.paulson@dot.state.	Phone:	+ 1 857 262 3378
Latitude (e.g., 42.625884):		41.886005903543975	
Longitude (e.g., -70.646114):		71.0300152141668	
City/Town, State:	Taunton/ Raynham MA	Waterway:	Taunton River
Project Description and Purpose:	The Massachusetts Department of Transportation (MassDOT – Highway Division) Is proposing a reconstruction of the Old Colony Avenue Bridge over the Taunton River. The overall project limits extend 250' north of the intersection of Old Colony Avenue and Battle Row in Taunton, MA; along the Old Colony Avenue Bridge; and 370' to the intersection of South Street East and Sandy Hill Road in Raynham, MA. The total length of the Project		
Anticipated Project Start Date:	Dec 2026	Anticipated Project End Date:	October 2028
Total area of impact to EFH (in acres): Include locus map with area of impact.		0.29	
Area of impacts to sensitive habitats (in square feet):		No impacts to submerged aquatic vegetation (SAV) or oyster reefs allowed.	
Natural rocky habitat (e.g., bedrock, boulders, cobble, and/or gravel):		0	
Salt marsh:		0	
Areas containing shellfish (excluding oyster reefs):		0	
Intertidal mudflats:		0	
Area of impact to diadromous fish habitat:		0.29	

Potential Stressors Caused by the Activity (Check all that apply based on activity type)

☐ Underwater Noise
☒ Impingement/Entrainment and Entanglement
☒ Water Quality/Turbidity
☒ Habitat Alteration
☐ Vessel Traffic

EFH Conservation Recommendation Checklist

FHWA/state DOT will indicate how the project addresses each of the programmatic EFH conservation recommendations, by selecting the appropriate check box and providing a brief explanation where necessary. **Bolded CRs are required.** If the project is not in compliance with any additional programmatic EFH conservation recommendation and FHWA/state DOT has still determined that the effects of a project on EFH are not substantial and the project is otherwise consistent with the FHWA programmatic EFH consultation, provide justification below under the conservation recommendations that are not included.

Underwater Noise

☒ Check here if the EFH conservation recommendations in this section are not applicable because the project will not create underwater noise as a stressor. Proceed to the next stressor.

1. Use a vibratory hammer to the maximum extent practicable.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans
☐ Included in description, other terms and conditions

2. For impact driving, an initial set of three strikes would be made by the hammer at 40 percent energy, followed by a 1-minute wait period, then two subsequent 3-strike sets at 40 percent energy, with 1-minute waiting periods, before initiating continuous impact driving. In addition to a soft start at the beginning of the day for impact pile driving, a soft start must also be used at any time following cessation of impact pile driving for a period of thirty minutes or longer and if any increase in pile installation or removal intensity is required. Build up power slowly from a low energy start-up over a 20-minute period to warn fish to leave the vicinity. This buildup shall occur in uniform stages to provide a constant increase in output. This should be done in accordance with the methods outlined in the NMFS GARFO/FHWA Best Management Practices (BMP) Manual.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

3. Avoid the use of hollow steel pipe piles when possible.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

4. Do not undertake noise-generating work in diadromous streams within the spring diadromous fish TOY restriction listed in Appendix C unless it is isolated behind sealed, dewatered cofferdams, to avoid impeding fish migration.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and condition

Impingement/Entrainment and Entanglement

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not lead to impingement/entrainment and entanglement as a stressor. Proceed to the next stressor.

5. **Turbidity control measures must be properly installed, secured and regularly monitored to ensure aquatic species are not entangled or trapped in the project area.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

6. **No new permanent surface water withdrawal, water intakes, or water diversions. (Permanent surface water intakes do not include dry hydrants.)**

☐ Not met: Project requires individual consultation with NMFS

☒ Met
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

7. Install and operate temporary intakes related to construction in accordance with the NMFS GARFO/FHWA Best Management Practices (BMP) Manual and equip intakes with mesh size screening and approach velocity appropriate for the species and life stage anticipated to be present during construction. Temporary pumping/intakes related to construction water handling will be based on the resource present and be in accordance with state fisheries consultation (with documentation provided) where such consultation is available. In addition,
   a) Per the NMFS Anadromous Salmonid Passage Facility Design manual, screen openings must not exceed 3/32 inch and screen approach velocity must be less than 0.25 feet per second (ft. /sec) in waters supporting anadromous salmonids.
   b) The use of 2 millimeter (mm) wedge wire screens must be used with a maximum intake velocity of 0.5 feet per second (ft. /sec).
   c) In Virginia, a 1 mm wedge wire screen with a maximum intake velocity of 0.25 ft. /sec) is required.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

Water Quality/Turbidity

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not negatively affect water quality or create turbidity. Proceed to the next stressor.

8. **Install soil erosion, sediment, and turbidity controls and maintain them in effective operating condition during construction. Remove controls upon completion of work, after all exposed soil and other fills, as well as any work waterward of ordinary high water or the high tide line, are permanently stabilized.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☒ Shown on project plans
- ☒ Included in description, other terms and conditions

9. **Prevent construction debris and sediment from entering aquatic areas and remove all construction debris and excess/deteriorated materials and dispose of in an appropriate upland area.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

10. **Dredged and/or excavated materials, including any fine-grained materials removed from inside culverts, shall either be moved to an upland location and stabilized to prevent reentry into the waterway or disposed of at a previously approved disposal site.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

11. **Completely remove and do not reuse existing creosote piles that are affected by project activities and do not install new creosote piles. Piles that break or cannot be removed due to site conditions must be cut off at the mudline.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

12. **Ensure that raw concrete does not contact the water; wet pours of concrete must be confined within sealed forms until the concrete is set or pre-cast members installed. Ensure grout bags are watertight.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

13. Install and remove any in-water soil erosion, sediment, and turbidity controls outside of the TOY restrictions listed in Appendix C.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

14. Conduct in-water work that produces turbidity or sedimentation in diadromous streams or EFH outside of the TOY restriction(s) in Appendix C.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

15. Do not use any creosote, coal tar epoxy, or other hydrocarbon-based coatings on any in-water structures or overwater structures. Dispose of any demolished structures treated with creosote, coal tar epoxy, or other hydrocarbon-based coatings in an approved upland disposal site.

☒ Not met:
- ☒ Not applicable, provide reasoning:

Project does not propose any hydrocarbon-based coatings

- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

16. In NJ only, in areas mapped as shellfish beds pursuant to N.J.A.C 7:7-9.2
    - All structures should be constructed with alternative materials, such as plastic, natural cedar or other untreated wood, or pressure-treated wood, coated offsite with an impact resistant, biologically inert substance to minimize leachate into shellfish areas.

- Coat any chemically or pressure treated piles (CCA, ACQ, etc.) with an impact-resistant, biologically inert substance. Coating should be applied during the manufacturing process, not post-manufacturing by a third party or contractor.

☒ Not met:

☒ Not applicable, provide reasoning:

Project action area is not in New Jersey

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans

☐ Included in description, other terms and conditions

Habitat Alteration

☐ Check here if the EFH conservation recommendations in this section are not applicable because the project will not cause habitat alteration. Proceed to the next stressor.

17. **Remove temporary and/or obsolete structures and fills in their entirety. Use geotextile barriers prior to placement of temporary fill material to ensure complete removal.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

18. **Return areas impacted by temporary activities, fills, or structures to pre-construction or better condition, including elevations and substrate, and replant with native species.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

19. **Temporary monitoring devices, if used in-water as part of an activity, shall be removed and the substrate restored to pre-construction elevations no later than 24 months from initial installation, or upon completion of data acquisition.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

20. **Pipelines and cables that cross a waterway must not rest on the substrate. They may be**

attached to an overwater structure or be buried to allow an area to return to preexisting conditions.

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

21. **Any fill, including planting media and placement of any seed shellfish, spatted-shell, or cultch must be free of all non-native or invasive species and/or contaminants. An invasive species control plan must be part of the project if the transportation agency cannot guarantee this.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

22. **Prevent dislodging of coir logs, mats, or native oyster shell.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

23. **Lowermost section of floating docks and vessels must be ≥18 inches above the substrate at all times.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

24. **Avoid propeller scour and grounding of all project vessels and floating docks.**

☐ Not met: Project requires individual consultation with NMFS

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

25. Provide compensatory mitigation for all permanent impacts to aquatic habitats and for temporary impacts in place over 12 months to address the temporal loss of aquatic habitat functions. This could include a contribution to an existing in-lieu fee program. Because compensatory mitigation is intended to offset adverse effects of an action, it

cannot be viewed separately from an action causing the effect.

When impacts are unavoidable:

a) Conduct a pre-biological survey to map the coverage of the sensitive habitats;
b) Develop a compensatory mitigation plan for biological resource losses, including success criteria, monitoring and adaptive management plans, and long-term maintenance plan. Use the 2008 Final Rule, Compensatory Mitigation for Losses of Aquatic Resources under Clean Water Act Section 404 (33 CFR Parts 325 and 332, 40 CFR Part 230) and NOAA's Mitigation Policy as guides for the development of the compensatory mitigation plan.
c) Undertake compensatory mitigation prior to or concurrent with any impacts to sensitive habitat.

☒ Not met:

◉ Not applicable, provide reasoning:

The project does not propose any loss of aquatic resources

☐ Project is unable to accommodate, provide justification:

☐ Met:

☐ Shown on project plans
☐ Included in description, other terms and conditions

26. Prior to construction, identify and mark in the field any SAV and wetlands at the project site. An SAV survey is required for activities adjacent to mapped or known SAV if a survey has not been conducted in the previous three years.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans
☒ Included in description, other terms and conditions

27. Locate temporary structures, anchors, spud barges, and construction, access, and dewatering activities outside of special aquatic sites.

☐ Not met:

☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

28. All in-water work, including dredging or discharge of fill material will be undertaken at, or approximating, low tide and using low ground pressure equipment to prevent compaction. Low ground pressure is defined as < 3 psi. Where construction requires heavy equipment operation in or across wetlands or mudflats, the equipment shall be placed on construction timber mats that are adequate to support the equipment; be operated on dry or frozen wetlands such that shear pressure does not cause subsidence of the wetlands immediately beneath equipment and upheaval of adjacent wetlands. Construction mats must not be dragged into position.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:
- ☐ Shown on project plans
- ☒ Included in description, other terms and conditions

29. Remove temporary and/or obsolete structures and fills in their entirety, unless the structure or fill is to be left in place in order to comply with conditions imposed by other state or federal permits. Obsolete structures do not include any structures that are repurposed or preserved to prevent habitat degradation (e.g., abutments or sheet piling that remain in place for habitat or scour protection).

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☒ Met:

☒ Met:

☐ Shown on project plans

☒ Included in description, other terms and conditions

35. The following buffers apply between the following habitats and the top of slope of the area to be dredged/excavated.:

a) In New England, setbacks of 100 ft. from tidal SAV or 25 ft. from natural rocky habitats, Special Aquatic Sites (wetlands, mudflats, riffle/pool complexes) and areas containing shellfish.
b) In NY, NJ, DE and PA, dredging shall not occur within 25 ft. from the edge of vegetated wetlands.
c) In NY and NJ, dredging shall not occur within 500 ft. of SAV in sediments greater than or equal to 90% sand and 250 ft. of SAV if sediments are less than 90% sand during the growing season (April 15-October 15) to minimize impacts to SAV due to turbidity.
d) In Virginia and Maryland, dredging shall not occur in areas within the distance from wetlands equal to four times the depth of the dredging.
e) In Maryland, dredging shall not occur within 500 yds. of a natural oyster beds between December 16 to March 14 and June 1 to September 30.

Fish Passage/Migration Habitat

37. Design replacement crossings to provide anadromous and resident fish and aquatic organism passage to the maximum extent possible. Use the Federal Interagency Nature-like Fishway Passage Design Guidelines for Atlantic Coast Diadromous Fishes and Culvert Design For Aquatic Organism Passage FHWA-HIF-11-008) for design guidance. In addition, structures must:
    - provide sufficient water depth and maintain suitable water velocities during migration periods; and
    - maintain or replicate natural stream channel and flow conditions.

☐ Not met:
  ☐ Not applicable, provide reasoning:

  ☐ Project is unable to accommodate, provide justification:

☒ Met:

☒ Shown on project plans
☒ Included in description, other terms and conditions

38. Replaced or upgraded crossings must be a similar or improved structure type and must be designed to provide diadromous and resident fish organism passage by providing sufficient water depth, maintaining suitable water velocities during migration periods, and maintaining or replicating natural stream channel and flow conditions. Upgraded crossings must be designed in accordance with the order of preference set out in NMFS' Anadromous Salmonid Passage Facility Design, unless such design is otherwise approved by the State Fisheries Agency.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:
☒ Shown on project plans
☒ Included in description, other terms and conditions

39. For activities that require soil erosion, sediment, and turbidity controls, prevent impeding the run by incorporating the following:
    a) in non-tidal streams containing diadromous fish
        i. the activities must not encroach >25% of the stream width measured from ordinary high water during the anadromous TOY restriction unless such encroachment is otherwise approved by State Fisheries; and
        ii. In waterways supporting diadromous fish, the activities must maintain safe, timely, and effective downstream fish passage throughout the project.
    b) in tidal waters:
        i. The activities must not encroach >50% of a tidal stream's width as measured from mean high water unless such encroachment is otherwise approved by the State Fisheries Agency.

☐ Not met:
☐ Not applicable, provide reasoning:

☐ Project is unable to accommodate, provide justification:

☒ Met:

☐ Shown on project plans
☒ Included in description, other terms and conditions

40. Incorporate climate change and sea level rise projections into the project design as appropriate to address changing hydrologic conditions (increased precipitation and stream flow, altered tidal regimes, etc.). Guidance can be found in NOAA Fisheries' national Procedure for Addressing Climate Change in NMFS Essential Fish Habitat Consultations and GARFO's Guidance for Integrating Climate Change Information in Greater Atlantic Region Habitat Conservation Division Consultation Processes, including the recommendation to use relevant local or regional climate prediction models where available as well as emission and climate projection scenarios on a global scale from the Intergovernmental Panel on Climate Change (IPCC). The use of a "high" (e.g., RCP/SSP8.5) and an "intermediate" (e.g., RCP/SSP 4.5 or RCP 6.0) scenario (IPCC 2021) is suggested. For SLR projections, at a minimum the 1.0 m mean global scenario is recommended with the relevant downscaled projections for the closest tide gauge location identified in Sweet et al. (2022).

☒ Not met:
☒ Not applicable, provide reasoning:

Climate change analysis was not done due to the project keeping existing abutments.

☐ Project is unable to accommodate, provide justification:

☐ Met:
☐ Shown on project plans
☐ Included in description, other terms and conditions

Vessel Interactions

☒ Check here if the EFH conservation recommendations in this section are not applicable because the project will not use vessels.

41. Project vessels shall be operated in adequate water depths in the action area to avoid propeller scour and grounding at all tides. Shallow draft vessels will be used in shallow areas to maximize the navigational clearance between the vessel and the bottom substrate. Spuds may be used to elevate the vessel.

☐ Not met:
☐ Not applicable, provide reasoning:
☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

42. Project vessels shall not be moored in or use spuds in SAV or be located in such a way that the vessel could shade SAV.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

43. Vessels transit through SAV shall be done at high tide.

☐ Not met:
- ☐ Not applicable, provide reasoning:
- ☐ Project is unable to accommodate, provide justification:

☐ Met:
- ☐ Shown on project plans
- ☐ Included in description, other terms and conditions

Activities that Require Individual Consultation

1. Any work (including anchoring) that results in temporary or permanent impacts to:
    a) Existing or historically mapped submerged aquatic vegetation (SAV) beds or areas within 100 feet of existing or historically mapped SAV beds unless otherwise confirmed to be absent by survey.
    b) ≥ 1,000 SF of tidal SAS (except tidal SAV, see 1 above), natural rocky habitats, or freshwater SAV.
2. Stream channelization.
3. Any temporary structures, construction access, and dewatering activities proposed to be in place for ≥ two years
4. Slip-lining or invert lining existing culverts in tidal waters or non-tidal waters that support diadromous fishes. Resources to assist in the identification of these waters can be found in Appendix H and from State fishery agencies.
5. Structures (docks, piers, walkways) or temporary structures: Less than 1:1 height/width ratio or wider than 4 ft. over salt marsh waterward of MHW. The height should be measured from the substrate to the bottom of the longitudinal support beam lowermost portion of the deck structure.
6. Construction of new or expansion of existing boating facilities. For the purposes of this programmatic EFH consultation, a boating facility is boat docking or mooring space for more than two non-commercial vessels.
7. Excavation for the purpose of establishing new or improved navigation channels (e.g. dredging), exceeding the thresholds listed under number 1 above.
8. Any nearshore disposal or beach nourishment activities.
9. New fill or stabilization structures placed below mean low water in excess of 200 linear feet (lf).
10. Replacement of:
    a) slope stabilization structures > 200 lf. *and* waterward of the existing toe, or
    b) vertical structures > 18 inches waterward of the existing face *and* > 200 lf.
11. in layer deposition as a part of wetland restoration.
12. Placement of any seed shellfish, spatted-shell, or cultch in the following sensitive habitats: fish and wildlife sanctuaries and refuges, mudflats, SAV beds, riffle/pool complexes, natural rocky habitats, intertidal areas, and areas containing shellfish.
13. In-water utility lines ≥100 linear feet (LF) installed by trench excavation; or where installed by jet-plow, fluidization or other direct burial methods:
    a) installed in mud, clay, or silt substrates; or
    b) ≥200 LF when installed in sandy substrates (e.g. >/= 90% coarse grained sand habitats (Wentworth <35 ASTM No. US Standard)). Direct burial methods do not include jacking or directional drilling/boring.
14. Airgun seismic activities.
15. Any new permanent surface water withdrawal, water intakes, or water diversions.
16. All work to tide gates without a USACE-approved operation and maintenance plan or alterations to tide gates that will affect the hydraulic regime. This does not include work on tide gates (e.g., duckbills, flap gates, etc.) that solely convey stormwater and/or NPDES-permitted discharges. See The Effects of Tide Gates on New England Wetlands and Other Tidal Resources. Greater Atlantic Region Policy Series [23-01] for additional information on tide gates and associated BMPs.
17. In-water blasting that affects EFH or diadromous species habitat, or out-of-water blasting with the discharge of blasted material in water.

18. Construction of new bridges or culverts, where no crossing existed previously.
19. Any new or replacement causeways (raised roadways across waters or wetlands). Temporary causeways do not require project specific consultation (i.e., they are covered under the programmatic consultation), provided they do not exceed the above listed threshold or include other excluded activities.
20. Dam and flood control or levee repairs that will alter water levels or flood elevations during the diadromous time of year (TOY) restriction provided in App C.
21. Living shoreline >500 linear feet in length located below OHW or the HTL and/or includes beach nourishment/ land reclamation activities.
22. Living shorelines with structure and/or fill area that extends into the waterbody more than 30 FT from the MLW line, including sand fills, sills, breakwaters, or reefs, or any living shoreline that proposes to impact SAV.
23. Excavated materials, stored, deposited, and retained anywhere but an upland area that prevents sediments from reentering aquatic habitats, except as authorized/required by the terms of a USACE or USCG approval.

DOT Determination of Effects to Essential Fish Habitat and Signature
After reviewing the programmatic EFH conservation recommendations in Section 6.0 and Appendix B, state DOT will select the appropriate determination:

☒ The activity is in compliance with all programmatic EFH conservation recommendations in the FHWA programmatic EFH consultation and adverse effects to EFH will not be substantial.

☐ The activity is not in compliance with all of the programmatic EFH conservation recommendations in the FHWA programmatic EFH consultation and individual consultation with NMFS is needed.

Use the electronic fillable fields to include the name and signature of the state DOT preparing this Verification Form, along with the date.

State DOT Name Massachusetts Department of Transportation

Signature David Paulson

Digitally signed by David Paulson
Date: 2025.12.19 10:03:33 -05'00'

Date 12/19/2025

By providing your determination and signature, you are certifying that to the best of your knowledge the information provided in this form is accurate and based upon the best available scientific information. This form must be filled out and signed state DOT staff, as an officially designated non-federal representative. Email this Verification Form to your FHWA Division Office.

FHWA Review
After receiving the Verification Form, the FHWA Division Office will contact the state DOT with any concerns. FHWA will review this form before a final NEPA decision. FHWA will email the signed form back to the state DOT for record keeping.

☐ FHWA concurs with state DOT's determination that the proposed project is consistent with the programmatic EFH consultation (without the need for justification).

☒ FHWA concurs with state DOT's determination that the proposed project is consistent with the programmatic EFH consultation, with justification described above.

☐ FHWA does not concur with state DOT's determination that the project is consistent with the programmatic EFH consultation. FHWA/state DOT must conduct additional coordination with GARFO HCD and a separate individual EFH consultation may be required.

NLAA CONCURRENCE VERIFICATION LETTER

THIS PAGE IS INTENTIONALLY LEFT BLANK

United States Department of the Interior

FISH AND WILDLIFE SERVICE
New England Ecological Services Field Office
70 Commercial Street, Suite 300
Concord, NH 3301-5094
Phone: (603) 223-2541 Fax: (603) 223-0104

In Reply Refer To: 12/18/2025 17:10:42 UTC
Project code: 2026-0024808
Project Name: 613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER

Subject: Not Likely to Adversely Affect Concurrence verification letter for the '613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER' project under the December 13, 2024, FHWA, FRA, FTA Programmatic Biological Opinion for Transportation Projects within the Range of the Indiana Bat, Northern Long-eared Bat, and Tricolored Bat.

To whom it may concern:

This letter records the determination of effects to federally listed (or proposed) bat species anticipated to result from the 613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER (the Project). This determination is based upon information you entered into the assisted determination key (Dkey) associated with the above referenced Programmatic Biological Opinion/Conference Opinion (PBO/PCO) in the U.S. Fish and Wildlife Service's (Service) Information for Planning and Consultation (IPaC) system on the date listed above to verify that the Project may rely on the concurrence provided in the PBO/PCO to satisfy requirements under section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (16 USC 1536), as amended.

Ensuring Accurate Determinations When Using IPaC:

The Service developed the IPaC system and this Dkey in accordance with the ESA and based on the PBO/PCO. All information submitted by the project proponent into IPaC must accurately represent the full scope and details of the Project.

Failure to accurately represent or implement the Project as detailed in the Dkey invalidates this letter. Answers to certain questions in the Dkey commit the project proponent to implementation of conservation measures that must be followed for the ESA determinations to remain valid. Carefully review this letter, your ESA requirements are <u>NOT</u> yet complete.

Determinations:

Based on the information you provided (Project Description shown below), you have determined that the Project is within the scope and adheres to the criteria of the PBO/PCO, including the adoption of applicable avoidance and minimization measures. Based on your IPaC submission and the PBO/PCO, the Project is consistent with the following effect determinations:

Species	**Listing Status**	**Determination**
Northern Long-eared Bat (*Myotis septentrionalis*)	Endangered	NLAA
Tricolored Bat (*Perimyotis subflavus*)	Proposed Endangered	NLAA

The tricolored bat is proposed for listing as endangered under the ESA, but not yet listed. For actions that may affect a proposed species, agencies cannot consult, but they can confer under the authority of section 7(a)(4) of the ESA. Such conferences can follow the procedures for a consultation and be adopted as such if the proposed species is listed. Should the tricolored bat be listed, agencies must review projects that are not yet complete, or projects with ongoing effects within the tricolored bat range that previously received a no effect or not likely to adversely affect (NLAA) determination from the key to confirm that the determination is still accurate.

The Service has 14 calendar days to notify the lead Federal action agency or designated non-federal representative if we determine that the Project does not meet the criteria for a NLAA determination under the PBO/PCO. **If the Service does <u>not</u> notify the lead Federal action agency or designated non-federal representative within that timeframe, you may proceed with the Project under the terms of the NLAA concurrence provided in the PBO/PCO**. This verification period allows Service Field Offices to apply local knowledge to implementation of the PBO, as we may identify a small subset of actions having impacts that were unanticipated. In such instances, Service Field Offices may request additional information that is necessary to verify inclusion of the proposed action under the PBO/PCO.

If the Project is modified, or new information reveals that it may affect the Indiana bat, northern long-eared bat, or tricolored bat in a manner or to an extent not considered in the PBO/PCO, further review to conclude the requirements of ESA section 7(a)(2) may be required.

For Proposed Actions that include bridge/culvert or structure removal, replacement, and/or maintenance activities:

If your initial bridge, culvert, or structure assessment failed to detect Indiana bat, northern long-eared bat, or tricolored bat use or occupancy, yet bats are later detected prior to, or during construction, promptly notify the local Service Field Office within 2 working days of the discovery. In addition, please document whether incidental take occurred, and if so, the type (i.e. kill or harm) and amount (i.e. number of individuals) and submit documentation to the local Service Field Office within 5 working days from the completion of the bridge, culvert, or structure construction (use Appendix E - Post Assessment Discovery of Bats at Bridge/Culvert or Structure Form in the User's Guide). In these instances, potential incidental take of Indiana bats, northern long-eared bats, or tricolored bats may be exempted provided that the take is reported to

the Service. In these instances, potential incidental take of Indiana bats, northern long-eared bats, or tricolored bats may be exempted provided that the take is reported to the Service.

If the Project may affect any other federally listed or proposed species and/or designated critical habitat, additional consultation between the lead Federal action agency and this Service Field Office is required for those species/designated critical habitat. If the Project has the potential to take bald or golden eagles, additional coordination with the Service under the Bald and Golden Eagle Protection Act may also be required. In either of these circumstances, please advise the lead Federal action agency to contact this Service Field Office

The following species may occur in your project area and **are not** covered by this determination:

- Monarch Butterfly *Danaus plexippus* Proposed Threatened
- Plymouth Redbelly Turtle = Plymouth Redbelly Cooter *Pseudemys rubriventris bangsi* Endangered

PROJECT DESCRIPTION

The following project name and description was collected in IPaC as part of the endangered species review process.

NAME

613642- RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003, SOUTH STREET EAST OVER THE TAUNTON RIVER

DESCRIPTION

RAYNHAM- TAUNTON- BRIDGE REPLACEMENT, R-02-003=T-01-004 (3M4), SOUTH STREET EAST OVER THE TAUNTON RIVER

The proposed project consists of replacing the bridge deck, increasing safety, and improving operations of the roadway. The proposed design relocates the existing bridge sidewalk from the east to the west side of the bridge to connect to an existing sidewalk on the southwest approach. A 5-foot shoulder for a bike lane in the northbound direction improves safety by providing dedicated space for cyclists, separating them from vehicular traffic. This separation reduces the risk of conflicts between cyclists and vehicles.

Monarch Butterfly: Proposed Threatened Species only. The project action will not jeopardize the continued existence of the proposed species.

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@41.88630155,-71.03005054127355,14z

DETERMINATION KEY RESULT

Based on your answers provided, this project(s) may affect, but is not likely to adversely affect the Indiana bat, northern long-eared bat or tricolored bat, therefore, consultation with the U.S. Fish and Wildlife Service pursuant to Section 7(a)(2) of the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended 16 U.S.C. 1531 et seq.) is required. However, also based on your answers provided, this project may rely on the concurrence provided in the Programmatic Biological Opinion/Conference Opinion for Transportation Projects in the Range of the Indiana bat, northern long-eared bat, and tricolored bat, dated December 13, 2024.

QUALIFICATION INTERVIEW

1. Which Federal Agency is the lead federal agency the action?

   A) Federal Highway Administration (FHWA)

2. Does the Action Area intersect the species list area of the Northern long-eared bat?

   Automatically answered
   Yes

3. Does the Action Area intersect the species list area of the tricolored Bat (TCB)?

   Automatically answered
   Yes

4. [Semantic] Is any portion of the action area within a 0.5 mile radius of an entrance/opening to any known NLEB or TCB hibernacula?

   Note: The map queried for this question contains proprietary information and cannot be displayed. If you need additional information, please contact the Field Office listed in the letterhead of this letter.

   Automatically answered
   No

5. Does your project's activities include raising the road profile above the tree canopy in documented habitat for the Indiana bat, NLEB, or TCB?

   Note: For the definition of documented habitat, refer to Appendix A: https://www.fws.gov/media/users-guide-range-wide-programmatic-consultation-indiana-bat-and-northern-long-eared-bat

   No

6. Is your project located within a karst area?

   No

7. Will the project include bridge, culvert, or structure removal, replacement, and/or alteration activities?

   Note: For definitions of bridge, culvert, and structure, refer to Appendix A: https://www.fws.gov/media/users-guide-range-wide-programmatic-consultation-indiana-bat-and-northern-long-eared-bat.

   Yes

8. Do your project's activities involve tree removal/trimming, temporary lighting, new/ additional permanent lighting, ground disturbance, percussives that involves noise/ vibration above existing background levels, vibrations, or slash pile burning?

   Yes

9. Is there suitable summer habitat for the Indiana bat, NLEB, or TCB within the project action area?

   Note: See the Service's summer survey guidance for current definitions of suitable habitat [https://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html].

   Yes

10. Have P/A surveys for the Indiana bat, NLEB, or TCB been conducted within the suitable summer habitat located within your project action area? This refers to mist-netting or acoustic surveys, not bridge assessments.

    Note: See the Service's survey guidance https://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html

    Yes

    SUBMITTED DOCUMENTS

    - *Raynham_613642_memo_20251027.pdf https://ipac.ecosphere.fws.gov/project/A3767GZ2FBHULEJFUCBVE3PERE/projectDocuments/173932326*

11. Did the P/A surveys detect Indiana bats, NLEBs, or TCBs?

    Note: If Indiana bats, NLEBs, or TCBs are detected, the action area is considered **documented habitat.**

    No

12. Did the local Service Field Office verify that this P/A survey can be used to determine Indiana bat, NLEB, and TCB are **not likely to be present** within the suitable summer habitat located within your project area?

    Yes

13. Will the project include **bridge** removal, replacement, and/or alteration activities?

    Yes

14. Has a Bridge Bat Assessment been conducted **within the last 24 months** to determine if the bridge is being used by the Indiana bat, NLEB, or TCB? If yes, upload assessment.

    Note: Refer to the Service's current survey guidance for acceptable assessment practices and validity timeframe of bridge/culvert and structure bat assessments: https://www.fws.gov/library/collections/range-wide-indiana-bat-and-northern-long-eared-bat-survey-guidelines.

    Yes

    SUBMITTED DOCUMENTS

    - *Raynham_613642_memo_20251027.pdf https://ipac.ecosphere.fws.gov/project/A3767GZ2FBHULEJFUCBVE3PERE/projectDocuments/173932326*

15. Please select one of the following results of the Bridge Bat Assessment:

    c) *Indicates the* ***absence*** *of Indiana bats, NLEBs, or TCBs roosting in/under the bridge (no bats, guano, etc.)?*

16. Does the project include **culvert** removal, replacement, and/or alteration activities?

    No

17. Does the project include **structure** removal, replacement, and/or alteration activities?

    No

18. Does the Action Area intersect the species list area of the tricolored Bat (TCB)?

    Automatically answered
    Yes

19. Does the Action Area intersect the species list area of the northern long-eared bat (NLEB)?

    Automatically answered
    Yes

PROJECT QUESTIONNAIRE

1. Have you made a No Effect determinations for all other species included on the FWS IPaC generated species list?

   Yes

2. Have you made a May Affect determination for any other species on the FWS IPaC generated list?

   No

3. Please enter the date of the bridge assessment.

   6/2/2025

AVOIDANCE AND MINIMIZATION MEASURES (AMMS)

This determination key result includes the commitment to implement the following Avoidance and Minimization Measures (AMMs):

GAMM1

Ensure all operators, employees, and contractors working in areas of Indiana bat, NLEB, or TCB suitable habitat are aware of all Transportation Agency environmental commitments, including all applicable AMMs.

DETERMINATION KEY DESCRIPTION: FHWA, FRA, FTA PROGRAMMATIC CONSULTATION FOR TRANSPORTATION PROJECTS AFFECTING IBAT, NLEB, OR TCB

This key was last updated in IPaC on September 11, 2025. Keys are subject to periodic revision.

This decision key is intended for projects/activities funded or authorized by the Federal Highway Administration (FHWA), Federal Railroad Administration (FRA), and/or Federal Transit Administration (FTA), which may require consultation with the U.S. Fish and Wildlife Service (Service) under Section 7 of the Endangered Species Act (ESA) and may affect the federally listed endangered Indiana bat (*Myotis sodalis*), northern long-eared bat (*Myotis septentrionalis*), and/or federally proposed endangered tricolored bat (*Perimyotis subflavus*).

This decision key should only be used to verify project applicability with the Service's Programmatic Biological Opinion/Conference Opinion for Transportation Projects in the Range of the Indiana bat, northern long-eared bat, and tricolored bat, dated December 13, 2024. The programmatic consultation limited transportation activities that may affect the covered bat species and addresses situations that are both likely and not likely to adversely affect the covered bat species. This decision key will assist in identifying the effect of a specific project/activity and the applicability of the programmatic consultation. The programmatic consultation is not intended to cover all types of transportation actions. Activities outside the scope of the programmatic consultation, or that may affect ESA-listed species other than the Indiana bat, northern long-eared bat, or tricolored bat, or their designated critical habitat, may require additional ESA Section 7 consultation.

IMPROVING COMMUNITIES TOGETHER

February 9, 2026

David McRae, Chair
Raynham Conservation Commission
558 South Main Street
Raynham, MA 02767

Re: Notice of Intent – Old Colony Avenue Bridge Replacement
Old Colony Avenue, Taunton, MA

Dear Mr. Turner and Commissioners:

On behalf of the City of Taunton, BETA Group, Inc. (BETA) is submitting this Notice of Intent (NOI) for the proposed Bridge Reconstruction of bridge R-02-003=T-01-004 (the Project) at Old Colony Avenue over the Taunton River in Taunton and Raynham, Massachusetts (the Site). The Project is being filed under the MassDOT bridge exemption as specified in the 2014 Transportation Bond Bill. The bridge replacement design is substantially the functional equivalent of and in similar alignment to, the existing bridge. Therefore, the Project is not subject to the Massachusetts Wetlands Protection Act (M.G.L. ch.131, s.40 – the Act) and this NOI is being filed under the Raynham Wetlands Protection Bylaw (Chapter 336 – the Bylaw).

The Project is necessary to improve safety and transportation infrastructure in Taunton and Raynham along the Taunton River. The existing bridge was constructed in 1945, and following a recent rating it was recommended the bridge be closed to vehicular traffic due to poor conditions along the bridge abutments. The Project will require demolition of the existing bridge superstructure, construction of the new bridge deck and associated structural appurtenances; installation of scour protection within the Taunton River; full depth pavement reconstruction; and grading. The Project proposes to retain the existing bridge substructure while replacing the superstructure with a deck that is one foot wider to allow for the addition of a bicycle lane. Ancillary Project facets including guardrails and a relocated sidewalk have also been incorporated into the design, and the Project will also address the addition of scour protection within the river during construction.

The Project is considered a limited project because it involves the maintenance and improvement of an existing public roadway limited to widening less than a single lane, adding shoulders, and improving the drainage system per 310 CMR 10.53(3)(f), and it involves the repair and improvement of a bridge and culvert per 310 CMR 10.53(3)(i).

The Project will consist of the following:

- Bridge deck replacement;
- Installation of scour protection within the Taunton River;
- Full depth pavement construction in the vicinity of the bridge;
- Pavement milling and overlay to the north and south of the bridge;
- Modifications to roadway geometry;
- Construction of a new sidewalk;
- Installation of new granite curbing;
- Striping of two travel lanes and a bike lane;

BETA GROUP, INC.
89 Shrewsbury Street, Suite 300, Worcester, MA 01604
P: 508.756.1600 | W: www.BETA-Inc.com

- Installation of Americans With Disabilities Act (ADA)-Compliant Ramps;
- Replacement of guardrails;
- Modifications to water, sewer, gas, electric and drainage utilities;
- Installation of a perforated High-Density Polyethylene (HDPE) infiltration trench; and
- Tree clearing and trimming.

The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). Accordingly, the Project will meet the Massachusetts Stream Crossing Standards to the maximum extent practicable because the existing conditions do not meet the Standards, and compliance of the existing bridge with the Standards will not change given the nature of work. Work associated with the Project will result in temporary and permanent impacts to Areas Subject to Protection under the Bylaw including Bank, Land Under Water (LUW), Bordering Land Subject to Flooding (BLSF), Riverfront Area (RA) associated with the Taunton River, 100' Buffer Zone to BLSF, and 25' No-Activity Buffer Zone. The Project will result in a total of 15,128 square feet (sf) and 117 linear feet (lf) of impacts to Resource Areas with the Town of Raynham, further broken down as follows:

- 66 linear feet (lf) of temporary and 51 lf of permanent impact to Bank;
- 2,304 square feet (sf) of temporary and 4,399 sf of permanent impact to LUW associated with a dredge volume of 1,052 cubic yards (cy);
- 1,121 sf of permanent impact to BLSF;
- 1,867 sf of temporary impact and 4,477 sf permanent impact to Riverfront Area; and
- 315 sf of temporary impact and 645 sf of permanent impact to the Bylaw 25' No-Activity Buffer Zone.

The Project is located entirely within the Bylaw 100' Buffer Zone to BLSF and therefore will result in 5,518 sf of temporary impact and 5,616 sf of permanent impact to the Bylaw 100' Buffer Zone to BLSF. The Project will also result in 1,309 sf of temporary impact and 3,253 sf of permanent impact to 100' Buffer Zone to Bank and 3,479 sf of temporary impact and 3,895 sf of permanent impact to 100' Buffer Zone to BVW.

An NOI with the Taunton Conservation Commission has been prepared and submitted concurrently with this Application. The NOI for work in Taunton is being filed under the MassDOT bridge exemption as specified in the 2014 Transportation Bond Bill and is therefore only subject to review under the Taunton Wetlands Protection Ordinance. As a municipal project, this filing is not subject to the fee requirements of the Bylaw. Abutters to the Project have been notified in accordance with Local requirements.

We trust that the following application provides adequate information to facilitate the issuance of an Order of Conditions approving the Project as presented. Should you have any additional questions, please do not hesitate to contact us.

Very truly yours,
BETA Group, Inc.

A. General Information (continued)

6. General Project Description:

The purpose of the Project is to replace the existing superstructure that makes up bridge No. R-02-003=T-01-004 over the Taunton River to address deteriorating conditions, install scour protection and to improve pedestrian and bicycle accommodations.

7a. Project Type Checklist: (Limited Project Types see Section A. 7b.)

1. ☐ Single Family Home
2. ☐ Residential Subdivision
3. ☐ Commercial/Industrial
4. ☐ Dock/Pier
5. ☐ Utilities
6. ☐ Coastal engineering Structure
7. ☐ Agriculture (e.g., cranberries, forestry)
8. ☒ Transportation
9. ☐ Other

7b. Is any portion of the proposed activity eligible to be treated as a limited project (including Ecological Restoration Limited Project) subject to 310 CMR 10.24 (coastal) or 310 CMR 10.53 (inland)?

1. ☒ Yes ☐ No

If yes, describe which limited project applies to this project. (See 310 CMR 10.24 and 10.53 for a complete list and description of limited project types)

Inland limited project per 310 CMR 10.53(3)(f) and (i)
2. Limited Project Type

If the proposed activity is eligible to be treated as an Ecological Restoration Limited Project (310 CMR10.24(8), 310 CMR 10.53(4)), complete and attach Appendix A: Ecological Restoration Limited Project Checklist and Signed Certification.

8. Property recorded at the Registry of Deeds for:

N/A - Roadway ROW
a. County

b. Certificate # (if registered land)

c. Book

d. Page Number

B. Buffer Zone & Resource Area Impacts (temporary & permanent)

1. ☐ Buffer Zone Only – Check if the project is located only in the Buffer Zone of a Bordering Vegetated Wetland, Inland Bank, or Coastal Resource Area.
2. ☒ Inland Resource Areas (see 310 CMR 10.54-10.58; if not applicable, go to Section B.3, Coastal Resource Areas).

Check all that apply below. Attach narrative and any supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

For all projects affecting other Resource Areas, please attach a narrative explaining how the resource area was delineated.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☒ Bank	51 PERM, 66 TEMP 1. linear feet	66 REST 2. linear feet
b. ☐ Bordering Vegetated Wetland	1. square feet	2. square feet
c. ☒ Land Under Waterbodies and Waterways	4,399 PERM, 2,304 TEMP 1. square feet 1,052 3. cubic yards dredged	6,703 REST 2. square feet

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
d. ☒ Bordering Land Subject to Flooding	1,121 PERM, 0 SF TEMP 1. square feet	2. square feet
	3. cubic feet of flood storage lost	4. cubic feet replaced
e. ☐ Isolated Land Subject to Flooding	1. square feet	
	2. cubic feet of flood storage lost	3. cubic feet replaced
f. ☒ Riverfront Area	Taunton River 1. Name of Waterway (if available) - **specify coastal or inland**	

2. Width of Riverfront Area (check one):

☐ 25 ft. - Designated Densely Developed Areas only

☐ 100 ft. - New agricultural projects only

☒ 200 ft. - All other projects

3. Total area of Riverfront Area on the site of the proposed project: 43,100 square feet

4. Proposed alteration of the Riverfront Area:

a. total square feet	b. square feet within 100 ft.	c. square feet between 100 ft. and 200 ft.
6,344	6,344	0

5. Has an alternatives analysis been done and is it attached to this NOI? ☒ Yes ☐ No

6. Was the lot where the activity is proposed created prior to August 1, 1996? ☐ Yes ☒ No

3. ☐ Coastal Resource Areas: (See 310 CMR 10.25-10.35)

Note: for coastal riverfront areas, please complete **Section B.2.f**. above.

B. Buffer Zone & Resource Area Impacts (temporary & permanent) (cont'd)

Check all that apply below. Attach narrative and supporting documentation describing how the project will meet all performance standards for each of the resource areas altered, including standards requiring consideration of alternative project design or location.

Online Users: Include your document transaction number (provided on your receipt page) with all supplementary information you submit to the Department.

Resource Area	Size of Proposed Alteration	Proposed Replacement (if any)
a. ☐ Designated Port Areas	Indicate size under Land Under the Ocean, below	
b. ☐ Land Under the Ocean	1. square feet 2. cubic yards dredged	
c. ☐ Barrier Beach	Indicate size under Coastal Beaches and/or Coastal Dunes below	
d. ☐ Coastal Beaches	1. square feet	2. cubic yards beach nourishment
e. ☐ Coastal Dunes	1. square feet	2. cubic yards dune nourishment

	Size of Proposed Alteration	Proposed Replacement (if any)
f. ☐ Coastal Banks	1. linear feet	
g. ☐ Rocky Intertidal Shores	1. square feet	
h. ☐ Salt Marshes	1. square feet	2. sq ft restoration, rehab., creation
i. ☐ Land Under Salt Ponds	1. square feet 2. cubic yards dredged	
j. ☐ Land Containing Shellfish	1. square feet	
k. ☐ Fish Runs	Indicate size under Coastal Banks, inland Bank, Land Under the Ocean, and/or inland Land Under Waterbodies and Waterways, above 1. cubic yards dredged	
l. ☐ Land Subject to Coastal Storm Flowage	1. square feet	

4. ☐ Restoration/Enhancement
If the project is for the purpose of restoring or enhancing a wetland resource area in addition to the square footage that has been entered in Section B.2.b or B.3.h above, please enter the additional amount here.

a. square feet of BVW

b. square feet of Salt Marsh

5. ☐ Project Involves Stream Crossings

a. number of new stream crossings

b. number of replacement stream crossings

C. Other Applicable Standards and Requirements

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section C and complete Appendix A: Ecological Restoration Limited Project Checklists – Required Actions (310 CMR 10.11).

Streamlined Massachusetts Endangered Species Act/Wetlands Protection Act Review

1. Is any portion of the proposed project located in **Estimated Habitat of Rare Wildlife** as indicated on the most recent Estimated Habitat Map of State-Listed Rare Wetland Wildlife published by the Natural Heritage and Endangered Species Program (NHESP)? To view habitat maps, see the *Massachusetts Natural Heritage Atlas* or go to http://maps.massgis.state.ma.us/PRI_EST_HAB/viewer.htm.

a. ☐ Yes ☒ No

If yes, include proof of mailing or hand delivery of NOI to:

Natural Heritage and Endangered Species Program
Division of Fisheries and Wildlife
1 Rabbit Hill Road
Westborough, MA 01581

2023
b. Date of map

If *yes*, the project is also subject to Massachusetts Endangered Species Act (MESA) review (321 CMR 10.18). To qualify for a streamlined, 30-day, MESA/Wetlands Protection Act review, please complete Section C.1.c, and include requested materials with this Notice of Intent (NOI); *OR* complete Section C.2.f, if applicable. *If MESA supplemental information is not included with the NOI, by completing Section 1 of this form, the NHESP will require a separate MESA filing which may take up to 90 days to review (unless noted exceptions in Section 2 apply, see below).*

c. Submit Supplemental Information for Endangered Species Review*

1. ☐ Percentage/acreage of property to be altered:

(a) within wetland Resource Area _____ percentage/acreage

(b) outside Resource Area _____ percentage/acreage

2. ☐ Assessor's Map or right-of-way plan of site

2. ☐ Project plans for entire project site, including wetland resource areas and areas outside of wetlands jurisdiction, showing existing and proposed conditions, existing and proposed tree/vegetation clearing line, and clearly demarcated limits of work **

(a) ☐ Project description (including description of impacts outside of wetland resource area & buffer zone)

(b) ☐ Photographs representative of the site

* Some projects **not** in Estimated Habitat may be located in Priority Habitat, and require NHESP review (see https://www.mass.gov/ma-endangered-species-act-mesa-regulatory-review).
Priority Habitat includes habitat for state-listed plants and strictly upland species not protected by the Wetlands Protection Act.

** MESA projects may not be segmented (321 CMR 10.16). The applicant must disclose full development plans even if such plans are not required as part of the Notice of Intent process.

Massachusetts Department of Environmental Protection

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File Number
Document Transaction Number
Raynham
City/Town

C. Other Applicable Standards and Requirements (cont'd)

(c) ☐ MESA filing fee (fee information available at https://www.mass.gov/how-to/how-to-file-for-a-mesa-project-review).
Make check payable to "Commonwealth of Massachusetts - NHESP" and ***mail to NHESP*** at above address

*Projects altering **10 or more acres** of land, also submit:*

(d) ☐ Vegetation cover type map of site

(e) ☐ Project plans showing Priority & Estimated Habitat boundaries

(f) OR Check One of the Following

1. ☐ Project is exempt from MESA review.
Attach applicant letter indicating which MESA exemption applies. (See 321 CMR 10.14, https://www.mass.gov/service-details/exemptions-from-review-for-projectsactivities-in-priority-habitat; the NOI must still be sent to NHESP if the project is within estimated habitat pursuant to 310 CMR 10.37 and 10.59.)

2. ☐ Separate MESA review ongoing. a. NHESP Tracking # b. Date submitted to NHESP

3. ☐ Separate MESA review completed.
Include copy of NHESP "no Take" determination or valid Conservation & Management Permit with approved plan.

3. For coastal projects only, is any portion of the proposed project located below the mean high water line or in a fish run?

a. ☒ Not applicable – project is in inland resource area only b. ☐ Yes ☐ No

If yes, include proof of mailing, hand delivery, or electronic delivery of NOI to either:

South Shore - Bourne to Rhode Island border, and the Cape & Islands:

Division of Marine Fisheries -
Southeast Marine Fisheries Station
Attn: Environmental Reviewer
836 South Rodney French Blvd.
New Bedford, MA 02744
Email: dmf.envreview-south@mass.gov

North Shore - Plymouth to New Hampshire border:

Division of Marine Fisheries -
North Shore Office
Attn: Environmental Reviewer
30 Emerson Avenue
Gloucester, MA 01930
Email: dmf.envreview-north@mass.gov

Also if yes, the project may require a Chapter 91 license. For coastal towns in the Northeast Region, please contact MassDEP's Boston Office. For coastal towns in the Southeast Region, please contact MassDEP's Southeast Regional Office.

c. ☐ Is this an aquaculture project? d. ☐ Yes ☒ No

If yes, include a copy of the Division of Marine Fisheries Certification Letter (M.G.L. c. 130, § 57).

Massachusetts Department of Environmental Protection

WPA Form 3 – Notice of Intent

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

Provided by MassDEP:
MassDEP File Number
Document Transaction Number
Raynham
City/Town

C. Other Applicable Standards and Requirements (cont'd)

Online Users: Include your document transaction number (provided on your receipt page) with all supplementary information you submit to the Department.

4. Is any portion of the proposed project within an Area of Critical Environmental Concern (ACEC)?

   a. ☐ Yes ☒ No If yes, provide name of ACEC (see instructions to WPA Form 3 or MassDEP Website for ACEC locations). **Note:** electronic filers click on Website.

   b. ACEC

5. Is any portion of the proposed project within an area designated as an Outstanding Resource Water (ORW) as designated in the Massachusetts Surface Water Quality Standards, 314 CMR 4.00?

   a. ☐ Yes ☒ No

6. Is any portion of the site subject to a Wetlands Restriction Order under the Inland Wetlands Restriction Act (M.G.L. c. 131, § 40A) or the Coastal Wetlands Restriction Act (M.G.L. c. 130, § 105)?

   a. ☐ Yes ☒ No

7. Is this project subject to provisions of the MassDEP Stormwater Management Standards?

   a. ☒ Yes. Attach a copy of the Stormwater Report as required by the Stormwater Management Standards per 310 CMR 10.05(6)(k)-(q) and check if:
      1. ☒ Applying for Low Impact Development (LID) site design credits (as described in Stormwater Management Handbook Vol. 2, Chapter 3)
      2. ☒ A portion of the site constitutes redevelopment
      3. ☐ Proprietary BMPs are included in the Stormwater Management System.

   b. ☐ No. Check why the project is exempt:
      1. ☐ Single-family house
      2. ☐ Emergency road repair
      3. ☐ Small Residential Subdivision (less than or equal to 4 single-family houses or less than or equal to 4 units in multi-family housing project) with no discharge to Critical Areas.

D. Additional Information

☐ This is a proposal for an Ecological Restoration Limited Project. Skip Section D and complete Appendix A: Ecological Restoration Notice of Intent – Minimum Required Documents (310 CMR 10.12).

Applicants must include the following with this Notice of Intent (NOI). See instructions for details.

Online Users: Attach the document transaction number (provided on your receipt page) for any of the following information you submit to the Department.

1. ☒ USGS or other map of the area (along with a narrative description, if necessary) containing sufficient information for the Conservation Commission and the Department to locate the site. (Electronic filers may omit this item.)

2. ☒ Plans identifying the location of proposed activities (including activities proposed to serve as a Bordering Vegetated Wetland [BVW] replication area or other mitigating measure) relative to the boundaries of each affected resource area.

Massachusetts Department of Environmental Protection

F. Signatures and Submittal Requirements

I hereby certify under the penalties of perjury that the foregoing Notice of Intent and accompanying plans, documents, and supporting data are true and complete to the best of my knowledge. I understand that the Conservation Commission will place notification of this Notice in a local newspaper at the expense of the applicant in accordance with the wetlands regulations, 310 CMR 10.05(5)(a).

I further certify under penalties of perjury that all abutters were notified of this application, pursuant to the requirements of M.G.L. c. 131, § 40. Notice must be made by Certificate of Mailing or in writing by hand delivery or certified mail (return receipt requested) to all abutters within 100 feet of the property line of the project location.

1. Signature of Applicant Gregory W. Barnes	2. Date 1/30/2026
3. Signature of Property Owner (if different)	4. Date 1/14/2026
5. Signature of Representative (if any)	6. Date 1/30/2026

For Conservation Commission:
Two copies of the completed Notice of Intent (Form 3), including supporting plans and documents, two copies of the NOI Wetland Fee Transmittal Form, and the city/town fee payment, to the Conservation Commission by certified mail or hand delivery.

For MassDEP:
One copy of the completed Notice of Intent (Form 3), including supporting plans and documents, one copy of the NOI Wetland Fee Transmittal Form, and a **copy** of the state fee payment to the MassDEP Regional Office (see Instructions) by certified mail or hand delivery.

Other:
If the applicant has checked the "yes" box in any part of Section C, Item 3, above, refer to that section and the Instructions for additional submittal requirements.

The original and copies must be sent simultaneously. Failure by the applicant to send copies in a timely manner may result in dismissal of the Notice of Intent.

B. Fees

To calculate filing fees, refer to the category fee list and examples in the instructions for filling out WPA Form 3 (Notice of Intent).

Fee should be calculated using the following process & worksheet. ***Please see Instructions before filling out worksheet.***

Step 1/Type of Activity: Describe each type of activity that will occur in wetland resource area and buffer zone.

Step 2/Number of Activities: Identify the number of each type of activity.

Step 3/Individual Activity Fee: Identify each activity fee from the six project categories listed in the instructions.

Step 4/Subtotal Activity Fee: Multiply the number of activities (identified in Step 2) times the fee per category (identified in Step 3) to reach a subtotal fee amount. Note: If any of these activities are in a Riverfront Area in addition to another Resource Area or the Buffer Zone, the fee per activity should be multiplied by 1.5 and then added to the subtotal amount.

Step 5/Total Project Fee: Determine the total project fee by adding the subtotal amounts from Step 4.

Step 6/Fee Payments: To calculate the state share of the fee, divide the total fee in half and subtract $12.50. To calculate the city/town share of the fee, divide the total fee in half and add $12.50.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands

NOI Wetland Fee Transmittal Form

B. Fees (continued)

Step 1/Type of Activity	Step 2/Number of Activities	Step 3/Individual Activity Fee	Step 4/Subtotal Activity Fee

Step 5/Total Project Fee: _____

Step 6/Fee Payments:

Total Project Fee:	FEE EXEMPT a. Total Fee from Step 5
State share of filing Fee:	FEE EXEMPT b. 1/2 Total Fee **less $**12.50
City/Town share of filling Fee:	FEE EXEMPT c. 1/2 Total Fee **plus** $12.50

C. Submittal Requirements

a.) Complete pages 1 and 2 and send with a check or money order for the state share of the fee, payable to the Commonwealth of Massachusetts.

Department of Environmental Protection
Box 4062
Boston, MA 02211

b.) **To the Conservation Commission:** Send the Notice of Intent or Abbreviated Notice of Intent; a **copy** of this form; and the city/town fee payment.

To MassDEP Regional Office (see Instructions): Send a copy of the Notice of Intent or Abbreviated Notice of Intent; a **copy** of this form; and a **copy** of the state fee payment. (E-filers of Notices of Intent may submit these electronically.)

ABUTTERS INFORMATION

Affidavit of Service
Under the Town of Raynham Wetlands Protection Bylaw

(to be submitted to the Conservation Commission when filing a Notice of Intent)

I, Hannah Davis, hereby certify under the pains and penalties of perjury that on or before February 9, 2026 I gave notification to abutters in compliance with the Bylaw, which is consistent with the second paragraph of Massachusetts General Laws Chapter 131, Section 40, and the DEP Guide to Abutter Notification dated April 8, 1994, in connection with the following matter:

A Notice of Intent filed under the Bylaw by The City of Taunton in conjunction with MassDOT – Highway Division with the Town of Raynham Conservation Commission on February 9, 2026 for The Old Colony Avenue Bridge Reconstruction Project in Taunton, Massachusetts and Raynham, Massachusetts.

The form of notification, and a list of the abutters to whom it was given and their addresses, are attached to this Affidavit of Service.

Name

2/9/2026
Date

Notification to Abutters

By Hand Delivery, Certified Mail (return receipt requested), or Certificates of Mailing

This is a notification required by law. You are receiving this notification because you have been identified as the owner of land abutting another parcel of land for which certain activities are proposed. Those activities require a permit under the Town of Raynham Wetlands Protection Bylaw.

In accordance with the Bylaw, which is consistent with the second paragraph of the Massachusetts Wetlands Protection Act, and 310 CMR 10.05(4)(a) of the Wetlands Regulations, you are hereby notified that:

A. A Notice of Intent was filed with the Raynham Conservation Commission on or before February 9, 2026 seeking permission to remove, fill, dredge, or alter an area subject to protection under M.G.L. c. 131 §40. The following is a description of the proposed activity/activities:

The Project proposes the replacement of the bridge superstructure along Old Colony Avenue and installation of riprap scour protection within the Taunton River. In addition to the repair and improvement of the bridge, the Project will also consist of paving, construction of a new sidewalk, and stormwater improvements including a new infiltration trench along South Street East.

B. The name of the applicant is: **The City of Taunton in conjunction with MassDOT – Highway Division.**

C. The address of the land where the activity is proposed is: **Old Colony Avenue (Right-of-Way) and South Street East**

D. Copies of the Notice of Intent may be examined or obtained at the office of the Raynham Conservation Commission, located at 558 South Main Street, Raynham, MA 02767. The regular business hours of the Commission are Monday, Tuesday, Wednesday and Thursday from 8:30 am to 1:30 pm, and the Commission may be reached at (508)-824-2706.

E. Copies of the Notice of Intent may be obtained from the applicant or their representative by contacting Hannah Davis, BETA Group, Inc. at (844)-800-2382 ext. 7241 or at hdavis@BETA-Inc.com. An administrative fee may be applied for providing copies of the NOI and plans.

F. Information regarding the date, time, and location of the public hearing regarding the Notice of Intent may be obtained from the Raynham Conservation Commission. Notice of the public hearing will be published at least five business days in advance, in the **Taunton Daily Gazette**.

NARRATIVE

1.0 INTRODUCTION

On behalf of the City of Taunton, BETA Group, Inc. (BETA) is submitting this Notice of Intent (NOI) for the proposed Bridge Reconstruction of bridge R-02-003=T-01-004 (the Project) at Old Colony Avenue over the Taunton River in Taunton and Raynham, Massachusetts (the Site). The Project is being filed under the MassDOT bridge exemption as specified in the 2014 Transportation Bond Bill. The bridge replacement design is substantially the functional equivalent of and in similar alignment to, the existing bridge. Therefore, the Project is not subject to the Massachusetts Wetlands Protection Act (M.G.L. ch.131, s.40 – the Act) and this NOI is being filed under the Raynham Wetlands Protection Bylaw (Chapter 336 – the Bylaw).

The Project is necessary to improve safety and transportation infrastructure in Taunton and Raynham along the Taunton River. The existing bridge was constructed in 1945, and following a recent rating it was recommended the bridge be closed to vehicular traffic due to poor conditions along the bridge abutments. The Project will require demolition of the existing bridge superstructure, construction of the new bridge deck and associated structural appurtenances; installation of scour protection within the Taunton River; full depth pavement reconstruction; and grading. The Project proposes to retain the existing bridge substructure while replacing the superstructure with a deck that is 1' wider to allow for the addition of a bicycle lane. Ancillary Project facets including guardrails and a relocated sidewalk have also been incorporated into the design, and the Project will also address the addition of scour protection within the river during construction.

The Project is considered a limited project because it involves the maintenance and improvement of an existing public roadway limited to widening less than a single lane, adding shoulders, and improving the drainage system per 310 CMR 10.53(3)(f), and it involves the repair and improvement of a bridge and culvert per 310 CMR 10.53(3)(i).

The Project will consist of the following:

- Bridge deck replacement;
- Installation of scour protection within the Taunton River;
- Full depth pavement construction in the vicinity of the bridge;
- Pavement milling and overlay to the north and south of the bridge;
- Modifications to roadway geometry;
- Construction of a new sidewalk;
- Installation of new granite curbing;
- Striping of two travel lanes and a bike lane;
- Installation of Americans With Disabilities Act (ADA)-Compliant curb ramps;
- Replacement of guardrails;
- Modifications to water, sewer, gas, electric and drainage utilities;
- Installation of a perforated High-Density Polyethylene (HDPE) infiltration trench; and
- Tree clearing and trimming.

The Project only proposes the replacement of the superstructure and will maintain the existing substructure (i.e., piers and abutments). Accordingly, the Project will not meet the Massachusetts Stream Crossing Standards to the maximum extent practicable because the existing conditions do not meet the Standards, and compliance of the existing bridge with the Standards will not change given the nature of work. Work associated with the Project will result in temporary and permanent impacts to Areas Subject to Protection under the Bylaw including Bank, Land Under Water (LUW), Bordering Land Subject to

Flooding (BLSF), Riverfront Area (RA), Buffer Zone to Land Subject to Flooding, and No-Activity Buffer Zone. The Project will result in a total of 15,128 square feet (sf) and 117 linear feet (lf) of impacts to Resource Areas with the Town of Raynham, further broken down as follows:

- 66 linear feet (lf) of temporary and 51 lf of permanent impact to Bank;
- 2,304 square feet (sf) of temporary and 4,399 sf of permanent impact to LUW associated with a dredge volume of 1,052 cubic yards (cy);
- 1,121 sf of permanent impact to BLSF;
- 1,867 sf of temporary impact and 4,477 sf permanent impact to Riverfront Area; and
- 315 sf of temporary impact and 645 sf of permanent impact to the Bylaw 25' No-Activity Buffer Zone.

The Project is located entirely within the Bylaw 100' Buffer Zone to BLSF and therefore will result in 5,518 sf of temporary impact and 5,616 sf of permanent impact to the Bylaw 100' Buffer Zone to BLSF. The Project will also result in 1,309 sf of temporary impact and 3,253 sf of permanent impact to 100' Buffer Zone to Bank and 3,479 sf of temporary impact and 3,895 sf of permanent impact to 100' Buffer Zone to BVW.

It is anticipated that this Project will address the existing safety concerns while also improving non-vehicular transportation accommodations. These accommodations associated with the Project have been designed to meet standards set forth by the ADA.

Given the nature of the bridge reconstruction work, there are no feasible alternatives that avoid the impacts to Resource Areas described herein. The Project has been designed to minimize impacts and restore altered areas following construction. During construction, erosion and sedimentation controls and in-water controls including compost filter tubes, siltation fencing, and cofferdams will be installed and maintained to prevent migration of sediment into the stream. Post-construction restoration activities include regrading and stabilizing Banks with a native seed mix and placing suitable streambed material over the proposed scour protection measures within the Taunton River.

The environmental permits and reviews required to construct the Project beyond the submission of this NOI include:

- A 401 Water Quality Certification (WQC) from MassDEP for impacts to Waters of the U.S. that exceed 5,000 sf of loss and 100 cy of dredging;
- Coverage under the U.S. Army Corps of Engineers (USACE) Section 404 Massachusetts General Permit including General Permits 23: Linear Transportation Projects and Wetland/Stream Crossings and 24: Temporary Construction, Access, and Dewatering;
- Order of Conditions under the Taunton Wetlands Protection Ordinance;
- Coverage under the National Pollutant Discharge Elimination Systems (NPDES) Construction General Permit (CGP);
- Coordination with the National Parks Service due to the status of the Taunton River as a Wild and Scenic River;
- National Historic Preservation Act of 1966 Section 106 review;
- National Oceanic and Atmospheric Administration (NOAA) Section 7 review;
- U.S. Fish and Wildlife Service (USFWS) Essential Fish Habitat (EFH) Section 7 review; and
- National Environmental Policy Act (NEPA) Review through preparation of a programmatic Categorical Exclusion.

The sediment Sampling and Analysis Plan prepared as part of the Section 401 Water Quality Certification that is being filed in addition to this NOI can be made available upon request.

2.0 Site Description

2.1 Project Locus & Existing Conditions

The Site is located along Old Colony Avenue approximately 250 linear feet north of its intersection with Battle Row (Figure 1 – Site Locus). The Taunton River flows east/northeast through the Site towards its confluence with Mount Hope Bay in Fall River, Massachusetts. The centerline of the Taunton River is the common boundary between Taunton and Raynham; therefore, the Site includes land in both municipalities. This NOI pertains to the work proposed within the Town of Raynham only.

South Street East is a two-lane road oriented in a north to south direction adjacent to the Taunton River through undeveloped forest and residential properties (Figure 1 – Site Locus). The roadway is under the jurisdiction of the Town of Raynham and is classified as an Urban Collector. Old Colony Ave is a two-lane road oriented in a north to south direction adjacent to the Taunton River through multi-family and industrial properties (Figure 1 – Site Locus). The roadway is under the jurisdiction of the City of Taunton and is classified as an Urban Collector.

The existing structure is an approximately 90’ two-span bridge with equal spans of approximately 45’ 3.5”, constructed in 1945. The structure consists of eight (8) steel beams supporting a 7” concrete deck and 2-1/4” of bituminous paving. The bridge is supported by unreinforced concrete gravity abutments and wingwalls and a reinforced concrete pier. The south abutment is founded on spread footings and the north abutment and pier are founded on timber piles. The bridge is 35’-0” wide, which includes a 26’-0” roadway, a 2’-6” safety walk and 5’-0” sidewalk with metal railing. The bridge has a skew angle of 23.6° and was designed for H20 loading. Stormwater infrastructure in the vicinity of the bridge includes two closed catch basins at the southern end of the bridge that discharge to the Taunton River through a 12-inch reinforced concrete pipe (RCP) within the southeastern wingwall. The remainder of the Site, particularly the portion in Raynham, consists of “country drainage”. A 4” Cast-Iron (CI) and an 8” Asbestos Cement (AC) sewer pipe is located within the bridge superstructure. Additionally, a 6” gas main suspected to be Ductile Iron (DI) is located within the bridge superstructure.

According to the USDA Natural Resources Conservation Service – Soil Survey and the field delineation performed by BETA Group, Inc (BETA) in March 2023, the soils on the Site and in the vicinity of the Site are classified as Birdsall Silt Loam, Urban Land, and Smoothed Udorthents.

Temporary and permanent easements are required for work within and along the Taunton River on both municipal and private properties. A total of 9 easements are required in Raynham (3 permanent, 6 temporary).

2.2 Wetland Resource Areas

A Site inspection was conducted by BETA Wetland Scientists on March 31st 2023, to review the previously delineated boundaries of existing Resource Areas within and in the immediate vicinity of the Site. LUW boundaries were identified and delineated in accordance with the methods developed by the *U.S. Army Corps of Engineers Wetland Delineation Manual; Northeast Region* (2009).

According to the July 16, 2015 FEMA Flood Insurance Rate Map (FIRM) Number 25005C0169G, the Site is within a National Flood Insurance Program (NFIP) Special Flood Hazard) Zone AE. Zone AE areas are considered to be within the 100-year floodplain. The base flood elevation onsite is 14.8’ on the upstream

side of the Old Colony Ave Bridge and 14.4' on the downstream side of the bridge. The Taunton River has a designated Regulatory Floodway at the Site.

The Taunton River is designated as a Wild and Scenic River by the United States Congress. Within the Site, the Taunton River is classified as a "Scenic River Area." Under Sec 2. [16 U.S.C 1273].b.(2) of the Wild and Scenic Rivers Act, Scenic River Areas is defined as "Those River or sections of rivers that are free of impoundments, with shorelines or watershed still largely primitive and shorelines undeveloped, but accessible in places by roads".

Wetland and Resource Areas identified on the Site include Bank, Bordering Vegetated Wetlands (BVWs), LUW, Bordering Land Subject to Flooding (BLSF), and Riverfront Area (RA). Areas Subject to Protection under the Act and Bylaw that are present throughout the Site include:

- Bank – Bank at the Site is associated with one (1) perennial stream (the Taunton River) and one (1) unnamed intermittent stream.
- Bordering Vegetated Wetlands (BVW) – Two (2) areas of BVW are present at the Site. The WF1 Series BVW is a scrub shrub wetland that borders on the B3/B4 Series intermittent stream. The WF2 Series BVW is a scrub shrub wetland located along the northern bank of the perennial stream (the Taunton River).
- Land Under Water (LUW) – LUW exists between the Bank boundaries below the mean annual low water level (MLW) of the streams located at the Site and generally consist of muck and gravel. The boundary of LUW is the MLW, which was not field delineated by BETA.
- Bordering Land Subject to Flooding (BLSF) – BLSF at the Site exists in the Zone AE Flood Hazard associated with the Taunton River.
- Riverfront Area (RA) – RA is present at the Site associated with mean annual high water (MAHW).
- 25' No-Activity Zone (the Bylaw) – The 25' No-Activity Zone is present at the western extent of the Site 25' from BVWs.

The Taunton River at the Site is also mapped as a diadromous fish run.

2.2.1 BANK

Banks were delineated by BETA in the field in March 2023 as described in Table 1: Bank Boundary Description and the Resource Area Boundary Delineation Report included in Appendix A.

Table 1: Bank Boundary Description

FLAG SERIES	LOCATION	DESCRIPTION / NOTES
B1 Series Flags B1-99 to 95 and B2 Series Flags B2-91 to 99 and B2-100 to 105	Taunton River, located east, under and west of the Old Colony Ave Bridge	The northern (*B1 Series*) and southern (*B2 Series*) Banks associated with the Taunton River, a perennial stream, that generally flows west were delineated in two (2) segments along the first observable break in slope consistent with the mean annual flood level. The Bank north of the Taunton River was delineated west (*B1-99 to B1-95*) and east (*B1-100 to B1-106*) of the Old Colony Avenue Bridge in Raynham. Banks west of the bridge were generally well defined and consisted of eroded soils. Banks east of the bridge were observed to be undercut and also consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including bush honeysuckle (*Diervilla lonicera*), silky dogwood (*Cornus amomum*) and Norway maple (*Acer platanoides*).

		Populations of poison ivy (*Toxicodendron radicans*) were also observed. The Bank south of the Taunton River was delineated west (*B2-91 to 99*) and east (*B2-100 to 105*) of the Old Colony Avenue Bridge in Taunton. Banks west of the bridge were generally poorly defined and consisted of rocks and stones of various sizes. Banks east of the bridge were generally well defined and generally consisted of eroded soils. Where vegetated, both Banks consist primarily of woody vegetation including slippery elm (*Ulmus rubra*), Norway maple, and silky dogwood. Populations of poison ivy were also observed. The channel width downstream of the Old Colony Avenue bridge is between 95 to 110 feet wide with a mucky, gravel substrate. The channel width upstream is 90 to 100 feet wide with a mixed cobble, gravel, and mucky substrate. Water depths within the Taunton River could not be determined in the field. The Taunton River is mapped as perennial on USGS topographic maps; therefore, it meets the definition of a perennial stream (River) per 310 CMR 10.58(2).
B3/B4 Series Flags B3-96 to 107 and B4-96 to 107	Northwest of Old Colony Avenue Bridge at 0 South East Street	The interior (*B4 Series*) and exterior (*B3 Series*) Banks associated with a shallow, braided intermittent stream west of South Street East were delineated along the first observable break in slope (consistent with the mean annual flood level). The *B3/B4 Series* stream flows west out of a drainage outfall associated with the closed drainage system under South Street East in Raynham, where flow becomes braided prior to reaching a confluence west of the Site. The *B3/ B4 Series* Banks were primarily vegetated with silky dogwood. The channel is approximately 3 to 5 feet wide and 2 to 6 inches deep with a substrate of sand and muck. This stream is not depicted on current USGS topographic maps or on the StreamStats program; therefore, it is presumed to be intermittent.

2.2.2 Bordering Vegetated Wetland (BVW)

BVWs[1] were delineated by BETA in the field in March 2023 as described in Table 2: BVW Boundary Description and the Resource Area Boundary Delineation Report included in Appendix A.

[1] BVWs described herein are located within the Town of Raynham only.

Table 2: BVW Boundary Description

Flag Series	Location	Description / Notes
WF1 Series Flags WF1-108 to 111	Northwest of Old Colony Avenue Bridge at 0 South East Street	The *WF1 Series* BVW is a scrub shrub wetland bordering on the *B3/B4 Series* intermittent stream. The attached U.S. Army Corps of Engineers Field Data Sheets describe evidence of hydrophytic vegetation, hydric soils, and indicators of hydrology at a specific data plot.
WF2 Series Flags WF2-100 to 102	Along the northern Bank of the Taunton River	The *WF2 Series* BVW is a scrub shrub wetland located along the northern bank of the Taunton River, west of the *B1 Series* Bank. Dominant hydrophytic vegetation observed within the area includes silky dogwood. Evidence of hydrology observed in the field includes sediment deposition and stressed vegetation (buttressed roots), and hydric soils indicators including sandy soils with prominent redox concentrations. A formal data plot was not performed at this location.

The dominant plant species in the *WF1 Series* BVW include silky dogwood (*Cornus amomum*) and multiflora rose (*Rosa multiflora*).

2.2.3 Land Under Water (LUW)

LUW exists between the Bank boundaries below the mean annual low water levels of the streams delineated at the Site. The boundary of LUW is the mean annual low water level. This boundary was not field delineated by BETA and is described in the Resource Area Boundary Delineation Report included in Appendix A.

2.2.4 Bordering Land Subject to Flooding (BLSF)

According to the Federal Emergency Management Agency (FEMA) FIRM Number 25005C0169G, dated July 16, 2015, a Zone AE Flood Hazard associated with the Taunton River exists at the Site with Base Flood Elevations (BFE) ranging from 14.4 feet (NAVD88) downstream of the bridge and 14.8 feet (NAVD88) upstream of the bridge. The Site is also located within the Regulatory Floodway of the Taunton River. Any work performed within BLSF (i.e. areas with a 0.1% yearly chance of flooding) is Subject to Jurisdiction under the Bylaw.

2.2.5 Riverfront Area (RA)

According to 310 CMR 10.58(2), RA is defined as the area of land between a river's mean annual high water (MAHW) line and a parallel line measured 200' away horizontally. A River is any natural flowing body of water that empties to any ocean, lake, pond, or other River flowing throughout the year and is shown as perennial on the current United States Geological Survey or more recent map provided by the Department, or has a watershed size of at least 0.50 square miles and a predicted flow rate greater than or equal to 0.01 cubic feet per second at the 99% flow duration using the USGS Stream Stats Method.

As noted in Table 2 above, the B1/B2 Series stream qualifies as a perennial stream (River) and is therefore afforded a 200' RA. The RA at the Site would be measured 200' horizontally from the MAHW flags. Descriptions of the MAHW boundaries associated with the Taunton River are provided below in Table 3: MAHW Boundary Description and the Resource Area Boundary Delineation Report included in Appendix A.

Table 3: MAHW Boundary Description

Flag Series	Waterbody	Description / Notes
B1 Series Flags B1-99 to 95, and B1-100 to 106 *B2 Series Flags B2-91 to 99, and B2-100 to 105*	Taunton River	The northern (*B1 Series*) Banks were delineated at the mean annual flood level (coincident with the mean annual high-water mark – MAHW) approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation and scour. The southern (*B2 Series*) Banks were delineated approximately ten (10) feet upgradient of Bank. MAHW was determined based on observations of sediment accumulation, scour and the presence of debris.

2.2.6 25' No-Activity Zone (The Bylaw)

According to Section 7 of the Bylaw, a 25' No-Activity Zone is required around BVWs for construction activities. There are two (2) BVW series at the Site, the WF1 Series wetland and the WF2 Series wetland. The 25' No-Activity Zone extends 25' from these BVWs.

2.3 Buffer Zones

The Project is located within the 100' Buffer Zone to Bank and BVW; however, the Buffer Zone within the Project area overlaps entirely within RA of the Taunton River. Buffer Zone on the Site consists of vegetated areas and the bituminous concrete roadway.

The Project is also located within the 100' Buffer Zone to BLSF. According to Section 2 of the Bylaw, a 100' Buffer Zone around BLSF is required for construction activities. The Site is entirely within the 100' Buffer Zone to BLSF.

2.4 NHESP-Mapped Habitat and Other Sensitive Areas

The Site is not located within Natural Heritage and Endangered Species Program (NHESP)-mapped Priority Habitat of Rare Species or Estimated Habitat of Rare Wildlife. No Certified or Potential Vernal Pools are present at the Site. In addition, according to the U.S. Fish and Wildlife Service (USFWS)'s Information for Planning and Consultation (IPaC) tool, the Site is located within the range of the northern long-eared bat (*Myotis septentrionalis*), and the Plymouth redbelly turtle/cooter (*Pseudemys rubriventris bangsi*), both endangered species under the federal Endangered Species Act (ESA). The Site is also within the range of the tricolored bat (*Perimyotis subflavus*), a proposed endangered species, and the monarch butterfly (*Danaus plexippus*), a proposed threatened species. The Site is not within the vicinity of any mapped Critical Habitats for the northern long-eared bat (*Myotis septentrionalis*) or the tricolored bat (*Perimyotis subflavus*). There is final critical habitat for the Plymouth redbelly turtle/cooter, but the Project is not within this habitat.

In addition, the Taunton River is a diadromous fish run and is habitat for the Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*), an endangered species. The Project is in mapped habitat of federally listed endangered species and therefore Endangered Species Act (ESA) Section 7 consultation with NOAA and USFWS for EFH is required (Appendix G).

A Time of Year (TOY) restriction will be observed within the Taunton River from March 15th to June 30th

and from September 1st to November 15th per TR-47 (pending confirmation from NOAA) in order to achieve a "Not Likely To Adversely Affect" determination via the IPaC NLEB Determination Key and to protect rare species. Water controls will be installed and removed outside of this time period. Section 7 consultation has commenced with NOAA to confirm these TOY restrictions.

The Taunton River is designated as a Wild and Scenic River with the River Classification of being a "Scenic River Area" Under Sec 2. [16 U.S.C 1273].b.(2) of the Wild and Scenic Rivers Act, Scenic River Areas is defined as "Those River or sections of rivers that are free of impoundments, with shorelines or watershed still largely primitive and shorelines undeveloped, but accessible in places by roads". Coordination with the National Park Service through the interagency review process is anticipated.

According to the latest MassGIS data, the Site is not located within NHESP mapped Priority Habitat of Rare Species or Estimated Habitat of Rare Wildlife. The Site is not located within an Area of Critical Environmental Concern (ACEC), Outstanding Resource Water (ORW) or within 200 feet of mapped Certified or Potential Vernal Pools. There are no Zone I, Zone II or IWPA groundwater protection areas or Zone A, B or C surface water protection areas.

3.0 Work Description

The Project consists of replacing the bridge superstructure while retaining the existing bridge substructure. The Project proposes to widen the bridge by 1' for curb-to-curb width of 27', which will allow a bicycle lane to be added to the roadway. The proposed sidewalk will be relocated from the east side to the west side of the roadways to connect the existing sidewalk at the condominium building south of the bridge and to Sandy Hill Street in Raynham. While the substructure will be retained, it is anticipated that in-water work will be required for placement of scour protection. Dredging will be required to install the scour protection and cofferdams will be installed within the River for control of water. Scour protection will consist of a 2'-8" layer of streambed material over 2'-0" layer of dumped riprap, which will all be over 1' of crushed stone for a total depth of 5'-8". Water controls and a dewatering system will be installed to install a the scour protection in dry conditions. Additional details on anticipated dewatering and water controls are provided in Section 7.3 below.

Specific activities associated with the Project include:

- Implementation of traffic controls and installation of erosion and sedimentation controls.
- Bridge Replacement:
    - Removal of existing Bridge superstructure.
    - Replace superstructure with the following:
        - S3-MTL4 Bridge Barrier
        - 3" Wearing surface at the roadway over an 8" cast-in-place reinforced concrete deck support by (6) W27 steel stringers;
        - Proposed superstructure will utilize the existing substructure that will remain in place;
        - Proposed low chord will match the existing low chord elevation of 14.35' and the hydraulic opening will remain unchanged;
        - Removal of debris that has accumulated at the pier.
- Full depth pavement reconstruction in the vicinity of the bridge.
- Pavement mill and overlay to the north and the south of the bridge.
    - Establishment of two 13.5' wide travel lanes with no shoulders south of the Bridge along Old Colony Avenue.

  - Establishment of two 11’ to 11.5’ wide travel lanes with 1.5’ to 2’ shoulders north of the Bridge along South Street East.
- Construction of a 6’-wide concrete sidewalk along the east side of Old Colony Avenue.
- Construction of a 5.5’-wide concrete sidewalk along the eastern side of the Old Colony Avenue Bridge.
- Construction a 5.5’-wide concrete sidewalk along the eastern side of South Street East.
- Installation of granite curbing.
- Striping for two (2) 10’ wide travel lanes and one (1) 2’ wide bicycle lane.
- Installation of ADA Compliant Ramps.
- Installation of guardrails.
- Modifications to water, sewer, gas, electric and drainage utilities.
- Installation of a 45’ 8” perforated High-Density Polyethylene (HDPE) infiltration trench.
- Dredging of 1,052 cy of LUW and subsequent LUW/Bank restoration:
  - Installation of 1’ crushed stone scour protection.
  - Installation of 2’-0” of riprap over 1’ crushed stone scour protection.
  - Installation of 2’-8” of streambed material over 2’-0” of riprap.
  - Placement of modified rockfill over permanently impacted segments of Bank.
- Clearing, grubbing, and grading.
- Stabilization of disturbed areas.

In order to complete the work outlined above, the bridge will be closed, and a detour will be implemented during construction. The 6.5-mile detour is proposed via New State Highway (Route 44) to Church Street/ Precinct Street to Middleboro Avenue. Erosion and sedimentation control measures will be implemented as discussed in Section 6.0 – Erosion and Sediment Controls to protect adjacent Resource Areas. Material stockpiles and staging areas will be located as far from the onsite resource areas as possible and will be placed on poly fabric and surrounded with erosion and sedimentation control measures. Stockpiling and equipment storage will occur on the adjacent paved surfaces of Old Colony Avenue and South Street East.

Cofferdams will be installed in two phases associated with dewatering and scour protection installation. Phase I covers the southern cell, diverting flow through the northern cell throughout construction. Phase II will cover the southern cell. A Time of Year (TOY) restriction will be observed within the Taunton River from March 15th to June 30th and from September 1st to November 15th per TR-47 (pending confirmation from NOAA) in order to achieve a “Not Likely To Adversely Affect” determination via the IPaC NLEB Determination Key and to protect rare species. Water controls will be installed and removed outside of this time period. Given the layout of the municipal boundary in relation to the River, water control efforts will span across both municipalities.

A Water Control Plan designed by a Mass. Registered PE is required to be submitted prior to starting work on the bridge replacement. The Water Control Plan will include a Sedimentation and Erosion Control Plan, as well as a Water Flow Diversion and Containment Plan. Work within Resource Areas, including placement of fill, will only occur within dewatered areas. Final streambed restoration will be overseen by a Fluvial Geomorphologist.

3.1 Work in Buffer Zones

The Project will occur within the 100’ Buffer Zone to Bank, BVW, and BLSF. Due to the nature of bridge work, Buffer Zone impacts are unavoidable. The Project was designed to result in the least possible impacts to Buffer Zone as practicable while still accomplishing the Project goals.

Proposed work within the 100' Buffer Zone to Bank and BVW include the following:

- Clearing and grubbing;
- Installation of guardrails;
- Roadway, sidewalk, and curb reconstruction;
- Installation of water controls and cofferdams;
- Drainage improvements; and
- Erosion control installation.

The Bylaw provides a 100' Buffer Zone to any land subject to flooding or inundation by groundwater or surface water, where a Buffer Zone to these Resource Areas is not present under the Act. The area of BLSF associated with the Taunton River meets the definition of land subject to flooding or inundation. Therefore, BLSF has a 100' Buffer Zone under the Bylaw. Given that the Project consists of bridge work within and over the Taunton River, work within the 100' Buffer Zone to land subject to flooding is required to complete the Project and consists of activities consistent with those described above.

Erosion and sedimentation control measures will be implemented as discussed in Section 4.1 to protect adjacent Resource Areas. Material stockpiles and staging areas will be located as far from the onsite Resource Areas as possible and will be surrounded with erosion and sedimentation control measures.

3.2 WORK WITHIN JURISDICTIONAL RESOURCE AREAS

Due to the nature of bridge repair activities, the Project will result in unavoidable temporary and permanent impacts to Resource Areas Subject to Protection and Jurisdiction under the Bylaw. Construction activities, including staging, dewatering, and construction work, have been designed to minimize impacts to Resource Areas to the extent practical by using appropriate erosion and sedimentation controls described in Section 4.1 and by conducting work far from the roadway when possible.

3.2.1 BANK (TO PERENNIAL STREAM, 310 CMR 10.54)

Permanent and temporary impacts to Bank will result from scour protection, clearing and grubbing, cofferdam installation, and dewatering. Table 4: Bank Impacts Summary describes the locations and areal extents of impacts.

Table 4. Bank Impacts Summary

LOCATION	BANK SERIES	IMPACT TYPE*	LENGTH (LF)
West of Station 4+00, along flags B1-98 to B1-97	BF1	Erosion control installation *	19
West of Station 4+00, along flags B1-98 to B1-99	BF1	Riprap scour construction	25
East of Station 4+00, along flags B1-100 to B1-102	BF1	Riprap scour construction	26
East of Station 4+00, along flags B1-102 to B1-104	BF1	Erosion control installation *	47
		TOTAL PERMANENT BANK IMPACTS:	51
		TOTAL TEMPORARY BANK IMPACTS:	66

Denotes a temporary impact that will be restored in-place per Project Specifications.

The majority of permanent impacts to Bank result from dredging and construction of the riprap scour protection. Temporary impacts result from water control through cofferdam installation and dewatering. Although riprap scour construction is considered a permanent impact, all impacts to Bank will be restored in place as described in Section 5.0.

3.2.2 Land Under Water (310 CMR 10.56)

Permanent and temporary impacts to LUW that occur within and adjacent to the Site will result from installation of water control / diversion devices, scour protection, cofferdam installation, and dewatering. A total of 6,703 square feet (sf) of LUW alteration is proposed within the Taunton River. Table 5: LUW Impacts Summary describes the locations and areal extents of impacts.

Table 5: LUW Impacts Summary

LOCATION	IMPACT TYPE*	AREA (SF)
Western side of the bridge between B1-97 and B1-98	Cofferdam installation and dewatering *	177
Western side of the bridge between B1-97 and B1-98	Dredging for access *	658
Eastern side of the bridge between B1-98 and B1-102	Dredging and installation of riprap scour protection	4,399
Eastern side of the bridge between B1-102 and B1-104	Cofferdam installation and dewatering *	961
Eastern side of the bridge at B1-102	Dredging for access *	508
	TOTAL PERMANENT LUW IMPACTS:	4,399
	TOTAL TEMPORARY LUW IMPACTS:	2,304

Denotes a temporary impact that will be restored in-place per Project Specifications.

Permanent impacts to LUW result from dredging and the installation of riprap scour protection. 1,052 cy of material will be dredged from the Taunton River to install scour protection. Although a suitable streambed material will be placed on these impacts areas, the presence of new riprap scour protection has resulted in these impacts being qualified as permanent with in-kind restoration. Temporary impacts result from the temporary control of water through the use of a cofferdam during construction that will be restored after work is completed. Dredging to access the area of scour protection installation will be restored and results in temporary impacts.

3.2.3 Bordering Land Subject to Flooding (310 CMR 10.57)

No permanent fill is proposed within BLSF. A total of 1,121 sf of permanent BLSF impact is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing;
- Installation of riprap scour protection; and
- Updates to drainage outfalls.

3.2.4 Riverfront Area (310 CMR 10.58)

A total of 1,867 sf of temporary impacts and 4,477 sf of permanent impacts to Riverfront Area is proposed over the course of the Project. The majority of these impacts result from:

- Roadway improvements and guardrail installation.

All temporary impacts will be restored in-place per the mitigation measures described in Section 4.0.

3.2.5 100' Buffer Zone

A total of 1,309 sf of temporary impacts and 3,253 sf of permanent impacts to the 100' Buffer Zone to Bank is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing;
- Installation of guardrails; and
- Erosion control installation.

A total of 3,479 sf of temporary impacts and 3,895 sf of permanent impacts to the 100' Buffer Zone to BVW is proposed over the course of the Project. In addition to the activities listed above, the majority of these impacts result from:

- Roadway, sidewalk, and curb reconstruction.

The Bylaw provides a 100' Buffer Zone to BLSF. The Site is located entirely within the 100' Buffer Zone to BLSF. A total of 5,518 sf of temporary and 5,616 sf of permanent impacts to the 100' Buffer Zone to BLSF is proposed over the course of the Project. In addition to the activities listed above, these impacts result from:

- Installation of water controls and cofferdams; and
- Drainage improvements,

3.2.6 25' No-Activity Buffer Zone (The Bylaw)

A total of 315 sf of temporary impacts and 645 sf of permanent impacts to the Bylaw 25' No-Activity Buffer Zone is proposed over the course of the Project. The majority of these impacts result from:

- Clearing and grubbing;
- Installation of guardrails;
- Roadway, sidewalk, and curb reconstruction;
- Installation of water controls and cofferdams;
- Drainage improvements; and
- Erosion control installation.

4.0 Mitigation Measures

4.1 Erosion and Sedimentation Controls

Best Management Practices (BMPs) for erosion and sedimentation controls will be adhered to for all phases of construction to minimize erosion, sedimentation, and impacts on Resource Areas.

Due to the clearing of vegetation, removal of dredged sediment and installation of stone, dust management will be necessary. Water will likely be used by contractors to minimize airborne particulate matter during construction.

Prior to final completion of construction, areas of exposed soils will be present at the Site and will require temporary stabilization. Temporary stabilization methods may include temporary seeding, application of straw mulch, and use of erosion control blankets. Erosion and sedimentation controls will be installed before any land disturbance begins and will remain in place for the duration of the Project. These control measures will be used throughout construction to prevent impacts to downgradient Resource Areas and may include compost filter tubes and siltation fencing or similar controls at the Contractor's specification. Compost filter tubes will be placed as close to the limit of soil disturbance as possible, along contours, and perpendicular to flow. Silt sacks will be used in all existing catch basins within and near the limit of work.

Erosion and sedimentation control measures will be implemented along the limit of work downgradient of the disturbed areas during construction to minimize further resource area impacts and act as a visual limit of work. Erosion and sedimentation barriers will be installed to reduce the chance of soil or sediment migration beyond the limits of work. Temporarily impacted areas will be restored to existing conditions upon completion of the Project. Erosion and sedimentation controls will remain in place and in proper working order until the Site is completely stabilized. A stockpile of approved erosion and sedimentation control materials will be kept on-site for emergency and routine replacement.

Clearing and grubbing will be mitigated with the application of loam and seed. Areas cleared for work will be revegetated with native herbaceous vegetation and monitored for growth after the completion of the Project.

The Contractor will be responsible for obtaining coverage under the Construction General Permit (CGP) pursuant to the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination Systems (NPDES). A Stormwater Pollution Prevention Plan (SWPPP) will be developed prior to any land disturbance. Per the SWPPP, the Contractor will monitor and assess conditions and identify problems in the field during and after construction activities.

4.2 WATER CONTROLS AND DEWATERING

The dredging of the streambed (LUW) and installation of riprap scour protection will require the implementation and maintenance of temporary water controls within the Taunton River so that the work can be completed in dry conditions. While the exact means and methods for water control will be determined by the contractor, it is anticipated that water controls will consist of cofferdams in the form of portadams or sandbags.

A Water Control Plan designed by a Massachusetts Registered Professional Engineer is required to be submitted prior to starting in-water work. The Water Control Plan will include a Sedimentation and Erosion Control Plan and a Water Flow Diversion and Containment plan. Work within Resource Areas, including placement of fill, will only occur within dewatered areas. Final LUW restoration will be overseen by a Fluvial Geomorphologist.

According to preliminary hydraulic studies performed for the Project, temporary closure of each half of the Taunton River will result in water levels remaining below bankfull conditions. Flow is expected to remain within the channel with no overbank flooding in response to a 2-year flood.

Cofferdams will be installed in two phases consistent with the phasing of the dredging work. Phase I addresses the southern half of the River and will divert flow through the northern cell, while Phase II addresses the northern half of the River and will divert flow through the southern cell. A Time of Year (TOY) restriction will be observed within the Taunton River from March 15th to June 30th and from September 1st and November 15th per TR-47 (pending confirmation from NOAA) to protect rare species habitat. Water controls will be installed and removed outside this period.

Dewatering of the work area will be completed to avoid an increase in turbidity over the baseline conditions. It is anticipated that the work area will be dewatered via pumping to a settling tank or dewatering system that filters the water prior to discharge back to the stream. The means and methods for dewatering will be determined by the Contractor at the time of construction based on Site-specific conditions and will be included in the prepared SWPPP which will be completed by the Contractor prior to the start of work.

4.3 Invasive Species Control

Invasive species observed at the Site by BETA include, Norway Maple (*Acer platanoides*), Garlic Mustard (*Alliera petiolata*), and Multiflora Rose (*Rosa multiflora*).

During or after construction, the contractor will employ BMPs designed to prevent further propagation of invasive plant species at the Site. These BMPs include proper disposal of any excavated invasive species, prevention of migration of rhizome fragments and seed pods, and cleaning vehicles of soil before and after accessing the Site. Any application of herbicides will be done in accordance with the practices set forth by the Massachusetts Department of Agricultural Resources.

4.4 Stormwater Management

4.4.1 Existing Stormwater Management

Stormwater runoff from the Site is described as Drainage Areas Ex-1E, Ex-2E, and Ex-3E in the Stormwater Report (Appendix B). Existing closed drainage systems are present along the roadway which convey stormwater runoff to two outfalls, one of which discharges to the Taunton River and one of which discharges to a nearby intermittent stream. No edge treatment is provided on the southern side of South Street East in Raynham, and stormwater runoff from this portion of the Site flows overland into a forested area.

4.4.2 Proposed Stormwater Management

Stormwater management is proposed via modifications to the existing closed drainage system. Existing inlets will be replaced with deep-sump catch basins, and additional deep-sump catch basins will be installed throughout the corridor to provide more effective stormwater collection and treatment. New curbing is proposed to better direct stormwater runoff to catch basins. The majority of existing trunklines will be retained. The Project will retain existing drainage runoff patterns to the maximum extent practicable.

The Project will retain the existing outfall from the closed drainage system within the Town of Raynham and will replace the existing outfall associated with the closed drainage system within the City of Taunton. The new outfall will be increased in size from 12” to 18” and the existing headwall will be rebuilt at the same location.

The Project proposes a new 45’ 8” HDPE infiltration trench within the Town of Raynham near the northeastern limit of work. Stormwater runoff will be directed to this SCM through a new deep sump catch basin which will overflow into the existing closed drainage system.

Additionally, country drainage/pavement disconnection will be implemented for several portions of South Street East by excluding curbing to allow treatment in the grass/woodland area adjacent to the roadway. Of this, approximately 100’ of South Street East, on the eastern side of the roadway, drains to an area that meets the definition of qualifying pervious area and is comprised of approximately 1,500 sf of impervious area.

4.5 COMPLIANCE WITH STORMWATER STANDARDS

The Project complies with the MassDEP Stormwater Management Standards (the Standards).

The Project is classified as a Limited[2] and Redevelopment[3] project under section 310 CMR 10.53(3)(f) and (i).

The proposed work within the roadway, such as replacing the existing catch basins with deep sump catch basins, constitutes Redevelopment work because the work will substantially occur within an existing paved area. Redevelopment work is required to meet Standards 1 and 7 through 10 fully, and Standards 2 through 6 only to the maximum extent practicable.

This section details the regulatory framework for stormwater management, the existing impervious cover and stormwater system, an assessment of impacts, and the project's regulatory compliance with the Massachusetts Stormwater Standards.

4.5.1 REGULATORY FRAMEWORK

The Project consists of redevelopment of an existing / paved bridge and roadway, widening of roadway and installation of a bicycle pathway, relocation of an existing sidewalk from the eastern side of the bridge to the west, associate drainage infrastructure improvements, and installation of scour protection within the Taunton River. The Project complies with the MassDEP Stormwater management Standards that meets all standards to the maximum extent practicable.

The Project is classified as a Limited[4] and Redevelopment[5] project under section 310 CMR 10.53(3)(f) and (i). As a result, the Project is only required to meet Standards 1 and 7 through 10 fully, and Standards 2

---

[2]The following projects may be permitted as a limited project pursuant to 310 CMR 10.24(7) provided the project complies with all applicable provisions of 310 CMR 10.24(1) through (6) and (9) and (10): 1. Maintenance and improvement of existing public roadways, but limited to widening less than a single lane, adding shoulders, correcting substandard intersections, and improving drainage systems. 2. The maintenance, repair and improvement (but not substantial enlargement except when necessary to reduce or eliminate a tidal restriction) of structures, including buildings, piers, towers, headwalls, bridges and culverts which existed on November 1, 1987.

[3] Redevelopment means replacement, rehabilitation, or expansion of existing structures, improvement of existing roads or reuse of degraded or previously developed areas for purposes of 310 CMR 10.58, governing work in the riverfront area. For purpose of the Stormwater Management Standards as provided in 310 CMR 10.05(6)(k) through (q), redevelopment is defined to include the following projects: (a) maintenance and improvement of existing roadways including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving

[4]The following projects may be permitted as a limited project pursuant to 310 CMR 10.24(7) provided the project complies with all applicable provisions of 310 CMR 10.24(1) through (6) and (9) and (10): 1. Maintenance and improvement of existing public roadways, but limited to widening less than a single lane, adding shoulders, correcting substandard intersections, and improving drainage systems. 2. The maintenance, repair and improvement (but not substantial enlargement except when necessary to reduce or eliminate a tidal restriction) of structures, including buildings, piers, towers, headwalls, bridges and culverts which existed on November 1, 1987.

[5] Redevelopment means replacement, rehabilitation, or expansion of existing structures, improvement of existing roads or reuse of degraded or previously developed areas for purposes of 310 CMR 10.58, governing work in the riverfront area. For purpose of the Stormwater Management Standards as provided in 310 CMR 10.05(6)(k) through (q), redevelopment is defined to include the following projects: (a) maintenance and improvement of existing roadways including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving

through 6 only to the maximum extent practicable. The Stormwater design for these Standards is described in the following sections.

4.5.2 Regulatory Compliance

The Project will result in vegetative clearing, grading, and construction of 781 square feet of new impervious area. Accordingly, stormwater SCMs that comply with the Stormwater Management Standards are required.

The Project qualifies as Limited Redevelopment Project under the Stormwater Management Standards. This section provides a list of the Stormwater Management Standards and a brief description of the Project's compliance with the Standards to the maximum extent practicable.

LID Measures

Low Impact Development (LID) techniques utilized along portions of the Project include:

- Preservation of existing vegetation;
- Use of country drainage for portions of the Site; and
- Preservation of existing drainage patterns.

Standard 1: No New Untreated Discharges

No new stormwater conveyances (e.g. outfalls) may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

The Project has been designed to comply with Standard 1. The Project proposes to replace the existing outfall from the City of Taunton closed drainage system. This work will include replacing the existing 12" MTL and 12" CMP outfalls with a new 18" DI outfall at the same location, replacing the existing headwall, and providing stone for pipe ends as stabilization to prevent erosion to the Taunton River. The Project proposes to retain the existing outfall from the Town of Raynham closed drainage system.

The Stormwater Management Report (Appendix B) provides supporting calculations for the outlet protection design.

Stormwater runoff will be treated by deep sump catch basins, the infiltration trench, or country drainage before discharging off-site.

See Standard 4 for the water quality treatment provided by the Project.

Standard 2: Peak Rate Attenuation

Stormwater management systems shall be designed so that the post-development peak discharge rates do not exceed pre-development peak discharge rates.

The Project has been designed to comply with Standard 2 only to the maximum extent practicable as a Redevelopment / Limited Project. This Project reduces post development peak runoff rates to below pre-development peak runoff rates for DP 3 during the 2-year and 100-year 24-hour design storm events based on NOAA Atlas 14 precipitation data as shown in Table 6. Otherwise, a net increase in peak runoff rates is anticipated for all design points and design storm events.

Table 6: Rainfall Depths (in)

DESIGN STORM EVENTS	RAINFALL DEPTH (in)
2-Year	3.42
10-Year	5.08
100-Year	7.71

Table 7 provides a summary of peak rates for each design point under existing and proposed conditions. The Stormwater Management Report (Appendix B) provides computations and supporting information regarding the hydraulic and hydrologic modeling.

Table 7: Peak Discharge Rates (cfs)

DESIGN POINT	EXISTING RATE (cfs)			PROPOSED RATE (cfs)		
	2-Year	10-Year	100-Year	2-Year	10-Year	100-Year
DP 1	1.14	2.08	3.61	1.23	2.22	3.81
DP 2	0.74	1.39	2.44	0.67	1.28	2.20
DP 3	0.52	1.11	2.14	0.39	0.90	1.81
TOTAL	2.40	4.58	8.19	2.29	4.41	7.82

The Project is unable to fully meet this standard due to constraints including right-of-way, grades, and existing developed properties. This Project includes a net increase of 781± square feet of impervious surface, which will result in minor increases to the volume and rate of stormwater runoff from the Project area. This increase in impervious area is necessary to provide sidewalks where none currently exist. Despite Project constraints and an increase in peak flow rates, the proposed deep-sump catch basins and infiltration trench will improve existing conditions throughout the Project corridor. Refer to HydroCAD calculations provided in the Stormwater Management Report (Appendix B) for additional information.

Standard 3: Recharge

Loss of annual recharge to groundwater shall be eliminated or minimized through the use of infiltration measures, including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The Project has been designed to meet this standard on a Project-wide basis, as the Project is a Redevelopment / Limited Project. The Project has significant right-of-way constraints, which restrict opportunities for recharge on the southern portions of the Site. Despite constraints, the proposed infiltration trench has been designed to provide the sitewide required recharge volume for new and a portion of the existing impervious area. However, the required recharge volume will not be achieved for design points DP 1 and DP 2.

Table 8 provides the required recharge volume for the Project, and Table 9 provides the recharge volumes proposed for each design point.

Table 8: Required Recharge Volume for Project

	HSG A	HSG B	HSG C	HSG D	Total
Existing Impervious (sq. ft)	26,829		1,964	2,417	31,210
Proposed Impervious (sq. ft)	27,280		2,213	2,498	31,991
Net Impervious Area (sq. ft)	451		249	81	781
Target depth, F (in)	0.6	0.35	0.25	0.10	
Required Recharge Volume, ReV (cf)	22.55		5.19	0.68	28.41

Table 9: Provided Recharge Volumes at Each Design Point

	HSG A	HSG B	HSG C	HSG D	Total
DP-1

DP-3					
Net Impervious Area (sq. ft)	-1593		244	-429	-1,778
Required Recharge Volume, ReV (cf)	-79.65		5.08	-3.58	-78.14
Provided Recharge Volume (cf)	0.00		0		0.00

The infiltration SCMs are designed to drain completely within 72 hours.

Standard 4: Water Quality Treatment

Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS)

The Project has been designed to comply with Standard 4 only to the maximum extent practicable as a

Redevelopment / Limited Project. Proposed drainage system improvements, including the installation of deep sump catch basins and an infiltration trench, will provide treatment of stormwater runoff that does not currently exist and will improve existing conditions. The proposed Project will provide an average TSS removal rate of 20% for 31,991± sq. ft. of impervious surfaces.

The Project is located in an area with a rapid infiltration rate (>2.4 in/hr) and the required water quality volume has been calculated based on the 1.0" water quality depth.

Table 10 shows the WQV to be treated for both new and existing impervious area within each drainage area, organized by design point.

Table 10: WQV at Each Design Point

DESIGN POINT	WQV FOR NEW IA (cf)	WQV FOR EXISTING IA (cf)	TOTAL WQV (cf)
DP-1			
10P	*97.58*	*722.75*	*820.33*
Total	97.58	722.75	820.33
DP-2

Total	-148.17	849.58	701.42
Project Total	**65.08**	**2,600.83**	**2,665.92**

Table 11 shows the WQV provided by the SCMs at each design point.

Table 11: WQV by the SCMs at Each Design Point

DESIGN POINT	PRETREATMENT (Y/N)	*WQV PROVIDED (cf)*	*MEETS TOTAL WQV (cf)*	*MEETS REQUIRED WQV for NEW IA*
DP-1		0	No	No
DP-2			No	Yes
Linear Infiltration Practice	Y	81.42	No	Yes
Total	Y	81.42		
DP-3		0		
Project Total			***No***	***Yes***

Opportunities to install treatment and recharge SCMs are limited due to the aforementioned constraints. Despite Project constraints, the proposed deep sump catch basins and linear infiltration practice will improve existing conditions throughout the Project corridor. Refer to Appendix A in the Stormwater Management Report for calculations relating to TSS Removal. Refer to Illicit Discharge Compliance Statement under Standard 10.

Appendix B includes the Long Term Pollution Prevention Plan for this Project.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

Land use with high potential pollutant loads must have source control and pollution prevention measures implemented in accordance with the Massachusetts Stormwater Handbook.

Standard 5 does not apply to the Project. There are no Land Uses with Higher Potential Pollutant Loads proposed as part of the Project.

Standard 6: Critical Areas

Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of specific source control, pollution prevention measures.

Standard 6 does not apply to the Project. There are no Critical Areas near the Project area.

Standard 7: Redevelopment

A redevelopment project is required to meet certain Stormwater Management Standards only to the maximum extent practicable.

The Project is a Redevelopment Project under the first definition: “Maintenance and improvement of existing roadways, including widening less than a single lane, adding shoulders, correcting substandard intersections, improving existing drainage systems and repaving.” Proposed deep sump catch basins and infiltration trench will provide treatment to the maximum extent practicable and represent an improvement to the existing conditions. Standards 1, 8, 9, and 10 are met, Standards 3 and 4 are met on a Project-wide basis, and Standard 2 is met to the maximum extent practicable. Standards 5 and 6 are not applicable to this Project.

Standard 8: Construction Period Pollution Prevention and Erosion and Sediment Control

A plan to control construction related impacts, including erosion, sedimentation, and other pollutant sources during construction and land disturbance activities shall be developed and implemented.

The implementation of erosion and sedimentation (E&S) controls during construction is considered a standard practice for all City projects. E&S controls will be installed before any land disturbance begins for the Project and will remain in place for the duration of the Project. The E&S controls for the Project are shown on the Project plans and include perimeter sediment control barrier, tree protection, temporary cofferdam for water control, and dewatering.

The Project as currently design disturbs one or more acres of land; therefore, the Project contractor will request coverage under the NPDES Construction General Permit (CGP) and develop a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP follows the requirements of this standard and complies with the NPDES CGP.

Standard 9: Long Term Operation and Maintenance Plan

A Long-Term Operation and Maintenance Plan shall be developed and implemented to ensure that stormwater management systems function as designed.

The roadway and bridge included in this Project are located in both the City of Taunton and the Town of Raynham. Ownership is divided between the City of Taunton and the Town of Raynham. The activities included in the O&M Plan will be implemented by the municipality. Appendix B of the Stormwater Management Report (Appendix B) includes the O&M Plan for this Project.

Standard 10: Prohibition of Illicit Discharges

All illicit discharges to the stormwater management system are prohibited.

The Project's stormwater management system, as shown on the plans submitted with this report, has been designed in full compliance with Standard 10. The Project area does not have any known illicit connections. Any illicit connections to the stormwater management system found in the Project limit of work during construction will be removed and/or resolved through the City's Illicit Discharge Detention and Elimination (IDDE) Program. The Long-Term Pollution Prevention Plan, provided in Appendix B of the Stormwater Report (Appendix B), includes measures to prevent illicit discharges.

For additional details see Stormwater Report in Appendix B– Stormwater Management Report details the stormwater management improvements proposed by the Project and describes the Project's relation to the Stormwater Management Standards.

The Contractor will be responsible for obtaining a National Pollutant Discharge Elimination Systems (NPDES) Dewatering and Remediation General Permit (DRGP). A Stormwater Pollution Prevention Plan (SWPPP) will be prepared prior to any land disturbance and will be submitted to the Conservation Commission for review and approval. Per the SWPPP, the Contractor will monitor and assess conditions and identify problems in the field during and after construction activities.

4.6 Resource Area Restoration and Replication

The Project was designed to avoid, minimize, and mitigate impacts to Resource Areas, wildlife habitat, and other sensitive areas. Due to the nature of the Project being a bridge replacement within a linear corridor, avoidance of impacts is infeasible; however, they have been minimized to the extent possible. Impacts will be mitigated with LUW and BVW restoration as described below.

4.6.1 LUW Restoration

To address the proposed permanent LUW impacts, the Project will restore the LUW conditions in place through the addition of native streambed material over installed scour protections. To restore LUW, 2'-8" layer of streambed material will be placed over a 2'-0" layer of dumped Class III riprap, which will all be over 1' of crushed stone for a total depth of 5'-8". The riprap will extend the length of the channel from each abutment and will extend 25' upstream and downstream of the embankment. All 6,703 sf of permanent and temporary LUW impacts will be restored in place.

4.6.2 Bank Restoration

To address the proposed temporary Bank impacts caused by the installation of erosion controls, all 66 lf of temporary Bank impacts and 51 lf of permanent Bank impacts will be restored through the application of a native roadside part-shade seed mix. Four inches (4") of loam and seed will be applied over pavement milling mulch.

Erosion and sedimentation controls will be 100% biodegradable and left in place at the conclusion of the Project. Compost filter tubes will be overlapped by a minimum of 3' for a continuous barrier and secured using hardwood stakes. Erosion and sedimentation controls will be used to reduce flow onto work and to prevent flow off-site by placing the controls as close to the area of disturbance as possible. Compost filter tube berms will be used for slopes 2:1 or steeper and will be staked every 5' to secure the tube or per the manufacturer's instructions. Any non-biodegradable material, if used, will be removed and disposed of off-site at the Contractor's expense. Filter tube compost will be spread or raked around to eliminate berm. The restored areas will be monitored over the course of two (2) years to document adequate hydrology and plant survivability.

BMPs will be employed by the Contractor to prevent further propagation of invasive plant species at the Site. These BMPs include proper disposal of any excavated invasive species, prevention of migration of rhizome fragments and seed pods, and cleaning vehicles of soil before and after accessing the Site. Any application of herbicides will be done in accordance with the practices set forth by the Massachusetts Department of Agricultural Resources. Further details regarding invasive species control can be found in Appendix D – Project Plans.

5.0 Alternatives Analysis

The purpose of this Project is to reconstruct a structurally deficient bridge, protect the bridge from scour, and improve safety for vehicles, cyclists, and pedestrians. As described in further detail within the Alternatives Analysis prepared for the Project (Appendix F), several factors were considered when determining the scope and approach of the Project design, including cost, construction constraints, and environmental concerns.

The intent of this analysis is to demonstrate that there is no alternative to the Project with less impacts on the environment that meets the Project purpose. Accordingly, this Alternatives Analysis focuses on the considerations made during the preparation of the Bridge Reconstruction R-02-003=T-01-004 Alternatives Analysis and were used to develop this Alternatives Analysis. This Alternatives Analysis assesses the following alternatives:

- No-Build Alternative;
- 10' Travel Lanes and 4' Shoulder on Safety Curb Side (Alternative #1 – Preferred);
- 12' Travel Lanes and 2' Shoulders on Either Side (Alternative #2);
- No Scour Protection (Alternative #3); and
- Embedment Below Scour Depths (Alternative #4).

5.1 Project Construction Alternatives

5.1.1 No-Build Alternative

The No-Build Alternative was assessed as a potential Project alternative. Under the No-Build Alternative, no aspect of the Project purpose as defined above is realized. While the No-Build Alternative would not result in a loss of Resource Areas, the Old Colony Avenue Bridge would remain deteriorating and insufficient for safe public transportation. Pursuing the Non-Build Alternative is not consistent with the Project purpose and would not serve the needs of the City of Taunton or the Town of Raynham, therefore, this alternative was not selected.

5.1.2 Alternative #1: 10' Travel Lanes and 4' Shoulder on Safety Curb Side (Preferred)

Alternative #1 features a cross-section with two 10'-wide travel lanes in each direction, accompanied by one 2' -wide shoulder on the sidewalk side and one 4'-wide shoulder on the safety curb side. Sidewalk is proposed on the west side of the roadway. The sidewalk is 6' wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5' wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative #1 will require a design justification for pedestrian accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, a 4' shoulder was provided on the east side, which is the minimum width for bicycle accomodation. A 2' shoulder was provided on the west side against the sidewalk for drainage, errant vehicles, and encroachment and off-tracking of wide vehicles. Sharrows can be added in the northbound lane.

Alternative #1 results in impacts to LUW totaling 6,703 square feet (4,399 square feet permanent and 2,304 square feet temporary); and impacts to Bank totaling 117 linear feet (51 feet permanent and 66 linear feet temporary). Alternative #1 and Alternative #2 result in the same impacts to Resource Areas.

Alternative #1 allows for bicycle accommodation southbound with a 4' shoulder, while still maintaining the minimum lane width for a collector of 10'. Old Colony Avenue and South Street East is a bus route on the Greater Attleboro Taunton Regional Transit Authority. Bus lanes are permitted on 10' travel lanes. The narrower 10' roadway will help reduce speeds. Alternative #1 presents an improvement upon existing bridge conditions and achieves the Project's purpose and need with no increase in Resource Area impacts compared to Alternative #2. Therefore, Alternative #1 is the preferred alternative.

5.1.3 Alternative #2: 12' Travel Lanes and 2' Shoulders on Either Side

Alternative #2 features a cross-section with two 11'-wide travel lanes in each direction, accompanied by two 2'-wide shoulders. Vertical granite curbing lines both sides of the roadway. Sidewalk proposed on the west side of the roadway. The sidewalk is 6' wide from the condominium driveway to over the bridge. North of the bridge the sidewalk tapers down to 5.5' wide and terminates at Sandy Hill Street with reciprocal ramps. Vertical granite curb is proposed along the front of the sidewalk. Vertical granite curb is proposed at the back of sidewalk at Station 5+70 +/- to 6+32 +/- (LT) to avoid impacts to the wetlands. Alternative #2 will require a design justification for pedestrian accomodations because only one sidewalk is being proposed. The design does not allow for sidewalks on both sides of the road due to the width constraint of the existing bridge substructure. A design justification is also needed for the bicycle accomodations. Neither a shared use path or seperated bike lanes were able to fit within the existing bridge structure. Therefore, 2' shoulders were provided on both sides of the roadway. Sharrows can be added to both travel lanes.

Alternative #2 results in impacts to LUW totaling 6,703 square feet (4,399 square feet permanent and 2,304 square feet temporary); and impacts to Bank totaling 117 linear feet (51 feet permanent and 66 linear feet temporary). Alternative #1 and Alternative #2 result in the same impacts to Resource Areas.

Alternative #2 presents the same conditions as existing conditions, where the lane widths are 11' wide and the shoulders are 2' wide. Alternative #2 does not propose any pedestrian or bicycle improvements in addition to addressing unsafe bridge conditions, while providing no decrease in impacts to Resource Areas. Therefore, Alternative #2 was not selected.

5.1.4 Alternative #3: No Scour Protection

Alternative #3 includes the design provisions of the preferred Alternative #1 without the addition of scour protection. In Alternative #1, scour protection consists of a 2'-8" layer of streambed material over 2'-0" layer of dumped riprap, which will all be over 1' of crushed stone for a total depth of 5'-8". Constructing the Project without scour protection eliminates the need for dredging and dewatering, reducing impacts to Resource Areas. Although Alternative #3 results in less impacts to Resource Areas, scour protection has been determined as necessary to protect the Taunton River and bridge from scour and eventual compromising of the substructure. Therefore, Alternative #3 was not selected.

5.1.5 Alternative #4: Embedment Below Scour Depths

Alternative #4 proposes to lower the bridge footings below predicted scour depths. This alternative would require the substructure to be replaced in order to embed it below the level where scour would occur.
